his army, after a great victory over the Moors, in A.D. 1139. *Serpa*, 20 miles E.S.E. of Beja, a considerable town, the inhabitants of which carry on a large contraband trade with Spain. *Villa Viçosa*, 23 miles N.E. by E. of Evora, a small town with a royal palace, and a walled park 10 miles in circuit. *Portalegre*, 70 miles N.N.E. of Evora, an episcopal city, with a considerable manufacture of cloth. To the north-east is the small town of *Marvao*, noted for its fortifications, and for some antiquities lately discovered.

3. *Beira*.—COIMBRA, a large episcopal city on the right bank of the Mondego, 112 miles N.N.E. of Lisbon, built partly on the western side of a steep rocky hill, and partly on a plain contiguous to the river. This city contains the only university of the kingdom, and is the seat of the general directory of public instruction, and of a considerable inland trade. Population 15,000. *Figueira*, a seaport town with considerable trade at the mouth of the Mondego. *Aveiro*, a small episcopal city, 35 miles N.N.W. of Coimbra, formerly an important seaport, and now recovering its ancient prosperity, in consequence of the great labour expended in draining the marshes in its neighbourhood, and in restoring its harbour. *Oliveira*, a large commercial town, at the northern end of the great gulf or inlet of Aveiro. *Viseu* or *Vizeu*, an episcopal city 48 miles N. of Coimbra, noted for a great annual fair for jewellery and plate, cloth, and cattle. *Lamego*, about 5 miles from the left bank of the Douro, an episcopal city in which the Cortes assembled in the year 1144 to establish the constitution of the kingdom. *Covilhan*, a large town at the foot of the Sierra d'Estrella, with fine woollen manufactures, and a literary society. *Almeida*, a fortified town near the frontier, 24 miles W. by N. of Ciudad Rodrigo, in Spain. It has always been deemed a military post of the greatest importance.

4. *Minho*.—PORTO OPORTO, a large episcopal city and seaport town in a delightful situation, on the slopes of two hills along the right bank of the Douro, three miles from its mouth. The town is very irregular and straggling, but is second only to Lisbon in the industry of its inhabitants, and in commercial importance; the principal trade consists in wine, both white and red, but chiefly the latter, which is made in this province, and also in Tras os Montes, and exported to the amount of 50,000 to 70,000 pipes a-year. It has also manufactures of hats, silks, linen, and pottery, with ropewalks and ship-yards. The climate is damp and foggy in winter; and the air is then cooler than anywhere else in Portugal, but it seldom freezes. In summer the heat is excessive; most of the plants of Southern Africa grow in the open air, as well as gooseberries, currants, and other fruits of the colder climates of Europe. The river affords a tolerably secure harbour, and is lined by a quay along the whole length of the town. Its mouth is obstructed by rocks and quicksands, which render entrance difficult, but the water is very deep in front of the town. Oporto has 4 suburbs, 11 campos or squares, 14 hospitals or asylums, 90 churches, besides a fine and spacious cathedral rebuilt by Henriquez, first Count of Portugal, A.D. 1105; and 17 monasterics, now uninhabited. On the south side of the river, which is crossed by a bridge of boats, is the *Villa-nova de Gaya*, chiefly inhabited by wine-coopers, and containing the immense vaults or lodges where the wine is kept till it is stored. On a rocky eminence above Villa-nova is the vast convent and garden of Serra Cruzios, near which the British army crossed the Douro in 1809. The city, including Villa-nova, and all its suburbs, contains probably about 70,000 inhabitants. *Braga*, a very ancient archiepiscopal city, with an ancient cathedral, the remains of a temple, an amphitheatre, an aqueduct, and other Roman antiquities, and an industrious commercial population, 30 miles N. by E. of Porto. *Guimaraens*, south-east of Braga, a large flourishing town, with manufactures of cutlery, linen, &c., was the first capital of the kingdom. *Caldas do Gerez*, noted for its well-frequented mineral baths, north-east of Braga. *Vianna*, a large seaport town at the mouth of the Lima, with considerable trade, and flourishing fisheries.

5. *Tras os Montes*.—VILLA-REAL, a large, busy, and commercial town, 50 miles N.E. of Oporto. *Peso da Regoa*, near the right bank of the Douro, south of Villa-real, a small town with a celebrated wine-fair, held every year in February, where business is done to the value of £1,500,000 sterling. *Bragança*, an episcopal city, with important silk manufactures, in the north-east quarter of the province, gives the title of duke and a sort of family name to the existing royal dynasty. *Chaves*, near the northern frontier, has been frequented for its mineral waters since the time of the Romans, and has a bridge built by them.

6. *Algarve*.—FARO, an episcopal and commercial city, with 8000 inhabitants, who are chiefly employed in the fisheries. *Tavira*, a large seaport town, with 9000 inhabitants, mostly employed in fisheries. *Villa-real*, a fine town, built in 1774 by the Marquis de Pombal, on a regular plan, with a harbour at the mouth of the Guadiana. *Monchique*, a small town, 30 miles N.E. of Cape St. Vincent, in a romantic situation, with well-frequented mineral baths. *Sagres*, a small fortified town, near Cape St. Vincent. It was here that the Infant Don Henriquez, Duke of Viseu, resided for many years, to prosecute those voyages along the coasts of Africa, which have rendered his name illustrious as the father of modern maritime discovery.

The *foreign possessions* of Portugal consist of:—1. The *Açores*; 3. *Madeira* and *Porto Santo*; 3. The *Cape Verde Islands*, on the west coast of Africa; 4. *Angola*, *Moçambico*, and other territories in southern Africa, *Goa*, *Diu*, and other settlements in the East Indies.

The AÇORES, or WESTERN ISLANDS, are situate in the Atlantic Ocean, between 37° and 39° north latitude, and 25° and 31° west longitude. They are nine in number, named *Santo Miguel* (*St. Michael's*), *Terceira*, *Pico*, *Fayal*, *Santo Jorje*, *Graciosa*, *Santa Maria*, *Flores*, and *Corvo*, all of volcanic formation, of a rugged rocky surface, and producing abundance of wine and fruits. SAN MIGUEL, 50 miles in length, and varying in breadth from 6 to 10 miles, rises in many parts precipitously from the water, but in others its elevation is very gradual. The more level parts are dotted with hundreds of small hills, many of which are perfect cones, while others are truncated or terminate in crater-shaped tops. The lower parts of the island are cultivated, and exhibit extended fields of Indian corn, wheat, and culinary vegetables. Houses and villages are scattered all along the coast, intermixed with vineyards and orange gardens.—Population, about 80,000. The chief town of the island is *Ponta Delgada*, on the south coast, a well-built town, with 16,000 inhabitants, but possessing a bad harbour, though the best in the island. It contains an English church and burying-ground. *Ribiera-grande*, on the north side of the island, is also a flourishing town, with 12,000 inhabitants. In 1811, a volcanic island rose from the sea, off the west end of St. Michael's, to the height of 300 feet, but disappeared four months after. TERCEIRA is a large compact island, to the west of St. Michael's, and contains the capital of these islands. *Angra*, an episcopal city, with 13,000 inhabitants, a military academy, and other literary establishments. *Horta*, in Fayal, is a large town with 10,000 inhabitants, and the best harbour in the group, the most frequented after those of Angra and Ponta Delgada. *Lagens* in Pico is a small town, but noted for its excellent wine. In its vicinity rises the great *Pico*, or snow-capped volcanic cone, to the height of 6900 or even 7000 feet above the level of the sea. The other islands are in no way remarkable. The total population has been estimated at 250,500, thus distributed:—Santo Miguel, 80,000; Terceira, 40,000; Pico, 24,000; Fayal, 22,000; Floras, 14,000; Santo Jorje, 10,000; Graciosa, 7800; Santa Maria, 5000; Corvo, 7000.

MADEIRA is situate off the north-west coast of Africa, in north lat. 32° 30', and west long. 17°; 35 miles in length, and 10 or 12 broad. It rises, for the most part, abruptly from the Atlantic, and the interior forms a huge mountain mass, interspersed with numerous chasms and precipices, many of which are frightful and inaccessible. The island is liberally supplied with rivulets and cascades, which leap

from rock to rock, through bushes of rosmary, jessamine, laurel, and myrtle. Groves of chestnuts and pine-trees stretch along the declivities of the mountains; the large leaves of the banana wave over the walls, and the splendid palm-trees overtop the houses. Coffee-trees form hedges and copses; while mimosas, protea, and a variety of the most gorgeous and fragant palms rise into tall and stately trees, displaying their far glittering blossoms in the most delightful climate. The air is filled with perfume, and thousands of birds warble in the woods. The uniformity of the temperature is remarkable; the average range of the thermometer is from 68° to 76° Fahrenheit during summer, and from 57° to 65° in winter; the mean annual temperature being 66°. But every desirable degree of temperature can be enjoyed with the corresponding changes of vegetation, on the acclivities of the Pico Ruivo, which raises its snow-capt summit in the centre of the island to the height of 5488, or, according to others, 6165 feet above the level of the sea. Madeira has long been the resort of invalids, especially of consumptive patients. The best season for them is from November to the middle of June. In July, August, and September, the heat sometimes becomes excessive, and the influence of the sirocco has been known to raise the temperature to 130°, a heat sufficient to melt wax. The winters too are sometimes stormy and uncomfortable. The geological structure of the island is likewise an insuperable obstacle to the making of good roads, so that the invalid cannot have the benefit of riding. *Funchal*, the capital, is a large town on the south side of the island, with 25,000 inhabitants; the population of the whole island is estimated at 120,000. The principal produce is wine. Madeira is chiefly composed of volcanic products. About 35 miles north-east is the small island of *Porto Santo*, which consists of tertiary sandstone and limestone, alternating with volcanic strata; and to the south-east of Madeira are some small rocky islets named the *Dezertas*.

ITALY.

ASTRONOMICAL POSITION. — Between 36° and 47° north latitude, and 5° and 19° east longitude.

DIMENSIONS. — Italy consists of two distinct portions, the continental and the insular; the latter including the three large islands of Sicily, Sardinia, and Corsica, with the smaller islands of Malta, Gozo, Comino, and others. The continental portion forms a long narrow peninsula extending from N.W. to S.E., of which the greatest length, from the sources of the river Tosa to Cape Cimiti in Calabria, or Cape Leuca in Otranto, measures about 695 or 700 miles. The breadth is very various; in the north, from the western border of Savoy to the eastern border of Friuli, it measures 365 miles; from Mont Genevre to the mouth of the Po, through the middle of Lombardy, about 275; from the coast of Lucca to the coast of Ravenna, 105; from Piombino to Ancona, 156; from the Gulf of Naples to the Gulf of Manfredonia, 98; and, in some parts of Calabria and Otranto, it does not exceed 20 miles. The superficial area, including the islands, is computed at 122,867 square English miles.

BOUNDARIES. — *Northern:* — Switzerland, Tyrol, Styria, Carinthia, and Carniola. *Western* and *South-western:* — France and the Mediterranean Sea. *Eastern* and *North-eastern:* — the Adriatic Sea, or Gulf of Venice. *South-eastern:* — the Ionian Sea.

GENERAL ASPECT. — The northern border of Italy proper is formed by the stupendous range of the Alps, which extend in a long curve line from the shores of the Mediterranean Sea near Genoa, to the head of the Adriatic. At their southern extremity the Alps are connected with the Apennines, an inferior but still important range, which stretches in a continuous line, parallel to the shores of the Gulf of Genoa, and then through the peninsular part of Italy to the Strait of Messina, dividing the country into two narrow sections of lowland, which extend from the mountains to the adjacent seas. Between the Alps and the Apennines, in Northern Italy, lies the great plain of Lombardy, which is traversed throughout its whole length by the Po, and is watered by innumerable streams which pour down from the adjacent mountains. The length of this plain is about 250 miles from east to west, with an average breadth of 50. Its western portion, at the mouth of the Ticino, has an elevation of about 300 feet above the level of the sea, but it gradually sinks towards the east, and terminates in a low sandy shore. It is thus nearly a dead flat, is of great fertility and well cultivated. Both of the mountain ranges by which it is bordered, rise from the plain with a steep acclivity, and inclose among their branches and offsets many fine valleys, some of which contain large lakes that serve as reservoirs for the water which is turned to account in irrigating the country. The Apennines, in their progress southward, and along the Gulf of Genoa, inclose many narrow but not very fertile valleys; farther south, however, their branches do not always reach the sea, but leave in some places spacious plains, such as the Tuscan and Roman *Maremme*, a singular tract with an undulating surface, which extends along the Mediterranean from Pisa to Terracina, about 200 miles in length, and of various breadth; the *Tavogliera de la Puglia*, which is a wide plain destitute of trees, and of very indifferent fertility; and the volcanic region of *Terra de Lavora*, one of the most fertile districts in the world.

GULFS, BAYS, STRAITS. On the west coast: — *Gulf of Genoa; Gulf of Spezzia*, at the eastern extremity of the Riviera de Levante of Genoa, extends 7 miles inland, forming one of the finest harbours in the world, and of the most exquisite beauty. There is in the midst of this gulf a spring of fresh water rising from the bottom of the sea. *Channel of Piombino*, between Piombino and the island of Elba, the *Strait of Bonifacio*, between Corsica and Sardinia; the *Gulfs of Gaeta, Naples, Salerno, Policastro*, and *St. Eufemia*, on the coast of Naples; and the *Faro* or *Strait of Messina*, between Naples and Sicily. Captain Smyth ascertained the width of this strait at four different places; namely, from Ganziri to Point Pezzo, the shortest distance, 3970 yards; from Messina lighthouse to Point del Orso, 5427; from Faro Point to the Castle of Scilla, 6047; and from Messina lighthouse to the cathedral of Reggio, 13,187. The currents in the strait are numerous and varied. In settled weather there is a central stream which runs alternately north and south, six hours each way, at the rate of from 2 to 5 miles an hour. On each shore there is a counter or returning stream at uncertain distances from the beach, often forming eddies to the central current; but in very fresh breezes, the lateral tides are scarcely perceptible, while the main stream increases, so as to send at intervals slight whirlpools to each shore; but though in light breezes the current may be so strong as to turn a

ship round, there is no real danger; and the proverbial terrrors of the ancients, of passing between Scylla and Charybdis, would appear to have been almost quite imaginary. The celebrated Charybdis, now called Galofaro, is close by the harbour of Messina, and is an agitated water from 70 to 90 fathoms deep, circling in quick eddies, which seem to be caused by the meeting of the harbour and other lateral currents with the main stream. Small craft are sometimes endangered by it, and ships of war wheeled round upon its surface, but with caution there is very little danger or inconvenience attending it. There is a curious aerial phenomenon observed occasionally in this strait, called the *Fata Morgana* by the Sicilians, who believe that it is produced by the fairies. It is a species of mirage, occasioned by a peculiar state of the atmosphere, during which from certain situations the opposite coast is seen pictured in curious forms, as if upon an aerial screen. On the south-east coast:—the *Gulfs of Taranto* and *Squillace*; and the east coast, the *Gulf of Manfredonia*, in the Adriatic Sea.

CAPES.—*Monte d'Argentaro, Cape Linaro, Cape d'Anzo, Monte Circello, Miseno, Campanella, Point Licosa, Cape Vatiano*, all on the west coast; *Spartivento, Stilo, Rizzuto, Cimiti, Nau, Leuca*, on the south-east coast; *Rasocolmo, Rama, San Vito, Fero, San Marco, Bianco, Scalambri, Ciarciaro, Passaro*, in Sicily; *Carbonara, Ferrato, San Lorenzo, Palmeri, Sierra Carallo, Bellavista, Monte Santo, Negra, Comino, Codacarallo, Libano, Falcone, Negretto, Caccia, Maraggio, Mannu, Frasco, Pecora, Giordanu, Tenlada, Spartivento, Pula*, all in Sardinia; *Corso, Scandolo, Fieno, Tizzano*, in Corsica.

ISLANDS.—*Sicily; Sardinia; Corsica; Malta, Gozo, Comino, Gorgona*, a small island, 23 miles W. by S. of Leghorn, covered with wood, which serves as a station for the sardel fishermen, and is famous for anchovies. *Capraia*, 20 miles E. of Cape Corso, a small calcareous island, belonging to the King of Sardinia. *Elba*, a large triangular island, 10 miles long, and 3 broad, off the coast of Tuscany, which has been famous, from the most remote antiquity, for its iron mines, which are still wrought. It contains also marble quarries, and produces corn, wine, oil, apples, pears, peaches, prunes, cherries, chestnuts, oranges, and lemons. Population, about 12,000; the principal towns are *Porto Ferrajo*, with 3000 inhabitants; *Porto Longone*, 1500; *Rio*, 2000; and *Marciana*, 1200.—*Pianosa, Monte Christo, Giglio, Giannuti*, small islands to the south of Elba. Giglio contains quarries of granite and valuable marbles; the hills are covered with trees, and the land is fruitful in wine. The *Pontian Islands* of *San Stefano, Vandotena, Zannone, Ponza*, and *Palmarola*, a volcanic group off the Gulf of Gaeta. *Ponza*, the largest, is about 6 or 7 miles long, and 3 broad. *Ischia, Procida*, and *Vivara* islands of volcanic formation, at the north-western extremity of the Gulf of Naples. Ischia is about 5½ miles long, and Monte Epomeo, in the centre, rises to the height of 2513 feet. The island consists of one large and several smaller hills, has many hot springs, and produces figs, oranges, pomegranates, chestnuts, and aloes. Monte Epomeo was formerly a volcano, of which a dreadful eruption is recorded in 1301. The town is on the eastern side of the island, is well fortified, and protected by a strong citadel connected with it by a stone bridge, 400 yards in length, near to which vessels may anchor securely in 3 or 4 fathoms water, fastened to the shore. Procida and Vivara lie between Ischia and the mainland. *Procida* is 2½ miles across, and is partly covered by the town, while the rest produces vines, figs, and oranges. *Vivara* is about a mile in length, and is chiefly occupied by fishermen. Between Vivara and Procida is secure anchorage for vessels in 4 fathoms water, open only to south or south-east winds. *Capri*, at the south-western extremity of the Gulf of Naples, consists of two lofty hills, one of which exceeds 3000 feet in height, with a fertile valley between them, which produces much wine and oil.—The population, 3620, is scattered over the island. The *Lipari Islands*, situate to the north of Sicily, consisting of *Lipari*, 100 square miles, with 15,000 inhabitants: *Volcano*, 15 miles in circuit; *Salina*, 14 miles in circuit, with 4000 inhabitants; *Felicudi*, 9 miles in circuit, with 1100 inhabitants; *Alicudi*, a volcanic cone, with 750 inhabitants. *Panaria*, 7 miles in circuit, with 200 inhabitants; *Basiluzzo*, 1½ in circuit. *Stromboli*.—These islands are all volcanic, with rugged surfaces, their western coasts rising abruptly in precipitous masses, and shelving down gradually to the eastward, and having each a high isolated rock on its northern shore. The climate is highly salubrious, and the weather generally soft and refreshing; but the general porousness of the volcanic soil occasions a scarcity of water. The land is however well cultivated, and yields grapes, currants, figs, prickly pears, corn, cotton, olives, and pulse. A large quantity of wine and currants is annually exported, and an active trade is carried on in bitumen, pumice, nitre, pozzolana, cinnabar, coral, and fish. Alum likewise formed at one time a considerable article of export, but the produce has decreased. Total population of the group 22,350, who are a contented, temperate, and hardy race, and are esteemed excellent sailors. *Lipari*, the chief town, and seat of government, is situate on the south-east side of the island of that name, is a bishop's see, has two havens, a castle, a cathedral, and several other churches. It is healthy, though crowded, irregularly built, and filthy, and contains 12,500 inhabitants. The most remarkable of these islands are *Volcano* and *Stromboli*. The former is lofty, with a great crater 2500 feet high, and not easily accessible, full of volcanic scoriæ, coated over with sulphur, alum, vitriol, and muriate of ammonia, and emits from numerous openings gusts of sulphureous and hydrogenous vapour, accompanied by a noise like that of a waterfall. Fire is observable from it at night, when a pale lambent flame issues from many of the fissures, accompanied by nauseous fumes and vapours. *Stromboli*, the most northerly of the group, is a conical bifurcated mountain 2000 feet high, with an irregular base, about 9 miles in circumference. A crater opens in the side, about a third of the height below the summit, and has continued to burn from the earliest ages, with frequent explosions, and a constant ejection of fiery matter. *Tremiti, Pelagosa, Pianosa*, small islands in the Adriatic, to the north of Monte Gargaro. *Pantellaria, Linosa*, and *Lampedosa*, three small islands in the Mediterranean, between Sicily and Africa. Pantellaria is about 30 miles in circumference, entirely volcanic, and covered with prodigious quantities of lava, pumice, and scoriæ. The valleys, however, produce olives, figs, vines, and cotton. Population about 5000. The other two are desert, but Lampedusa contains a good harbour. They all belong to Naples.

RIVERS.—The Po, the largest river of Italy, rises from the eastern side of Monte Viso, one of the Cottian Alps, and flows, with few great windings, almost due east, into the Adriatic Sea. It has a course of 500 miles; and, though languid in its current in the lower part of its course, is yet so full, generally, in the spring, as to cause extensive inundations on its banks, which would be attended with very destructive effects, but for the great dykes which have been constructed to keep it within its channel. It soon becomes a large river, and is deep enough to float boats and barges at thirty miles from its source; but its current is often so rapid, that the navigation is at all seasons difficult, and not seldom hazardous. Hence, though it passes in its course more than fifty towns, little advantage comparatively is derived from it for the conveyance of merchandise. The vast body of mud carried down by the Po has, in the course of ages, formed a large delta, extending into the Adriatic, which has raised its channel so much, that the water is now about thirty feet higher than the streets of Ferrara, which is only protected by dykes from being overflowed. Its principal affluents on the right are: the *Vraita; Mairo; Tanaro*, with its tributaries, *Bormida, Ellero, and Stura; Scrivia; Staffora; Tidone; and Trebbia*, all in Piedmont; *Nura, Taro, Parma*, and *Lenza*, in Parma; *Crostolo, Secchia*, and *Panaro*, in Modena; the *Reno, Savena, Silaro, Santerno*, and *Senio*, in the Roman State. Its

principal affluents on the left are: the *Cluson*, *Dora Riparia*, *Orco*, *Dora Baltea*, *Sesia*, *Gogna* or *Agogna*, *Terdoppio*, in Piedmont; *Tesin* or *Ticino*, from Lake Maggiore; *Olona*, *Adda*, *Serio*, *Oglio Mella* and *Chiesa*, and *Mincio* from the Lake of Garda, in Austrian Lombardy. The Po near its mouth divides into three principal branches, named the *Po di Primaro*, *Po di Volano*, and *Po di Levante*.

The VAR, MAGRA, and VAGRA, in Genoa; SERCHIO, in Lucca; ARNO rises in the Apennines, in the province of Arezzo, flows westward, passing Florence and Pisa. Its principal affluents on the right are: the *Sieve* and *Ombrone*; on the left, the *Elsa* and *Era*. The Arno communicates with the Tiber by a canal, partly natural and partly artificial, the basis of which is the *Chiana*, which flows from the lake of Monte Pulciano, on the one side, to fall into the Arno, and from the lake of Chiusi, on the other, to fall into the *Paglia*, an affluent of the Tiber; but these two lakes are really only one with two names, in different parts. The OMBRONE flows through the provinces of Siena and Grossetto, in Tuscany, and falls into the sea in the middle of the Sienese Maremma. The Grand-duke has caused a canal to be dug to carry a part of its waters into the lake or lagune of Castiglione, for the purpose of filling it up with the mud and earth brought down by the river, and thereby removing one cause of malaria. The TEVERE (TIBER) rises near the eastern border of Tuscany, as far north as Florence, and near the source of the Arno, and flows south and south-west into the Tuscan sea below Rome. At Ponte Molle, near Rome, its stream is 600 feet wide, and it flows into the sea with a strong current. Near its mouth the Tiber divides into two branches, one of which enters the sea at Ostia, the other at Fiumicino; by the latter of which vessels now pass to and from Rome. Its principal affluent on the right is the *Chiana*, with its tributary the *Paglia*; on the left it receives the *Topino* or *Topino*, whose affluents are the *Chiasco* and the *Timia*; the *Nera*, with its affluents the *Corno* and *Velino*; the *Cremera*; and the *Teverone* (anc. *Anio*.) The *Marta*, the outlet of the Lake of Bolsena.

In the kingdom of Naples the principal rivers are,—the *Garigliano* and *Volturno*, which flow through the Terra de Lavora, and fall into the Gulf of Gaeta; the *Sele*, in the Principato Citra; the *Crate*, in Calabria Citra, and the *Bradano*, in the Basilicata, both of which fall into the Gulf of Taranto; the *Ofanto*, *Candelaro*, and *Fortore*, in Apulia; the *Pescara* and *Tronto*, in the Abruzzi.

On the Adriatic side of the Roman State are the *Amone*, *Marecchia*, *Metauro*, *Esino*, *Musone*, *Potenza*, and *Chienti*. To the north of the Po, in Venetian Lombardy, are, the ADIGE or ETSCH, which rises in the Tyrol, passes Trent, Verona, and Legnago, then divides into several branches, and falls into the Adriatic, near the mouth of the Po; its principal affluent is the *Eisch*, on the left. The *Adigetto*, one of its principal branches, passes Badia and Rovigo; another branch, the *Canal Bianco* or *Castagnaro*, passes Adria. The *Bacchiglione*, *Brenta*, *Sile*, *Piave*, *Livenza*, and *Tagliamento*, flow from the Alps, through the Venetian provinces, into the Adriatic Sea; the first passing Vicenza and Padua; the second, Bassano; the third, Treviso; the fourth, Belluno; the fifth, Sacile; and the last passing Tolmezzo, Spilimborgo, and Latisana. The *Isonzo* or *Lisonzo* rises in the kingdom of Illyria, passes Goricia and Gradisca, and falls into the Adriatic.

LAKES.—The principal lakes of Italy are situato at the base of the Alps, on the northern border of Lombardy; but there are also many smaller lakes and considerable lagoons in the interior and on the coasts of the Peninsula. The *Lake Maggiore* formed by the river Ticino and 28 smaller streams, is about 48 miles in length, and from 4½ to 7 in breadth; its surface is 640 feet (195 metres) above the level of the sea, and its greatest depth 2625 feet (800 metres.) In a bay, about the middle of its western side, are the celebrated *Borromean Islands*, which, about the middle of the sixteenth century, were converted from barren rocks into beautiful gardens, and decorated and embellished at an immense expense by the Count Borromeo. They have been an object of admiration to travellers ever since. The lake is surrounded by picturesque hills, covered with vineyards interspersed with villas, and here and there with cascades which fall down the sides of the mountains. The *Lake of Lugano* is situate to the eastward of Lake Maggiore, to which it sends its surplus waters by the river *Tresa*. It is fed by 43 brooks and rivulets, and is surrounded by rugged mountains, generally rising abruptly from the water's edge; but having in six places small cultivated valleys which recede from as many bays. The *Lake of Como* and *Lecco*, about 37 miles in length, and from one to four miles in breadth. About the middle it divides into two branches, one of which terminates at Como, the other at Lecco, from which towns the two portions take their names; it is traversed by the Adda (an affluent of the Po, which comes from the Valteline, and leaves the lake at Lecco. The surface of the lake is about 650 feet (198 metres) above the level of the sea, and its greatest depth is 1698 feet (589 metres); but in the northern part it is shallow, and the shores are infested with malaria. This lake is much exposed to sudden and severe storms, occasioned by gusts of wind from the neighbouring mountains; but it is highly celebrated for the picturesque beauty of its shores, and is plentifully stocked with fish. The *Lake of Iseo*, between Bergamo and Brescia, 20 miles in length, and from 4½ to 7 in breadth. Its surface is about 630 feet (192 metres) above the level of the sea, and its greatest depth 984 feet (300 metres.) The *Lake of Garda*, one of the most beautiful of all the lakes of Lombardy, is about 35 miles in length, varying in breadth from 4 to 14 miles. Its surface is 256 feet (78 metres) above the level of the sea, and its greatest depth 951 feet (290 metres.) Its principal feeder is the river Sarca, and its surplus waters form the Mincio, an affluent of the Po. *Orta*, to the south-west of Lake Maggiore, about nine miles in length, a romantic lake, surrounded by lofty mountains, wooded slopes, and shores enlivened with numerous villages. Besides these, there are the smaller Alpine lakes of *Varese*, *Monate*, *Comabbio*, to the east of Lake Maggiore; *Piano*, near the east end of the Lake of Lugano; *Lake Pusiano*, and *Lake Sala*, south-west of Lecco.

In Central Italy:—The *Lake of Perugia* (ancient *Thrasimenus*), 50 miles S.E. of Florence, is a beautiful sheet of water, about 30 miles in circumference, and, in some parts, about four miles across. It is surrounded by picturesque hills, abounds with excellent fish, and one of the rivulets which flows into it bears the name of *Sanguinetto* (bloody), so called from its having flowed with blood on occasion of the terrible victory gained by Hannibal over the Roman Consul Flaminius. The *Lake of Bolsena*, a circular basin in the Roman territory, about 50 miles N. of Rome, is 40 miles in circumference, and is surrounded by volcanic hills. The *Lake of Bracciano*, 20 miles N. of Rome, is also a circular basin, 28 miles in circumference, and more than 6 miles across. The *Lake of Albano*, 12 miles S.S.E. of Rome, an oval-shaped basin, is one of the most beautiful pieces of water in the world, and, in respect to scenery, beyond comparison the finest of those of purely volcanic origin in Italy. It is 2½ miles in length, 1¼ in width, more than six miles in circuit, and 919 feet above the level of the sea.—(*Gell's Topography of Rome, &c. I.* 39.) It is situate in a deep hollow, formed by a volcanic ridge, 8 miles round. The water escapes through an emissary or Tunnel, more than a mile and a half in length, cut through the hill by the Romans, 359 years B. C., and still in perfect preservation. The *Lake of Nemi*, a small circular basin to the south of Albano, formerly embosomed in the *Nemus Dianæ*, from which it takes its modern name. "Nothing," says Sir William Gell, "can exceed the beauty of this *Speculum Dianæ*." Its surface is 1022 feet above the level of the sea. *Baccano*, another circular lake, in the bottom of an extinct crater, 20 miles N. of Rome, is now almost completely drained by deep cuts through the lip of the crater. *Lake Martignano* (*Lacus Alsietinus*), 16 miles from Rome, between Baccano and Bracciano, in a crater four miles in circumference, and 310 palms deep. Near it is the *Lake of Straccia Cappa* or *Cappi*, about 2½ miles in circuit, and 49 palms deep. About 13 miles east of Rome, on the road to Tivoli, are three lakes, from one of which, called *Solfatara*, or *Lake of Zolfo*, flows a strong sulphureous current, generally accompanied by a long line of vapour, in an arti-

ficial channel, nine feet wide, and four deep, into the Teverone. The water of these lakes adds continually to the rocks around them by petrifaction or incrustation; and the lake called *the Lake of Tartaro*, two miles nearer Rome, which was once deep, has now so nearly filled itself with its own deposits, that in June 1825 it was perfectly dry, a crust having been formed, which probably cut it off from the subterraneous reservoir below.—(*Gell*, I. 72-3.) The *Lake of Celano* (ancient *Fucinus*), in Abruzzo, 15 miles long, from four to six wide, and 100 square miles in superficial extent, is surrounded by hills through which there is no natural outlet for its waters. For the purpose of draining it, a tunnel, 3 miles long, leading to the Liris (Garigliano), was formed by the Roman Emperor Claudius; but, that having in the course of time been choked up, the lake increased so much as to cover more than 10,000 acres of the best land in the province; and the tunnel has accordingly been re-opened, and other hydraulic works constructed, so as to keep the lake at a certain low level. The *Lake Amsancto (Amsancto Nesanto)*, in Principato Ultra, a mile and a half from Rocca San Felice, at the mouth of a valley, and close under a steep shelving bank of decomposed limestone, is of a rhomboidal shape, measuring diagonally about thirty paces by twenty. The water continually bubbles up over a large portion of the surface, with a noise resembling that of distant thunder, though it does not rise higher than two feet. It is of a dark ash-colour, and is supplied by a constant and rapid stream which runs into it from under the barren rocky hill on the one side; a little above it are holes in the ground through which warm blasts of sulphurated hydrogen gas are continually issuing. On the opposite side of the lake is another but smaller pool, called the *Cocraio* or Caldron, on the surface of which are continually floating in rapid undulations thick masses of carbonic acid gas, which are visible at the distance of a hundred yards. The larger lake bears the name of *Mephite*, and is Virgil's *Vallis Amsancti*, through which he makes the Fury Alecto return to Hell, after having roused the Italians to war against Æneas. The *Pontine Marshes*, on the coast, midway between Rome and Naples, 24 miles long, and from 6 to 12 in breadth. Repeated efforts were made during many ages to drain these noxious swamps, a work which has been nearly accomplished by the exertions of Popes Pius VI. and VII.; and this tract of country, whose atmosphere was formerly fraught with disease and death, may now be passed by travellers with little danger, except in July, August, and the beginning of September. The ancient Appian way, and the modern road from Rome to Naples, pass through them. The marshes now form a luxuriant pasturage for cattle.

CLIMATE.—In a country which extends through ten degrees of latitude great varieties of climate must arise from position alone; but in addition to this, the climate of Italy is modified by the proximity of lofty mountains, and the influence of the sea. According to Saussure, Italy, in respect of climate, may be divided into four regions:—The first extends from latitude 46° 28′ to 43° 30′, comprising Lombardy and the northern portions of the Roman States. In this region the mercury of the thermometer sometimes falls 23° below the freezing point; the lagunes at the mouths of the rivers are sometimes frozen; and in January and February snow lies for ten or fourteen days. Delicate plants fail to grow except in sheltered places; but mulberry trees flourish, and rice is cultivated. Slight frosts occur during night in November, and sometimes so late as April; and even in summer, a benumbing cold is brought down from the Alps by the north wind. The second region extends from 43° 30′ to 41° 30′, including Tuscany, Lucca, the southern part of the Papal States, the Abruzzi, and the whole of the western coast to the south of the Appenines. Some part of the latter, indeed, extends northward beyond the 44°; but, being sheltered by the Appennines, it partakes of the more southerly climate. This region is the appropriate climate for the orange, the lemon, and the olive; but even here snow is occasionally seen on the ground. The summer heat at Florence and Rome often rises to 90° Fahrenheit, but in the former the winter is considerably prolonged by the vicinity of the mountains, which in that season, and indeed during the whole year, send down piercing cold winds. The third region extends from 41° 30′ to 39°, and comprises the greater part of continental Naples. Here snow is rarely seen, and never remains on the ground; the mercury seldom falls more than seven degrees below the freezing point, and all plants of the agrumenous tribe flourish in the open air. In the fourth region, which includes Calabria Ultra and Sicily, the mercury rarely falls below the freezing point, and snow and ice are unknown, except upon the tops of Etna and Sila. Tropical fruits come to perfection in the open air, the sugar-cane flourishes, cotton ripens, date trees are seen in the gardens, and the enclosures of the fields are formed by aloes. But this classification applies only, or principally, to the lowlands of Italy; for the increasing elevation of the sides of the mountains, the vicinity of the sea, and the volcanic nature of the soil, all exercise an influence which occasions many local variations of climate. The tops of the Alps are covered with perpetual snow. The northern Apennines are usually clothed with it from the middle of October to the beginning of April; and on the highest mountains of Abruzzo, the Majella, and the Velino, it remains from September till May. The northern part of Italy, indeed, including Tuscany and the Papal States, does not generally present that charming aspect which travellers from the north expect to find in the garden of Europe; it is only after passing Terracina and Manfredonia, on the east and west coasts, that they are introduced to the region, where the winter is scarcely colder than the English September; where vegetation continues without interruption, and the air is filled with aromatic odours. The mean temperature of Naples is, in winter 27° 14′ Fahrenheit, in summer 97° 35′. The climate of Italy is, however, not without great and serious inconveniences. From May to September a burning heat pre-

...vails the sun consumes all descent vegetation: the land, unrefreshed by a drop of ...rain, assumes a russet hue. The sea breeze is scarcely perceptible, except upon the ...coast, and is so tempered as to bring with it from the shores of Africa only a thick ...sultry vapour, which is at the highest degree oppressive. Under the noxious influence ...of the Scirocco south-east wind, vegetation droops and withers, and the human ...frame is affected with languor and depression. In addition to these external evils, vol...canic fires burn perpetually under ground, and periodically sends forth noxious ...vapours which are injurious to health, and sometimes threaten to depopulate exten...sive districts. To these evils may be added the annoyance produced by numerous ...swarms of insects which fill the air, visit the houses, and are a constant source of ...irritation. The low marshes at the mouth of the Po, the Pontine marshes, and other ...similar localities, produce miasmata which shorten human life, and are reckoned among ...the causes that the population in districts to the whole number of inhabitants is greater ...than that in any other country in Europe.

...Such are the facts respecting the finest climate in Europe, Italy may almost be said ...to possess in perfection, or at least the most amiability. The clear blue sky gives only ...a faint idea of the transparency of the atmosphere. Yet there is hardly a spot in the country that is free from the ravages of the *malaria*, a mysterious scourge which, during a great ...part of the year, infests many of the finest places, has converted large tracts of country ...into pestilential wastes, and deserts, and appears to be in some places continually ...increasing its dominion. But besides the *malaria*, the climate is in many parts ...subject to extreme changes of temperature, from its relative situation to the Alps, ...the Apennines, and the deserts of Africa. In England atmospherical changes are very ...frequent, but are limited in their range, while in Italy the reverse is the case; ...the changes are not so frequent, but their range is often most extensive; and the ...sudden and violent transitions of the English atmosphere are not to be compared to ...the more striking meteorological phenomena of Italy. Indeed, the very circumstance ...which forms its charm, and the theme of praise in the Italian climate, is that which ...forms its imperfection, namely, the long intervals of fine weather ...without any perceptible changes.

...The Italians seem proud of the dryness of their climate. In some places, however, ...as at Pisa, as much rain falls as in Cornwall; at Rome, only about one-third less ...than in Portugal. In the former country, being 28 inches, and the number of rainy ...days [illegible] at Naples and Leghorn the average is 35 inches; at ...Pisa [illegible] at Venice, 38; at Florence, 25; but at Altemura, in the ...Abruzzi, at Naples, and at Terracina, only 17 or 18 inches.—*Gell's Top. of Rome*, I. ...[illegible] The rains are not more frequent than in England; but it makes ...[illegible] flooding the water courses, overflowing ...[illegible] The powerful sun then bursts ...[illegible] not only exhales vapour from the soil, but also the ...[illegible] of vegetable and animal substances, pro...duces a [illegible] fatal not only to the invalids who have visited the ...[illegible]

...[illegible] which [illegible] atmosphere is [illegible] by the Apennines, ...[illegible] which [illegible] are of essentially different forma...tions. [illegible] throughout the greater part of their mass, are a ...[illegible] [illegible] of their northern and western prolongation ...[illegible] [illegible] Near the point where they are con...nected [illegible] [illegible] consist of serpentine, of gneiss and beds of slate, limestone, and ...a [illegible] rock. [illegible] [illegible] and the Val of Spezzia are principally ...[illegible] [illegible] [illegible] The mountains from Ho...mond's, Apennine, and Monte Alto, in the Carrara district, resemble that of Jura: in ...Carrara the central part of the chain consists of crystalline gneiss, mica slate, and other primary ...forms, having upon [illegible] [illegible] [illegible] are deposits of tertiary rocks. But ...along the Mediterranean [illegible] [illegible] [illegible] [illegible] the base of the mountains, more ...ancient rocks appear at the surface, [illegible] [illegible] [illegible] [illegible] the ridges on the Adriatic side, ...in which [illegible] [illegible] [illegible] [illegible]

Bolsena, and the extinguished craters of Viterbo, Bolsena, Bracciano, and La Tolfa; and to the south-east, the basaltic hills of Albano, Frascati, and Marino, and the ancient craters of Albano and Nemi. Accompanying this belt of volcanoes, is a bed of tufa regularly extended from the mountains of St. Flora in Tuscany, through the Romagna into Campania, the vicinity of Vesuvius, and the Phlegrean fields, and even into Ischia, Procida, and Lipari; but in the neighbourhood of Rome, the tufa strata are intermixed with a limestone of modern formation, called travertino, of which the principal monuments of that city are built, and with formations of marl, clay, river sand, and other fresh-water deposits.

The only active volcano now in Italy is *Monte Vesuvio*, situate on the eastern shore of the Bay of Naples. It is composed of an older portion, named Monte Somma, evidently the remaining half of a very large crater, and of the modern conical summit rising within and overtopping it. The first recorded eruption of Vesuvio took place in the year 79 of the Christian era; since which time, its eruptions have been frequent, and often terribly destructive. To the westward of Naples is situate the volcanic region named the Phlegrean fields, where, in the year 1538, a hill, still called *Monte Nuovo*, 413 feet high, and 8000 in circumference, was thrown up in two days. The hill is composed of fragments of scoriform matter, or of a compact rock of an ash-grey colour, in some places resembling trachyte, and in others approaching to porphyry and calx, and on its summit is a crater of a quarter of a mile in circumference. Between Monte Nuovo and Puzzuoli, is an extinct volcano named the *Solfatara*, from which gaseous exhalations mixed with aqueous vapour are continually rising. The rock of the hill is trachyte, and a vast stream of lava extends from it to the sea, where it forms the promontory of Monte Olibano, overtopping the extensive formation which reaches from Puzzuoli to Cuma, and appearing to be continuous with the rock which is found in the vicinity of Naples, and which, long known by the name of Puzzuolana, is a formation of volcanic tufa. The lakes of Agnano and Avernus occupy the craters of extinct volcanoes. Monte Barbaro, also on the west side of Naples, has on its summit a crater of great antiquity, now covered with verdure. The crater of Astroni, likewise, is of such perfect formation that it has been selected by the King of Naples as a preserve for wild animals destined for the chase. According to Brieslac, the number of craters in the vicinity of Naples is not less than twenty-seven. The *Grotto del Cane*, situate on the borders of the lake of Agnano, is perpetually giving out carbonic acid gas, mixed with aqueous vapour, which proves fatal to any animal plunged into it, an experiment often tried with dogs *(cane)*, whence the name.

The great plain of Lombardy, which occupies nearly the whole of the north of Italy, is formed of tertiary rocks, more or less covered with diluvium; while the lower ranges of the Alps, in the districts of Como, Bergamo, Brescia, Verona, &c., and the hills of Brianza, in the plain of Milan, are of secondary limestone, probably identical with that of the Appenines. To the south of Padua rises a tract of high ground, named the *Euganean hills*, which consist of a trachyte formation evidently of volcanic origin. The tertiary deposits of Lombardy contain remains of whales of extinct species, of elephants, rhinoceroes, hippopotami, &c.; and fossil remains of the same kind occur more abundantly in the overlying diluvium. Tertiary and diluvial deposits also extend from Ancona along the coasts of the Adriatic, with but little interruption, to the extremity of the Peninsula.

SOIL AND VEGETATION.—The variety which we have exhibited in the composition of the solid masses, which are the foundation of the cultivable mould, must have an influence equally diversified upon the nature of the soil and the vegetation. The soil of the valley of the Po, which consists partly of loam and partly of sand, and has been formed by extensive alluvial washings and gradual deposition, shews, upon the whole, more uniform relations than that deposited in the valleys and at the foot of the Appenines. Among these hills the soil possesses various qualities, according to the species of the rocks from which it has been formed, and which it still covers, as well as according to the different ways in which its particles were deposited. In the bottom of the great valley the soil is for the most part rich and deep, but along the bases of both the Appenines and the Alps, are vast accumulations of beds of pebbles, thinly covered with mould, which cannot be cultivated with any profit. The greatest difference is found between the soil which belongs to the middle and principal limestone region of the Apennines, which is mostly of a clayey nature, and the fine, loose, and generally dark-brown coloured mould, which has proceeded from the decomposition of volcanic products, and is in general highly favourable to vegetation. But besides these differences of soil, the great extent of the country in latitude gives to northern Italy a vegetation almost entirely different from that of the south; and the elevation of the ground above the level of the sea, from the coast to the plains and the mountain ridges, occasions also a great variety of vegetable regions.

The vegetation of Northern Italy bears a striking resemblance to that of the warmer regions of southern Germany, Switzerland, and France. The chestnut tree is the ornament of the forest; the vine, with its tendrils, climbs the mulberry tree; wheat and maize, in some districts, and rice in others, are the principal grains. Cultivation, which is favoured by the loose soil of Lombardy, derives great advantage from the abundant supply of water poured down from the mountains. An extensive and skilful system of irrigation is constantly employed, not only in watering the meadows, but also in promoting the cultivation of rice, which is entirely dependent upon it; and, in order to preserve the necessary degree of moisture in the air, the fields are bordered by trees, whose stems support ivy and vines. The whole of this region consequently exhibits a monotonous character, which, however, is lessened on approaching the mountains; while the valleys which open out of the Alps exhibit the greatest and the most varied natural beauties. At the outlet of some of those valleys the streams become expanded into lakes, which indescribably increase the attractions of the scenery. Steep mountain walls reflect the rays of the sun; yet the temperature is

moderated by the cool breezes from the mountains. The vine overhangs the liquid mirror, and chestnut trees cast their shadows along the bottoms of the hills. The laurel indicates the neighbourhood of the evergreen vegetation which particularly characterizes the south of Europe; and single pines and cypresses announce the peculiar forms of the trees which first appear more generally in middle and southern Italy. Rocks tower in picturesque forms above the trees; torrents rush through the deep ravines; and in the back ground, through the foliage of the pine clad mountains, are seen the snowy summits of the Alps.

The Apennines, as far as they bound the valley of the Po, draw a marked line of distinction between the productions of Northern Italy and those of the south; and the difference of vegetation on the opposite acclivities of the chain is striking. That upon the north side agrees entirely with the vegetation of the southern base of the Alps; whereas on the south side of the mountains, which suddenly sinks towards the sea, the olive is extensively cultivated, and many other evergreen trees and shrubs appear. Proceeding southward into Middle and Lower Italy we find the trees and shrubs characteristic of those regions limited to the lower plains in the neighbourhood of the mountains, and extending from the sea to a height of 1200 feet. These plants include the evergreen oak, the pistacio tree, the strawberry tree, and the myrtle. The olive tree extends over the whole of this evergreen region, and the laurel and the orange-tree likewise flourish in it. In the greater part of Italy, however, the orange-tree is found only in detached districts, which are peculiarly favourable to its growth, and is not cultivated to any considerable extent. Even where the culture of the orange is an object of importance, as in Calabria, there are still no proper orange groves. Hence the cultivation of the orange-tree has much less influence than that of the olive on the general aspect of the Italian landscape, the leading peculiarity of which arises from separate lofty pines with their wide spreading tops being mixed with groups of cypresses, which present a singular contrast. In a still higher degree the landscape acquires a distinctive character from the date palm; a tree which is found only in isolated and sheltered spots, especially on the coast, and even there it occurs very sparingly, only a few individuals generally growing together. Rising above this evergreen region, the vegetation of the next zone more resembles that of the northern parts of Europe. The evergreen trees and shrubs disappear, and in their stead grow deciduous oaks and chestnut trees, which are found to the height of 3000 feet. Above them the beech becomes the prevailing tree, accompanied sometimes by various trees with pointed leaves, as pinus picea, p. sylvestris, taxus baccata. At a height between 5000 and 6000 feet, the beech and the pine are found occasionally intermixed with creeping shrubs and alpine plants, and generally reach as high as 7500 feet; and with them are associated vaccinium myrtillus, arbutus uva ursi, juniperus nana. Only a few mountain summits exceed the height of this zone; these are the pinnacles of the Abruzzi, Gran Sasso, Majella, and Velino. The vegetation of Middle and Lower Italy varies very much in regard to its richness and abundance. In many districts it is most luxuriant; especially where crystalline or volcanic rocks produce a favourable soil; or where, as in some bays, rocks afford shelter against hurtful winds; or where the supply of water maintains the requisite degree of humidity. Travellers are enraptured with the rich vegetation at the base of the marble mountains of Massa and Carrara, and on the declivities of the Appenines towards Lucca; with that on the volcanic hills of Frascati and Albano, on the rocky shores of Terracina, Molo di Gaeta, Sorrento, and Salerno; and with that at the waterfalls of Terni and Tivoli; but such luxuriance is not general. Over the far greater part of the calcareous Apennines only a stinted vegetation is found. Myrtles, which fix their roots in fissures, and other evergreen shrubs, do not form a foliage so thick as to conceal the rocks on which they grow, particularly on the offsets or spurs of the mountains; it is only in the interior recesses of the range that high and thick forests are occasionally found. When, notwithstanding this barrenness, the mountains appear picturesque to the eye, the beauty in general arises from their outline alone. The indentations and projections can be distinctly recognised from a great distance, and occasion that striking contrast of light and shade which produces the most agreeable impression. The extraordinary clearness of the atmosphere, which gives an indescribable charm to distant objects, the deep blue of the sky, the unusual forms of the vegetation, the enrapturing view of the sea, and the remarkable appearance of Vesuvio and its smoke, all taken together, fix the gaze of the observer. Hence districts often appear beautiful, which, when viewed in reference to the surrounding objects, are not truly so; and after reflecting upon the scenery with unprejudiced composure, and considering what really constitutes the beauty of a landscape, we deem them inferior to

many in our own country. But it is not only what is produced spontaneously that imparts specific character to a landscape; that is, in a great degree, modified by cultivation. In this respect also, there are the greatest differences between Middle and Southern Italy. The regularly planted olive tree, with its stem often crooked and hollow towards the root, and its small bluish-green leaves, can never impart much beauty to a country; but the vine must always be an ornament, where, as in Italy, propped up by elms and poplars, it has a much more luxuriant growth than in France and Germany. Sometimes, as in the fertile plains of Naples, it climbs with its tendrils around the well cultivated fields, and forms a sheltering roof for the wheat, maize, or pulse, which they bear. — *(Sketches of South European Nature — Italy. By Professor Hausman. — Edin. New Phil. Journal, XXVIII.* 326.)

ANIMALS. — There seem to be few, if any, wild animals peculiar to Italy; the native quadrupeds have never been particularly enumerated; the wolf is still found among the Apennines, and the wild boar in Calabria. There is a great variety of birds; and, among the insects, the tarantula and the silk-worm are equally celebrated. The domesticated animals are not very remarkable, the country being ill adapted for grazing. The common breed of oxen is one of the largest known; but there is another species, principally found in Tuscany, which is much smaller, and is esteemed for its fine form and pure white colour. Sheep are generally scarce, though in La Puglia there are large flocks. In Southern Italy the cheese, butter, and milk, are derived from goats, which are kept in flocks. The pigs are all of the long-legged, unimproved breed. At San Rossara, near Pisa, in Tuscany, there is a breed of the Arabian camel which was introduced about two centuries ago, but has considerably degenerated, the soil and climate being ill adapted for it.

PEOPLE AND LANGUAGE. — The Italians are a mixture of races, composed of Greeks, Gauls, Germans, Goths, Arabians, and many others, who have migrated into the Peninsula at various times, and intermingled with the aboriginal population, whose language they have superseded. They have long been divided into numerous tribes and nations, with separate political and social interests, and speaking dialects so different, that the inhabitants of one province can scarcely, if at all, understand the language of another. From these dialects, however, has been framed a speech which by cultivation has attained a peculiar character, and has become a common bond of union. The language employed by the best writers, is nearly the same in every part of Italy; and all the educated classes can understand and relish the works of the great Italian classics, Dante, Petrarcha, Boccacio, Tasso, and Ariosto, which are written in the Tuscan dialect. The basis of the language is the Latin, but very much modified by the infusion of foreign elements, and by the inevitable changes of many centuries. As a nation, the Italians, excepting those of the lowest class, are a fine race of people. The men are well formed, rather slim than stout, but strong and agile, with a dark complexion, expressive countenances, dark sparkling eyes, and, generally, black hair. Their gait is grave, but not solemn, and their whole appearance is indicative of self-respect. The women have narrow foreheads, black or dark-brown hair, large, brilliant, and expressive eyes, a beautiful nose, which, with the forehead, forms the elegant Roman profile; a small mouth, with lips rather swelling; a clear white complexion, with slight red tinges appearing through it, and a delicate, but well formed figure. But the lower classes, in consequence of early marriages, of living wholly on vegetable food, and hard labour under a burning sun, rarely display any peculiar attractions. The lower class of the town population are in bad repute, as to both morals and instruction. They are represented as more acute than honest, and as restrained from violations of life and property only by the activity of a very vigilant police. In no country is to be found a greater number of beggars, or so numerous a body of people, as in all the cities of Italy, whose cares extend merely to the wants of the passing hour. The greater part, however, of the population in the country is devoted to agricultural pursuits. Very few of these are in circumstances of even moderate affluence; a few more may be represented as in a state of comparative ease, enjoying a bare competency; but the great mass of the people, to which all the other classes bear but a small proportion, are in the most wretched condition. They are the occupiers of small portions of land, sometimes not larger than an acre, and generally less than four acres, where, living in miserable hovels, which barely furnish them with shelter, they labour in their fields and support themselves and their families on half the produce of the land, the other half forming the proprietor's rent. Even with the utmost care, their supply of food sometimes fails, and they have then no other source than beggary or starvation. This is the condition of the great mass of the people of Northern and Middle Italy; while, in the South, the lazzaroni of

Naples are living proofs of the wretched condition of great numbers in that more fertile soil and more temperate climate. Some German travellers have even asserted that the majority of the tenants in Italy are in a worse condition than the serfs in those parts of Germany where the system of serfage continues in force. An excessive population, and a system of legislation favourable only to the rich, are the chief causes of these evils. Capital, courage, and opportunity are wanting to enable the peasantry to attain better circumstances elsewhere. But one of the greatest and most dangerous evils of Italy, at the present day, is the legalized mendicancy which everywhere prevails; a system the more dangerous, because the support of it is regarded as a proof of beneficence and genuine christianity. Large foundling hospitals exist in almost all the cities, in which thousands of deserted children are annually provided for; other institutions of various kinds are likewise numerous; and the result is the continual increase, rather than the prevention or alleviation, of beggary, misery, and crime.—*Raumer's Italy.*

RELIGION.—All the Italians may be said to profess the Roman Catholic religion, because only a small fraction of the population adhere to any other creed. This fraction is subdivided into: the *Vaudois*, or *Waldenses*, an ancient sect of Protestants, who occupy the valleys of Lucerne, Angrogno, and Saint Martin, in Piedmont; the *Calvinists* and *Lutherans*, established in the principal commercial towns, particularly at Venice, Naples, and Leghorn; the *Greeks*, who are found at Venice, Leghorn, and in different parts of Naples; and the *Jews*, who live in all the great towns and places of trade, but are most numerous at Rome, Leghorn, and Venice. The Roman Catholic clergy are very numerous, being said to amount to about 500,000, or to one in forty of the population. But the number of sees, which formerly exceeded that of all the bishoprics in the rest of Christendom, has been much reduced, as well as the greater part of the monasteries which once abounded in the cities and towns. The churches, however, still possess great wealth, and are everywhere sumptuous in their decorations and ornaments, containing much of what is most magnificent in art, and most refined in taste and beauty. The exterior of the churches is, in general, very imposing, and the religious ceremonies are performed with the greatest degree of pomp and solemnity. The higher clergy possess great power, they all enjoy immunity for their persons and property, and are in most cases exempted from taxation. The secular priests are under the superintendence of the bishops, and the monasteries are governed by the chiefs of their several orders. The moral virtues, however, of the people, owe but little to the institutions of the church; for though religion is interwoven with the whole fabric of Italian life, and pervades intensely the entire frame of society, it exercises but little influence on the conduct and character of the mass of the population. Penances, confessions, and absolutions, are the almost universal substitutes for moral qualities; and little beyond these is inculcated in religious instruction.

EDUCATION.—In no part of Europe is the education of the lower classes so much neglected as in Italy; for, though some advances have been made in Lombardy and Tuscany, no improvement has yet been projected in the other States. The instruction of the poor is entirely in the hands of the clergy, and is so ill attended to that but few of the peasantry can read, while of the mechanics in the towns it is difficult to find one who can write his own name. The institutions for the education of the higher classes are also far behind those in other countries of Europe. Among these are the colleges and lyceums, where the instruction is partial, and little calculated either to improve the taste, or to foster freedom and expansion of thought. The studies of the youth are principally directed to logic and classics, to the exclusion of the sciences, the languages of other countries, their customs, institutions, and modes of thinking and reasoning. Mathematics are scarcely known, but casuistry is sedulously cultivated. The Ambrosian College and the Brera College at Milan, are exceptions to this description, but in everything, except classical literature, even they are far from being well conducted. Notwithstanding, however, the disadvantages under which they labour, many Italians may be said to be well educated, and to be qualified, upon some subjects, to rank with the most distinguished literary and scientific men in Europe. They acquire knowledge not by means of their institutions but in spite of them. A general desire for knowledge seems likewise to be pervading the country; and under its influence both literature and science will extend more rapidly by means of self-cultivation, than through the instrumentality of indifferent, or ignorant and hostile teachers. The universities are sufficiently numerous, and nearly all of ancient date: Bologna, founded in the year 1119; Naples, 1224; Padua, 1228; Rome, 1248; Perugia, 1307; Pisa, 1329; Siena, 1337; Pavia, 1361; Turin, 1412;

Parma, 1422; Florence, 1433; Catania, 1445; Cagliari, 1764; Genoa, renewed and extended in 1783; to which may be added that of Modena, which, after long neglect, has been lately re-established. In almost all the cities there are literary and scientific societies, which have been long in operation, and have cherished and encouraged learning among their members. These societies which were begun in the fifteenth century, and have multiplied and increased ever since, have contributed, since the revival of learning, to its preservation, at least, and have been, in a great degree, the means of bringing talents and industry into public notice. One of the earliest, as well as the most celebrated, is the Academia della Crusca at Florence, established for the purpose of improving the Italian language, by which it has acquired great renown; but the most flourishing of these institutions at present, are the Imperial Institute at Milan, and the Academy of Sciences at Turin. The institutions for the promotion of the fine arts are numerous, and are placed in connection with schools, in which painting, sculpture, and architecture are taught by competent masters. The most important of these are at Rome, Florence, and Bologna. Italy abounds with collections of books, and especially of manuscripts of great antiquity and of high value. The libraries, however, are generally very deficient in works of science and of modern literature. The most celebrated of the libraries are those of the Vatican at Rome, the Ambrosian at Milan, that of St. Mark at Venice, and of the Magliabechi and Medici at Florence. There are also in every part of Italy museums of great value, which are generally arranged in the most perfect manner. The most distinguished of them are those of Florence and Naples: all of them are open to the public, and thereby made the common property of all nations. Each palace of the nobility, and every public building is a cabinet of art; and every city boasts of its antiques or collections of modern works. Picture galleries are to be found everywhere; the churches too are adorned by exquisite pieces of painting and sculpture, as well as by their architecture. There are also botanic gardens attached to most of the universities, and several in the vicinity of the larger cities; and there are astronomical observatories at Bologna, Padua, Milan, Florence, and Palermo.

GOVERNMENT. — Italy is divided into nine sovereign States, in all of which, with the exception of the petty republic of San Marino, the government is vested in an absolute monarch, and is everywhere exercised with the most rigorous despotism. But even in this respect there are varieties; for, while some of the governments are so despotic as to be positively oppressive, others are exercised with a degree of liberality and attentive consideration of the welfare of the people that would almost entitle them to be called paternal. The governments of Rome and Naples, though equally despotic with the others, have long been singularly inefficient, powerless for good, and exercising but little restraint upon the corruptions of a disorganized society. Upon the affections of their people, whom they have never benefitted, the sovereigns have no hold, and it is only by the support of Austria that they are enabled to keep possession of their thrones and dominions. But, while it affords this protection to the governments, the power of Austria effectually checks the energies of the people, who, participating in the spirit of liberty which at present pervades all Europe, are eager to throw off the yoke of their worthless oppressors. Of these nine States, three are kingdoms; one, a grand-duchy; three, duchies; one, an elective ecclesiastical monarchy; and one a republic. Their names, areas, population, revenues, and military forces, are stated in the following table: —

Names of States.	*Area in Sq. Miles.*	*Population.*	*Revenue.*	*Army.*
Kingdom of Lombardy,	8,460	2,474,000	—	31,400
and Venice	9,472	2,094,000	—	
Kingdom of Sardinia,	29,050	4,470,000	—	35,200
Kingdom of Naples,	44,510	7,752,000	4,500,000	37,725
Grand-duchy of Tuscany,	8,700	1,350,000	—	4,500
Duchy of Parma,	2,300	440,000	—	1,400
——— Modena,	2,068	390,000	274,000	1,750
——— Lucca,	420	145,000	—	680
States of the Church,	17,860	2,471,000	—	17,707
Republic of San Marino,	27	8,000	—	40
TOTALS,	122,867	21,483,000		140,390

Of the kingdoms and duchies the sovereigns are hereditary monarchs; the sovereignty of the States of the Church is vested in the Pope, the primate or head of the Roman Catholic Church, and who is elected for life, out of their own body, by

the college of cardinal bishops, priests, and deacons. The Popes being generally old men before their election, their succession has been more frequent than that of any other series of sovereign princes, hereditary or elective. The Pope unites in his person three different offices: — 1. Supreme pontiff and head of the Roman Church and hierarchy; 2. Bishop of Rome; 3. Temporal sovereign of the Roman State. His ministers in his spiritual capacity are: — 1. The *cardinal-grand-penitentiary*, who decides on cases of conscience, with the assistance of several prelates; 2. The *cardinal-sommista*, who presides at the tribunal of the Apostolic Chancery, and whose duty it is to give his opinion on matters of doctrine or discipline, to affix the seals to, and expedite the Pope's bulls (*i. e.* charters, letters, rescripts); 3. The *cardinal-prodatario*, who, with a numerous body of sub-officers, decides all affairs concerning livings and other temporalities of the clergy, dispensations, licences for marriages between relations, &c.; 4. The *cardinal-segretario di brevi*, who has the charge of the Pope's correspondence concerning ecclesiastical matters, expedites the briefs to foreign potentates, &c.; 5. The *uditor santissimo*, a prelate who examines, revises, and reports upon all matters of importance laid before him, examines the claims of the candidates for bishoprics, and is generally the intimate adviser of the Pope, whose full confidence he is supposed to enjoy; 6. The *cardinal-vicar*, who exercises the authority and performs the duties of the Pope as bishop of Rome. As temporal sovereign, his two principal ministers are the cardinal secretary of state, and the cardinal-camerlingo; the former of whom unites in his person the departments of both the home and the foreign affairs, is the prime minister and representative of the sovereign both with foreign courts and with his own subjects. He is appointed by the reigning Pope, and leaves office on the death of his superior. The camerlingo, chamberlain, or master of the household, is appointed for life. The republic of San Marino is situate within the papal territory, and is under the Pope's protection. It consists of only the town of San Marino and four neighbouring villages, but is one of the oldest States in Europe. The Lombardo-Venetian kingdom, or States of Lombardy and Venice, form part of the empire of Austria, and are directly ruled by a viceroy under the controul and direction of the imperial ministry of Vienna. Besides the nine States above mentioned, there is also the small *principality of Monaco*; but the prince resides in Paris, allowing his territories to be garrisoned by Sardinian troops, and is in fact merely a mediatized prince, subject to the King of Sardinia.

PRODUCTIVE INDUSTRY.—*Agriculture.*—With respect to its agriculture, Italy may be divided into three regions; the first consisting of the great plain of Lombardy and Piedmont, bounded by the Alps on the west and north, the Apennines on the south, and the Adriatic Sea on the east; the second is that which extends from the western Apennines, and the frontiers of France and Lombardy, to the borders of Calabria; and the third comprehends those districts where animals and vegetables thrive, but from which man is almost wholly excluded by the malaria, and which, extending along the sea coast from near Pisa to Terracina, is called the *Maremma (Ora maritima.)* Lombardy is without doubt one of the richest countries in the world; the soil of the plain, or central part, is entirely alluvial, composed of materials which have been deposited by water to an unknown depth. In the tracts nearest to the mountains, much gravel, and that of considerable size, is mixed with the earth; but it becomes smaller in size, and less in quantity towards the centre and eastern borders, so that almost the whole may be said to be composed of a black and very fertile mould. The neighbouring mountains afford an immense supply of water; and to this, not less than to the natural richness of the soil, is Lombardy indebted for its great fertility. To distribute the water, a very regular system is pursued, which it has required considerable skill and capital to carry into effect. From the irrigation thus practised arises an inconceivable fertility which supports a crowded population. Lombardy abounds in villages and large towns, and possesses all the beauty which richness and cultivation can give to a level country containing nothing which is naturally picturesque. The fields into which it is divided are small, and separated by rows of poplars, which give it the appearance of a wooded country. The country between Lodi and Cremona is the richest part of the Milanese territory. The soil is extremely fertile, and the system of irrigation the most perfect that can be conceived; but the culture of corn gives place, in a great degree, to that of pasture, which serves as food for the cows that produce the cheese so well known over Europe as the Parmesan. The district in which it is produced extends from Pavia to Milan and Lodi, about twenty miles, and in length about forty miles, from Abbiate-grasso, on the Ticino, to Codogno, near the confluence of the Adda and the Po. About 80,000 cows are kept for the purpose, whose annual produce is about 200 lbs. (155 kilogrammes) each. The value of the cheese and butter exported and consumed is about one million sterling (23,360,000 francs.) The other principal articles reared are, wheat, maize, oats, rye, hemp, flax, and legumes; and, in the flat grounds of the lower districts, rice, of which the quantity raised is now very considerable. A crop of rice is reckoned at three times the value of a crop of corn; but the stagnation of a large body of water in a hot climate, covering an extensive surface, which is necessary for the growth of rice, is highly injurious to health; the rice country is in consequence thinly peopled, and the few inhabitants are in a very sickly and diseased condition. In no other part of Italy is the cultivation of silk so large, so valuable, and so well understood as in the north. From the Var to the Isonzo, are extensive plantations of the white mulberry, in some places trained as tall and stately trees, in others pruned down almost to square bushes, but everywhere giving a peculiar and attractive character to the agricultural scenery. With the progressive increase of the culture of silk, the value of land and the prosperity of the people have undergone a corresponding improvement; and it may be added that the quality of the silk has greatly improved under the encouragement of a perpetually extending demand. The estimated produce of raw silk in Italy is believed to be now not much less than twelve millions of pounds annually, of which Lombardy, Venice, Tyrol, and Tessin produce 7,000,000; Piedmont and Genoa, 2,000,000; Naples and Sicily, 1,200,000; Papal States, 800,000; Parma, Modena, and Lucca, 550,000; Tuscany, 300,000: worth about £12,000,000 sterling. The cultivation of the land in Lom-

bardy, and indeed throughout all Italy, is performed solely by means of oxen. The plough is drawn by two oxen without a driver; the waggons also, or carts, are drawn by oxen, the horse being scarcely ever employed for any purpose of husbandry. The implements used are also everywhere of a very rude and unimproved construction. About four-fifths of the population of Lombardy are connected, directly or indirectly, with agriculture, and about eight-ninths of the whole surface of the country are under cultivation.

The Genoese territory rises everywhere from the seaside into hills and mountains, and is less adapted for agriculture, than for gardens and orchards. The olive is the prevalent object of cultivation, southern fruits are raised in the most favourable places, the chestnut on the higher grounds, while pasturage and herds are the objects of attention among the maritime Alps. Everywhere there is great industry, but nowhere much opulence, the proverb holding good; "He who possesses only olive trees will always remain poor." Even a trifling frost injures this delicate plant, and still greater destruction is occasioned by certain insects. Seedlings bear no regular crop of fruit till they are fifty years old; but, if propagated by cuttings, the trees bear in twenty-five years. In good years 150 or 200 olive trees, on a surface of two acres, will produce from 500 to 800 gallons of oil. The trees blossom in May, and the harvest begins in December. Orange and lemon trees yield a full harvest only after twenty years; they grow best on a light soil, which is well watered, and well manured. A hundred trees will produce 30,000 fruit. The pastoral part of the population are more opulent than the olive growers; though the pasturage and cattle are both inferior to those of Switzerland.—*(Raumer's It aly, I. 275, &c.)*

The agriculture of Tuscany belongs partly to a system of irrigation similar to that of Lombardy, and is partly adapted to the cultivation of the steep sides of the hills. Property is extremely subdivided, and the farms are in general cultivated by farmers who divide the produce with the landlord. The principal articles of cultivation are wheat, maize, clover, beans, peas, and other pulse; and, above all, the vine and the olive. Such is the richness of the alluvial soil in the valleys, that although manure is applied to it only once in five years, yet the crops are very abundant. The culture also which is very fine and careful, and the judicious succession of crops, have their share in producing this effect. An immense population lives on the produce of these farms; but there is observed among them a complete absence of all the conveniencies of life, and an appearance of the greatest penury in the midst of a country producing everything which the wants of the most luxurious can require. Either the population is too great; or their system of rural economy must be radically bad. The evil, indeed, seems to arise from the universal prevalence of the *mezzeria*, or half and half system, by which all the farms are held, and which seems expressly calculated to depress the farmer, and keep him in a state of hopeless poverty. The finest part of Tuscany is the valley of the Arno, which is everywhere most carefully cultivated; but with all the advantages of a rich soil, and temperate climate, adapted to the vine and the olive, the land does not yield more food for the support of man than in countries twelve or fourteen degrees farther north, countries which labour under all the disadvantages of a long and severe winter, of a spring which hardly deserves the name, and of a summer and autumn during which the inconstancy of the climate is severely felt. Tuscany was formerly celebrated for its high state of cultivation, and is still highly cultivated; but the quantity of labour expended is quite disproportioned to the result; the greater part of the produce is consumed by the labourer; the methods pursued are eminently unscientific; the capital swallowed up by the land is enormous; and every species of cultivation which does not contribute to supply the direct home consumption of the country is neglected. The forests have been destroyed or badly managed; mulberry-trees, which the country would produce in abundance, are not in favour with the cultivators, because they spoil the fields and contribute nothing to the use of the table. The rearing of silk-worms is not attended to; the production of silk is much less considerable than it might be; and the same may be said of every other article which is available only for exportation. In former times many of the Tuscan wines were celebrated for their excellence; but at present, though a vast quantity of wine is made, and is generally of good quality, the sole purpose of the cultivator is to render it suitable for home consumption. The culture of the vine is accordingly subordinate to that of the olive, the mulberry-tree, and grain, or is considered at best as only of equal importance; the vine being produced on the same lands, and subjected to a treatment quite unsuited to its perfect developement. Little pains are taken at the vintage, and the process of wine-making is still the same which has existed for generations. Of late, however, there seems a disposition to take measures for the better cultivation of the grape, and the more careful preparation of the wine; and, if successful, it may yet become an object of no small commercial importance.

The mezzeria system has existed from time immemorial, and is the only one understood in Tuscany; but it is costly in the extreme. Agriculture gives no fair return for capital; for, after deducting all expenses the proprietor does not receive more than a third of the produce, while the outlay for his half generally amounts to two-fifths or even three fifths of the total expense. Landed proprietors were formerly the wealthiest class of society, but relatively to other capitalists, they are now impoverished, and cannot compete with people whose fortunes are not vested in hereditary estates. One of the causes of the poverty of the Tuscan proprietors is the great number and expense of buildings required on their farms, where the houses of the peasants are of a very superior description, and have been mostly rebuilt within the last sixty years. The number of buildings too required for their villas, and the expense of maintaining them are ruinous to the owners, more especially now when comfort is as much an object of attention as grandeur was formerly.

Besides the Val d'Arno, and the hills, to which cultivation has been hitherto chiefly confined, there are in Tuscany two extensive fertile plains, the Val di Chiana, and the Maremme, which till lately were quite neglected. In the Val di Chiana, however, through the success of hydraulic operations, large tracts of country have lost their pestilential character, and lands formerly useless have been turned into profitable estates. The Maremme, too, which had been uninhabitable for centuries, during many months of the year, through the effects of malaria, have been for several years the object of special attention on the part of the Grand-duke. A large expenditure has been devoted to their improvement; satisfactory results have been obtained in many districts, and are anticipated in all. Abandoned by man, the destructive energies of nature had for ages been contributing to make the Maremme what Dante has called them, a fit image of hell, the abode of desolation, disease, and death; but their present state is an interesting example of the power of art to arrest the devastations of nature, and to bring the very elements of ruin to contribute to healthful and profitable results. The contrast between their late and their former state is almost without example. They were the richest, and perhaps the most densely peopled part of ancient Italy. The most renowned cities of Etruria occupied districts, which for centuries have been encroached upon by pestiferous lakes and marshes, and covered with weeds, canes, and reeds. The climate, renowned in former times for its beauty and salubrity, had become pestilential; but cultivation is again gradually extending; capital is being invested; a laborious population is constantly narrowing the circle of the former seats of desolation; and the cares of Government aiding the progress of improvement by a liberal expenditure, promise ultimately to restore to profitable use large tracts which had been neglected as valueless, or abandoned as uninhabitable. Wheat is abundantly grown on spots, which only a few years ago afforded a scanty subsistence to a few wandering fishermen; and it is not unworthy of remark, that while miles of fertile ground have been won from waste and pestilence by the deepening of rivers,

and the draining of marshes, the confining of the streams and lakes to narrow and defined limits has enabled the fishermen to obtain greater supplies of fish, with diminished toil and danger; so that the rent now paid to the Government by those who farm the fisheries, is greater than at any former period. The Maremme offer many attractions to cultivation and to capital. They possess the greatest variety of temperature and soil; the hills which skirt the level lands are rich in mineral productions; and, when the cross roads shall have facilitated intercourse with the main branches of communication, and the clearing of the brushwood, the forests, and the marshes shall have made the country inhabitable throughout the year, abundant employment will be found for capital and labour in new and lucrative enterprize. But vast estates throughout the Maremme, are still in the hands of a poor nobility, whose principal rental is derived from wood-cutting, and from the pasturage of flocks of sheep and goats which descend from the mountains in winter, and feed in the plains. Of sheep alone the annual migration is said to be from 60,000 to 80,000. Herds of buffaloes and other horned cattle are also frequently met with, and form another source of revenue; but the want of capital is everywhere visible, and the decay of the ancient aristocracy may be traced in the neglect or the gradual transfer of their large possessions. The great works for clearing and draining the Maremme were commenced in January 1829, and by July 1832, nearly £200,000 sterling had been expended in clearing and giving new directions to river courses, filling up the beds of lakes and marshes with the deposits of the rivers, in making roads and bridges, and the necessary buildings. One of the most remarkable improvements is the making of an excellent road along the west coast, where formerly not a dwelling was to be found through extensive tracts; but inns and other houses are now building, and the Government has frequently, as an encouragement to settlers, granted small pieces of land to those who have built houses. A universal opinion prevails that the pestiferous character of the marshes has been already much modified; great part of the marshy lands have been brought in and prepared for cultivation, and population is gradually spreading over a country formerly abandoned.

Most of the lands in the *Agro Romano*, or territory of the Roman State, as generally in the Maremme, are divided into large properties, though the extent varies much, generally from 1200 to 2400 acres. All the country from the Apennines to the Mediterranean is divided into possessions of considerable size, except in the suburban districts, and in the neighbourhood of the towns and villages, where there are small estates belonging to petty proprietors who often cultivate them with their own hands. But the number of wealthy proprietors is small; perhaps there are not twenty landlords of ample fortune. The large estates are for the most part held in mortmain. In the Adriatic marshes, and in the districts of Ferrara and Ravenna, the land is divided into large properties; elsewhere there is a greater subdivision. Agriculture is in apparent prosperity; but the majority of the landowners are poor; a few only are in easy circumstances; and the opulent are rare indeed. The value of land is infinitely various; but speaking generally, the most profitable agricultural pursuit, especially in the Maremme, is the grazing of cattle; and in the neighbourhood of Rome, hay is found to be the crop which produces the best return. In the Maremme the land is often left to repose for from three to seven years, during which time it is clothed with verdure. Agriculture is in a very backward state, owing to the want of instruction where the people are numerous, and, in the marshes, to the want of labourers. The agricultural labourers have no education whatever, and no means of acquiring it, though their natural aptitude is excellent. In the Maremme they live poorly; but in other parts of the country somewhat better. They seldom eat animal food; but use, for the most part, maize bread and polenta. Beans and pulse, as well as other vegetables, form ordinary articles of food. Their beverage is pischetta, a mixture of wine and water, in winter, and wine in summer. The coloni (farmers) are generally in debt to their landlords, whose portion of the charges of cultivation is more than they can bear, and they are often insolvent; so that the nominal returns for property held on mezzeria is seldom borne out by the results, and the consequence is a reduction of all the portion with which the farmer is overcharged. There are indeed many cases in which the amount received by the landlord is not one-sixth, instead of one-half, of the produce. The cattle of the Roman states are nearly sufficient for the ordinary consumption. Horses are exported; and there is a small importation of oxen and swine. The breed of sheep is increasing, and the supply of wool for foreign markets is greatly augmenting. Nothing can be more rude than the agricultural implements; heavy custom-duties prevent the introduction of those of foreign manufacture, and the useful arts are too little advanced to allow production of them at home. The impediments to agricultural improvement are numerous; the political situation of the country and its sad misgovernment; the protective system, which retards advancement; the want of capital; the scanty population of the Maremme, and the mezzeria system elsewhere; the want of knowledge, and more especially of agricultural knowledge among the cultivators; mortmain; the oppressive taxation, which falls particularly upon agricultural produce, and the difficulty of sales from the many restrictions. Indeed, says Sir William Gell, "at Rome, the expenses of cultivation, and the pressure of taxes are scarcely met by the sale of the produce of the soil; and grain from the Black Sea is often cheaper than that produced at home, in most of the commercial cities of Italy."—(*Top. of Rome*, I. 253.) The people, however, are neither indolent nor unwilling to improve their condition; much activity and perseverance have been exercised; a general desire for improvement has been shown; a general conviction that great changes are necessary has been manifested; but the requisite intelligence is wanting. The smaller lakes in the Maremme have been drained, little has yet been done for the larger; there is still a vast field for useful and profitable exertion; but numerous impediments have hitherto checked it. The principal productions of the territory are corn, wheat and maize, rice, hemp, wine, vinegar, brandy, oil, timber, charcoal, and tobacco, and culinary vegetables, apples, cucumbers, melons, garlic, onions, potatoes, flax, seeds, and oleaginous vegetables, dyewoods, bark, potash, hay, soda, mulberry-trees, anniseed, &c., cattle and sheep, wool, cheese, hides, bacon, hams, lard, butter, silk, wax, honey, tallow, horns, bones. Buffaloes, goats, mules, and other animals for carriage are to be found, but not in large numbers. Domestic poultry and game are produced in abundance.

In the kingdom of Naples there are three distinct systems of agriculture pursued, according to the nature of the climate and the soil of the mountains and the plains. The greater part of the surface of the kingdom is limestone, chiefly of a bluish colour and easily decomposed, which affords a soil favourable to the labours of the farmer. By far the greater part is mountainous, being covered by the Apennines and their branches; but there are two extensive tracts of level country, the one upon the Adriatic, and the other upon the Mediterranean, forming the plains of Apulia and Campania. There is a great want of rivers to supply to any extent the means of irrigation; but the fall of rain, which is very considerable, and which is heavier upon the western than upon the eastern slope of the Apennines, supplies their place. Nearly every species of plant peculiar to the torrid or the temperate zone is found in suitable sites; the palm-tree and the cactus flourish almost by the side of the oak and the fir; the cotton plant divides the field with hemp and flax. On the less elevated spots all the varieties of the orange and the lemon attain perfection; the olive "swells with floods of oil;" and the vine, allowed to extend its graceful tendrils from tree to tree, affords equal delight to the eye and to the palate. A peculiarity of Neapolitan agriculture is, that the soil produces a greater crop of cerealia and grass when protected by trees from the burning rays of the summer sun, than when left open and unprotected. Hence, the cultivation of the vine, the olive, and the mulberry is most advan-

taneously combined with arable husbandry. In the best cultivated provinces the fields are covered with elms or poplars, on which the vines are trained, or with olive-trees planted in rows. The mulberry-tree is only planted extensively in Calabria; but, as it affords a most profitable crop with a small amount of labour, it is gradually spreading in the other provinces with the increase of the population. The farms in the elevated districts are small, varying in extent from one and a half to seven acres, and are almost all cultivated by manual labour. The principal articles raised are wheat, barley, potatoes, beans, rye, maize, and culinary vegetables; rye and barley only succeed in elevated spots, and spelt is sometimes, but much more sparingly cultivated. The system of agriculture practised in Campania is peculiar, and is considerably different from that of the hills. This district includes the seacoast of the Bays of Gaeta and Naples, between the Garigliano and Sorrento, with Ischia, Procida, and the smaller neighbouring islands, and stretches eastward to the main chain of the Apennines near Cava, Nola, and Avellino, including Benevento, and is distinguished as the region of active and extinct volcanoes. Its greatest length is about 69 miles, and its greatest breadth, from Benevento to the extremity of Ischia, about 50. Thus the whole of the province of Naples, and great part of the Terra di Lavora are included in the district. The soil of the extensive plain of Capua is composed of what has been called secondary tufa, to distinguish it from the more ancient or primitive tufa of Ischia, Procida, and the Vomero near Naples. Both kinds of tufa yield a most productive soil, easily decomposed, and of considerable depth in the plains. As the high road from Rome to Naples lies through the plain of Capua, the luxuriant vegetation of this part of Italy strikes involuntarily the most superficial traveller, who there sees flourishing crops of grain waving under the shade of myriads of olive-trees, and vine-clad elms or poplars. On the heights near Naples, cultivation is so admirably managed, that in some of the villas at Capo di Monte, three crops are actually produced at once, by the addition of the lofty pine, whose roof-like foliage towers so far above the vines, that it deprives them of but a small portion of the sunshine, while the delicate fruit which the former yields, is a most welcome addition to the juice of the latter in the dessert of the connoisseur. The valley of the Sebeto, between Capo di Monte and Vesuvius, is one continued garden, from which the markets of the capital are supplied; the sides of the volcano are covered with the vineyards, which yield delicious lacryma christi, a species of wine, which, like that of Pozzuoli, near the Solfatara, is said to owe its superior flavour, in a great measure, to the influence of the subterraneous heat. The population in this volcanic region is very dense; land is divided into farms of a middling size, and the abundance of manure causes the ground to be kept in an almost unremitting state of productiveness. The third system of agriculture is that pursued in Apulia, or the plains which extend from the foot of the Apennines to the Adriatic. From time immemorial this district seems to have been resorted to by the shepherds of the adjacent mountains; and now by a system of laws and regulations called the *tavogliere*, of the same nature with those of the Spanish mesta, and equally mischievous, the owners of the flocks and herds of the mountains have the established right of transporting them to the plains for winter pasturage; and to this singular institution the kingdom is indebted for a peculiar system of agriculture which prevails in the three provinces of Capitanata, Terra di Bari, and Terra di Otranto, where the farms are usually divided into three equal portions, one of which is under seed, the second fallow, and the third in repose, or waste. On the two latter the right of pasture is exercised by the tavogliere; and thus a tract of country containing two millions of acres is not only doomed to partial sterility, but is the cause of unproductiveness in all the adjoining provinces, from which it attracts the cattle, and in which it consequently prevents the accumulation of the means of giving fertility to the exhausted soil. Under the French domination the system of the Tavogliere di Puglia was abolished; but after the restoration of 1815, it was restored with its ancient local privileges, roads, resting-places, and the whole apparatus of administration. The total area of the kingdom of Naples is reckoned to contain about twenty millions of acres, of which one-fifth is occupied by towns, villages, roads, water, and places incapable of cultivation, and nearly one-eighth by forests, leaving 13,635,000 acres of cultivable soil, of which nearly twelve millions are found by the returns of the land-tax to be actually cultivated, or at least occupied; and as the population in 1836 was 5,781,036, this extent of land ought, with proper management, not only to suffice for their support, but also to yield a considerable surplus. But in the present state of matters, the periodical wanderings of the cattle not only deprive the farmer of manure, but dispose him to adapt his stock to the prevalent system, by preferring sheep, which are most easily managed at a distance, and which require no dairy establishment; and the consequence is, that the crops of corn, so far from sufficing for the support of the population, are actually deficient. In 1835, the number of live stock in the continental part of the kingdom of the two Sicilies was thus estimated approximatively. Beeves, 300,000; buffaloes, 40,000; horses, 60,000; mules and asses, 600,000; goats, 600,000; sheep, 4,000,000.*

Mines and Minerals.—The minerals of Italy are of small amount; and, though mines of gold, silver, and copper, were once wrought, they are now almost all extinct. It yields at present some alum in the States of the Church and Naples, some vitriol and antimony in Parma, and sulphur in the kingdom of Naples. In Lombardy, mining operations are confined to the procuring of iron in the Alpine valleys of Bergamo and Brescia, and of copper in Belluno. In Tuscany there are a great variety of minerals, which were once extensively wrought; but a large proportion of the mines have been abandoned. The most important are the iron mines of Elba, which are deemed inexhaustible. For a period of ten years, from 1825 to 1834, the quantity of ore produced annually was 1600 centi (each 25,000 lbs.), of which 700 centi were consumed in Tuscany, and the rest exported, chiefly to Rome, Genoa, Naples, and Corsica. At Perita, in the province of Grosseto, is a sulphur mine, which, for ten years, gave an annual produce of 413,000 lbs., but is capable of being greatly increased by a growing demand. At Monte Catini, in the valley of the Cecina, is a copper mine, producing 100,000 lbs. per annum, and there are other copper mines at Montieri, the produce of which is not known. The territory of Pietra Santa contains mines of iron and silver, and is rich in marbles, of which there are twelve quarries in operation, one of them yielding statuary marble equal to that of Carrara. In the Volterra district, near Pomerance, the lagoons of Monte Cerboli furnish boracic acid, which is ingeniously and economically obtained by impregnating the water with the gas which issues copiously from the ground. The produce is, in ordinary years, about 600,000 lbs., of which 100,000 lbs. are manufactured into borax, and the remainder exported to foreign countries. In the Volterra districts are numerous quarries of alabaster in full activity; stone for building, paving, and other ordinary purposes of life, is abundant; and also gravel, the employment of which is one main cause of the excellence of the Tuscan roads. The granite quarries of Elba and Giglio, which furnished the columns

so often found in the ancient buildings of Tuscany, are still capable of yielding similar materials. Travertine abounds in many parts of Tuscany; near Pisa, and in various parts of the Maremme, and in the territory of Siena, are marble quarries, wrought according to circumstances. At Monteoni is an alum mine; and in the Maremme are lead mines which are unwrought. In Lucca and the States of the Church are some mines, and numerous indications of metals and minerals, but they are little wrought, and in the latter State no accurate estimate exists of the quantity of minerals produced or worked; pozzalana, however, is both used at home and exported to some extent for subaquatic works; the Viterbo vitriol mines give more than 40,000 lbs. annually, one-half of which is exported; there are many mines of fossil coal, some of which have been wrought, but they are now utterly neglected. About 4,000,000 lbs. of sulphur is dug in Romagna, Pesaro, and Tormignano; but the government works only the alum mines, which are found at Tolfa; all others are private undertakings. There are many salt springs in Romagna and the Marche (frontiers), and a quantity of salubrious mineral waters, both hot and cold. Those of Porretta, near Bologna, are particularly esteemed; and those of Aqua Santa, in Rome, and in the neighbourhood of Ascoli, of Civita Vecchia, Riolo, Nocera, and Stigliano. Of Naples, the mineral productions are unimportant; and consist chiefly of some iron, extracted from mines in the vicinity of Stilo; with mines of rock salt, which are little worked. The province of Massa, in the Duchy of Modena, produces the excellent statuary marble found in the quarries of Carrara.

Fisheries.—The fisheries contribute largely to the supply of food in Italy. The most considerable are those for the tunny, a very large fish, and the anchovy, which is very small. These are conducted on a very large scale by joint stock companies, composed of almost all the inhabitants of the coasts where they are carried on, and more part cularly along the vast extent of the Neapolitan shores. The lakes and rivers likewise yield a considerable quantity. The tunny is a gregarious fish, shoals of which enter the Mediterranean early in the year, and are caught in great abundance with nets, on the Italian coasts, in May, June, and July. The anchovy fishery is chiefly carried on for the sake of foreign trade; the fish are caught in shallow water in March, April, and May, and the curing of them occupies about a month. Sword fish are also taken with the harpoon, in the straits of Messina, and sometimes in the tunny nets; their flesh is esteemed very delicate, and when broiled resembles veal. The coast also swarms with mullets, the roes of which are converted into a sauce called botarga, which is in great request. A great variety of testaceous and crustaceous fish, among which are prawns of gigantic size, is taken along the whole coast.

Manufactures and Trade.—The manufactures of Italy are comparatively unimportant; but those of Lombardy and Venice are extensive. The manufacture of silk gives the most extensive employment; but great numbers of people are also employed in the linen and woollen trades, in both of which branches the use of machinery has been widely diffused. Woollen goods of almost every kind are manufactured in the delegations of Venice, Padua, and Como. Milan has long been celebrated for its weapons and arms, and iron work of all kinds is still extensively carried on. Besides these greater branches, most of the smaller departments are also carried on, especially those of paper, glass, gold and silver articles, and domestic utensils. The foreign trade of Lombardy is not great; that of Venice has much declined since its annexation to Austria. There are still many ships navigating the Adriatic and Mediterranean seas, under the Austrian flag, which are built and equipped at Venice.

In Tuscany the fundamental maxim of commercial legislation is, that trade and industry should be unfettered; it is, however, essentially an agricultural country, and the manufactures are unimportant. The principal articles are organzine and manufactured silks, and straw-hats and tresses. The principal articles of import trade are corn and grain from Odessa and Alexandria; superior wines from Spain and France; colonial produce, of which the consumption has greatly increased; woollen and cotton manufactures from France, England, Belgium, and Switzerland; wrought iron, chiefly from England; high bred horses, articles of fashion, hardware, &c.; wool from the Levant. The principal articles of export are, oil; silk, both raw and manufactured; kid and lamb skins; tartar, potash, charcoal, firewood, timber, corkwood, staves, bark for tanning; iron ore from Elba; marble and alabaster, wrought and unwrought; straw-hats, and straw for platting; woollen caps for the Levant; paper, and works of art; borax, alum, sulphur; worked coral, tallow, and bacon. But the free nature of the trade necessarily prevents the publication of accurate or even approximative returns of its amount and value.

In the States of the Church, the population in general is agricultural rather than manufacturing; for its manufactures there is little demand abroad; they serve only for home consumption. The principal manufacture is that of woollens of ordinary quality, of which Rome is the most important seat. Next in importance is the manufacture of hats, which are well made everywhere, but especially in the capital. There are manufactories of silk and ribbons at Rome, Bologna, Camerino, Perugia, Pesaro, Ascoli, and Ancona; and of tanned and dressed leather at Rome and other principal cities; hemp and flax are also manufactured to considerable amount, but only in public schools, orphan asylums, or private houses; the paper manufacture is considerable, and is increasing; there are many ironworks, though the ore used in them is imported; the brass pins of Urbino are famous; and there are brass, copper, and other metallic works in various places. The abundance of sulphur, and its excellent quality, has led to the establishment of vitriol manufactories at Bologna and elsewhere. It may, however, be stated generally, that the following manufactures, though they exist in the country, are not in a prosperous state, namely, woollens, silk veils, leather, gloves, cotton, and alum. Those which flourish are hats, some silk goods, paper, screws, and sulphur. The manufacture of fine cloths in Bologna has ceased. The principal articles of export are: corn, hemp, olive oil, charcoal, planks, tobacco, wood, garlic and onions, aniseed, pine kernels, saffron, bark for tanning, linseed oil, vinegar, tartar, potash, soda, wool, cheese, skins to a great amount, wrought silk, horns, bones, honey, tallow, lard, and fat. Nearly 50,000 sheep and 40,000 swine are annually exported from the provinces of Perugia and Viterbo to Lombardy, Venice, Tuscany, and Illyria, and the number would be larger, but for the heavy duties imposed by Austria. Perugia and Romagna export oxen to Tuscany, the maritime and rural districts, to Naples, altogether about 10,000 yearly. There is an export trade in horses to Naples, Tuscany, and Lombardy. With respect to imports, the character of the country must be kept in mind; not only the quality of the soil, but the fact that a chain of mountains traverses the country, making the north-east almost inaccessible to the south, so that while one part of the State is exporting, the other may be importing the same sort of articles. This arises from the difficulty, delay, and cost of carriage. Thus in the north-eastern districts there is an importation of oil from Naples and Tuscany, wood for building and fuel, and charcoal from Tyrol, Illyria, Dalmatia, and Venice. The imports, generally speaking, consist of a great variety of the productions of the neighbouring countries, and of colonial produce principally from England and France.

The manufactures of Naples are chiefly of the domestic kind. The women spin the flax, hemp, and wool; and the coarse cloths made from those substances suffice for the greater part of the population. There are manufactures of coarse woollen and cotton goods in many of the towns. Silk goods are manufactured in larger establishments than those engaged in other articles of trade. Leather,

paper, hardware, glass, earthenware, and porcelain, mostly of inferior workmanship, and in small quantities, are also made in different places. The condition of the great body of the people forces them to be content with the coarsest clothing, with few articles of domestic furniture, or even cooking utensils, and to procure what they do use of the cheapest and most durable kind. No country in Europe has so little foreign trade, in proportion to its extent and population. It produces almost everything that is necessary for the use of its inhabitants, and has a very insignificant surplus to give in exchange for the few luxuries which the condition of the people requires. The foreign trade centres chiefly in the city of Naples, to which the greater portion of the surplus products are brought by small coasting vessels, and where the foreign commodities required are also procured.

Before the seventeenth century, Genoa was the centre of all the supply of manufactured silks and velvets to the other parts of Europe; but at present the manufacturing industry, so far as regards silk, is reduced to the extent of supplying the home consumption, or preparing the raw material for the manufactories of France, England, Holland, Germany, and Russia. The Sardinian States generally have sufficient manufactures to supply with silk, linen, or woollen goods, the home demand. The Sardinian silks are handsome and strong, especially the stockings; but from the want of the best kinds of machinery in producing them, they are dearer than elsewhere. Leather, iron-goods, copperware, glass, pottery, and smaller domestic articles, are also manufactured. The most valuable article of export is silk, which is mostly transported by land-carriage to France and Germany. Olive oil is also largely exported from Genoa, after being collected there from the adjoining coasts. Rice, fruit, soap, white-lead, essences, and perfumery, are also exported to some extent; and there is besides a considerable transit trade carried on through Genoa, by which the products of the other parts of Italy are exchanged for those of France, to the advantage of the commission houses in that city. The principal articles of import consist of sugar, coffee, spices, cotton-wool, manufactured cotton, indigo, cochineal, and other dying stuffs, corn, salt fish, salt, hides and leather, iron, steel, lead, copper, pitch and tar, tobacco, timber, besides many smaller articles. The trade in grain is casual, depending in a great degree upon the Swiss harvests, to supply the deficiencies of which, when they occur, corn, chiefly wheat, from Odessa and Taganrog, is imported through the Sardinian territory. The Genoese are active and enterprising, and trade to the most remote parts of the world.

INTERNAL COMMUNICATION.—The roads throughout northern and central Italy are generally well made, and kept in excellent order; and there being little navigable water communication, the practice of land-transport has become almost universal. A railway from Venice to Milan, 166 miles in length, is in the course of being made with great rapidity; it will be almost on a dead level, and will, no doubt, greatly facilitate the internal communication of Lombardy. Several great roads have been constructed over the Alps, so that communication between the north of Italy and the tramontane countries is now almost entirely divested of the character of difficulty and danger, which made it scarcely practicable even in the few places where it was attempted. The principal of these roads are, that called the *Cornice*, leading along the coast from Nice to Genoa, and in some places cut like a shelf on the face of precipices which overhang the sea; the road of Mont Cenis, extending from Lanslebourg in Savoy, to Susa in Piedmont, commenced by Napoleon, was completed by the Sardinian government, and rises to an elevation of 2,100 metres (6,773 feet) above the level of the sea; the great road over the Simplon, was constructed by order of Buonaparte, and made easily passable by carriages, but was in some places nearly destroyed by recent storms (1839-40); and the roads over the Splugen, the pass of Finstermunz, and the Wurmser Joch, leading to the Lake of Como, constructed by the Austrian government, and not surpassed, if indeed they are equalled by any undertaking of the kind elsewhere. There are also passable roads at Mont St. Gothard, Great St. Bernard, and Little St. Bernard.

Lombardy abounds with innumerable canals, some of which are navigable, but they are principally used for the purposes of irrigation. The most ancient, as well as the most considerable of these, is the Naviglio Grande, which was opened in the year 1270, and extends from the Ticino to Milan. The Nuovo Naviglio di Pavia, which was completed in 1819, extends from Milan to Pavia, where it falls into the Adda, a little above its confluence with the Po, and thus places Milan in direct communication with the seaports of Goro, Chioggio, and Venice, by means of the Po and its branches, connected by canals with the lagoons of Venice, and the rivers Adige and Brenta.

In Tuscany, the Arno is usually, though not always navigable between Florence and the sea. There are canals from Pisa to Leghorn; from Pisa to the Serchio, the lake of Bientino, and that of Fiocchio, which communicates with the Arno; parts of the Serchio, Bizenzio, Ombrone, and other rivers, are also navigable.

TOPOGRAPHY.—Italy is divided, into seven independent States, which we shall now proceed to describe in the following order: 1. States of the King of Sardinia; 2. The Lombardo-Venetian kingdom, or kingdom of Lombardy and Venice; 3. The duchy of Parma; 4. The duchy of Modena; 5. The Grand-duchy of Tuscany; 6. The States of the Church; 7. The kingdom of Naples; 8. The islands of Sicily, Malta, Gozo, and Comino.

§ 1. *States of the King of Sardinia.*

The Sardinian dominions consist of two distinct portions, the continental and the insular. The latter comprises the Island of Sardinia; the former occupies the north-western portion of Italy, adjoining France and Switzerland, and consists of three distinct parts; 1. The Principality of Piedmont, the Duchies of Aosta and Monferrat, the Lordship of Vercelli, the County of Asti, the Marquisate of Saluzzo, a part of the Duchy of Milan, and the imperial fiefs of Canavese, all in the basin of the Po, and forming the upper or western part of Lombardy; 2. The Principality of Nice and the Duchy of Genoa, lying along the Mediterranean sea, and bounded on the west and north by the Alps and Apennines; 3. the Duchy of Savoy, on the north-west side of the Alps, beyond the proper limits of Italy.

The Continental States contained in 1818, 3,439,000 inhabitants; and in 1839, about 4,000,000. There are 72 towns and 2,632 villages. Institutions for the support of the poor, the relief of the sick, &c. are very numerous; and there are no less than 18,365 children maintained in foundling hospitals. The financial system is one of the best regulated in Europe. A yearly budget is drawn up; and there is every year a surplus of revenue. The estimate of revenue for 1839 amounted to 73,600,000 lire (£2,913,333), and of expenditure, to 74,474,000 (£2,946,678), but the revenue always produces from four to eight millions beyond the estimate. Salt and tobacco are royal monopolies. The public debt amounts to 152,000,000 lire (£6,016,666, 13s. 4d.), the interest of which is punctually paid; and the securities enjoy great confidence, and rarely appear in the market. The government is vested absolutely in the king, who is assisted by a council of state, consisting of a president and fourteen ordinary members. In each province the sole power of government is placed in the hands of an intendant, without a council to controul him. Inferior intendants are appointed to the towns and

districts. The system of education is in a very low condition; elementary schools are still wanting in many places, and, where they exist, they are under the superintendence of ignorant and ill-paid teachers. The clergy are endeavouring to obtain the exclusive direction of public instruction, and to regulate it entirely in conformity with their own views. These they proclaim to be holy, Christian, and anti-revolutionary; but many complain that every advance of science is looked upon by them with jealousy, that freedom of opinion is treated as heresy, the ignorance of the people considered as advantageous to the government, and passive obedience lauded as the highest degree of virtue. There is in Turin one principal university, with four faculties; and there are secondary universities at Chambery, Asti, Mondovi, Nice, Novara, Saluzzo, and Vercelli, either for the study of medicine only, or for medicine and jurisprudence. Chambers of commerce and of agriculture have been established at Turin, Genoa, Chambery, and Nice; which are composed of landowners, bankers, merchants, and manufacturers. From time to time, public exhibitions take place of the productions of the national industry. The Piedmontese are distinguished above all the other Italians for their energy of character, their extraordinary industry, their devotion to literary inquiry, the regularity of the state economy, the efficiency of their army, and the activity of the people.—*Baumer's Italy.*

The continental territory is divided, for administrative purposes into eight general intendancies, subdivided into forty sub-intendancies. The general intendancies are likewise co-extensive with the eight military divisions of this part of the kingdom.

1. *Intendancy of Torino.*—TORINO (TURIN), the capital of the kingdom, is situate on the left bank of the Po, near its confluence with the Dora Riparia, and is one of the most regularly-built cities in Europe, particularly in the new town, which is called Nuovo Torino. It contains about 110 churches and chapels, some of which are remarkable for their architecture, and the splendour and taste of their ornaments, though now little calculated to strike the traveller by their magnificence. Turin is the see of an archbishop, and the seat of the senate of Piedmont, or supreme civil tribunal for the provinces of Turin, Coni, Alessandria, Novara, and Aosta; and has also a fine mint. In respect of its scientific and literary establishments, Turin holds the first rank among the cities of Italy; of these the principal are, the university, the best frequented in Italy; the military academy, with 33 professors and eight masters; the royal academy of sciences, one of the most celebrated in Europe; the royal agrarian society; the royal academy of the fine arts; the royal historical society; the philharmonic academy; the library of the university, one of the richest in Italy; the superb museum of Egyptian antiquities, containing upwards of 8000 articles, chiefly collected by M. Drovetti, and considered by Champollion as the first in Europe in respect of historical monuments; the fine botanic garden of Valentino; and the hydraulic building (edificio hydraulico), a unique institution, where in the months of May and June a course of lectures is given on hydraulics, illustrated by experiments with large masses of water; and the experimental garden of the agricultural society, which also contains rich collections of objects of natural history, agricultural implements, and machinery, and a library of the best works on agriculture and botany. There are several walks round Turin remarkable for their beauty; and in the delightful neighbourhood rises the chain of heights named the *Collina*, adorned with superb villas, and within a radius of a few miles are several small towns and places both beautiful and interesting, as the royal palace of *Stupinigi*, one of the finest summer houses in Europe; the *Venaria reale*, a small town, with a veterinary school, a riding school, and a stud; *La Superga*, five miles from the city, a magnificent church built on an eminence, from which there is a fine view; it is now the mausoleum of the royal family. *Aglie, Ricoli, Moncalieri*, three small towns, with royal palaces or chateaux; *Chieri*, a busy little town on the slope of a hill, which in the middle ages, acted a conspicuous part among the republics of Upper Italy; and the *Villa Madame*, a royal pleasure house, with fine gardens and terraces. Population of the city exceeds 114,000. To the south-west of Turin are the three valleys of the Vaudois or Waldenses. *La Tour*, the chief town, is 36 miles from Turin, and 14 from Pinerolo. They now contain only thirteen parish churches.

2. *Intendancy of Cuneo.*—CUNEO or CONI, a large episcopal city, with considerable trade, 50 miles S by W. of Turin, formerly an important fortress, the works of which have been demolished. *Fossano*, an episcopal city, noted for its baths, silk works, and a royal academy of the Belles Lettres. *Vinadio*, a small town, noted for the baths, and for an argentiferous lead mine in its vicinity.

3. *Intendancy of Alessandria.*—ALESSANDRIA, a large town, and recently one of the principal fortresses in Europe, situate on the right bank of the Tanaro, near its confluence with the Bormida. It is well built, has numerous churches, palaces, and hospitals, with manufactures of cloth and linen, and some trade. The strong citadel still remains, but all the rest of the fortifications have been demolished. To the south-east of the town is the village and battle field of *Marengo*, where Buonaparte gained a great victory over the Austrians in 1800.

4. *Intendancy of Novara.*—NOVARA, an episcopal city, with considerable trade and an industrious population, 30 miles W. of Milan. *Arona*, a small but well-built commercial town, on Lake Maggiore; near which is a colossal statue of San Carlo Borromeo, a native of the town, erected by the people of Milan in 1697. The statue is 66 feet high, and raised upon a pedestal of 46 feet. The head, hands, and feet are cast: but the drapery, and the book which he holds in his hand, are formed of sheet copper, set on timber framing. The work is beautiful and well-executed, and contains a staircase which

* The figures denote *thousands*.

leads to the top. *Vercelli*, an archiepiscopal city, formerly rich and flourishing, with some fine buildings and a public library.

5. *Intendancy of Aosta.*—AOSTA, a small episcopal city, situate where the roads of the Great and the Little St. Bernard meet, contains a Roman triumphal arch, and the remains of an amphitheatre. *Gressan*, a small town, with rich iron mines. *Pré-St. Didier*, a small place, near Mont Blanc, with warm ferruginous springs, frequented by the Piedmontese. *Courmayeur*, at the head of the Val d'Aosta, with mineral springs.

6. *Intendancy of Nizza.*—NIZZA (NICE), an episcopal city, 100 miles S. by W. of Turin, in a delightful situation at the mouth of the Paglione, at the foot of an amphitheatre of hills, which are cultivated like a garden, and covered with country houses, and orange and lemon groves. Nice is the seat of a bishop, and of a judicial senate or tribunal of appeal; and has a theatre, some fine public buildings and baths, a good harbour, upon the Mediterranean, and an extensive trade. It is a great resort for invalids, though the climate seems not very favourable; for in summer the heat is excessive, and, during winter and spring, the proximity of the Alps, and the Vent de bise, render the air frequently cold and even frosty. Nice is connected with Turin by a superb road over the maritime Alps. *Villafranca*, a small seaport town, with a harbour, where the royal galleys are stationed, a fine road, and a school of navigation. *Vintimiglia*, a small fortified town on the coast. *San Remo*, a small town, with a harbour, and considerable trade. *Monaco*, a small town on the coast, east of Nice, is the capital of a sovereign principality, but under the complete controul of the King of Sardinia. No trifling part of the prince's revenues is derived from a tax which he levies on travellers passing through his petty state. The prince resides mostly at Paris.

7. *Intendancy of Genova.*—GENOVA LA SUPERBA (GENES, GENOA), a large, strong, and commercial city, on the east side of a bay of the Gulf of Genoa, which forms a large and capacious harbour, which, though protected from the sea by two large moles or piers projecting from the opposite sides of the entrance, is not very safe, being exposed to the libeccio or south-west wind. The city is built on the slope of a hill, in a delightful situation, but few of the streets are remarkable for elegance, though they contain many large and costly palaces and public buildings. Its numerous churches are all magnificent, though not to be compared in dimensions with some of the other churches of Italy. It possesses a university with 29 professors, a marine school, a navigation school, a deaf and dumb institution, an academy of the fine arts, four public libraries, of which that of the university is the principal, and an arsenal, with building slips for the royal navy. The *Albergo dei poveri* is perhaps the most magnificent poor's-house in Europe. It is sufficiently capacious to lodge 2000 persons, and serves as a refuge for the destitute, a house of correction, and a school, where every person able to work is taught some useful trade. Genoa is the seat of an archbishop, a council of admiralty, and of a judicial senate or tribunal of appeal. Besides the walls of the city, a large extent of ground surrounding the harbour is also inclosed with fortifications; and at the south-western extremity of these, and on the west side of the entrance of the harbour, is the lofty fanal or lighthouse. A part of the enclosure is considered as a free port, and displays a great degree of commercial activity. Including soldiers, sailors, foreigners, and strangers, the city is supposed to contain 113,000 souls; the garrison amounts to 6000 men. Genoa was for a long time the capital of a sovereign state, the rival of Venice in her maritime power and commerce; but her independence was lost during the French invasion of Italy; and, in 1815, the city with the adjoining territory was assigned by the Congress of Vienna to the king of Sardinia. The civic government is now vested in a great town council, which is self-elected, and a little town council, upon the latter of which the ordinary business devolves. The opposite sides of the Gulf have been long known by the names of *Riviera di Levante* and *Riviera di Ponente*, or the eastern and western shores. *Savona*, an episcopal city, with some cloth manufactures, commerce, and a small harbour, south-west of Genoa. *Voltri*, a small town, possesses the largest clothworks in the duchy. *Cugoletto*, a small village, claims the honour of being the birthplace of Columbus, and his house is still shewn. *Chiavari*, a small seaport town, with some trade, and an economical society. *Spezzia*, a small town, in a beautiful situation, at the head of the fine gulf to which it gives its name. *Bobbio*, a small episcopal city, with a celebrated library belonging to a convent, founded in the beginning of the seventh century by St. Columban, from which nearly all the palimpsests decyphered by Mai, Peyron, Neibuhr, and others were obtained. *Oneglia*, a town also on the Riviera de Ponente, only noted for its extensive olive groves.

8. *Intendancy of Savoy.*—Savoy being, as already mentioned, beyond the proper limits of Italy, no part of the preceding description can apply to it. It extends in length about 85 miles, from the lake of Geneva to the French departments of Isere and Hautes Alpes, which form its border on the south; and in breadth, from the crest of the Alps to the banks of the Rhone, below Geneva, between 50 and 60. The country is nowhere level, but on the western side some of the valleys open out to a width of several miles. The greater part of the country consists indeed of high alpine valleys, the lowest of which are more than a thousand feet above the level of the sea, and some of which are so inclosed by mountains as to be almost entirely secluded. These valleys have no other outlet than a deep gorge or chasm, through which the waters have forced a channel, but which was too narrow to admit of an entrance until the labour of man had widened the passage. As the mountains recede from the crest of the Alps, their summits fall below the line of perpetual snow; the fir grows nearly to their highest points, and the intermediate declivities, though too elevated for cultivation, afford summer pasture. A real Swiss climate prevails. Summer in its glorious garb, may often be seen in the valleys, while the surrounding hills have their sides and tops covered with snow. The atmosphere is too ungenial to produce the more delicate fruits of Italy; but in favourable spots grapes ripen, and the sides of the hills yield abundance of chestnuts. But, though changeable, the air is, upon the whole, pure and healthful. The lowest hills and slopes, and the bottoms of the valleys, are the only portions that can be cultivated by the plough or the spade. In the Maurienne and the Tarentaise, two of the most alpine districts, the proportion covered with bare rocks, stones, and glaciers, is equal to one-half of the surface capable of cultivation. The principal rivers of Savoy are, the *Isere*, which drains the valley of Tarentaise, and flows into France, after receiving on the left the *Arc*, from the valley of Maurienne; the *Arve*, which drains the valley of Chamouny, and flows through Faucigny into the Rhone, below Geneva; the *Dranse* which flows into the lake of Geneva, between Thonon and Evian. Besides the lake of Geneva, which forms the northern border, Savoy contains also the *Lake of Annecy*, ten miles in length, and from one to two in breadth, 1350 feet above the level of the sea, and 180 feet deep, drained by the rivers Thon and Fier, affluents of the Rhone; and the *Lake of Bourget*, 10 miles in length, and from 2 to 3 in breadth, and 240 feet deep, drained into the Rhone by the canal of Saviere. There is also a lake on Mout Cenis 5740 feet above the level of the sea. Savoy Proper occupies the lower part of the valley of the Isere; *Genevrino* or *Genevois*, between Geneva and Savoy; *Faucigny* or *Faussigny*, the valley of the Arve; and *Chablais*, the country along the lake of Geneva. The soil of Savoy is everywhere stony, and consequently not favourable to agriculture. Trees grow to the height of 6700 feet above the level of the sea: shrubs to 8500; vines will grow at the height of 2380; the oak at 3518; barley to 4180; the larch to 6000; the pinus cembra to 6600; the rhododendron to 7400; some plants are found on a granitic soil, at 10,600 feet; above which a few

lichens are found, up to 11,000. The Savoyards belong to the French family, and French is the language generally spoken, and, what is remarkable, with greater correctness than by the peasantry of France. The Savoyards have, in general, the character of being honest, industrious, and more civil and sociable than their neighbours, the Swiss; the women bear almost as large a share in the labours of husbandry as the men. The inhabitants of the mountains are wealthier and more industrious than those of the lower valleys, and are mostly proprietors of the ground which they cultivate. Though the peasantry are very poor, yet their condition is not abject or miserable. They are in the practice of migrating annually, at the fall of the leaf, to Piedmont and France, or even to Germany, where they pursue their respective trades, and in the spring return to the labours of husbandry. Many of them are also in the practice of proceeding to distant parts of France, and even to other countries, where they spend several years in the most active or laborious professions, and return at length to their native mountains to enjoy their savings.

Chambery, the capital, is a small archiepiscopal city, situate in a fertile and well cultivated plain, on the great road from Lyon to Mont Cenis. The streets are gloomy and crowded, and none of the public buildings are worthy of notice. It is the seat of the royal academical society of Savoy, which applies itself to agriculture, industry, and trade, and has published some interesting memoirs. The museum and the public library are the principal literary establishments. A railway has been formed between Chambery and Bourget. *Aix les bains*, 10 miles N. of Chambery, a small town in a calcareous district, with nothing to recommend it but its baths, which are supplied by two abundant springs of hot water, and are contained in a large and commodious building. *Haute Combe*, a small place noted for a magnificent abbey founded in 1125, by Amadeus III., Duke of Savoy, where several members of his family have been buried. *Les Echelles*, a remarkable passage on the road from France, where there is a grotto or tunnel 325 yards in length and 25 feet high, commenced by the French, and completed by the present government. *Annecy*, a small and ill-built episcopal city, with 5000 to 6000 inhabitants, numerous manufactories of cotton thread, printed linen, and glass, and iron mines in its vicinity. *Montiers*, a small town with a mineralogical school. *Conflans*, a town with a royal foundry supplied with lead and silver from the mines of *Pesay* and *Marot* in the neighbourhood. *Lesseillon*, a fortress recently erected to defend the frontier on the side of France. *Chamounix* or *Chamouny*, a priory and hamlet, 40 miles S.E. of Geneva, 3463 feet above the level of the sea, situate in a secluded valley 12 miles long and one in width, surrounded by glaciers and lofty mountains, among which rises Mont Blanc, the highest of the Alps. It is from Chamouny that the ascent of Mount Blanc is usually made. *Bourget*, an ancient town at the south-western extremity of the lake to which it gives its name, is now connected with Chambery by a railway.

Island of Sardinia.

This is a large island in the Mediterranean Sea, between 38° 50′ and 41° 20′ north lat., and 8° and 10° east longitude, being 167 miles in its greatest length, and 90 in its greatest breadth, and having an area of 9500 square miles. The interior is occupied by two chains of mountains running north and south, with an elevated valley between them. The eastern chain, the principal part of which is named the *Ginargentu mountains*, is the higher, and rises, in *Monte Schiuschiu*, to 6000, and in the *Lyubarra mountains* to 3768 feet; while the western chain probably nowhere exceeds 3000. The valleys are numerous but very narrow, and are drained by a number of rivers, none of which are navigable. In some places, particularly at Oristano, on the western coast, are low marshy tracts, which are extremely unhealthy. About a third of the surface is covered by forests, a considerable portion of which is oak, and well adapted for ship-building. The predominating formations are primitive and transition, the rocks being granite, mica-slate, clay-slate, and limestone. On the southern and north-western coasts are considerable deposits of tertiary limestone, in connection with which trachyte and volcanic rocks appear. The island contains rich mines of silver, copper, lead, and iron, but a mistaken policy prevents their being wrought to advantage; the working being cramped by the most absurd regulations. Besides the space occupied by lakes, marshes, and torrents, the sandy or stony districts occupy more than a third of the island; an equal extent may be assigned to forests and pastures; the remainder is laid out in corn-fields, vineyards, olive-grounds, and gardens. Grain is cultivated to such an extent as to afford a surplus for exportation; the wines are reckoned equal to those of Spain, and the olives are not inferior to those of Genoa and Provence. The salt-works and the tunny fishery are also important objects; but till lately the island was much neglected, and the people were in a very degraded state. The sojourn, however, of the Royal family in Sardinia, during the period of their expulsion from Italy by the French, made its princes better acquainted with the condition and the wants of its inhabitants; and the reign of the late King Charles Felix was marked by the special care which he bestowed on the affairs of the island. In 1820, an edict of Victor Emmanuel authorized the enclosing of common lands, which extended over the greater part of the island and were nearly useless. This permission has been largely acted upon, and many of the enclosed tracts have become well cultivated estates equal to the best in Piedmont. King Charles Felix directed that in every commune, or parish, there should be a school for the gratuitous instruction of the peasantry in reading, writing, arithmetic, the church catechism, and the elements of agriculture. In 1820, out of the whole number of 392 villages, 300 were already provided with such schools, and in each of the ten districts of the island there are normal schools, attended by upwards of 6600 students. In 1836 feudal jurisdictions were abolished, and the courts of law placed under the direct control of the State. In 1838 all feudal rights were abolished, feudal services were ordered to be converted into money payments, and the land to remain free property or be converted to the use of the Crown. In September 1838, a law was promulgated "to establish a free and unlimited system of property, and to relieve the land from all burdens, bonds, and obligations that may appear to be of an intolerable character;" and in February 1839, a more important law was passed, the object of which is to define the nature of property, and secure a more extensive cultivation of the land. The want of inland communication was severely felt; to remedy which inconvenience, a great carriage road was begun in 1823, and completed in 1829, extending from Cagliari to Oristano on the western coast, and thence, inland by Bonoro and Sassari to Porto Torres on the Gulf of Asinaria, where the mails and Government dispatches are landed and embarked to and from Genoa. The whole length of the road is about 145 miles; about 6000 workmen were at times employed upon it, and the cost to the Government was about £160,000, part of which was defrayed from the King's private purse. The northern division of the road passes through high mountainous tracts, reaching in some places the elevation of 2000 feet above the level of the sea; and besides the nineteen towns or villages which occur along its line, there are houses of refuge in the most solitary places, where the keepers of the road reside. The people of the interior have now become anxious to establish at their own expense cross roads in every direction to communicate with the main line; and the Stamenti, or Parliament of the island, have granted money for the purpose of making other high roads leading from the central one to the eastern and western coasts. The laws also, which were the productions of various epochs, differing in the various districts, and often clashing, have been digested into a new code, all their anomalies and obscurities have been removed, and their deficiencies supplied. The beneficial effects of these measures soon became apparent on the minds of the people,

more particularly in the decrease of crime, most of which originated, as among all uncivilised people, in violence, jealousy, or revenge. This was especially the case in the inland mountain districts of Barbagia and Gallura, while robbery on the roads or in houses was very rare, and in many parts unknown. The population of the island exceeds half a million. The people are brave, high-spirited, and generally hardy and robust, except in the unwholesome plains, as at Oristano, where the malaria fever is very prevalent and destructive. The Government is vested in the King, who is represented by a viceroy, assisted by the Stamenti, or Parliament, which consists of three estates; the first or ecclesiastical, which comprises the bishops, abbots, and chapters; the second, or military, which comprises the nobles; and the third, or royal, formed by the counsellors of the seven cities. But their powers are limited chiefly to the raising of taxes; and every three years a junto of the deputies of the three orders grants to the Government certain contributions or donativi, which the King demands by circular letters. The island is divided into ten provinces, namely, *Cagliari*, *Busachi*, *Iglesias*, *Ivili*, *Lanusei*, *Nuoro*, *Sassari*, *Alghero*, *Cuglieri*, and *Ozieri*. The principal employment of the people is agriculture, and the enclosed lands are generally well cultivated. Grain was formerly the principal article of export, but its value has been greatly reduced by competition with Odessa. The horses are of a good breed, but many of them are wild; and, previously to the late improvements, of the estimated number of 470,000 beeves, no less than 350,000 were wild, and the whole of the sheep, nearly a million in number, were in the same unreclaimed state. The beef is of excellent quality; the mutton is only tolerable; but the pork, especially in winter, is the finest in Europe. There was, however, even then, a considerable exportation of saltmeat and cheese; salt, made by evaporation in the salines of Cagliari, Palmas, and Oristano, and fish, formed also an important part of the exports. (*Foreign Quarterly Review*, XII. *Raumer's Italy*, I.) Besides the coast fisheries, the lakes at Oristano, Cagliari, and Porto Pino, abound with fine mullet, bream, eels, and other fish, which, being carefully fattened, are a staple article of consumption and commerce, and afford considerable profit to the proprietors. There are also coral fisheries, the best of which are on the west and south coasts, where two or three hundred boats arrive annually from Naples and Genoa for the purpose of fishing it, paying only a small duty for anchorage, and an impost of about five per cent. on the produce. The fishery begins in March and ends in October, each boat collecting coral to the value of about £300, at the rate of 6½d. per English pound weight. Around Cagliari are three natural salterns, namely, Molentargius, Spiaggia di Mezzo, and Rollone; two, which are artificial, belonging to Government, the whole capable of producing annually 50,000 tons. The expense of collecting the salt is little more than 6s. a ton; but the King makes the Sardinians pay 20s., and his continental subjects £10 for that quantity. Tobacco is also a royal monopoly, and is grown by licence. Linseed and flax are exported to a considerable amount; silk, cotton, madder, and barilla are produced in small quantity; but are capable of being greatly extended. (*Macgregor's Report*, 70, 1, 2, 3.)

CAGLIARI, the capital, situate on the shore of a deep bay on the south-east coast, is a large, but ill built, ill paved, and crowded town, with 27,000 inhabitants and considerable trade. It is also the see of an archbishop, and possesses a university, which is well attended. *Sassari*, in the north-western corner of the island, is a fine town, with a university, and 18,000 inhabitants. The other principal towns are *Oristano* or *Oristagni*, which has a fine harbour, and flourishes by the tunny fishery and the export of wines produced in the neighbourhood, *Bosa*, and *Alghero*, all on the western coast, each with about 5000 inhabitants; *Iglesias*, *Tempio*, and *Quarto*, in the interior, each with about the same number. The smaller islands around Sardinia are:—*Madalena*, *Santa Maria*, *Caprera*, on the north-east; *Mortorii*, *Tavolara*, *Molara*, *Petrosa*, *Oghastra*, *Chirra*, *Serpentaria*, and *Cavoli*, on the east coast; *Asinara*, *Pelosa*, *Maldiventre*, *Coscia*, *San Pietro*, *San Antioco*, *Vaca*, and *Toro*, on the west coast. Sardinia contains numerous remains of antiquity, the most remarkable of which are the Nurages or Nuraghes, which are conical towers, constructed of large cubic stones without cement. The largest are from fifty to sixty feet in height and ninety in diameter. The interior is divided into three dark chambers, one above another, and communicating by a spiral stair-case. Under several of them burial places and subterraneous passages have been discovered. In some instances an outer wall of the same construction, ten feet high, encloses the terrace on which the Noraghe is built, with a circuit of 130 feet. Of these buildings more than 600 are scattered over the island. (*Foreign Quarterly Review*, XII. 252. *Balbi's Geography*, 3*me. edition*, p. 383.) Sardinia came into the possession of the Duke of Savoy in 1719, with the title of King, by grant from the great powers of Europe, in exchange for Sicily, which he had received as a new kingdom at the peace of Utrecht.

§ 2. *Lombardo-Venetian Kingdom.*

This kingdom consists of the north-eastern part of the great plain of Lombardy, with the country between the northern extremity of the Gulf of Venice and the Alps, and some Swiss valleys; and includes the eastern portion of the ancient Duchy of Milan, the Duchy of Mantua, the Valteline, Chiavenna, and Bormio, which formerly belonged to the Swiss canton of the Grisons; some fractions of Parma and of the States of the Church, lying on the left bank of the Po; and the territory of the late republic of Venice. It now forms an integral part of the Austrian empire, under the government of a viceroy; and is divided, for administrative purposes, into the two governments of *Milan*, or *the Lombard Provinces*; and *Venice*, or *the Venetian Provinces*; each of these being subdivided into delegations, as stated in the following table. In the capital of each delegation is a court of first instance for civil and criminal business; in Milan and Venice are courts of appeal for the two governments, and at Verona a high court of revision is established for the whole kingdom.

I. GOVERNMENT OF MILAN.

Delegations.	*Cities, Towns, &c.*
Milano, . .	MILANO, 160.* Simonetta, Linterno, Rho, Monza, 16. Desio, Lainate, Inverigo, Gallarate, 4. Saronno, Somma, Gorgonzola.
Como, . . .	Como, 16. Torno, Fino, Bellagio, Bellano, Menaggio, Lecco, 2. Colico, Gravedona, Dongo, Varese, Angera, Laveno, Porto, Luino.
Sondrio, .	Sondrio, 4. Tirano, 2. Chiavenna (Cleven, Cleves), 3. Bormio (Worms,) 1.2. San Martino, Morbegno (Morben.)
Pavia, . . .	Pavia, 24. La Certosa, Buffalora, Abbiategrasso, Binasco, Belgiojoso.
Lodi, . .	Lodi, 16. Crema, Codogno, Soncino, San Colombano, 5.
Bergamo, .	Bergamo, 32. Alzano Maggiore, Zogno, 2.5. San Pellegrino, San Salvatore, Gandino, Trescore, Romano, 3. Martinengo, 3. Caravaggio, Treviglio, 6. Clusone, 3. Edolo, Breno, 2. Bieno, 2. Lovere, 4. Pisogne, 3. Malonno.
Brescia, . .	Brescia, 34. Chiari, 8. Lonato, 6. Rovato, 5. Orzi Nuovi, Pentevico, 5. Gardone, 1.4. Desenzano, 3.6. Toscolano, Salo, 4.5. Bagolino, 3.7. Montechiari, 6. Iseo, Idro, Lumezzano, Pieve, 1.3. Gavardo, 1.9. Castenedolo, 4.5. Leno, 4. Travagliato, Verolanuova, 4. Calcinato, 3.

* These figures denote *thousands*; the decimals, *hundreds*.

Cremona, . Cremona, 27. Casal Maggiore, 5. Pizzighettone, 4. Castelleone.
Mantua, . . Mantua, 28. Pietole, Revere, Sabionetta, 6. Bozzolo, Castiglione, 5. Delle Stiviere, Peschiera, 1.5. Viadana, 14. Asola, Ostiglio, Gonzaga, 13.

II. GOVERNMENT OF VENICE.

Venezia, . VENEZIA (VENEDIG, VENISE, VENICE), 103. Murano, 4. Burano, 5. Mazzorbo, Torcello, Altino, Jesolo, Caorle, Concordia, Portogruaro, 2.9. Eraclea, 8. Dona di Piave, Poreglia, Lazzaretto-vecchio, Malamocco, Palestrina, Chioggia, Brondolo, Cavarzere, Loreo, Ariano, Fusina, Malghera, Mestre, La Mira, 2. Dolo, Stra.
Padova, . . Padova (Padua), 51. Abano, 2.6. Montegrotto, Teolo, 2.7. Luvigliano, La Battaglia, 2.7. Cattajo, Arqua, Saonara, Pieve di Sacco, Conselve, Monselice, Ponte di Brenta, Noventa Padovana, Mirano, Sala, Campo San Pietro, Loreggia, Piazzola, Este, Montagnana.
Vicenza, . Vicenza, Costoza, Brendola, Montecchio Maggiore, Camisano, Cittadella, Bassano, Angerano, Marostica, Nove, Asiago, Schio, Magre, Tretto, Valle, Velo, Tiene, Malo, Valdugno, Reccoaro, Arzignano, Lonigo, Montebello, Barbarano.
Verona, . . Verona, 47. Bussolengo, Azzano, Villafranca, Vallegio, Isola della Scala, Zevio, 8. Bonifacio, Arcole, Soave, Caldiero, Illasi, Badia Calavena, Vestena, Ponte di Veja, Monte Bolca, Lazise, Rivoli, La Chiusa, Cerea, Legnago, Cologna, Caprino, Incafi, Bardolino.
Rovigo, . . Rovigo, 9. Adria, Lendinara, La Fratta, Badia, Canda, Occhiobello, Crespino.
Treviso, . Treviso, La Follina, Oderzo, La Motta, Porto Buffole, Conegliano, Ceneda, Serravalle, (Polesina.) Tarzo, Monte Belluna, Lovadina, Asolo, Maser, Crespano, Possagno, Valdobbiadene, Castelfranco.
Belluno, . Belluno, 11. Capo di Ponte, Longarone, Perarolo, Cadore, Auronzo, Agordo, Alleghe, Fonzaso, Feltre, Mel, Sedico.
Udino, . . . Udino, 20. Campo Formido, San Daniele, Spilembergo, Maniago, Aviano, Polcenigo, Sacile, Caneva, Pordenone, Cordovado, Codroipo, Passeriano, San Vito del Tagliamento, Latisana, Palma-nova, Marano, Cividale, Moggia di Sotto, Ponteba, Ampezzo, Tolmezzo, Cercivento, Gemona, Osopo, Venzone.

MILAN (MEYLAND, MILAN), the capital of Lombardy, is situate on the river Olono in the centre of a large plain, noted for its beauty and richness. Milan has no fine squares, and many of the streets are narrow and crooked; it contains, however, some wide and spacious streets, which, with the great number of elegant houses and palaces, and its public buildings remarkable for their massiveness and their architecture, entitle it to rank among the finest cities of Italy. It is intersected by three navigable canals, one of which extends to Pavia; its climate during winter is damp and cold, in summer it is oppressively hot, and in autumn and spring, often damp and unwholesome. The city is surrounded by broad ramparts, planted with large trees, which afford ever-varying prospects. The population amounts to about 160,000. The principal object of attraction is the Duomo or Cathedral, a very large building of mixed gothic, built of white marble, and profusely adorned with pinnacles and statues. It was commenced in 1385 by John Galeazo, first Duke of Milan, but remained unfinished till the reign of Napoleon, who ordered it to be completed, and both he and his successors, the Emperors of Austria, have devoted large sums to this purpose. It measures in length 486 feet, in breadth, 288, and to the top of the cupola, 258; but it has neither domes nor towers to relieve its massiveness. In a fine subterranean chapel, which is sumptuously adorned, rests the body of San Carlo Borromeo, in a crystal sarcophagus, ornamented with silver gilding. The church of St. Ambrose, the oldest in Milan, is an assemblage of several styles of architecture, from the days of the Emperor Theodosius, who did penance before its gates. Among the other public buildings may be mentioned, the royal and archiepiscopal palaces, the theatre della Scala, one of the largest in Europe; the lazzaretto and great hospital, the latter of which contains 2200 beds; the mint, the royal palace of the arts and sciences, the observatory, the public library, the botanic garden, the academy of the fine arts, and the magnificent triumphal arch which serves as the terminus of the road of the Simplon. Milan contains, besides these, a number of other scientific and literary establishments; is the residence of the Viceroy of Lombardy, and the see of an archbishop; and from its favourable situation, which places it in communication with the great roads of the Simplon, St. Gothard, the Splugen, the Stelvio, and the canals of the Adda and the Ticino, has become the general entrepot of the trade of northern Italy. Its commerce embraces not only the agricultural produce, but also the productions of the numerous manufactories of printed calicoes, ribbons, veils, velvets, and handkerchiefs; goldsmith work, gilt bronze ornaments, artificial flowers, embroideries, and lace. It has also of late acquired considerable importance even in matters of exchange, and its printing and bookselling business is the most important in Italy, the only rivals being Venice, Turin, and Florence. At *Monza*, on the Lambro, three leagues north of Milan, Charlemagne was crowned King of Lombardy with the iron crown of the Lombard kings, which is still preserved along with several other royal relics in the cathedral. Monza contains about 16,000 inhabitants, a fine palace of the Viceroy, and a very rich botanic garden.

Como, a fine episcopal city, at the south-western extremity of the cognominal lake, with flourishing manufactures of cloth, silk stuffs, physical and optical instruments, a large cathedral, one of the finest in upper Italy, and 16,000 inhabitants. In its immediate vicinity is the *Villa Odescalchi*, so large and magnificent, as to be fit for a royal residence. *Lecco*, on the eastern branch of the lake, at its southern extremity, is a small town with 2000 inhabitants, an iron foundry, and considerable trade. *Dongo* a busy commercial town, with 3000 inhabitants, many of whom are employed in the manufacture of physical and musical-instruments, which are carried to every country.

Sondrio, on the Adda, a very small town, with 3000 inhabitants, in the Valteline. *Bormio* (German, *Worms*), with 1600 inhabitants, in an elevated position, is only noted for the baths of St. Martin in its vicinity, and for its connection with the great military road over Monte Stelvio, or the Stilfersjoch, which commences at these baths, and reaches the elevation of 2814 metres (9232 feet) above the level of the sea. *Chiavenna* (German, *Cleven*, French, *Clevez*), upon the Maira, a small town, with 3000 inhabitants, who carry on a considerable traffic along the three great roads with which it is connected; that which leads by the lake of Lecco to Milan, that of the Engadine, which leads to St. Moritz, and that of the Splugen.

Pavia, an episcopal city of moderate extent, near the left bank of the Ticino, is more remarkable for its antiquity and its historical celebrity as the capital of the Lombard kings, than for its present importance. It possesses a celebrated university, with three colleges, a botanic garden, and several other scientific and literary establishments. Population about 24,000. Four miles from Pavia is the monastery of the *Certosa*, suppressed by the Emperor Joseph, considered to be the most tasteful and most richly adorned building in Italy. Including its church and other buildings, it occupies sufficient space for a large village. Its church is encrusted with precious marbles, and an annual allowance is made by the government for keeping it in repair.

Lodi, an episcopal city on the right bank of the Adda, over which there is an ancient bridge, memorable for "the terrible passage" effected by Buonaparte in 1796. The citizens manufacture

a large quantity of pottery, are engaged in the spinning of silk, and carry on a great trade in Parmesan cheese, which is all made in the adjoining district.—Population 16,000.

Bergamo, a large town with 32,000 inhabitants, occupying a singular situation, partly on a scarped height, and partly round it, has a flourishing trade and numerous manufactories of silk. During the last eight days of August and the first days of September a great fair is annually held here, at which business to a great amount is transacted. The place in which the fair is held is a building of hewn stone, containing more than 600 shops, symmetrically disposed round a large area, in the centre of which is a fountain.

Brescia, an episcopal and commercial city, situate in the middle of a fertile and finely cultivated plain, 50 miles east of Milan, with 34,000 inhabitants, who are chiefly employed in cutlery and the manufacture of arms and silk. At the southern end of the lake of Garda, near *Desenzano*, is the fort and peninsula of *Sermione*, where the ruins of the villa of the poet Catullus are said to be still seen.

Cremona, a large and fine episcopal city on the left bank of the Po, 50 miles S.E. of Milan, is chiefly remarkable for the manufacture of fiddles and fiddle-strings. Its duomo or cathedral is one of the largest and most interesting Gothic churches in Italy, with a very high tower, and a zodiac sculptured on its façade. *Pizzighettone*, on the Adda, is only noted for its fortifications, which, of late, have been very considerably augmented.

Mantua, a large and fine episcopal city, is situate in the middle of a lake formed by the Mincio, and connected with the mainland by causeways. Its extensive fortifications and its situation in the lake, entitle it to rank among the principal fortresses in Europe. The atmosphere, however, is unwholesome.—Population 28,000. In the vicinity are, the magnificent Gothic church of *Santa Maria delle Grazie*, on the lake, almost entirely covered with votive tablets, and visited annually by so many as from 80,000 to 100,000 pilgrims; *Pietole*, a fort on the right bank of the Mincio, constructed to maintain the inundation which surrounds Mantua, and makes it inaccessible except at four points, defended by formidable batteries, viz. St. George's Bridge, the Citadel, the Pradella Gate, and the Port of Pietole, which is supposed to occupy the site of *Andes*, the birth-place of Virgil; *Peschiera*, a fortress on the Mincio, at the outlet of the Lake of Garda.

VENEZIA (VENEDIG, VENISE, VENICE), an ancient city, in a most singular situation, being built upon a cluster of islands in the midst of a salt lagune, or shallow lake, separated from the sea by a long strip of firm sand, through which there are several openings for the tide, which alternately covers and lays bare a considerable portion of the bottom of the lagune. Venice is considered as one of the finest cities in Europe, though its streets are very narrow, and in most cases only wide enough for foot passengers. But its chief thoroughfares are the canals, which intersect it in every direction, the principal of which is the great canal, 300 feet wide, extending in a long curve line through the centre of the city, and crossed near the middle of its course by the *Ponte di Rialto*, a fine marble structure of one spacious arch. In the midst of this labyrinth of streets and canals are several large piazzas or open areas, almost every one of which is adorned with a fine church or palace. The principal of these is the Piazza di San Marco, a large oblong area 562 feet by 232, surrounded by elegant buildings, and containing at its eastern extremity the metropolitan church of San Marco, a singular but splendid combination of the Gothic and the oriental styles of architecture. The piazza also contains a lofty square tower, 316 feet high and 42 feet square, with a pyramidal top, to which the ascent is made by an easy inclined plane instead of a stair. Adjoining the church is the ancient Palace of the Doge, the prisons, and other public offices of the late republic of Venice. The arsenal is likewise a very spacious structure, placed on an island three miles in circumference, and strongly fortified; it is now the head-quarters of the Austrian imperial navy, and communicates with the Adriatic by a deep channel cut through the lagune. Venice is seven miles in circumference, and situate about four miles from Fusina, the principal landing place on the mainland; and is amply supplied with all necessaries, and even luxuries, though it possesses naturally neither soil nor fresh water. A railway to connect it with Milan is now in rapid progress. Great difficulty was found in carrying it across the lagune; but this has been overcome, and the work, when finished, will probably tend in some degree to restore the prosperity of Venice, which has rapidly declined since the downfall of the republic in 1797. In 1830 Venice was declared a free port, and a decided increase has since taken place in its maritime trade; but the magnificent expectations which that act excited have not been realized, though the progress of decay seems to have been arrested, and improvement is slowly advancing. The population is about 103,000, without including the garrison, which is inconsiderable. Venice is the residence of a Catholic patriarch, an Armenian bishop, and a Greek bishop; and the Viceroy of Lombardy usually spends a part of the winter here. In the neighbourhood of Venice are, *San Michieli di Murano*, a pretty islet, with a fine marble church, and the convent of the Camaldules, to which it belongs; *Murano*, a small town, with glass works, which for several centuries were in great repute, though their productions are now inferior to those of France, England, and Bohemia; *San Andrea di Lido*, a small islet, with a fort, which defends the harbour of Lido, now accessible only by small vessels; *San Lazzaro degli Armeni*, an island, inhabited by Armenian monks, who devote themselves to the education of their countrymen, and have published several useful works in their national tongue; they also publish a weekly journal, which is circulated throughout the East. *Malamocco*, a small town on the west side of the *Lido*, or bank which defends Venice from the sea. Its harbour, defended by two forts, has been much improved by a great bulwark or dike, which, when completed, will be 1400 metres (4593 feet) long, and will have cost £60,000. Malamocco has only about 800 inhabitants, most of whom are employed as pilots. *Palestrina*, a town to the south of Venice, on a long narrow island, named the Litorale di Palestrina, with 7000 inhabitants, who are employed in navigation, fishing, and cultivating gardens, which supply Venice and other places with fruit and vegetables. It was along the outside of this Litorale that, during last century, the Venetians constructed, at great expense, the magnificent bulwark called the Murazzi, to protect their city from the sea. *Chiaggia*, an episcopal city on an island of the lagune, connected by a long stone bridge with the Litorale di Sotto Marina. Gardening, navigation, fishing, the making of salt, and ship-building, form the principal occupation of its inhabitants, who amount to 24,000, including those of the suburbs. Two forts defend the entrance of the harbour. *Brondolo*, a miserable place with a harbour, where formerly the Adige, and now the Brenta and the Bacchiglione enter the sea. The entrance is defended by batteries; but the atmosphere of the town is so unwholesome as to have become proverbial. *Cavarzere*, a large commercial town with 7000 inhabitants, divided by the Adige. *Eraclea*, on a peninsula formed by the confluence of the Livenza and the Piave, was formerly a flourishing town, the capital of the republic, but is now completely destroyed, and almost obliterated. Here the first Doge, or Duke of Venice, was elected in 697, and the town continued the capital till 742, when the ducal residence was transferred to Malamocco. To the west of Venice is *Malghera*, a miserable place, where extensive fortifications have been erected for the military defence of the city. *Mestre*, *Fusina*, *La Mira*, and *Dolo*, considerable towns or villages on the mainland, at the terminations of the several roads and canals by which Venice communicates with the interior of Lombardy.

Padova (Padua), a large and busy commercial and episcopal city, between the Brenta and the Bacchiglione, 22 miles W. by S. of Venice. Its university has been long celebrated as one of the first in Europe, and was restored and augmented by the late Emperor Francis, who added several chairs which were wanting to complete the curriculum. There are, besides, in the city many other

scientific and literary institutions. Population above 31,000. In the neighbourhood are, *Abano*, a village frequented for its sulphureous baths; *Teolo*, a town in the Euganean hills, said to be the birth-place of Livy; and near it *Luriglano*, a summer palace of the bishop of Padua; *La Battaglia*, visited annually by great numbers of people on account of its sulphureous baths, and the amenity of its climate; and *Arqua*, a village on one of the Euganean hills, which contains the tomb of Petrarcha, and the house in which he died. *Este*, 13 miles S. by W. of Padua, one of the most ancient cities of Italy, with a population of 9000, was, during the middle ages, the residence of the Marquis of Este, one of the principal potentates of Italy, and the stock from which the Dukes of Modena and Brunswick, and the present royal family of Great Britain, are sprung.

Vicenza, on the Bacchiglione, 37 miles W. of Venice, a fine episcopal and commercial city, with 31,000 inhabitants. It was the residence of the architect Palladio, and is still adorned with several buildings erected by him. Vicenza is advantageously distinguished for the varied industry of its citizens, who are largely engaged in the manufacture of silks, of which an immense quantity is produced in its fertile and highly cultivated district. *Bassano*, 23 miles N. by W. of Vicenza, a fine town upon the Brenta, with 10,000 inhabitants, distinguished for their industry and trade. *Ariago*, a large town with 5000 inhabitants, is the chief place of a mountain district known by the name of the seven communes, whose inhabitants speak a dialect of German. The origin of its inhabitants has long been an object of antiquarian research.

Verona, on the Adige, a large commercial and episcopal city, adorned with many fine ancient and modern buildings, among which may be mentioned a Roman amphitheatre, still very perfect. Placed near the gorges of the Tyrol, and the defile of the Adige, and commanding that river by its four stone bridges; and situate between the gorges of the *Chiusa* and the heights of *Caldiero*, and supported by the fortresses of Mantua, Peschiera, and Legnago. Verona has always been a most important military position; its fortifications have been lately much enlarged. It is also noted for its fine dyeing, and carries on a great trade in silk thread both for sewing and weaving, which is spun by a great number of water mills. Population 47,000. *Arcole*, on the Alpon, in the midst of marshes, S.E. of Verona, is distinguished in history for the victory gained there by Buonaparte, over the Austrians, in 1797. *Legnago*, a well built commercial fortified town on the Adige, with 10,000 inhabitants. In its neighbourhood, between the Adige and the Tartaro, is the unhealthy canton of *Valli Veronese*, which produces an immense quantity of excellent rice. Near *Incaffi*, at the foot of Mount Baldo, is the sanctuary of *La Madonna de la Corona*, which occupies a remarkable position in a cleft of the mountain, to which the only access is by a stair of 234 steps cut in the rock; while the descent is effected by ropes 420 feet long.

Rovigo, on the Adige, a small commercial town, with 9000 inhabitants, formerly the capital of the Polesina, and now the ordinary residence of the bishop of *Adria*, a very ancient Etruscan city, which had a flourishing trade both by land and sea, during the best periods of Roman history. Its harbour and the adjacent sea have been so much filled up by the earth and mud brought down by the Adige and the Po, that it is now 20 miles distant from the coast. By the opening, however, of the canal of Porto-vico, its climate, which had been long deleterious, has been considerably ameliorated, and its territory, drained from pestilent water, is now covered with beautiful and fertile fields. It is an episcopal city, contains several remains of Etruscan and Roman antiquities, and has 10,000 inhabitants.

Treviso, upon the Sile, an episcopal city, with numerous manufactures of linen and paper, a flourishing trade, and 19,000 inhabitants. *Possagno*, a large village with 1200 inhabitants, has acquired great celebrity as the birth-place of the sculptor Canova, and for a fine temple, erected by him, in which he has united the dome of the Pantheon to the peristyle of the Parthenon.

Belluno, a small city, near the Piave, with considerable manufactures, and 11,000 inhabitants. In the vicinity, at *Capo di Ponte*, is a fine bridge, with one arch of 160 feet span. *Cadore*, near the Piave, a village with 500 inhabitants, has considerable trade, and is noted as the birth-place of Titian. *Auronzo*, a small town, with mines of oxide of zinc, or calamine, of excellent quality and of extraordinary richness. The firs of the forest of Auronzo are of an unusually large size, and supply the arsenal of Venice with masts for ships of the largest class. *Agordo*, near Cordevole, possesses copper mines, which are considered to be the richest in Italy. *Alleghe*, a village with 700 inhabitants, is noted for its forges and a great manufacture of ironmongery.

Udino, formerly the capital of the province of Friuli, a well-built episcopal city, with several literary and scientific establishments, and some manufactures of linen, silk thread, &c. Population 20,000. In its vicinity is *Campo-Formido* (or *Campo Formio*), a village with 600 inhabitants, noted for the treaty of peace concluded there between France and Austria, in 1797. *Tolmezzo*, a small town with 1200 inhabitants, the chief place of Carnia, which formerly enjoyed great privileges, was governed by its own laws, and was recently the centre of a great linen trade. It is supposed that more rain falls here than in almost any other place in Europe.

§ 3. *Duchy of Parma.*

This small State is situate in Lombardy, to the south of the Po, and extends from that river southwards to the crest of the Apennines, between the Sardinian States on the west and the Duchy of Modena on the east. It consists of the ancient duchies of Parma, Placentia, and Guastalla, with the exception of those portions of them situate to the north of the Po, and was formed into a sovereign duchy in 1815 in favour of the Archduchess Maria Louisa, late Empress of the French. Guastalla is separated from the main body of the state by an intervening portion of the duchy of Modena. PARMA, the capital, is a large and handsome city, on the Parma, with about 30,000 inhabitants, is a bishop's see. The dome of the cathedral is painted in fresco by Corregio; the finest church in the city is that of La Madonna della Steccato. There are several scientific and literary institutions, the principal of which are the university, the school of arts, the college of nobles, and the ducal library. *Piacenza (Placentia)*, near the right bank of the Po, is a large well-built episcopal city, with a ducal palace, a cathedral, several other fine edifices, and a citadel occupied by Austrian troops. Population 28,000. *Borgo San Donino*, a small episcopal city, with 5000 inhabitants. *Guastalla*, a small episcopal fortified city, with 6000 inhabitants, near the right bank of the Po, N.E. of Parma. *Fiorenzuola*, a small place noted of late years for the discovery in its vicinity of the ruins of the ancient *Velleia*, which seems to have been suddenly destroyed by a volcanic eruption, or by the fall of a mountain soon after the period of Constantine the Great. It was among these ruins that the famous Trajan table, one of the most important relics of ancient Rome, was found.

§ 4. *Duchy of Modena.*

The Duchy of Modena is situate to the eastward of Parma, and extends from the south bank of the Po to the crest of the Apennines; beyond which, the Duke also possesses the Duchy of Massa and Carrara, which reaches to the Tuscan Sea. The present sovereign is an Archduke of Austria, who acquired the duchy in right of his mother, the Duchess Maria-Beatrice d'Esté, the heiress of the ancient family of the Dukes of Modena. *Modena*, the capital, is a fine episcopal city, between the Secchia and the Panaro, with 27,000 inhabitants. The ducal palace is an elegant and majestic edifice, and

is richly furnished; the cathedral is remarkable for its tower called the Guirlandina, one of the highest in Italy, and for the wooden bucket, still preserved, which was the subject of the famous heroi-comic poem of La Secchia rapita. Modena also possesses a university, a college of nobles, a military academy of nobles, an academy or royal school of the fine arts, a royal academy of sciences, letters, and arts, a royal academy of philharmonics, and a public library. The citadel has been converted into a correctional workhouse, where manufactures of coarse cloth, linen, and ropes have been established. The other important places in the State are:—*Reggio*, 15 miles W. of Modena, an episcopal city, with 18,000 inhabitants; *Massa*, 60 miles S W. of Modena, a small episcopal city, with 7000 inhabitants; *Carrara*, a small place, noted for its quarries of statuary marble; *Mirandola*, 15 miles N. of Modena, a busy fortified town, with 6000 inhabitants; *Finale*, with 6000; *Carpi*, a bishop's see, with 5000; *Castelnuovo*, with 3000; *Sassuolo*, *Rubiera*, *Novallora*, *Canossa*, and *Correggio*, the last of which was the birth-place of the celebrated painter Allegri of Correggio.

§ 5. *Grand-duchy of Toscana (Tuscany.)*

This large territory is situate on the west coast of Middle Italy, almost entirely to the west of the crest of the Apennines; and is bounded on the north by Parma, Modena, Lucca, and Romagna, and on the east and south, by the States of the Church. The sovereign is an Austrian archduke, the cousin of the present Emperor, and the descendant of the second son of the late Emperor Leopold II., who, during the reign of his brother Joseph II., was himself for sometime Grand-duke of Tuscany, and first introduced that excellent system of policy for which the Tuscan government is so distinguished. The territory contains altogether 5,224,974 English acres of taxable land, which are thus occupied: in the cultivation of the vine, 568,974; vine and olive, 389,000; arable, 839,000; wood of all kinds, 1,398,000; chestnuts, 304,000; natural and artificial meadows, 66,000; pastures, 1,574,000; various smaller products, 62,000; buildings, 24,000; upon which the government levies a nett annual revenue of about 3,150,000 lire (£103,162 sterling.) The population amounted, in 1815, to 1,169,000; in 1825, to 1,256,000; and in 1838, to about 1,500,000, with an army of from 7000 to 8000, who are levied by a sort of conscription, and serve six years. In 1835, the number of the secular clergy was 8901; of monks, 2461; of nuns, 3939; of monasteries, 133; and of convents, 69. Education has hitherto been very much neglected; and schools and seminaries for the higher branches appear to be very scanty in comparison with the number and revenues of the clergy, and especially of the monks. The country possesses two universities, which are not of great repute; on an average of late years, that of Pisa had from five to six hundred students, that of Siena from two to three hundred; the faculty of law having the largest number, the faculty of divinity the smallest. In 1828, the total revenue of the State amounted to 25,186,000 lire (£824,799 sterling), of which sum the land-tax produced 3,032,000 lire: the customs and commercial duties, 8,401,000; salt, 3,725,000; lottery, 2,309,000; tobacco, 1,577,000. Though a public debt exists, there is no entry of it in the published accounts; nor does it ever appear in the market or at the exchange, a proof that the amount is small, and the security unquestioned. The improvements in the Maremme have occasioned much extraordinary expenditure, which will probably be amply repaid.—(*Italien, von F. von Raumer; Leipzig*, 1840, II. 73, &c.) The territory is divided into five *compartimenti*, which are subdivided into *territori-comunitativi*. The following table contains the names of the compartimenti and their principal towns.

Compartimenti.	*Cities, Towns, &c.*
Firenze, . .	FIRENZE (FLORENCE), Signa, Prato, Pistoja, Pescia, Colle, Volterra, Empoli, San Miniato, Scarperia, Modigliana.
Arezzo, . . .	*Arezzo*, Anghiari, Castiglion Fiorentino, Cortona, Borgo San Sepolcro, Monte Pulciano, Chiusi.
Siena, . . .	*Siena*, Colle, San Geminiano, Montalcino, Poggibonsi, Radicofani.
Grossetto, .	*Grossetto*, Massa, Pitigliano, Orbitello; the islet *Giglio*.
Pisa, ...	*Pisa*, Livorno (Leghorn), Piombino, Pietra Santa, Seravezza, Barga, Fivizzano, Bagnone, Pontremoli, Porto Ferrajo, Porto Longone, and Rio, in Elba.

FLORENCE (FIRENZE LA BELLA), the capital of the grand-duchy, situate on the Arno, in a delightful valley, is considered as one of the finest cities in the world, notwithstanding the narrowness of some of its streets, the irregularity of some of the buildings, and the style of several of its palaces, whose construction resembles that of the fortresses of the middle ages. It contains several palaces, built in a massive rather than an elegant style, as that of Pitti, the ordinary residence of the grand-duke, and the old palace on the banks of the Arno, near which is the celebrated gallery of Florence, "where stands the statue that enchants the world," and many other precious productions of the fine arts. It contains also many churches, most of which are mean and poor, when compared with those of Rome. The principal church is the *Duomo*, or cathedral of Santa Maria del Fiore, remarkable for its extent, its magnificent tower, the richness of the marbles with which it is constructed, and its dome, rivaling in grandeur that of St. Peter's at Rome, for which it served as the model. The church of San Lorenzo is celebrated for its two sacristies, and the chapel of the Medici usually styled "the wonder of Tuscany." The church of Santa Croce is the pantheon of Tuscany, and contains the tombs of Michael Angelo, Dante, Machiavelli, Galileo, Leonardo-Bruni-Aretino, Alfieri, Viviani, and other great men. Florence likewise possesses several important scientific and literary establishments; the Scuole Pie, to which is annexed the observatory; the imperial and royal school of the fine arts; the academy of the georgifili, or royal and imperial economical society; the academy della Crusca; the Italian atheneum, and Colombarian society; the Magliabechian library, the library of the Grand-duke; the Laurentian library, or library of the Medici, rich in valuable manuscripts; the museum of natural history; and the gallery or Florentine museum, which may be considered as the finest existing collection of antiquities and specimens of the fine arts. The Arno flows through the centre of the city, within which it is crossed by four bridges. The climate is cold during winter, very hot in summer, but delightful in autumn and spring. Population, in 1836, 97,548. In the neighbourhood of the city are many country houses and villas, among which are, the royal farms or *Cascini*, to which the public are admitted at all times; the *Carregi de Medici*, the favourite retreat of Lorenzo el Magnifico; *Poggio Imperiale*, and *Pratolino*, two grand-ducal villas: *Fiesolé*, a picturesque village, on the top of a hill, on the site of *Fæsulæ*, an ancient and strong Etruscan city, portions of the massy walls of which still remain. *Vallombrosa*, 14 miles from Fiesole, is also worthy of notice, on account of the beauty of the country and its noble Certosa or Chartreux, which still contains some fine paintings. *Prato*, 12 miles N.W. of Florence, a busy episcopal city, with 10,000 inhabitants, a fine cathedral, and an academia petrarchesca. *Pistoja*, 22 miles N.W. of Florence, a large town, with 12,000 inhabitants, who are employed in making organs, manufacturing cloth, arms, and ironmongery. *Pescia*, a small town, 32 miles W. by N. of Florence, is noted for its paper works and silk trade. *Volterra*, 30 miles S.W., a place of great antiquity, noted for its Cyclopean walls; its citadel, now converted into a prison; its museum of Tuscan antiquities; its salt springs, which supply a great quantity of salt; and its quarries of alabaster, the finest in Europe. *Signa*, a large village on the banks of the Arno, may be considered as the centre of the straw-hat manufacture, which is carried on to a prodigious extent.

Arezzo, 33 miles S.E. of Florence, a town with 9000 industrious inhabitants, some fine buildings, and the remains of an amphitheatre, is the native place of Petrarcha. Guido d' Arezzo, and Redi, whose houses are still shewn. *Cortona*, 12 miles S. E. of Arezzo, a small town of 3500 inhabitants, noted for the great hydraulic operations, which have changed its marshy and pestilential deserts into wholesome, fertile, and well-peopled fields; its collections of Etruscan antiquities, and its Etruscan academy. It also contains some remnants of ancient Cyclopean walls. *Chiusi*, 30 miles S. of Arezzo, in an unhealthy situation, with only 3500 inhabitants, contains numerous collections of Etruscan antiquities. *Monte Pulciano*, 10 miles N.W. of Chiusi, is noted for its excellent wine.

Siena, 33 miles S. of Florence, a large and fine archiepiscopal city, situate on three hills, in a healthy and delightful situation. It contains several fine buildings, among which, the most remarkable is the cathedral, a gothic structure, highly ornamented, and forming a historic gallery of the fine arts, from their revival in the thirteenth century to their perfection in the fifteenth. It contains a university, an academy of sciences, the only one in Tuscany, a college of nobles, a school of the fine arts, and a public library. Population 18,000. *Radicofani*, a small fortress and post-house, on the road to Rome, in a wild and desolate region, 2475 feet above the level of the sea.

Grosseto, a small town in the Maremme, 45 miles S.S.W. of Siena, noted for the great hydraulic works in its neighbourhood for draining the marshes and improving the country. Its salines produce a large quantity of salt. *Orbitello*, a very small place, celebrated among antiquaries for the necropolis of an Etruscan city, which has been discovered there, and is supposed to be that of *Sudrcum*.

Pisa, an ancient but decayed and now desolate city, the capital of a sovereign republic in the middle ages, the great rival of Genoa, is situate on the right bank of the Arno, near its mouth. Several fine buildings still bear witness to its ancient splendour, among which are the cathedral, one of the largest and finest churches in Italy, and the Campanile-torto, a tower 188 feet high, of a cylindrical form, composed of seven ranges of columns, and diverging fifteen feet from the perpendicular. It is constructed with great solidity, and is already 700 years old. The Campo Santo, or burying-ground, is also remarkable for its architecture, its fine paintings, and its ancient monuments. It is covered with earth brought from the Holy Land. Pisa possesses the first university in Tuscany, with four colleges, a rich library, a museum of natural history, an observatory, and a botanic garden. Population about 20,000. The baths of *San Giuliano*, in the vicinity, attract a great number of strangers to the city; and in the neighbourhood is the *Certosa* of Pisa, remarkable for its beauty. *Serarezza*, near Pisa, has quarries of fine statuary marble, which is becoming daily of more importance, since Carrara seems incapable of supplying the quantity that is now required. *Pontremoli*, a small town in a valley of the Apennines, 60 miles N.N.W. of Pisa.

Livorno (Livourne, Leghorn), a fine modern episcopal city, situate on the shore of the Mediterranean opposite the island *Meloria*, is one of the principal commercial towns in Europe, an advantage which it owes to its being a free port, where the productions of all countries can be landed and re-exported without restriction. One of its quarters is named New Venice, from its being intersected by a number of canals, by means of which goods are brought to the doors of the warehouses. The harbour is entirely artificial, and is formed and defended by a great mole or bulwark, and by strong military works; and outside is the road formed by sandbanks surrounding Meloria, on which the lighthouse is built. There are also building slips, on which large ships of 60 guns have been constructed. The city is two miles in circuit, and contained, in 1836, 76,397 inhabitants, of whom upwards of 20,000 are Jews, who have a synagogue, considered to be the largest and finest in Europe, after that of Amsterdam. The great square is spacious, and the Duomo or Cathedral is a noble building. Leghorn, in the fifteenth century, was only an inconsiderable port; and it was not till the middle of the seventeenth century that the liberality of its institutions towards Jews and other strangers laid the foundation of its modern prosperity, and accomplished the transfer from Pisa of the principal trading establishments. In 1645, the civic revenue was 6280 crowns, the number of inhabited houses 700, and of the population between eight and nine thousand. In 1791 the population amounted to 50,790; in 1807, to 64,095; in 1829, to 72,190; and in 1836, to 76,397. With the exception of the period of French domination the trade has been in a state of continual advancement. In 1757, its value amounted to about £106,660 sterling; in 1834, it had reached £1,733,330. *(Bowring's Report, &c.)*

Duchy of Lucca.

The Duchy of Lucca is a small maritime district between Modena and Tuscany, formed into a separate state in 1815 out of the territory of the late republic of Lucca. The duke is to succeed to the duchy of Parma on the death of the Archduchess Maria Louisa, on which event, Lucca is to be annexed to the grand-duchy of Tuscany. The only remarkable places are:—*Lucca*, the capital, an archiepiscopal city, on the Serchio, in the centre of a plain which is cultivated like a garden, with 22,000 inhabitants. The fortifications have been converted into fine walks, and a magnificent aqueduct is constructing to supply the city with water. Lucca has a university, newly established, with the title of Lyceum, a botanic garden, a public library, and the Lucchese academy of sciences, letters, and arts, which regularly publishes memoirs. The environs abound with elegant villas. *Viareggio* is a small seaport town, with a considerable coasting trade, and a population of 5000. *Camaiore*, on the sea coast; *Borgo-a-mazzano*, on the Serchio; and *Ceraiana*, on the Lima. In the vicinity of Corsena are situate the *Baths of Lucca*, which are much frequented both by natives and strangers.

§ 6. *States of the Church.*

The States of the Church occupy the greater part of Middle Italy, extending along the Adriatic Sea, from the Po to the northern frontier of the kingdom of Naples, and being bounded on the west by the Duchies of Modena and Tuscany, and on the south by the Mediterranean Sea. The length from north to south is about 260 miles, the breadth is very various. Since 1832, the dominions of the Pope have been divided into twenty-one provinces, of which the province of Rome is styled a *Comarca*; that of Loreto, a *Commissariato*; those of Bologna, Ferrara, Ravenna, Forli, Urbino and Pesaro, and Velletri, *Legazioni*, because they are governed by legates. The delegation of Benevento, and the territory of Ponte Corvo, are entirely separated from the rest of the dominions, being situate in the northern part of the kingdom of Naples. Ponte Corvo forms part of the legazion of Frosinone. The names of the provinces, and of their principal cities and towns are stated in the following table.

Provinces.	*Cities and Towns.*
Roma. . . .	Roma, Tivoli, Albano, Castel Gandolfo, Frascati, Subiaco, Palestrina, Ostia.
Velletri. . . .	Velletri, Terracina, Sezze, Cori.
Frosinone. . .	Frosinone, Alatri, Ponte Corvo, Veroli, Anagni.
Benevento. . .	Benevento, San Lucio.
Civita Vecchia.	Civita Vecchia, Tolfa, Corneto, Allumiere.
Viterbo. . . .	Viterbo, Montefiascone, Ronciglione, Civita Castellana, Nepi.
Orvieto. . . .	Orvieto, Aquapendente, Bagnarea.

Provinces.	*Cities and Towns.*
Rieti.	Rieti, Poggio Mirteto, Magliano.
Spoleto. . . .	Spoleto, Narni, Terni, Amelia, Norcia, Pie di Luco.
Perugia. . . .	Perugia, Foligno, Nocera, Assisi, Citta di Castello, Citta della Pieve, Todi, Gubbio.
Camerino. . . .	Camerino.
Macerata. . . .	Macerata, Fabriano, Recanati.
Fermo.	Fermo, Porto di Fermo.
Ascoli.	Ascoli, Montalto, Ripatransone.
Loreto.	Loreto.
Ancona.	Ancona, Iesi, Osimo.
Urbino e Pesaro.	Urbino, Pesaro, Fano, Fosombrone, Cagli, Gubbio, Sinigaglia (Senigalia), San Leo.
Forli.	Forli, Cesena, Rimini, Savignano, Cesenatico.
Ravenna. . . .	Ravenna, Imola, Cervia, Faenza, Castel Bolognese.
Bologna. . . .	Bologna, Cento, Forte Urbano, Medicina.
Ferrara. . . .	Ferrara, Commachio, Lugo, Bagna Cavallo, Ponte di Lago Scuro.

The population amounted in 1800 to 2,400,000; in 1829, to 2,679,000; and in 1833, to 2,728,000; an increase which shows at least some external improvement. All attempts to place the financial system on a proper footing have hitherto failed; in 1837, the revenues amounted to about 13,485,000 dollars, the expenditure to 14,730,000, leaving a deficit of 1,245,000. Of this sum the support of the army engrosses 20, and the interest of the public debt 25, or, according to others, not less than 38 per cent. Into this dilemma the Government has been brought chiefly by its solicitude to restore the ecclesiastical and monastic system of former times in its fullest extent, and to compensate all losses sustained during the French occupation. Recourse is had to expensive loans, which scarcely alleviate the pressure for the moment; while the cause of embarrassment remains unabated, and seems likely to lead at last to the dissolution of the State. The army amounts to 18,748 men. (See GOVERNMENT, p. 568.) *Raumer's Italy*, II.

ROMA (ROME), the capital of the States, is situate on the banks of the Tiber, partly on a plain, and partly on low hills, with their intervening valleys, about 16 miles from the mouth of the Tiber, and between 50 and 60 feet above the level of the sea. The city is divided by the Tiber into two unequal parts, the larger of which, on the left or eastern bank, is Rome properly so called; the smaller portion, on the right bank, is named the Leonine city and Trastevere, and is inhabited by a rude and uncivilized population. The whole city is surrounded by ancient walls about fifteen miles in circuit; but only a part of the inclosed area is occupied by the modern city, which is mostly built upon a plain (the ancient *Campus Martius*), lying along the banks of the Tiber, to the north of the seven hills, which formed the site of ancient Rome. Four of the hills are now almost entirely deserted, or are occupied by gardens, vineyards, scattered buildings, and ruins. The streets, though generally spacious, are often winding and ill-kept. Of the numerous public buildings with which Rome is filled, the 364 churches claim our first attention. Seven of these are styled *basilicæ*, or cathedrals, namely, *San Pietro in Vaticano, San Giovanni in Laterano, Santa Maria Maggiore, San Paolo fuori le mura, San Lorenzo, San Sebastiano*, and *Santa Maria in Trastevere*. San Pietro (St. Peter's), stands on a gentle acclivity in the Leonine city, in the north-western corner of Rome, and is built in the form of a Latin cross, the nave being 607 feet long, and the transept 444. The east front is 396 feet wide and 160 feet high; the pillars which compose it are each 88 feet in height, and 8½ in diameter. The height of the dome, from the pavement of the church to the top of the cross which surmounts it, is 448 feet. In front of the church is a fine piazza, consisting of a double circular colonnade, with an Egyptian obelisk in the centre, and forming altogether an architectural display which is very much admired. St. Peter's occupies the site of Nero's circus, and the spot where St. Peter is supposed to have suffered martyrdom. The present church was erected instead of the more ancient one, between the years 1506 and 1780, having occupied in building two centuries and a half, under thirty-five popes, and cost from fifteen to twenty millions sterling. *San Giovanni in Laterano* (St. John Lateran), is the proper church of the Pope himself, who is its official minister, and on that account ranks above all other priests in the Catholic world; it is here also that the popes are crowned. The church, or some part of it at least, is as old as the time of Constantine the Great. It contains the famous chapel of the Corsini, reckoned the finest in the world, which is said to have cost so much as £400,000. *Santa Maria Maggiore* (St. Mary the Great), is noted for the fine colonnades and unbroken entablatures which divide the nave from the aisles, for mosaics of the fifth century and for the chapels of Sixtus V. and Paul V. *San Paolo fuori le mura* (St. Paul without the wall), is situate on the road to Ostia, south of the city, on the spot where the Apostle Paul is supposed to have been beheaded. It was a very ancient structure, but was destroyed by fire in 1824, and is now in the course of being rebuilt. It is, however, in a very unhealthy situation, and but little frequented. The only other church which deserves particular notice is *Santa Maria ad Martinæ*, or, *the Rotunda*, a large circular building, surmounted by a dome rising 130 feet above the pavement, and terminating with an open window in the centre, by which the church is lighted. The entrance is formed by a magnificent portico of sixteen granite Corinthian columns, each of which is 39 feet high, and its shaft of a single stone. According to an inscription on the entablature of the portico, the building seems to have been erected by Marcus Agrippa, the favourite minister of Augustus, but whether for a Pantheon (a temple of all the gods), or merely as an entrance hall to his baths, is uncertain. It is now, however, dedicated to St. Mary and all the saints, who have supplanted the deities of pagan Rome.

Next to the churches, the palaces attract the attention of the traveller. These are very numerous, and are generally very fine buildings; but sixty of them are such large and ornamental structures as might suffice for sovereign princes rather than for provincial nobles. Our space permits us to notice only those belonging to the Pope. The *Vatican*, the winter palace of the Pope, stands on the Vatican hill, close by St. Peter's, with which it forms a very inharmonious architectural composition. It is a very large heavy building, said to contain 4422 halls, chambers, or galleries, and 22 courts; but the apartments are irregularly arranged, and the whole pile is characterized by want of unity of design. It contains the Pio-Clementine and the Chiaramonti museums, both filled with the masterpieces of ancient and modern art, among which are particularly distinguished the Apollo Belvidere, the Laocoon, and the Antinous; galleries and halls painted by Raffaelle; the Sistine Chapel, which contains the Last Judgment, by Michael Angelo; the Vatican Library, contained in two galleries, as remarkable for their vast extent as for their ornaments, and embracing an immense collection of printed books, with perhaps the richest collection in Europe of rare manuscripts, and numerous pictures and other works of art. The *Quirinal*, another superb palace, on the Quirinal hill, is the Pope's summer residence; the garden attached to it is more than a mile in circuit, and is one of the finest in Italy. It is also named the palace of Monte-Cavallo, from two ancient colossal figures of horses placed there. The *Campidoglio* occupies the site of the ancient Capitol, and contains the palaces of the senator or chief magistrate, and of the conservators or municipal magistrates of Rome, a rich museum of antiquities, and an ancient equestrian statue in bronze of the Emperor Marcus Aurelius.

Rome also contains a great number of scientific and literary establishments, at the head of which may be placed *Universita Romana della Sapienza*, one of the oldest universities in Europe. Next in

importance is the *Roman College*, which may be considered as another university, to which is annexed a fine library, and collections of antiquities, natural history, models of machines, &c. The other principal seminaries are, the college *de Propaganda fide*, where natives of India, Abyssinia, Syria, Armenia, Greece, China, and other foreign countries, are instructed by professors, for the purpose of preaching the gospel to their benighted countrymen; the *Seminario Romano*; the *Collegio Nazareno*; the English, Irish, Scottish, and seventeen other national colleges for students from different countries; the deaf and dumb institution; the Ripa grande institution, where 2000 children are taught useful arts and trades; the Roman academy of St. Luke, where painting, sculpture, architecture, perspective, anatomy, history, mythology, and costumes, are taught by ten professors, &c. &c.

Besides the walls which inclose the site of ancient Rome, there are many other remains of the splendid buildings which adorned "the eternal city;" but of these we can do little more than mention the names. The largest and most imposing is the *Flavian amphitheatre*, or *Colosseum* (Coliseum), a very large oval structure formed externally of three tiers of arches and half columns of different orders, surmounted by a range of Corinthian pilasters without openings. It is said to have been capable, when entire, of containing 100,000 spectators. Half the building has been destroyed, but the remainder is considered as a very grand and imposing structure. The three triumphal arches of Titus, Severus, and Constantine; the two monumental columns of Trajan and Antoninus; the Ælian bridge, now called St Angelo's; ten Egyptian obelisks; the pyramid of Caius Cestius; and the tomb of Cecilia Metella, are still very entire, and are among the finest specimens of the antiquities of Rome. Most of the other remains are merely fragments, as the Cloaca Maxima or great sewer, said to have been constructed in the time of the Tarquins; the circus of Caracalla; three columns of the temple of Jupiter Stator; the theatre of Marcellus, built by Augustus; the baths of Titus, Caracalla, and Diocletian; the temple of peace, and several others; and the mausoleum of Augustus; the *Moles Hadriani*, or tomb of the Emperor Adrian, consisted originally of a large building, ornamented externally with three tiers or ranges of colonnades, forming so many superb galleries, decorated with statues and sculptures, and surmounted by a golden pine apple; but all these have disappeared, and the naked body of the structure now forms the keep or central tower of the Castle of St. Angelo, where the treasures and records of the Court of Rome are preserved. It serves occasionally as a state prison, and communicates by a subterranean gallery with the Vatican palace. The magnificent palace of the Cæsars, on the Palatine hill, has entirely disappeared, its site being covered by gardens; the capitol is occupied by modern buildings, and the site of the temple of the Capitoline Jupiter is said to be now covered by the church of *Santa Maria in Ara Cœli*. Of all the stupendous aqueducts of ancient Rome, the ruins of the Martian and the Claudian only remain, the former of which conveyed the water thirty-five, the latter, sixty miles. Rome, however, is still most abundantly supplied with water, brought into it by several Popes, and distributed by means of fountains, in every part of the city, some of which are very ornamental structures.

In 1800, the population of Rome amounted to 153,000; in 1813, it had fallen to 117,582; but, by 1836, it had again increased to 157,368, of whom 3709 were Jews, 201 Turks and heretics, 37 bishops, 1468 priests, 2023 monks, 1476 nuns, 541 seminarists and collegians; 112,940 church communicants, 40,738 non-communicants; males 81,488, females 72,190. It is the boast of the Romans that in no other city is so large a sum devoted to public charity in proportion to the population; but of the great number of benevolent establishments and institutions, many are of doubtful, and even pernicious tendency; and in spite of the liberality with which the charity is distributed, nowhere is there more mendicity, want, and misery. Besides numerous foundling hospitals, there are thirteen societies for giving doweries to young women on their marriage, and gifts on becoming nuns; and, of 1400 women annually married, 1000 receive dowries from the public purse. There are twenty-two establishments for the diseased, the insane, and the convalescent, which, as a whole, can accommodate 4000 patients. Rome is one of the greatest receptacles for abandoned children, which are brought from distant provinces, and even from Naples. Above 2800 children are annually received by the seven foundling hospitals. The Protestant inhabitants of Rome are now allowed to have a chapel for worship, and to bury their dead in a piece of open ground beside the Pyramid of Caius Cestius. The Campagna di Roma, or country around Rome, is now for many miles completely desolate, and a prey to malaria, which sometimes even pervades the seven hills and penetrates into the streets of the city.

Tivoli (anc. *Tibur*), on the Teverone (Anio), is a small episcopal city, with 6000 inhabitants, 18 miles E. by N. of Rome, in a delightful situation, with several remarkable antiquities, as the remains of the round temple of Vesta or of the Sibyl, the Villa of the Mecænas, and the villa of the Emperor Adrian. The Teverone formed a picturesque cascade at Tivoli; but this has recently been destroyed by diverting the river into a new channel. *Albano*, a small episcopal city, with 4200 inhabitants, is agreeably situate near the western side of the lake to which it gives its name, 14 miles S.S.E. of Rome. On the banks of the lake is *Castel Gandolfo*, where is a fine summer palace belonging to the Pope; and on the east side of the lake, on a long narrow ridge, are the remains of *Alba Longa*, the parent and early rival of Rome. *Frascati*, the ancient *Tusculum*, a small episcopal city, with 4000 inhabitants, 12 miles E.S.E. of Rome, occupies a fine situation on the side of a hill, and contains several remains of antiquity, particularly those of Cicero's villa. *Subiaco*, a small town of 2000 inhabitants, near the Teverone, with a castle belonging to the Pope, the remains of a palace of Nero, and the rich convent of St. Benedict. *Palestrina*, the ancient *Prænesta*, 24 miles east of Rome, with 3500 inhabitants. From its lofty citadel, now called Castello di San Pietro, which Hannibal and Pyrrhus are said to have ascended for the purpose of viewing Rome, the prospect over the plain of Rome, and the valley of the Hernici, towards Anagni, is splendid. *Labano*, a fortified town beyond Palestrina, with 3000 inhabitants. *Ostia*, at the mouth of the southern branch of the Tiber, 16 miles from Rome, formerly the flourishing port of that city, is now almost entirely abandoned on account of malaria; "and of all the wretched places on the coast in the vicinity of Rome, Ostia, in its present state, is one of the most melancholy." At the mouth of the other branch of the river is *Fiumicino*, adjoining the remains of the port and docks constructed by the Emperors Claudius and Trajan. It contains a tower, surmounted by a lighthouse.—(*Gell's Top.* II. 134.) About 10 miles N.W. of Rome is the site of the ancient Veii, the remains of which are now almost completely obliterated.

Velletri, an irregularly built episcopal city, with 10,000 inhabitants, 23 miles S.E. of Rome, is finely situate on a height, from which there is an extensive view. *Norma* (*Norba*), 13 miles from Velletri, a small town, contains the remains of ancient Cyclopean walls, with five gates and two towers. *Terracina* (anc. *Anxur*), a seaport town, with 4000 inhabitants, on the Gulf of Gaeta, 60 miles S.E. of Rome, and on the east side of the Pontine marshes. *Frosinone*, 45 miles E.S.E. of Rome, is built on the top of a lofty hill, whose base is washed by the river Cosa, on the site of the ancient *Frusino*, a large and powerful Latin city. At the distance of 10 miles is *Alatri*, on the slope of a hill crowned by the citadel, whose walls, as well as those of the town itself, are of the most gigantic dimensions, evidently the work of the Pelasgi. *Benevento*, 130 miles E.S.E. of Rome, and 32 N.E. of Naples, an archiepiscopal city, with 18,000 inhabitants, occupies a fine situation, but its streets are narrow and dirty; and its public buildings neither grand nor elegant. It contains, however, a beautiful triumphal arch, erected A.D. 113, in honour of the Emperor Trajan, and still in good preservation; and other Roman

remains. The province of Benevento is entirely separated from the rest of the Roman States, and, during the French ascendancy, was formed into a principality in favour of the celebrated Talleyrand; and also *Ponte Corvo*, another separate territory, belonging to the Pope, in favour of Marshal Bernadotte, now King of Sweden.

Civita Vecchia, a small episcopal seaport town, with 7000 inhabitants, is a free port, has a naval arsenal, and considerable trade; 40 miles N.W. of Rome. *Corneto*, 10 miles N. of Civita Vecchia, is noted for the great number of Etruscan antiquities found in its neighbourhood. Similar antiquities have also been found at *Piano di Voce (or Vulce)*, *Ponte Bodio*, *Montalto*, *Canino*, and at *Civita Turchina*, one league north of Corneto, the site of the ancient Tarquinii. *Tolfa*, noted for its rich alum mine, on the range of the woody mountains of Cervetere, which were anciently called the Lucus Silvani. Tolfa contains a great manufactory of saltpetre. At *Cervetere*, the ancient *Cære*, a sepulchral building has lately been discovered under ground, which is considered to be a very ancient specimen of architecture.

Viterbo is a neatly-built episcopal city, with 13,000 inhabitants, at the foot of a hill surrounded with gardens, vineyards, and country houses, 42 miles N.W. of Rome. *Orvieto*, also an episcopal city, 63 miles N.W. of Rome, noted for its fine gothic cathedral, and its excellent wine. Population 8000. *Aquapendente*, a small ill-built town, with a cathedral, five churches, and 2400 inhabitants, 15 miles W of Orvieto. *Ronciglione* is a flourishing town, with 3357 inhabitants, between Monte Rosi and Viterbo, and the fourth post from Rome on the road to Florence. *Civita Castellana*, 35 miles N. of Rome, a small town in a strong and beautiful situation, is supposed to occupy the site of the ancient *Falerii*. Between Civita Castellana and Nepi is a famous grotto, cut in the rock, during a period of fifteen years, by the hermit Giovanni Andrea Rodio, who died in 1819. *Rieti* (anc. *Reate*), a town of very great antiquity, 43 miles N.N.E. of Rome, is a bishop's see, and is noted for the fertility of its neighbourhood, the industry of its inhabitants, and its remains of antiquity. Population 12,000. *Spoleto*, a large but thinly-peopled episcopal city, with 7000 inhabitants, 65 miles N. by E. of Rome, is particularly noted for the remains of its ancient magnificence. *Narni* and *Terni*, are two towns on the Nar; the former a place of great antiquity, and noted for a fine Roman bridge, called the Sanguinazio; and the latter celebrated for a waterfall, called the *Cascade delle Marmore*, formed by the river Velino, where it joins the Nar, after draining the valley of Rieti. *Pie di Luco*, on a lake of the same name near Spoleto, is noted for one of the finest echoes known, which repeats distinctly eleven syllables. *Bolsena*, an unimportant village, on the lake to which it gives its name, represents the ancient *Vulsinii*. *Montefiascone*, S.E. of the lake, produces wine so excellent that a German prelate died there from drinking it to excess.

Perugia, 90 miles N. of Rome, an episcopal city, built on a hill not far from the right bank of the Tiber, in a fertile and well-cultivated country, possesses some fine remains of antiquity, a university, an antiquarian museum, a library, several fine churches, a good theatre, some silk manufactures, and 30,000 inhabitants. *Foligno*, 22 miles S.E. of Perugia, is a commercial town, with manufactures of wax candles, cloth, paper, and comfits, a museum of antiques, and 9000 inhabitants. *Assisi*, 85 miles N. of Rome, an episcopal city, with 4000 inhabitants, occupying a conspicuous situation on a hill, is the birth-place of San Francisco, the founder of the order of Franciscan monks, and contains his tomb, which still attracts great crowds of pilgrims; and also a double church (upper and lower), built in the 13th century in honour of the saint, and ornamented with pictures, of the earliest modern artists, in a good state of preservation. The celebrated church of *Santa Maria degli Angeli*, near Assisi, has been destroyed by an earthquake. *Gubbio*, 17 miles N. by E. of Perugia, with an industrious population of 4000, is noted for its antiquities, among which are the Eugubian tables, an Etruscan relic, discovered in 1456 in the ruins of the temple of Jupiter Apenninus, which have puzzled antiquaries to decipher their contents. *Camerino*, 32 miles east of Perugia, is an episcopal city, with a secondary university, and 7000 inhabitants. *Fabriano*, an episcopal city, with 7000 inhabitants, and manufactures of paper and parchment. *Fermo*, is an archiepiscopal city, with a secondary university, and several fine buildings, among which are the cathedral and the theatre, 107 miles N.E. of Rome. Population 7000. *Macerata*, a large town of 12,000 inhabitants, with a university and other literary establishments, 15 miles N.W. of Fermo. At *Tolentino*, 10 miles S.W. of Macerata, a peace was concluded between Buonaparte and the Pope in 1797. *Ascoli*, is a well-built handsome town, with a cathedral, numerous other churches, and 12,000 inhabitants, 15 miles from the Adriatic, and 90 N.E. of Rome. *Loreto*, a considerable town, with 8000 inhabitants, stands on the coast of the Adriatic, 124 miles N.N.E. of Rome. Its celebrated church of Our Lady is superstitiously believed to contain the *Santa casa*, or house in which the Virgin Mary dwelt at Nazareth, and which was transported by angels to this place. It attracts, of course, great crowds of pilgrims, and once contained a large and valuable treasury, the greater part of which has been converted by its guardians to other than pious uses.

Ancona, an episcopal city, built in the form of an amphitheatre, on the slopes of two hills which rise from the shore of the Adriatic, 132 miles N.N.E. of Rome, is a busy commercial town, with a citadel, a fine quay, and a harbour formed by a pier 2000 feet in length, 100 in breadth, and 65 above the water, and having at its extremity a lighthouse with a revolving light. — Population 24,000, many of whom are Jews, Greeks, and Moslems. Its manufactures consist principally of wax, tallow, silk hats, and paper. The harbour is well adapted for building and repairing ships, and being a free port, is frequented by traders of all nations. *Sinigaglia*, a seaport town on the coast of the Adriatic, N.W. of Ancona, with 8000 inhabitants, has an annual fair in July, which is the best frequented in Italy, and one of the first in Europe. *Urbino*, 45 miles W. by N. of Ancona, once the capital of a duchy, and now an episcopal city, is noted as the birth-place of Raffaelle and Bramante, some of whose works embellish its cathedral and the church of the Capuchins. *Pesaro*, a seaport town near the mouth of the Foglia, with a cathedral, a theatre, and a good harbour. *Fano*, an episcopal seaport town, stands near the mouth of the Metaro (Metaurus.)

Rimini, a large but thinly-inhabited episcopal city, near the mouth of the Marecchia, which forms a harbour adapted only for fishing boats. The city contains some good streets, places adorned with fountains, a number of well-built houses and churches, a public library, and several important remains of antiquity, with 15,000 inhabitants. *San Marino*, 12 miles S.W. of Rimini, a small town on a lofty hill, is the capital of a sovereign republic, whose territory contains three castles, five churches, and about 5000 inhabitants.

Ravenna, an archiepiscopal city, between the Montone and the Ronco, 175 miles N. of Rome, adjoins some large marshes, which render the air unwholesome. It is a place of great historical celebrity, but is now very much decayed, and contains only about 16,000 inhabitants. *Forli*, a busy manufacturing town with 16,000 inhabitants, 18 miles S.W. of Ravenna. *Cesena*, is also a busy town, with 12,000 inhabitants, 20 miles S. of Ravenna. *Cervia*, in the same district, contains 4000 inhabitants, with immense salines. *Faenza*, a large and well-built episcopal city, 19 miles S.W. of Ravenna, has considerable trade and manufactures, with 14,000 inhabitants. Faenza has given its name *(faience)* to the pottery, called *majolica* by the Italians, the manufacture of which is still considerable. *Imola*, an episcopal city, with 8000 inhabitants.

Bologna, a large archiepiscopal city, with an industrious commercial population, is situate on a canal, between the Reno and the Savena, in the midst of a fine country covered with elegant houses and villages. It is a well-built town, adorned with a number of fine buildings, and has always been

distinguished for its important literary and scientific institutions; the principal of which are the university, one of the most ancient in Europe; the botanic garden; the institute, a magnificent establishment with rich collections of books, and objects of chemical, anatomical, and physical science, and antiquities; a fine observatory; an academy of the fine arts; galleries of sculpture and painting, &c. — Population 71,000.

Ferrara, a large and fortified archiepiscopal city, on a branch of the Po, and a canal which connects that river with the Macstro. It contains a university, a public library, a large, strong, and regular citadel, and 24,000 inhabitants. The city occupies an unwholesome situation, in a flat marshy country, 30 feet lower than the surface level of the Po, which is prevented by dykes from overflowing it. *Porto di Lago Scuro*, a small town on the Po, with a great transit trade and 5000 inhabitants.

§ 7. *The Kingdom of Naples, or The Kingdom of the Two Sicilies.*

This kingdom consists of two distinct portions; the continental, styled *Al di qua de' Faro*, or, On this side of the strait; and the insular, consisting of the Island of Sicily, or, The other side of the strait. The former occupies the southern portion of the peninsula of Italy, from the parallel of 43 N. and the meridian 13 E. to the Strait of Messina, extending in length 380 miles, but varying very much in breadth, and comprising an area of 37,500 square English miles. The kingdom is divided into fifteen intendancies, as stated in the following table: —

Intendancies.	*Cities and Towns, &c.*
Napoli, ...	NAPOLI (NAPLES), Puzzuoli, Somma, Ottajano, Casoria, Portici, Resina, Torre del Greco, Torre del Annunziata, Castelamare, Sorrento; the ruins of Herculaneum and Pompeii; the islands of Procida, Ischia, Capri.
Terra di Lavoro,	*Caserta*, Piedimonte, San Germano, Monte Cassino, Sora, Arpino, Atina, Gaeta, Capua, Santa Maria, Nola, Acerra, Aversa, Maddaloni; the Pontian Islands.
Principato Citra,	*Salerno*, Campagna, Sala, Vallo, Amalfi, Nocera, Cava; the ruins of Paestum or Poseidonia.
Principato Ultra,	*Avellino*, San Angelli de Lombardi, Ariano, Monte Vergine, Atripalda, Montella, Solofra.
Molise, ...	*Campobasso*, Isernia, Larino, Termoli, Agnone.
Abruzzo Ultra I.,	*Teramo*, Campli, Penne, Civitella del Tronto, Senarica.
Abruzzo Ultra II.,	*Aquila*, Avezzano, Capistrello, Anglizia, Civita Ducale, Pescina, Sulmona.
Abruzzo Citra, .	*Chieti*, Lanciano, Ortona a mare, Pescara, Vasto, San Vito.
Capitanata, . .	*Foggia*, Ascoli, Bovino, Lucera, Manfredonia, Monte San Angelo, San Severo. The Isles of Trimiti, &c.
Terra di Bari, .	*Bari*, Andrea, Terlizzi, Bitonto, Altamura, Gravina, Barletta, Trani, Bisceglia, Molfetta, Giovenazzo, Monopoli.
Terra d'Otranto,	*Lecce*, Sta Maria di Leuca, Alessano, Otranto, Brindizi, Francavilla, Taranto, Manduria, Gallipoli, Nardo, Galatina.
Basilicata, . . .	*Potenza*, Lagnero, Tursi, Matera, Montepeloso, Melfi, Oppido, Muro.
Calabria Citra, .	*Cosenza*, Bisignano, Cassano, Castrovillari, Corigliano, Rossano, Scigliano, Paola or Paula, Longobuco.
Calabria Ultra I.,	*Reggio*, Scilla, Seminara, Palmi, Gerace, Bova.
Calabria Ultra II.,	*Catanzaro*, Sta Severina, Cotrone, Nicastro, Pizzo, Monte Leone, Parghelia, Tropea, Nicotera, Stilo, Serra.

These provinces are subdivided into districts, circles, and communes. Of the whole surface of the kingdom about 14,100 square miles are under tillage or cultivated as orchards. Since the separation of the country from Spain, the population has been gradually increasing; it amounted, in 1781, to 4,709,000; and in 1835, to 5,946,000. During the French domination the military institutions corresponded essentially with those of France, and these have been in many respects retained. The peace establishment amounts to about 57,000 men; every man is liable to the conscription from the completion of his eighteenth to the completion of his twenty-fifth year; the period of service for the infantry extends to six years, and for the cavalry, to eight. The financial system is in a very unsatisfactory state; for the amount of the total revenue, Raumer says, *Italy and the Italians* in 1826, vol. ii. he finds abundance of figures, but nobody to vouch for their accuracy, as the truth is either purposely concealed, or alterations made in the system of management render it impossible to reconcile the various items with sums. Upon the whole the revenue and the expenditure have kept progressively increasing, though the latter has too often exceeded the former. The revenues are said to have amounted, in 1832, to 27,112,000 ducats, £1,545,624 sterling. The estimated revenue for 1838-9 amounted to 26,670,000 ducats; of which 14,230,000, or more than a half, were set apart for the financial management, the royal household, and the public debt; for the council of ministers, 44,040; ministry of foreign affairs, 251,000; ministry of justice, 727,000; ministry of religion, 1,000; ministry of the interior, 1,846,000; army, 7,200,000; navy, 1,330,000; and police, 2,000,000.

The productions of the kingdom are of the most various description, and might be made very valuable. Corn, wine, oil, flax, hemp, oranges, and other fruits, and all kinds of vegetables might be raised in quantities equal at least to twice the consumption of the inhabitants. Rock-salt, coal, and other minerals abound, but scarcely any attempt has been made to work them. In many parts of the interior timber for ship-building is to be found, but the expence of conveying it to shipping ports would more than equal the expense of importing it from other countries. Agriculture and industry of every sort are in the rudest state. Farming implements, carts, ploughs, and tools of every kind, are of the most wretched description. A miserable cotton manufactory, a sort of Government monopoly established at Salerno, glove and hat manufactories at Naples, with coarse linens and cloths, comprise nearly all the branches of manufacturing industry. For some time past the government has extended support, especially to the shipping of Naples, in the fictitious shape of premiums, thus taxing the community for the benefit of a few traders. Premiums have also been held out for the establishment of manufactures, while roads, and other facilities to the promotion of agriculture and the productions of the soil generally, have been entirely neglected since the time of Murat, with the solitary exception of a railway, which has been constructed from Naples to Portici. The neighbouring seas abound with fish, the forests contain game, and the marshes and shores are frequented by wild fowl. No means have been used to drain the marshy grounds for the purpose of preventing malaria; and all the harbours, even that of Naples, are in the most neglected condition. In short, no country in Europe possesses great natural advantages; and in none has so little been done to develope the abundant resources and riches of the kingdom. The tariff has been ruinous to the Customs; two-thirds of the sugar consumed in the country are smuggled, chiefly from the Adriatic. A trade which would create an extensive demand for the produce of the kingdom; a less expensive and less rigorous system of raising the land taxes and octrois; a diminution in the rate of taxation, especially in agriculture; liberal commercial regulations with a moderate tariff; and perfect security of person and property, are the changes necessary to render the kingdom of the two Sicilies productive

and flourishing. At present it is one of the poorest, worst governed, and least flourishing of the European communities. Taking into account the productive character of the soil, it has been estimated that the two portions of the kingdom are capable of yielding abundant food for at least twenty millions of inhabitants, or three times the present amount. (*Report on the Commercial Relations of the Kingdom of the Two Sicilies, by J. Macgregor; presented to Parliament, August* 1840; *page* 50.)

Cities and Towns.

Intendancy of Naples. NAPOLI (NAPLES), the capital of the kingdom, and one of the largest cities in Europe, is situate on the northern shore of a beautiful bay, opening to the west, in N. lat. 40° 50', and E. long. 14° 22'; about 120 miles S.E. of Rome. Nothing can be more beautiful than Naples when viewed from the bay, rising as it does from the sea on an amphitheatric slope, crowned with the sombre castle of San Elmo. The city is 9 miles in circumference, and contains about 350,000 inhabitants; but though the buildings are lofty and solid, and some of the streets wide and straight, yet, relatively to its extent and importance, it contains few edifices which can be compared with those of the other great cities of Italy. Its churches, overloaded in the interior with gilding, pictures, and other ornaments, are little remarkable for their dimensions or architecture; and nearly the same may be said of the palaces and other public edifices. The *Royal palace*, the King's ordinary residence, is, however, remarkable for its vast extent, the architecture of its front, its magnificent stair, and the beauty and richness of its rooms. There is another royal palace on the *Capo di Monte*, overlooking the city; and a third named *di Chiatamone*, remarkable for its delightful situation and its hanging garden. The other principal buildings worthy of notice are: The large edifice of the *Studii Publici* or *University*; the *Royal Museo Borbonico*, now enriched with antiquities, and a collection of paintings, in a building originally erected for the Studii, which were transferred to the Convent of Gesu Vecchio, in 1790; the *Reclusorio*, or poor's house; the hospital for incurables, and that of the Annunziata, to which is annexed a well-endowed foundling hospital; the arsenal; the archbishop's palace; the theatre of St. Ferdinand, the finest, in respect of its architecture, of the ten which the city possesses; the Vicario or Castel Capuano, an old royal palace, now occupied by the courts of justice; the Theatre of San Carlo, one of the largest and finest in the world; and the palace of the Royal Ministers, or of the Finances, finished in 1826, and remarkable for its architecture and great size. Among the numerous churches, the only one worthy of particular notice is the new cathedral or church of San Gennaro (Januarius), the patron saint of Naples, whose head, and two small vessels filled with his blood, are preserved in a chapel called El Tesoro. The blood of the saint is publicly exhibited three times a-year, in May, September, and December, on which occasions it melts in its vase; if the fusion take place quickly, the joy of the people is great; but if there be any unexpected delay, their tears, prayers, and cries, are excessive; as the absence of the miracle is supposed to announce some dreadful impending calamity. The principal scientific and literary establishments are: The University; the lyceum del Salvatore; the school of paleography, attached to the general archives of the kingdom; the school of painting and sculpture; the establishment for unrolling and decyphering the MSS. found at Herculanum; the military college; the military school; the marine academy; the veterinary school; the two great schools for girls, Miracoli and San Marcellino; the two colleges for music, that for males at San Pietro a Majolla, and that for girls at the Concordia; the royal poor's house, where 6000 children are taught arts and trades, at the cost of £20,000 a-year to the Government; the chairs of clinical surgery, midwifery, opthalmologie, and surgery attached to the public hospitals; the botanic garden; two observatories; the topographical board; four public libraries, among which is the Borbonica, one of the richest in Europe; the cabinets of mineralogy, natural history, physics, and chemistry; the royal museum of antiquities; the Borbonic academy, divided into the three branches of antiquities, sciences, and fine arts, to the support of which the King assigns an annual revenue of £2400; the institute of encouragement; and the societies Pontaniana and Sebezia. The fortifications of the city are of little military importance; they consist of five forts or castles, the principal of which are, that of San Elmo, on a hill behind the city, which it completely commands, the Castello del'Ovo (egg or oval castle), built on a rock in the sea, and the Castello Nuovo (new castle), which contains a triumphal arch and several other curious objects. The harbour is artificial, being formed by a great mole, which is continually crowded with people, and contains a light-house and a fine well. In a hill, in the northern part of the city, are the catacombs, which served as burial places in the early ages of the church, and which are said to be more extensive than those of Rome and Syracuse. At the south-west corner of the city is the tufa hill of Pusilipo, through which the public road is carried by a gallery or tunnel, a mile in length; and at the east end of the gallery is Virgil's tomb.

Puzzuoli, a small episcopal city, with 8000 inhabitants, stands on the coast, 6 miles W. of Naples, in a delightful situation, where were many villas of the ancient Romans. It contains the remains of an amphitheatre called the Colosseo, nearly as large as that of Rome, the ruins of a temple of the nymphs, and one of Serapis, which has given rise to some interesting speculations among geologists. In the neighbourhood are several remarkable curiosities; the Lucrine Lake, the Lake of Avernus, the Lake of Fusaro noted for its excellent oysters, the Dog's Grotto, the Lake of Agnano, the Solfatara, and the Monte Nuovo.—(*See anté, page* 563.) On the west side of the bay, opposite to Puzzuoli, is *Baia*, a miserable place, almost deserted, but with a safe road and harbour, and remarkable in ancient times as the summer retreat of the Roman nobles, of whose villas, temples, and tombs it contains numerous remains. To the north of Baia are the ruins of the ancient city of Cumæ, and the Sibyl's Grotto, a tunnel which penetrates to a great depth, but is now almost choked up with rubbish; and to the south the promontory and harbour of *Miseno*, which was the station of the Roman fleet for the protection of the western part of the Mediterranean. *Portici*, 4 miles S.E. of Naples, at the foot of Vesuvius, is a small town with a royal palace and 5000 inhabitants. Almost contiguous to Portici is *Resina*, a large village with 9000 inhabitants, on the site of *Herculaneum*, a Roman town which was buried under a thick bed of gravel, at the terrible eruption of Vesuvius in A. D. 79, and first discovered in 1713. *Torre del Annunziata*, a town with 9000 inhabitants, on the coast, 12 miles S.E. of Naples, at the southern base of Vesuvio, is noted for its great manufacture of military arms, and for its vicinity to *Pompeii*, an ancient city which was buried, like Herculaneum, in the year 79, and discovered in 1755. A considerable part of the ancient town has been cleared, exhibiting the remains of a forum, and of several fine temples and theatres, besides private houses, baths, and streets, which give a perfect idea of a Roman city. There are several other towns round the base of Vesuvius, as *Torre del Greco*, on the sea shore, with 13,000 inhabitants; *Somma*, with 7000; *Ottajano*, with 15,000; *Santa Anastasia*, with 6000. The neighbourhood of these towns produces the famous wine known by the name of *Lacrima Christi* (Christ's tears.) *Castelamare*, *Vico*, and *Sorrento*, three towns on the south-east coast of the bay, opposite Naples. Castelamare is an episcopal city, with 15,000 inhabitants, built in a delightful situation, above the ruins of the ancient buried city of *Stabiæ*, from which several manuscripts, statues, and paintings have been dug. Near it is *Quisisana*, a small town, with a fine summer palace of the king, and the principal building yard for the royal navy. Sorrento is a small archiepiscopal city with 5000 inhabitants, in a fine situation, noted for its excellent silk, and for its antiquities.

Terra di Lavoro.—CASERTA, 13 miles N. by E. of Naples, a small town with 5000 inhabitants, oc-

cupies a fine situation, and has a magnificent royal palace, and an aqueduct across the valley of Maddaloni, composed of three ranges of arches. The water course, of which it forms a part, is 27 miles long, and is carried through Mont Garzano by a remarkable tunnel, more than 3000 feet long. Here is also the *Colony of San Leucio*, founded by King Ferdinand IV., which exhibits, on a small scale, a model of all that is necessary for the education of the people. *Piedmonte*, noted for its industry and its great works, where the cotton of the kingdom is manufactured.—Population 5000. *San Germano*, a small town, with 5000 inhabitants, near which is the celebrated monastery of *Monte Cassino*, considered as the oldest in Europe, containing a fine church, and adorned with precious marbles and superb paintings, and a library rich in valuable documents. *Arpino*, the birthplace of Cicero, Marius, and Agrippa, is a small town with 8000 inhabitants, who are engaged in the manufacture of cloth and parchment, and carry on a brisk trade. It still contains the remains of the ancient town with its Cyclopian walls, and a large paper-work, which employs 200 people. *Atina*, a small town with Cyclopean remains. *Gaeta*, a strongly fortified episcopal city, with a harbour, one of the safest and best in Italy, and several remains of antiquity; the inhabitants amount to 14,000, besides the garrison. *Capua*, a fortified archiepiscopal city, with a citadel considered one of the keys of the kingdom, on the Volturno, 18 miles N. of Naples. In its vicinity are the remains of the ancient capital of Campania, among which there is an amphitheatre. *Santa Maria*, a large market town, with 9000 inhabitants, and a large prison, is the seat of the provincial tribunal. *Nola*, an episcopal city, with 5000 inhabitants, near the famous Phlegræan plains, is celebrated for its ancient remains, and particularly for the tombs, in which have been found great numbers of vases, and other curious objects. It was here that the Emperor Augustus died; and it is said that bells were first used here, about the end of the fourth century, by one of its bishops, to summon his people to worship. *Aversa*, an episcopal city, of 16,000 inhabitants, with a large foundling hospital and a house for idiots. *Maddaloni*, a fine town, with a royal college, and a great market held twice a-week, for the supply of provisions to the capital.

Principato Citra.—SALERNO, an archiepiscopal and commercial city, with 11,000 inhabitants, is situate on the gulf to which it gives its name; it is noted for its ancient school of medicine, and contains a lyceum, and the palace of the Intendant, one of the finest of the provincial government residences in the kingdom. *Amalfi*, a small archiepiscopal city, on the rocky coast west of Salerno, with about 3000 inhabitants, acted a distinguished part in the middle ages, by its numerous commercial navy, with which its citizens traded to all parts of the then known world. It was here that a copy of the Pandects was discovered in the 12th century, that the mariner's compass was invented, or at least perfected, and that the order of the Knights of St. John of Rhodes and Malta originated. *Nocera*, an episcopal city, with 7000 inhabitants, and a fine church of Santa Maria Maggiore, resembling the Pantheon at Rome, and one of the oldest in Italy. *Cava*, an episcopal city, with an industrious population, and a celebrated abbey, which possesses a fine library particularly rich in Lombard manuscripts. On the coast, 23 miles S. by E. of Salerno, are the celebrated ruins of *Pæstum*, or *Posidonia*, in the midst of a pestilential desert, where, after having been long forgotten, they were discovered in 1755. The principal remains are portions of the city walls, an amphitheatre, the northern gate of the city, and three temples of colossal dimensions, still very entire, and of the most admired architecture.

Principato Ultra.—AVELLINO, an episcopal city, with an industrious population of 13,000, and a royal college. *Monte Vergine*, a celebrated abbey and sanctuary, with valuable archives. *Sudefra*, a small town of 6000 inhabitants, with numerous tanneries and other works.

Molise.—CAMPO BASSO is a small town with 8000 inhabitants, a royal college, and numerous manufactures, among which the cutlery is particularly noted. The fine road which passes through it, forming the communication between Naples and the Adriatic coast, has rendered it the first commercial place in the kingdom. *Agnone*, a town of 7000 inhabitants, with copper manufactures, which are considered the best in the kingdom. *Isernia*, a small episcopal city, with numerous remains of antiquity.

Abruzzo Ultra I.—TERAMO, an episcopal city, has 9000 inhabitants, and a royal college. *Giulia Nuova*, a very small town, with an important custom-house. *Civitella del Tronto*, a fortified town.

Abruzzo Ultra II.—AQUILA, a fortified episcopal city, on a hill near the Aterno, with a lyceum, and 8000 inhabitants, is one of the best built and most commercial places in the kingdom. *Arezzano*, a town with 6000 inhabitants, near the outlet of the Lake of Celano. *Sulmona*, an episcopal city, with 8000 inhabitants, is noted for comfits, and as the birth-place of the poet Ovid.

Abruzzo Citra.—CHIETI, a fine archiepiscopal city on the Pescara, contains a royal college, a society of agriculture, arts, and trade, and about 13,000 inhabitants. *Lanciano*, an archiepiscopal city, with 9000 inhabitants, is considered as the most commercial place in the Abruzzi.

Capitanata.—FOGGIA, a well-built commercial town, in an unhealthy situation, on the Cervara, contains a tribunal of commerce, a school of rural economy, and a fine custom-house. Population of town and district about 21,000. *Manfredonia*, an archiepiscopal city, is situate on a gulph of the Adriatic, with 5000 inhabitants. *Lucera*, an episcopal city, with a royal college, a civil and criminal tribunal, and about 8000 inhabitants. *Canosa*, a very ancient town, with 4000 inhabitants, not far from the Ofanto, possesses the remains of an aqueduct, an amphitheatre, and a triumphal arch. In the vicinity is the field of *Cannæ*, where Hannibal gained a signal victory over the Romans.

Terra di Bari.—BARI, a fortified archiepiscopal and commercial city, with a harbour on the Adriatic, a lyceum, several manufactures, a fine theatre, and 19,000 inhabitants. *Trani*, a fine archiepiscopal city, on the Adriatic with a harbour, and 14,000 inhabitants. The tower of its cathedral is one of the highest in Italy. *Barletta*, a fine town, is agreeably situate on the shore of the Adriatic, with a harbour, and 18,000 inhabitants. It has a fine cathedral, and other remarkable buildings; the rich salines in its vicinity, and its flouri-hing trade, render it a place of considerable importance. *Molfetta*, an episcopal city, with 11,000 inhabitants, has linen manufactures, and considerable trade. *Altamura* is noted for remains of antiquity, and its fairs, with about 16,000 inhabitants. *Monopoli*, an episcopal city, is noted for the industry of its inhabitants, for the subterranean habitations found in the vicinity, which are supposed to have been formed in very remote antiquity. At the distance of a few miles are the ruins of the ancient *Egnatia*. *Giovenazzo* is a small town, with 6000 inhabitants, and a large foundling hospital.

Terra d'Otranto.—LECCE, the capital, is a well-built, commercial, episcopal city, with fortifications, and about 14,000 inhabitants. *Taranto*, a fortified archiepiscopal city, with extensive salines, a harbour nearly filled up, and about 14,000 inhabitants. *Brindisi*, a small archiepiscopal city, with a harbour, considerable trade, and 6000 inhabitants, is a place of great celebrity in Roman history. *Gallipoli*, a small episcopal city, with important fortifications, a harbour, and some trade. Population 8000. *Galatina*, a small trading town, in a delightful situation.

Basilicata.—POTENZA, is an episcopal city, with a civil and criminal tribunal, a royal college, and 9000 inhabitants. *Matera*, an archiepiscopal city, with a college, and about 11,000 inhabitants.

Calabria Citra.—COSENZA, a busy and commercial archiepiscopal city, with a civil and criminal tribunal, a royal college, a fine cathedral, and several other remarkable buildings. Population 9000. *Castrovillari*, a small town, with numerous plantations of cotton, mulberries, and fruit; in the

vicinity, near Mont Pollino, is made the famous cheese called caccio-cavallo. Population nearly 6000. *Longobuco*, a small town, in the vicinity of which are iron mines.

Calabria Ultra.—REGGIO, an archiepiscopal city, on the Strait of Messina, is the capital of Calabria Ultra I., with a civil and criminal tribunal, a royal college, and a considerable public library. It is considered the wealthiest provincial city of the continental part of the kingdom, for which it is indebted to the commercial activity of its citizens. Population 17,000. *Gerace*, a small episcopal city, with 3000 inhabitants; in the vicinity of which are thermal springs, and the ruins of the ancient *Locri*. *Scilla*, a small place representing the ancient Scylla, so noted for its danger to those sailing through the Strait of Messina. CATANZARO, the capital of Calabria Ultra II., an episcopal city, occupying a height between the mountains and the Ionian Sea, has a civil and criminal tribunal, a lyceum, a harbour, and 11,000 inhabitants. *Monte Leone*, an episcopal city, with a royal college, and about 7000 inhabitants. *Potrome*, a very ancient episcopal city, with considerable trade, and a harbour on the Ionian Sea. *Stilo*, a small place, with iron mines.

§ 8. *The Island of Sicily.*

This lovely island is situate in the Mediterranean Sea, adjoining the south-western extremity of Italy, from which it is separated by the narrow Strait of Messina. Its greatest length is about 190 miles, and its greatest breadth about 106, the superficial area being 8067 square English miles, and the population about 1,800,000. The island is studded with mountains; the principal range of which extends in the direction of east and west, nearly parallel to the north coast from the Strait of Messina to the western point, with a branch which starts off near the middle of the island, and stretches to the south-east, terminating at Cape Passaro. Among these mountains, and sometimes on their very tops, are plains of moderate extent, some of which are nearly 1000 feet above the level of the sea. The predominating rocks are the tertiary, secondary, and volcanic; the older formations being less abundant. Primitive rocks occur near Messina, where the prevailing species appears to be gneiss. The transition rocks constitute a chain of hills which extends obliquely from Melazzo on the north coast to Taormina on the east. A large sandstone deposit occupies a great part of the central chain, extending along part of the north coast; and resting upon it is a formation of dolomite and limestone, which compose the north-western portion of the island. Above these are marls and limestone, which are again overlaid by a conglomerate containing shells of species still existing in the Mediterranean, with a superincumbent deposit of bone breccia. Above these is a diluvial deposit, of which there are two kinds, the oldest occupying considerable heights, the newer covering the bottoms of the valleys. The tertiary rocks, so abundant in the island, contain beds of common salt, sulphur, gypsum, alum, and beautifully crystallized sulphate of strontites. On the eastern coast, from a base of eighty miles in circumference, rises the gigantic volcanic cone of *Monte Gibello (Ætna)*, to the height of 10,870 feet, of which a splendid section is displayed on the east side, in the *Val di Bove*, which penetrates far into the body of the mountain, and exposes the strata of which it is composed. Etna has been an active volcano since the dawn of history; and its huge mass seems to be entirely composed of volcanic matter. Its base exhibits all the fruit trees peculiar to the transition zone, rich corn fields intermixed with vineyards and olive groves and orange trees, producing altogether a variety of foliage, such, perhaps, as cannot be seen in any other part of Europe. Higher up is the forest region, containing the oak, the beech, the ash, horse chestnuts in the greatest abundance, and plum trees: and still higher are woods of birch, which are scanty on the southern side but very numerous on the north. Beyond the birches every thing green disappears, and the only shrub is bivona. Above all these is the region of bare lava and snow, in the midst of which the sulphur cone rises with a very steep ascent to the full height of Vesuvius, or about 3000 feet. The top of the crater, is above two miles in circumference, and, when quiescent, several hundred feet deep, pouring forth sulphureous vapour from thousands of small openings. The only perpetual snow, however, occurs in shaded crevices, above the height of 9000 feet. Sicily is not rich in metals; the mountains to the north-west of Taormina present traces of a gold mine said to have been worked at a very remote period; mines of silver, copper, lead, and iron are also mentioned. Beds of sulphur occur abundantly in the blue tertiary clay, from which Europe has long been supplied with that mineral. The blue clay also contains beds of rock salt, of which the most considerable are at Alimina, north-east of Castro Giovanni, where this substance is found both massive and crystallized. The climate of Sicily is very much the same as that of Calabria; its summers are very hot, while, on the contrary, frost is scarcely known in winter. The natural vegetable productions, and the objects of agricultural industry are likewise nearly the same. The wheat of Sicily is reckoned the finest in Europe; the vine is also extensively cultivated, and produces in some places excellent wine. The sugar cane, the custard apple, and the date, are cultivated; and the enclosures are surrounded by the American aloe, which forms an impenetrable fence. By the side of the plane, the poplar, and the willow, grow the cactus tuna, or prickly fig, the orange, the citron, the olive, the myrtle, the laurel, the carob tree, and the pomegranate; while arbutus and tamarisk abound upon the coasts. The dates of Girgenti on the south coast are said to be excellent; but at Palermo, on the north coast, this fruit is found only in gardens. Sicily was in ancient times the granary of Rome, and still possesses the same fertile soil, and the same capability of abundant productiveness; but the system of rural and political economy in the island is such, that it sometimes does not produce corn sufficient for the consumption of its own inhabitants. Wild animals are very scarce, and even sheep are almost unknown; hares and rabbits are now almost the only native quadrupeds to be met with, and even the latter are not common; but, to compensate this deficiency, there are vast flocks of water-fowl in the marshes of Leontini and Syracuse, and quails in incredible numbers pass over the island for the northward in spring. Bee-eaters, orioles, rollers, are then common everywhere, and are pursued by numerous hawks and owls. The African flamingo is not uncommon in the marshes of Syracuse, and the pelican is also an occasional visitor. The purple heron, the night heron, the little bittern, the long-legged plover, the glossy ibis, the pratincole, and several other rare European species are also among the common migratory visitors. Insects are numerous; and flights of locusts have occasionally afflicted the island. The most destructive invasion of these insects appears to have happened in the beginning of last century, when they spread devastation and ruin over the island during a period of five years. The Sicilians partake of the general character of their Neapolitan neighbours, profess the same religion, with the concomitant characteristics of ignorance and superstition, and are subject to the same ruling power. The despotic character of the government, together with the exorbitant feudal privileges of the grandees, have reduced the body of the people to the lowest state of penury; while the want of roads, or the badness of those that exist, prevents much internal communication or trade. Sicily, however, produces some wines that are esteemed by foreigners; the raw silk of the island is also fine; and these articles, with olive oil, fruits, sulphur, and salt, afford materials for exportation. In return she receives manufactured goods in great variety, though in small quantities, on account of the prevailing poverty of the people, who cannot afford to purchase anything beyond the coarsest articles of furniture and clothing.

Sicily forms a portion of the kingdom of the Two Sicilies, and possesses, in theory at least, a representative constitutional government, established in 1812; but since 1815, this has fallen into complete abeyance; and the island is now under the uncontrolled sway of the King. For administrative pur-

poses it is divided into valli or intendancies, districts, and communes, corresponding to departments, arrondissements, and communes in France. Each valle is placed under the charge of an intendant with a council. Civil and criminal justice are administered in the king's name by conciliators, judges of circuit and instruction, tribunals of commerce and civil matters, superior courts for civil, criminal, and special adjudication, all of which are amenable to one supreme court. The judges amount to 250; the lowest class of whom, the judges of circuit, have salaries varying from £38 to £80; the highest, those of the supreme court, receive £415 per annum, and the president of the latter £615. The property of the island was valued in 1811, when the British garrison and fleet created a great demand and high prices for the produce of the country, and that valuation has been continued as the basis on which the land and house-tax is levied. On this valuation a tax of 7½ per cent was first raised; it was afterwards increased to 12½; and now amounts, taking together the former and the present value of produce, to 21, and in some cases to 60 per cent. of the produce. The nett annual revenue amounts to about £1,000,000 sterling; of which one half is transmitted to Naples. About £370 are professedly expended in improvements; the remainder is appropriated to the officers of government, and to the maintenance of criminal prisons. There is no country which is so highly taxed; nor is there one which derives less benefit from its government. Primary and secondary schools figure in every commune; colleges and academies are established in twenty-one towns, and in the two universities of Palermo and Catania, are 81 professors, and about 1250 students. There are besides Jesuit schools, three episcopal academies for divinity students, and boarding schools at Palermo for the gentry. Females belonging to families of distinction are educated in convents; but with all these means, the people, from the highest to the lowest, are, with few exceptions, remarkably ignorant. There are several libraries and museums of natural history at Palermo and Messina, with hospitals and other institutions for the relief of the sick, and lodging the insane. But, of all the public establishments, the prisons seem especially to claim the attention of the government, not, however, with the view of promoting the comfort of the prisoners, but their security. The state and criminal prison on the island of Marittimo contains, perhaps, the strongest and most hideous dungeons in the world, to which the prisoners are lowered several hundred feet from the rocky height above, and are seldom, if ever, heard of afterwards. The island contains three archbishops, and ten bishops; with priests in every commune. The church is chiefly maintained by revenues from landed estates; but the priests are paid by the communes. There are 660 monasteries, belonging to twenty-one or twenty-two orders; and the number of monks has been stated to amount to from 12,000 to 15,000.

Agriculture, pasturage, fisheries, the sulphur mines, and a few manufactures, form the principal occupations of the people. The land is chiefly belong to the nobility; but, as estates are now divided by law among the children, instead of going, as formerly, to the eldest son, the princely incomes formerly enjoyed by some of the nobles have dwindled away to a third or a fourth; and, in the course of time, their estates will be frittered down to very small possessions. Owing to the oppressive amount of the land-tax, many fertile tracts remain uncultivated. Sicily is the only European country where we find numerous modern ruins, consisting of whole towns, which have ceased to be inhabited within the last century. The distribution of the land is estimated thus: — Cultivated as arable, or corn lands, 3,125,000 acres; vineyards, 115,000; vegetable and fruit gardens, 260,000; woods and olive plantations, 1,125,000; entirely waste, though nearly all fertile, 1,265,000; pastures, fertile, but chiefly waste, 1,125,000; total, 5,163,000 acres. Over the whole island the art and implements of agriculture, and the dwellings of the people, are in the most wretched condition. Indeed, were it not for the fruit of the Indian fig, which grows wild and in abundance, the agricultural produce of Sicily, once the granary of Rome, would not probably maintain two-thirds of its diminished population. It produces, however, good crops of wheat, barley, beans, tobacco, cotton, hemp, flax, &c., with scarcely more cultivation than scratching the surface of the ground to admit the seed. With few exceptions, the horses, mules and asses are small and ill made; the Tunisian or reddish brown breed of cattle are large, strong, finely formed, and have generally long horns; the native or black breed are much smaller. There are many large and fine flocks of merino sheep; but the native breed is small and yields coarse wool. The goats are a tolerably good breed, and their hair is made into cloth. The swine are of a very inferior description. With the exception of the vine, a great deterioration appears to have taken place in the cultivation of fruit; the best olive trees are those which were planted many centuries ago by the Saracens. The oranges and citrons are delicious, and are collected with more than usual care. The forests have nearly disappeared; the woody region of Etna, and the woods of Caronia, on the northern mountains, consist chiefly of various kinds of large oak, elm, firs, and ash. Staves for wine casks and ship timber are imported; for, so far from being able to export any wood, great difficulty is now felt in procuring even fuel for cooking. Of the vines the black grape is the most general and abundant, though it is often planted promiscuously with the white. Except on the high grounds, the vintage usually begins in the latter half of September. The wines of Marsala, Mazzara, and the adjoining districts, are those chiefly exported. This wine is produced from a mixture of white and black grapes, to the amount annually of 30,000 pipes, of which from 18 to 20,000 are exported. Along the north coast, the slopes of the mountains and the valleys are almost entirely covered with olive trees; but on the south and west coasts, and generally in the interior, olive groves are rare, and do not furnish oil sufficient for the use of the inhabitants. Part of the east coast, north of Catania, produces the olive tree in great perfection; the olives are gathered in low situations in October; and in higher places, from October to January. Sicily produces silk in small quantities, to the extent of only about 400,000 lbs. a-year; the greater part of which is manufactured into ordinary silk stuffs at Catania. Cotton is cultivated in small patches, but very negligently; and scarcely enters into the exports. Dye stuffs, barilla, honey, liquorice, and many other articles might be cultivated to a great and profitable extent; but these are all totally neglected.

The principal mineral production is sulphur, the mines of which extend over a great part of the centre, and down to the south coast of the island. The mineral is imbedded in blue marl, but is occasionally found also in gypsum and limestone. The mines have been known and wrought for more than three centuries; but the quantity dug and prepared for exportation was unimportant, until within the last fifteen years, when the discoveries in chemistry caused an extraordinary quantity to be successfully applied to manufacturing purposes. British capital and industry were applied to its production; about 300 ships, of from 150 to 350 tons, were annually employed in the trade between Great Britain and Sicily; the capital, profit, and wages so employed amounted annually to at least £2 000,000 sterling, besides the large sums invested in buildings and the machinery necessary for working the mines. This rapidly prosperous state of things excited the cupidity of certain interested persons, who persuaded the king to grant them a monopoly of the sulphur trade, on the ostensible ground of protecting the proprietors of the mines from the bad effects of over-production. For this they were to pay to his Majesty an annual premium of 400,000 ducats; but the effect of the monopoly was almost immediately to reduce the trade to its former insignificance, to the great loss and injury of those who had embarked their capital in it. The king, however, has been recently obliged, by the threats of the British government, to recal the monopoly, and restore the trade to its former footing.

The fishery of Palermo employs from 600 to 1000 boats, with 3500 fishermen, and the produce is valued at from £20,000 to £24,000 a-year. There are twenty-two tunny fisheries, of which six are at Palermo, seven at Trapani, four at Melazzo, and five at Syracuse; each fishery employs about fifteen boats. The sword fishery is confined chiefly to the straits of Messina, and the produce is consumed

on the island. The anchovy and sardine fishery is carried on at Siculiana, where it is begun after Easter, by the fishermen of Palermo, Termini, and Cefalu, who cure and pack up the fish for exportation. The coral fishery is chiefly followed by the Trapanese, who go for the purpose to Bona in Africa; the coral is polished and worked at Trapani, and sent to Catania, Naples, Leghorn, and other places. Before 1816 the foreign trade of Sicily was chiefly in the hands of the Genoese, the Ragusans, and the French; the Sicilian vessels being then chiefly limited to the coasting trade, from the fear of being taken by the Barbary corsairs. There belong at present to the several ports of Sicily about 2250 vessels of all kinds, measuring about 43,000 tons, and employing about 25,000 men and boys. — (*Report of the Commercial Statistics of the Kingdom of the Two Sicilies, by J. Macgregor; presented to Parliament, August* 1840.)

Sicily is divided into seven valli, or intendancies, as stated in the following table:—

Intendancies.	*Cities and Towns.*
Palermo, ...	PALERMO, Monreale, Corleone, Termini, Cefalu, Bisacquino.
Messina, ...	MESSINA, Milazzo, Patti, Mistretta, Randazzo, Taormina, Castroreale, Lipari.
Catania, ...	CATANIA, Aci Reale, Mascali, Paterno, Bronte, Nicosia, Caltigirone.
Siragosa, ...	SIRAGOSA (*Syracuse*), Agosta, Noto, Spaccaforno, Ispica, Modica, Scicli, Ragusa, Comiso. The islet Marzamene.
Caltanisetta, . . .	CALTANISETTA, Leonforte, Mazzarino, Terranova, Piazza, Castro Giovanni, Pietra-Perzia.
Girgenti, ...	GIRGENTI, Aragona, Palma, Naro, Mussomeli, Sciacca, Sambucca, Alicata, Cannigati, Catolica, Bivona. The islands Pantellaria, Linosa, and Lampedosa.
Trapani, ...	TRAPANI, Monte Giuliano, Castelamare, Alcamo, Calatafimi, Salemi, Castel Vetrano, Mazzara, Marsala. The islands of Favignana, Maretimo, Levanso, &c.

PALERMO, the capital of Sicily, is a large and fine archiepiscopal city, agreeably situate on the northern coast, in a luxuriantly fertile and well-cultivated plain, named La Conca d'Oro (the golden shell), which is enclosed on three sides by mountains, and opens on the north to a spacious bay. The houses are all flat-topped, and, instead of windows, have balconies with glass doors; the streets are well laid out, and almost all terminate at two of the principal thoroughfares. Several fine public buildings, seven squares, and fine walks, the best of which is the *marina*, lying along the shore, a university, and several other literary establishments, an active commerce, and 130,000 inhabitants, entitle Palermo to rank among the principal cities of Europe. The fete of St. Rosalia attracts every year in July, an immense crowd of people from all parts of the island, and gives a great stimulus to the trade of the city, which is otherwise very considerable. *Monreale*, an archiepiscopal city, west of Palermo, has a royal college, and 18,000 inhabitants. *Corleone* has a royal college and 12,000 inhabitants. *Termini* a fortified seaport town on the coast, east of Palermo, has a royal college, a nautical seminary, and celebrated mineral waters, with a population of about 11,000. *Cefalu*, an episcopal city, with 9000 inhabitants, 40 miles east of Palermo, has a harbour, a school of navigation, considerable fisheries, and trade. In its neighbourhood are some Cyclopean remains.

Messina, a large and fine episcopal city, with an industrious and commercial population of 85,000, possesses the finest harbour in the kingdom, and one of the best in Europe, and occupies a delightful situation on the west side of the strait to which it gives its name. The city has been rebuilt since 1783, when it was almost entirely destroyed by an earthquake. It has a citadel, and is otherwise strongly fortified; and its environs are the most densely inhabited, and the best cultivated part of the island. The exports are oil, currants, raisins, wine, almonds, lemons, sumach, and other produce of the island. *Taormina*, 30 miles south of Messina, a small town, in a beautiful situation on the coast, contains a Roman theatre, cut in the rock, a naumachia, a cistern, and an aqueduct; it maintained against the Saracens a siege of 80 years' endurance. *Catania*, a large archiepiscopal city, with wide and straight streets, and a good harbour on the eastern coast, stands at the foot of Mount Etna. It has suffered severely from earthquakes, but nevertheless still contains the remains of an amphitheatre, larger than the Colosseum at Rome, and other Roman antiquities. It contains a university, a lyceum, a public library, a museum, and other literary establishments. The silk stuffs of Catania rival the best in the kingdom; the population amounts to about 40,000. *Aci Reale*, N.E. of Catania, a clean and well-built town, stands on streams of lava, and contains 14,000 inhabitants. *Bronte* gave the title of Duke to the celebrated Lord Nelson, but his estate, to which the title was attached, has been, since his death, completely destroyed by the eruptions of Etna, at whose base it is situate. *Siragosa*, a fortified episcopal city on the east coast, with 14,000 inhabitants, a large natural harbour, a royal college, two seminaries, a library, and a museum, stands amidst the ruins of the ancient *Syracusa*, which cover a space of 20 miles in circumference, and of whose five magnificent and populous districts, the small island of Ortygia is the only one now inhabited. Its harbour, formerly one of the finest in the Mediterranean, was long believed to be so choked with sand as only to admit chebecks or brigantines, till Lord Nelson proved the contrary, in 1798, by sailing right into it with his ships of war and frigates, and finding excellent anchorage. The celebrated fountain of Arethusa which flows through the town in a stream 4 feet deep, has become turbid and muddy, and is now used for washing the clothes of the citizens. *Agosta*, the ancient *Augusta*, to the north of Syracuse, is a small fortified city, in a delightful situation, with a harbour, and 10,000 inhabitants. *Noto*, a finely situate and well-built city, with 13,000 inhabitants, four miles from the shore, and 17 miles S.W. of Syracuse. *Caltanisetta*, a large well-built inland town, with 16,000 inhabitants, 60 miles S.W. of Palermo.

Girgenti, an irregularly-built episcopal city, on the south-west coast, is situate on a hill, 1100 feet above the sea, not far from the shore, where it has a harbour. It has some fortifications, and about 15,000 inhabitants. In its neighbourhood, at Girgenti Vecchio, are the remains of *Agrigentum*, consisting of the Temple of Concord almost entire, the Temple of Juno, and the ruins of the Temples of Ceres, Proserpine, Hercules, Apollo, Diana, Castor and Pollux, Esculapius, and the Olympian Jupiter, the last of which was never finished, but was constructed with enormous columns 120 feet high. The pier of the harbour of Girgenti has been built from the ruins of these magnificent temples. *Aragona*, a small town with 6000 inhabitants, 6 miles N.E. of Girgenti, is noted for its picture gallery, its antiquities, and the singular mud volcano of *Macaluba* or *Mocaluba*, in its neighbourhood. Here, on a level surface, are numbers of scarcely perceptible openings, from which at regular intervals, and with a hissing sound, little explosions of gas burst; while, at the same time, a white and very delicate marly slime wells out, and flows in a sluggish stream. *Castro Giovanni*, a large town, with 11,000 inhabitants, and a royal college, is situate on a high mountain, almost in the middle of Sicily, in the locality of the ancient *Enna*, so noted for the rape of Proserpine, and for the magnificent temple of Ceres, who was worshipped there. *Sciacca*, 32 miles W. of Girgenti, a little seaport town, is built on a green hill, amidst a profusion of cactus; off which, at the distance of about 20 miles, a volcanic mount rose from the sea to a considerable height in 1833, and soon afterwards disappeared, leaving only a bank in its place.

Trapani, a busy commercial fortified town, with a royal college, a tribunal of commerce, and 24,000 inhabitants, built on a peninsula, at the western extremity of Sicily. Its inhabitants are largely engaged in fishing coral, part of which is carved into necklaces, and exported even to India, by way of

Alexandria. The Trapanese are also expert carvers in ivory, alabaster, amber, mother-of-pearl, &c. *Marsala*, a large seaport town, about 20 miles S. by W. of Trapani, has a royal college, and 21,000 inhabitants. Its harbour is encumbered by sand, but its celebrated wines furnish an important article of export. There are here six wine establishments, four British, and two Sicilian; three of the British are on a large scale, and have from 8000 to 20,000 pipes in annual deposit; the fourth, recently established, only requires time to be equally extensive. The wines have only come into repute since 1802, when they were introduced by Nelson, for the use of the British fleet. *Castel Vetrano*, 25 miles S.S.E. of Trapani, with 13,000 inhabitants, is noted for its coral articles, its alabaster works, and particularly for its vicinity to the remains of the ancient *Selinus*, where are still to be seen enormous heaps of ruins, which the people of the country call the pilleri de Giganti (Giant's pillars.) In the midst of a pile of ruins resembling massive rocks, rise several gigantic columns, of the same style of Doric architecture as those of Segesta and Girgenti; while many others lie in confusion on the ground. *Alcamo*, an archiepiscopal city, with a royal college, and 18,000 inhabitants, 25 miles west of Palermo. In the neighbourhood is the site of the ancient *Ægesta*, called also *Egesta*, *Acesa*, and *Segesta*, where is a temple in very good preservation; but everything else is reduced to a mass of shapeless stones and rubbish. *Mazzara*, a small city, with narrow, ill-paved, and dirty streets, surrounded by a Saracenic wall, on the south-west coast, has a considerable trade in exporting grain, pulse, cotton, wine, fish, fruit, barilla, madder, oil, and soap.

Malta, Gozo, Comino.

This group of islands is situate in the Mediterranean sea, between 35° 45′ and 36° 6′ north lat., and 14° 9′ and 14° 35′ east long., about 63 miles S.W. of Cape Passaro in Sicily, and extends in a line from north-west to south-east, a length of 28 miles, divided by two straits which are separated by Comino, the central island. Malta, the largest, is of an irregular oval figure, about 16 miles in length by 8 or 9 in breadth, and is composed of calcareous rocks, which slope like an inclined plane from the level of the sea towards the south and east, where they attain the elevation of nearly 200 yards. The surface is composed of small valleys, defiles, and hills, which extend across the breadth of the island. In most places the rock is entirely naked, except where the hand of industry has placed over it a layer of travelled earth, brought originally from Sicily and other places. Gozo, the most northerly, is more elevated than Malta, and is entirely surrounded with perpendicular rocks, the highest of which are to the west and south, where they are very steep. The surface is not so uneven as that of Malta, and is consequently more easily cultivated; the pasture land is good, and great numbers of cattle are fed on it for the use of Malta. The grapes of Gozo are peculiarly fine, and are highly esteemed by the Maltese. Cotton and grain are cultivated with success; the air is particularly salubrious, and the country presents many agreeable prospects. Comino is a small island, two miles in length, between Malta and Gozo, and partakes most of the character of the latter. The two channels which it forms have from 12 to 20 fathoms water, and are safely passable by the largest ships in mid-channel, in which, too, there is good anchoring ground of fine sand. The greater part of the land in Malta is planted with cotton It also produces wheat, barley, and a grain called tommon, which grows in the poorer soils, sometimes mixed with wheat, and sometimes with rye. Both Malta and Gozo produce fruit of exquisite flavour, with excellent roots and very fine odoriferous flowers; cummin, aniseed, laricella, and a lichen which grows on the rocks exposed to the north, and is used for dying an amaranthine colour. Gardens are numerous in Malta, especially towards the east, which are generally ornamented with orange and lemon trees; the greatest attention is paid to them, and they are commonly watered twice a-day from cisterns hewn in the rock, with trenches dug round about to collect the rain. Bees are kept in great numbers; the honey is delicious, and remains always liquid. There are numerous asses of a strong breed; the sheep are very prolific, and exceed 12,000 in number. About six or seven thousand beeves are also maintained, and five or six thousand horses of all kinds. But, besides the food produced from the soil, there are several hundred boats employed in the fisheries, for the daily supply of the markets. In August and September a fish is caught resembling the dolphin, which is called at Malta the lampoukeag. The climate is delightful; the four seasons are regularly defined, and the country is remarkably salubrious. The Maltese are a mixed race, principally Italian and Arabic. Their language is, like themselves, an Italiano-Arabic dialect, intelligible to the natives of the opposite shore of Africa; but pure Italian is used by the mercantile and higher classes, and English, which is the language of government, is generally understood in some degree by the natives. The Maltese are a robust, active, and temperate people; but, from want of employment, are still very poor, wasting their energies in idleness. Their condition has, however, been greatly improved since they became British subjects, by the opening up of new sources of industry, and some of them have become the best sailors in the Mediterranean. They are bigoted catholics, and very superstitious and fanatical; but education is spreading, and will by and by modify their character. The population of Malta in 1836 amounted to 106,614, being 1122 24-95ths to the square mile; that of Gozo to 16,534, being 612 10-27ths to the square mile. The total value of imports in that year amounted to £685,531, and of exports, £307,942. The shipping inwards, 1,963 vessels, with a burden of 199,500 tons; outwards, 2083 vessels, burden, 216,267 tons. The capital of the islands is *Civita Valetta*, on the north-east coast, built upon a tongue of land extending into a bay, so as to form a splendid harbour on each side, where also the projecting points are occupied by towns and forts; the city itself and the suburbs being surrounded by impregnable fortifications, parts of which are cut out of the solid rock. The streets of Valetta are narrow and steep; but it contains some splendid buildings, which still attest the magnificence and the devotion of its former masters, the Knights of St. John, to whom the island was gifted by the Emperor Charles V. after they had lost Rhodes, and was possessed by them till 1798, when they were dispossessed by the French. Valetta surrendered to the British in 1800, after a two years' blockade, and was confirmed to Britain by the peace of 1815. The *Civita Vecchia*, or old town, is situate nearly in the centre of the island, and is called by the natives *Medina* (i. e. the city); it is an episcopal see, and contains a large cathedral, besides several other churches. It stands on so high ground, that in a clear day the whole islands, and the coasts of Sicily and Africa, may be seen, both at the distance of about sixty miles. The catacombs are very extensive, and of great celebrity. The island contains besides, twenty-two casals or villages. Near the western part of the north coast is the *Calle de San Paulo*, or haven where St. Paul is said to have landed after his shipwreck; though some critics consider the island of Meleda on the Dalmatian coast, to be that on which the Apostle was cast. Gozo contains six casals or villages, two castles, and a fortress on a rock of 300 yards in diameter, in the interior of the island.

TURKEY IN EUROPE.

ASTRONOMICAL POSITION.—Between 39° and 48° 15′ N. latitude, and 16° and 30° E. longitude.

DIMENSIONS.—Turkey, in its present restricted limits, exclusive of Greece and the adjacent Islands, but embracing the tributary principalities of Moldavia, Wallachia, and Servia, extends from E. to W. in its greatest length about 700 miles, from the western border of Croatia to the Channel of Constantinople, or the mouths of the Danube; and from N. to S. in its greatest breadth, about 650 miles, from the northern frontier of Greece to the N. E. frontier of Moldavia, including an area of nearly 180,000 square English miles.

BOUNDARIES.—*Northern*:—The Military Borders of Croatia, Sclavonia, Hungary, Transylvania, the Buckowine, and Bessarabia. *Southern*:—The Archipelago, and the northern frontier of the Kingdom of Greece. *Eastern*:—The Black Sea, Channel of Constantinople, Sea of Marmora, and the Dardanelles. *Western*:—The Ionian Sea, Channel of Otranto, Adriatic, and the Austrian provinces of Dalmatia and Croatia.

GENERAL ASPECT.—The greater part of Turkey is occupied by a series of lofty mountain ranges, which form and inclose high valleys and table lands, leaving only in some places a narrow border of lowland along the sea coasts. Such is its general character between the Danube and the frontier of Greece; but to the north of the great river, the country sinks into a plain which stretches north-eastward to the frontiers of Russia and the Carpathians, and includes the principalities of Wallachia and Moldavia. According to Dr. Boué, even the best maps are erroneous and defective; containing not only false names, but wrong places, and erroneous positions. Hills, and even large rivers, are entirely omitted; while the hills marked in many parts are merely imaginary representations. All maps exhibit a great central chain, extending from the north-west, in an easterly direction to the Black Sea, supposed to be a continuation of the Alps, or, at least, to be connected with them by the hilly region at the north-eastern corner of the Gulf of Venice. But, in reality, the Balkans, from Sophia to the Black Sea, are only a range of moderate heights; the central part of the chain may be crossed anywhere in a day, and in some places even in a few hours. Indeed, the site of these pretended lofty mountains is, in some places, occupied by molasse hills.

GEOLOGY.—The central nucleus of Turkey consists of a high undulating country or plateau, extending from east to west between Sophia and Pristina, and forming the upper part of the basin of the Morava. To the northward of this plateau the limits of Servia are defined from E. to W. by the *Jastrebacz* (chain of the Sparrow-hawks), the *Plocsa*, and the *Kopaonik*. The first chain is covered only with oaks, and higher up with elms, like the hills in middle Servia, but the two latter have fir trees near their summits. The greatest elevation of the chain appears to exceed 5500 feet. The Jastrebacz is a mass of crystalline slaty rocks, the others consist of transition slates, with syenite, diallage rock, serpentine and metalliferous deposits. Southward of the plateau is a pretty large group of hills, named the *Kurbetska-planina*, probably the *Orbelus* of the ancients, which have an absolute elevation of between 4000 and 5000 feet. To the west and east of this group are low chains clothed with oaks, and forming the northern frontier of Macedonia from Uskub to Dubnicza and Sophia. These hills are chiefly composed of talcose or micaceous slates, and scarcely reach an elevation of more than 3000 feet; they are still lower in some places to the west of Kostendil (Ghiustendil), where they partly consist of transition limestone, and even of tertiary molasse. The Orbelus itself is a massive mountain of granitic rocks blendid with gneiss; and in its vicinity are found trachytes, which are connected with those of Karatova. Trachyte also extends along the low central chain, from Strazin in Macedonia to the vicinity of Vranja, south of the Morava. A sulphureous hot spring issues forth at the northern extremity of these hills.

On the eastern border of the central plateau, south of Nizza, are situate the lofty *Stari-planina* (Old Mountain), and *Suro-planina* (Dry Mountain), limestone ridges, occurring next to the mica slates of Baditschka-Gora. A very extensive group of mica slate and talc-slate hills rises more to the south, between the Morava valley and those of Irn and Sukova. On the north-eastern base of this group are found trachytes and trachyte conglomerates; but on the very steep southern declivity porphyry dykes occur in the slates; while the tops of some of the hills are composed of trachyte, and a white trachyte aggregate. Here, as in the Servian hills, elms cover the low flats, oaks the sides, and pasturage the summits, the chief of which is the broad *Snegpol* (Snowfield.) The last mountain is a little higher than the Stari-planina, and attains an elevation of nearly 4350 feet. The Snegpol is united by the ridges above the village of Klisura (defile) to the *Kurbetska-planina*, and the hills of *Egri-palanka*. The talc slates of which these ridges are formed, are often decomposed, and contain microscopic crystals of magnetic iron ore, which is washed and smelted in many places. These hills completely separate the upper valley of the Morava from that of Irn, whose stream flows into the Sukova and Nissava. To the south-east of this group are lower ridges composed of limestone and newer transition slate, or Silurian rocks, with numerous defiles or rents running nearly N.-S. These hills extend to the great valley which leads from Nizza to Sophia, and which is excavated, particularly towards the east, in a conchiferous limestone, probably belonging to the Jura formation. All the above-mentioned chains are inhabited by a pretty dense population of industrious Bulgarians.

To the west of the central plateau lies the *Pristina*, or *Kostova Plain*, surrounded by low hills, which rise only 800 or 1000 feet above it, whilst its own absolute height is 1400 feet. The hills are chiefly composed of talc or mica slate, with some serpentines and amygdaloidal limestones; and are covered with forests, chiefly of oak. The central plateau itself is occupied by hills a little higher than those last mentioned, and contains valleys or basins formed by the rivers Morava and Toplitza, and their defiles. The valleys are covered with villages, and cultivation extends far up among the hills. The Morava valley is composed of tertiary beds of an argillaceous or sandy nature, as near Nizza and Laskovacz: alluvial beds occur higher up in the Vranja basin. Some trachytic eruptions have taken place to the south-east of Laskovacz, and siliceous limestone, probably of fresh water origin, occurs to the north-east, near Sheshiné, at the foot of the hills to the east of the Morava. Between Radomir (at an elevation of 1614 feet, on the eastern side of the Strymon), Bresnick, and Sophia, is a long plateau, nine miles broad, and composed of tertiary augite porphyry. To the south rises the mountain *Wistoska*, or *Wistosh*, with its limestones, slaty and granitic rocks, argentiferous ores, and abundant springs; its height may be estimated to exceed 4000 feet. To the west it overtops the bare hilly country round Radomir, and to the east the beautiful plain of Sophia, which has an elevation of only 1348 feet.

The ranges to the south of the central plateau are united geographically to the *Despoto-dagh* or *Rhodopé*, and *Balkan* or *Hæmus*, by means of the Wistoska, together with some granitic and syenitic hills, at the base of the Rhodopé, and three or four low ridges running obliquely from Barja to Ichtiman. These last are composed of mica slate, gneiss, and granite, with some granular limestones, and have an elevation from 2000 to 2356 feet. At the base of the Despoto-dagh they are crossed by the *Kix-derbend* (Girl's defile), running W.-E., and composed at its narrowest part of granular limestone. The road from Tartar Basardschik to Barja is carried along it; but this must not be confounded with another defile of the same name to the south-west, between Rasluk and Neurokop. The passage of this deep defile occupies nine hours, and all around it appears a chaos. At Somakov the alluvial soil is full of microscopic particles of magnetic iron ore; for the smelting of which there are several foundries, and the Pasha of Sophia has built one after an English plan. The *Despoto-dagh* or *Rhodopé* does not extend to the Dardanelles, as all maps indicate; its highest summits are situate towards the west, to the south of Barja, Samakov, and Dubnicza, and reach an elevation of 8000 feet, or probably still higher. There it is called by the Servians *Rilo-planina*, and by the Turks *Rilo-dagh*; towards the east it takes the names of its great valleys. The chain gradually diminishes in height from west to east, and terminates rather abruptly about five leagues from the Maritza, and six leagues S.W. of Adrianople. The declivities on the northern side are generally steep. Pine trees occur highest up among the hills, next to them are elms, and lower down oak forests. A number of rents running N.-S., form deep valleys, adorned with monasteries, villages, and cottages, and serving as the passes by which the chain is crossed. The chain is composed of crystalline slates, gneiss, granite, and granular limestone, of which some isolated portions are also found in the northern tertiary basin; and at Philippopoli sienite forms four small hillocks in the town, or close to it. From the Archipelago to beyond Kara-bunar (south of Dimotika), is a long stripe, running S.-N., of trachyte and trachyte conglomerate. On the northern base of the Rhodopé hornblendic trachytes are found in some parts of the Semidsche valley; the trachytic country is partly a stony barren soil, and partly covered with low trees of the pallurus aculeatus. It is fertile only where the conglomerates are in connexion with the tertiary argillaceous-calcareous beds. South of Adrianople, between the Maritza and the Dardanelles, are the low ridges and plateaux of the *Tekir-dagh*, in which molasse is associated with clay, and a sand which occasionally contains shells, with numerous fragments of scilicified coniferous wood. Coralline and shelly limestones are found on the sands of Malgara, and particularly on the western banks of the Maritza, near the trachytic zone round Fered. The greatest elevation of the Tekir-dagh may be nearly 900 feet. To the south-east of Aimadtschik, is a somewhat higher ridge, which, near the Sea of Marmora, is probably 300 or 400 feet higher than the Tekir.

The *Balkan* or *Hæmus* extends from Sophia to Emineh-burun, on the Black Sea; the western part being called *Veliki-balkan* (or Great Range), and the eastern *Malo-balkan* (or Little Range.) It is a much lower chain than the Despoto-dagh; the southern slopes are generally very steep; but on the northern side it is only the highest ridge which is much inclined. The Balkan is almost destitute of subordinate chains towards the south, and is composed of the principal high ridge, and a series of parallel low ranges, which diminish in height towards the Danube. Among these are long valleys extending east and west, and occasionally rents intersect the ridges from north to south, and are occupied, as in the Alps, by the great rivers which issue from the long valleys. The western portion of the chain, *Kodja-Balkan*, at the source of the Osma, probably reaches an elevation of more than 4000 feet; but near the sea the summits are only from 1800 to 2000 feet above its level. There is an oblique and pretty high ridge to the west of Czatac and Bashkoe, which separates the waters of the Bebrova from those of the Akali-Komtschik. The high Balkan is composed of crystalline slaty rocks, gneiss, mica-slate, talc, and clay slate. Above Islivné (*Selimno* of maps), near the middle of the Balkan, are some very picturesque hills of quartziferous porphyry; and among these the peaks of the *Tschatal-dagh* (rent hill), rise to the height of 2800 feet, and afford a most beautiful view of Roumelia. Immediately above these older rocks of the Balkan is a thick formation of green sand, composed of marly greyish sandstone, quartzose and greenish-coloured sandstones, and beds of marly clay, and whitish, greyish, or black compact limestone, which forms thick beds, and occasionally craggy precipices; but the other rocks, except the green sandstones, form only hills, which are generally either covered with oaks and elms, or, being destitute of trees, are used as pasture grounds. At the east end of the Balkan the green sand is covered with extensive plateaux of chalk, with flints and belemnites. Between the Balkan and the Danube, Bulgaria is covered by a great tertiary formation, which becomes broader as we proceed from east to west. The Danube flows past a series of small hills on the Bulgarian side; but on the northern or Wallachian side, the country is flat. The isthmus between Rassova and Kostendsche, on the Black Sea, is occupied by alluvial matter, and some low tertiary hills; and the Danube can never have had its channel there in historical times. South of the Balkan there exists only one subordinate chain, at some distance, consisting of low hills of transition slate and limestone, extending between Kalofer (Caloper), Eski-Sagra, and a place west of Islivné, where the Tondja issues through a defile from its upper alluvial basin. This basin is the plain which extends between Tschipka, Kezanlik, and Czirkua, and it is on it that roses are cultivated for making attar.

From Islivné to Burgas, on the Black Sea, there is an extensive hollow at the base of the Balkan. The remainder of the chain bounds the vast tertiary gulf whose surface forms the present soil of a great part of eastern Roumelia or Thrace. The southern base is remarkable for the exuberance of its vegetation, consisting of gardens of roses, jasmine, and wild lilac, vineyards and forests of all kinds of fruit trees, but without the olive-tree, the anis, or the lepleb. The adjacent plain, however, is destitute of trees, and consists chiefly of fields under cultivation, and pasture grounds, which are partly marshy, with a black soil. This alluvial and tertiary plain extends to the chain which runs along the Black Sea, the Sea of Marmora, and the Archipelago. In the plain north of Adrianople small groups of isolated hills composed of trachyte are occasionally met with; and in the north-eastern portion of the basin is a very extensive undulating plateau formed of augite pophyry, and extending from the foot of the Balkan, north of Aidos, to the gulf of Burgas and Karabunar on the Curu. In

the wild and wooded country between Aidos and Burgas is a hot sulphureous spring. The chain which extends along the south-western shore of the Black Sea is not in immediate connection with the Balkan; but, speaking geographically, is only a continuation of the chain at Eski Sagra. On approaching the Bosphorus the shore chain is divided into a number of small hills which rise on low-lying plateaux. Near Seral are clay slates, which extend to the Bosphorus, and alternate with grey-wacké and silurian shell limestone. To the north of Buyukdereh is a small trachytic district.

To the west of the central plateau of Mœsia is Upper Albania, a country occupied to the east and south-east by the lofty *Tschar*, and to the south by its prolongation, consisting of the high ridges interposed between the wild primary valley of the Debres and the plain of Bitoglia and Perlepe, with the valley of Kalkandel, called Tetovo in the Bulgarian tongue. They are in some places more than 8000 feet high, and occasionally capped with snow during summer. The ridges consist of immense masses of crystalline slates, which, in the Tschar, become talcose or argillaceous, and contain whole hills of compact or semigranular limestone. To the west of these ridges, and rising to the average height of 6000 or 7000 feet, are the primary mountains of *Elbessan*, through which passes the only military road from Roumelia or Monastir to Skutari. It is carried through Ochri, where the vineyards indicate that the elevation of the lake of Ochrida is under 2000 feet. Further south extends the primary *Pindus*, with parallel limestone ridges like those of the Tschar. To the north of these chains there have been immense eruptions of diorite, compact euphotide, and serpentine; and among these are found all the compact, lamellar, syenitic, decomposed, and earthy varieties of the ophite of the Pyrenees. Diallage rock occurs rarely, but forms some magnificent masses and small hills in this deposit round the torrent of Rapé, 30 miles east of Skutari. These dioritic hills are connected geographically with the high calcareous ridges of the lower Drin, which are only the extremities of the very high similar chains between Ipek or Scherkoles and the country of Montenegro. Their greyish white summits covered with eternal snow, except towards the east, and their numerous rents, recall to mind the secondary calcareous chains of the Alps. Around the lake of Plava, near Gusinio, above Plava, and a little to the eastward, their elevation probably exceeds 8000 feet. Their lower declivities are covered with villages; for the Albanians, like the inhabitants of Montenegro, seek liberty and exemption from taxes in the wildest abodes. These serrated ridges are connected with the *Kom* and *Dormitor*, two high chains to the east and west of Drobniak, and also with the *Lubitschnia*; all of which are limestone hills capped with snow. Further north, these chains are united to those east of *Glubigne*, between Mostar and Novaschin in Herzegowina. The cretaceous formation occurs in the upper tertiary basin of the White Drin. The inferior chalk is found on the coasts of Albania, where it occurs in the form of singularly-shaped hills of limestone. It is also distributed over Dalmatia and part of Herzegowina, forms numerous high hills round the bay of Cattaro, and extends to Montenegro, where its rocks are so numerous as materially to impede the cultivation of the country. The cretaceous system forms all the hills round Skutari, the lake of which contains some rocky islands of limestone. To the east of Alesio the same limestone forms conical hills, which, more to the south, extend, east of Durazzo, to Berat. The *Acroceraunian* or *Chimærian* chain belongs to the same formation, which probably crosses over to the Ionian islands, and stretches along the coast to Prevesa. These mountains exhibit frequent examples of natural fires; and large springs, issuing like rivers from the rock, are found as in the older limestone districts. Pindus, in its progress southward, sends off several divergent branches eastward, two of which inclose the plain of Thessaly, terminating at the Channel of Trikiri, where they are separated by the gulf of Volo. They contain several very lofty summits. (See *anté*, p. 152.)

Bosnia is an extensive plateau, inclined from south to north, and presenting to the Albanian plain of Ipek and the hills of Myrdita a limestone wall from 6000 to 7000 feet high. To the west it is bounded in a similar manner by the snowy chain, east of Mostar and the *Kom*, west of Kolaschin and east of Drobniak. Towards Servia, the plateau also descends very abruptly, especially to the north-east. In the highest and most southerly part of the plateau are many miles of level ground; but the rest of the country is furrowed by ridges of hills, which diminish in height towards the north, and running S.E.-N.W., so as to form a slightly inclined plane as far as the Save. Bosnia is entirely composed of the transition formation, particularly of the older and medial divisions, intersected here and there by igneous rocks. It produces in some places gold and silver; and rich iron mines are found at Maidan and other places. The chief foundries are at Bosna Seral. Bosnia is a cold country, and its hills are covered with firs, pine-trees, and birches. The plants chiefly cultivated are barley, oats, rye, potatoes, hemp, flax, and plum-trees for making brandy. It is only connected with Turkey by the broken part of its high walls above Novibazar and Ipek, and with Skutari and Maritime Albania by high mountain passes, rendered dangerous by snow and precipices.—(*Dr. A. Boué. Edin. New Phil. Journal, XXV.* 174.)

GULFS, BAYS, STRAITS.—The BLACK SEA (*Kara-dengis* of the Turks, *Tcheriago-moré* of the Russians, *Pontus Euxinus*, or simply *Pontus*, of the Latins), is situate between 40° 50′ and 46° 45′ N. lat., and 27° 25′, and 40° 48′ E. long., being bounded on the N.W. and N. by the Russian governments of Bessarabia, Kherson, and Taurida; on the N.E. by the Caucasian countries of Circassia, Abkhassia, and Mingrelia; on the E. and S.E. by Imeritia, Grusia, and Armenia; S. by Asia-minor; W. by Roumelia and Bulgaria. Its extreme length, E.-W., is about 690 miles, and its greatest breadth, N.-S. 380; but its width is variable; the superficial area is about 160,000 square miles, and the extent of its coasts exceeds 2000. It is very compact in form, giving off few or no large branches, though small bays and harbours occur at short distances all round. The depth is variable; but the variations appear to be very regular: at the entrance of the Thracian Bosphorus, 48 fathoms are found; an equal or greater depth is preserved along the west shore, at a little distance from the land, as far as the mouths of the Danube, where it becomes shallower; but in the main sea, between the Bosphorus and the Crimea, no bottom is found with 100, 120, and 160 fathoms. The south coast, from the Bosphorus to Sinub, is deep; and thence to the east coast, it may be navigated by vessels of any size. There are no tides, but the currents are marked, strong, and regular, with a general direction towards the Bosphorus of Thrace, through which the Black Sea pours its surplus waters. The water is by some voyagers said to be only brackish, and this may be the case near the mouths of the rivers; but by others it is said to be only one-seventh part less salt than the Atlantic, and fully one-tenth salter than the Baltic. To account for this saltness, with such a continual supply of fresh water as it receives from numerous large rivers, and so constant an outflow as it sends through the Bosphorus, it has been imagined that an under current from the Archipelago flows upwards through the Straits, and communicates its saltness to the waters of the Euxine. It may, however, be also accounted for by the great abundance of salt which is found in the country, to the north and north-east, and which probably finds its way to the sea. The navigation of this sea is unobstructed; there is deep water almost throughout, with only one small island, near the mouth of the Danube, and two rocks off shore in the Crimea. The smallest gale, however, raises a short and troublesome sea; but it is noway dangerous; storms, which are not more frequent than in other seas, are seldom of long duration; and even in the worst there is no want of sea-room. The largest ships may sail close to the shore; the anchorages are good, and many of its harbours are excellent. The prevailing wind is from the north-east, and as it blows over a great extent of cold and swampy country, it is not only piercingly cold, but is also loaded with moisture, occasioning thick fogs, and in winter storms of snow. Towards the middle of summer, northerly winds generally prevail, and are succeeded very late

in the year by breezes from the south, which again appear in January, February, and March. The climate is subject to great extremes; and the average of temperature is lower than might be supposed from the latitude. The northern gulfs and straits are in some winters frozen hard enough to admit of the passage of troops; and though such extreme severity is not very common, yet navigation is always suspended during winter in the shallow sea of Azov, and most commonly along the northern shores of the Euxine. On the other hand, the summers are usually hot. The sea teems with seals, porpoises, sturgeons, sterlets, dolphins, mackerel, mullet, bream, and other fish, chiefly of the same kind as those caught in the Caspian and the Aral; tunny fish also enter it from the Mediterranean, for the purpose of spawning; there are also turbot, whiting, and roach; and some writers speak of herrings in shoals, which are probably only large sprats; but there are few fisheries along its shores, though, where they do exist, they are very productive. The Black Sea receives the waters of many large rivers, as the Danube, the Dnieper, the Dniester, the Bog, the Don, the Kuban, and the Kizil-Irmak; and its basin occupies about a third part of Europe, with a small portion of south-western Asia.

The *Thracian Bosphorus* (properly *Bosporos*), or *Channel of Constantinople*, forms the only outlet of, and entrance to the Black Sea. It opens, with a narrow channel, only a mile and and a half wide, in the S.W. corner of that sea, and extends, about 20 miles, to the sea of Marmora. Its width varies from less than 3-4ths of a mile to 2¼ miles; it forms in fact the finest river in the world, with a constant current flowing southward. Its banks are high, exhibiting everywhere the most beautiful scenery, and lined with an almost continuous range of towns and villages. The winding of its shores occasions strong eddies and currents, which are sometimes so rapid, that it is scarcely possible for ships to make way by tacking, in their course to the Black Sea, though, in returning, the current will carry them downwards even against the south wind. Northern winds are, however, more frequent than those from the south, and vessels from the Mediterranean are often detained by them for months in the Dardanelles and the Bosphorus, which they may easily pass in a couple of days with a favourable breeze. At its southern extremity the current of the Bosphorus strikes upon the Seraglio point, which divides it into two portions, one of which flows westward into the Golden Horn, or harbour of Constantinople, while the main body of the water flows onward to the Sea of Marmora.

The *Sea of Marmora* (ancient *Propontis*), measures in its greatest length, from Gallipoli to Ismid, about 170 miles, and in its greatest breadth, to the eastward of the 28° meridian, 48. It is indeed but an inland lake, though salt, for it is formed by the waters of the Black Sea which are poured into it through the Bosphorus, and transmitted to the Archipelago by another channel as narrow, the Hellespont or Dardanelles. It has considerable depth. Five miles N.E. of Marmora, it has 133 fathoms of water, and, at the same distance north, no bottom was found with 355. The shores are cultivated and picturesque; those of the Asiatic side are bolder than the European. The navigation is not difficult; it is generally free from danger, and good anchorage may be found along its northern shore and under shelter of the islands. It contains a large peninsula on the south coast, and several large islands, from one of which (*Marmora*, or Marble island) it takes its name.

The *Hellespont*, or *Channel of the Dardanelles*, is a strait 40 miles in length, and varying from 3-4ths of a mile to two miles in width, which connects the Sea of Marmora with the Archipelago. A strong current runs always through it to the south, at the rate of from 2 to 4 miles an hour. The wind also generally sets in the same direction, so that ships are often detained for a long time at the entrance, and find it sometimes very difficult to work up the stream. There are shoals in some places, but deep water is always to be found in some part of the channel. The Asiatic shore presents the most beautiful scenery; the European is generally steep and rugged. Being the only channel to Constantinople and the Black Sea from the south, it is in several places lined with strong fortifications, mounted with heavy guns; but these are commanded by the neighbouring heights, and can only prevent or retard the passage of ships; while the forts or castles themselves may be taken by landing troops with artillery. The Seraskier Pasha, who commands the forts on both sides, has his station at the Sultanieh Kalessi, on the Asiatic shore of the narrowest part of the strait. The general appearance of the channel is that of a large river flowing between banks everywhere pleasant, in some parts wooded, but on the whole far inferior in beauty to those of the Bosphorus.

The *Archipelago* (ancient *Aigaion pelagos, Ægeum mare*, or *Egean Sea*), is a large offset of the Mediterranean, extending northward between Greece and Asia minor about 380 miles, from Crete to the coast of Thrace, and having a width of from 80 to 240 miles. It is studded with islands; from which circumstance its name has come to be used to signify a group of islands in any part of the world. The navigation is rather intricate, and, owing to the currents produced by the numerous islands, and to the varying winds, not seldom dangerous, particularly to small vessels. On the north-west side, the Archipelago forms in Turkey several deep bays, as the *Gulf of Orphano* or *Contessa*; the *Bay of Istillar*; the *Gulf of Agion Oros*, or *Monte Santo*; the *Gulf of Cassandra* or *Hagios Hamas*; the *Gulf of Saloniki*; the *Channel of Trikiri*; and the *Gulf of Volo*.

The *Gulf of Arta* (ancient *Ambracian Gulf*) is a deep inlet of the Ionian Sea, between Albania and Western Greece, in N. lat. 39°, and E. long. 21°. Its extreme length, from east to west, is about 25 miles, and its greatest breadth about 10; but in several places it is narrower. The depth varies from 13 and 14 to 36 fathoms. The southern shore is formed by high land, with bold promontories, which are clothed with fine woods; the northern shore is for the most part low, and has encroached considerably upon the water. The entrance is only 700 yards across, and, outside, is a bar of gravel, coarse sand, and sea weed, with 18 feet water where shallowest. It was at the mouth of this gulf that the battle of Actium was fought, between Cæsar Octavianus and Mark Anthony, B.C. 29, which decided the fate of the Roman empire at that time.—(*Journal R. Geog. Soc.* III. &c.)

The other principal bays and gulfs of the Ionian and Adriatic Seas are: the *Gulf of Kasropo*, between Corfu and Albania; the *Gulf of Aulona*; the *Gulf of Durazzo*; and the *Gulf of Drin*.

CAPES.—*Tuh Bournu, Gulgrad-burun* or *Cape Kalakria, Eminch-burun*, and *Cape Zaitan*, on the Black Sea; *Helles Bournu*, the S. point of the Thracian Chersonese, at the mouth of the Hellespont; *Cape Monte Santo* or *Akon Oros* (ancient *Athos*), *Cape Drepano*, and *Cape Pailouri*, the extremities of three peninsulas on the coast of Macedonia; *Cape Kiswbo, Cape St. Demetrius*, and *Cape St. George*, on the coast of Thessaly; *La Punta*, a narrow tongue of land (the ancient promontory of *Actium*), at the entrance of the Gulf of Arta; *Cape Linguetta*, on the coast of Albania.

ISLANDS.—In the Archipelago:—*Imbro, Samothraki, Thaso, Lemno* or *Stalimené*, between the Dardanelles and Mount Athos. These are large islands, generally mountainous, but fertile. *Imbro* lies 21 miles west of Cape Janissary, is 16 miles long, 9 broad, and contains some fine villages. The interior is woody. *Samothraki*, 14 miles N. of Imbro, is an oval-shaped rocky island, 8 miles long, and 6 broad. Its summit, Mount Fengari, rises 5248 feet above the level of the sea. (See *antè*, p. 153.) In ancient times it was celebrated for mysteries. *Thaso* is a large oval-shaped island, 30 miles N. of Monte Santo, and near the coast. It is 18 miles long, and 14 broad; and its summits, Ipsario and St. Elias, rise respectively to 3128 and 3374 feet above the level of the sea. *Stalimené* (ancient *Lemnos*) is a fertile and beautiful island, opposite the mouth of the Dardanelles, from which it is 41 miles distant. Its greatest length is 15 miles, and its breadth nearly equal; but its form is irregular, and it is almost cut in two by the ports of Paradise and St. Antonio. *Lemno*, the chief town, is on the west coast, but it contains no object of interest. *Thaso-poulo*, a small island between Thaso and the mainland. *Mouillani* and *Diuporo*, two small islands in the Gulf of Monte Santo. *Kasandra*, a small island in

the gulf of that name. *Sasseno*, a small island off the Gulf of Avlona. *Kriti*, or *Candia*, a large island, forming the southern border of the Archipelago. (See *post.* p. .)

RIVERS.—DANUBE (See *anté*, p. 393.) Its principal affluents in Turkey are:—On the right, the *Save*, with its affluents, the *Unna* from Croatia, the *Verbas* or *Verbitza*, the *Bosna*, and the *Drina*, from Bosnia; the *Moravva* or *Morava*, with its affluents the *Ibar* and the *Nissava*, from Servia; the *Timok*, *Lom*, *Ogoust*, *Skitul*, *Iaker*, *Wid*, *Osma*, *Jantro*, *Jemurlu*, from Bulgaria. On the left, the *Syll*, or *Schyll*, *Olt* or *Alouta*, *Ardjis*, and *Jalonitza*, from Wallachia; the *Sereth*, and *Pruth*, from Moldavia.

The MARITZA, which drains the plain of Adrianople, and has a course of 320 miles into the Gulf of Enos in the Archipelago. Its principal affluent on the right is the *Arda*; on the left, the *Tunja*, and the *Erkenheh*. The *Karasu*, or *Strouma*, or *Marmara* (ancient Greek *Strumon*, Latin *Strymon*), flows through eastern Macedonia, into the Gulf of Orphano or Contessa, after forming and running through the Lake Kadaka. The *Vardar* flows from the Tschar-dagh through Macedonia, passing by Uskub and Gradisca, into the Gulf of Saloniki, a few miles to the west of that city. The *Indje-Karasu* flows through the southern part of Macedonia into the Gulf of Saloniki, not far from the mouth of the Vardar. The *Salambria* (ancient *Peneus*) drains the celebrated vale of Thessaly, and opening a passage between Ossa and Olympus (the vale of *Tempé*), flows into the Gulf of Saloniki. The *Hellada* (ancient *Sperchius*), flows through the southern part of Thessaly into the Gulf of Zeitoun.

The *Aspro-potamo (Achelous)* drains the western slopes of Pindus in Albania, and flowing southward, through Western Greece, falls into the Ionian Sea. The *Arta* also flows from Pindus into the Gulf of Arta. The *Kalemas* flows through Lower Albania, into the Channel of Corfu. The *Voiussa* or *Vedis*, with its affluent the *Argyrocastron*, in Lower Albania, flow into the Adriatic. The *Ergent*, called also the *Beratino* and the *Krevasta*, flows from the mountains north-west of Kastoria, through Middle Albania, into the Adriatic. The *Scombi* or *Tobi*, the *Mati*, the *Black Drin*, and the *White Drin*, the *Bujana*, named *Moracca* in the upper part of its course, all flow through Albania, into the Adriatic. The *Narenta* in Hertzegowina or Turkish Dalmatia.

LAKES.—*Raselm* or *Rassein*, near the mouth of the Danube (see p. 393), is rather a lagoon than a lake. *Takinos* or *Kadaka*, formed by the Strouma, *Betchik*, *St. Basili*, and *Ienidja*, in Eastern Macedonia; *Kastoria*, in Upper Macedonia, 80 miles W. of Saloniki; and the mountain lakes of *Joanina*, 2500 feet above the level of the sea; *Skutari* or *Scodra*, *Ochrida* or *Okhrida*, *Plava*, and others in Albania.

CLIMATE.—In a country consisting of so many high plains, and intersected by so many lofty mountains, the climate must necessarily be very various, being affected not only by the elevation of the ground, but also by exposure to the prevailing winds. Commencing with the Danubian provinces, we find Bosnia and Croatia to be high and cold countries, though, on the fruitful plains near the banks of the Drina, the winters are mild. In the higher parts, however, snow lies for half the year to the depth of several feet, and Fahrenheit's thermometer has been often observed between 10° and zero. The heat of summer is seldom oppressive; but the northern districts are then warmer than the southern. The weather is often tempestuous from the beginning of June to the middle of August; the forests on the mountains collect the clouds, but the great rains during these months fertilize the ground. Spring begins in the high country about the end of April, and continues till June; the summer's heat then commences, and lasts till September; snow falls generally before the end of that month, and does not entirely disappear till the middle of May. Bosnia is, on the whole, a very healthy country; it is well supplied with water, the air is salubrious, and marshes are almost exclusively confined to the banks of the Save. The climate of Servia much resembles that of Bosnia, though, being a lower country, it is somewhat more temperate, particularly in its long open plains. Bulgaria is a country highly favoured by nature; the cold is sometimes as severe as in Servia, but, being sheltered on the north, the common temperature is sufficiently mild to ensure the cultivation of the vine, corn, tobacco, and various kinds of fruits. The climate of Wallachia is more temperate than that of the adjoining provinces; but the inhabitants are exposed to two months of severe cold in winter, and to two of excessive heat in summer. Lower Wallachia, being overspread with extensive marshes, is unhealthy, and bilious and intermittent fevers are common diseases. The winters in Moldavia are in general intensely cold; the thermometer has been seen at 15° below zero. The summers, on the contrary, are very warm; the grape ripens by the end of July; and the vintage is over in September. Upper Macedonia and Thrace, the modern Roumelia, were considered by the ancients to be cold countries, and in the former was placed the residence of Boreas. At Constantinople the climate is extremely changeable; and the temperature sometimes falls 31° in a single hour. Indeed, it depends upon the prevalence of the north or the south wind, whether one is shivering in the cold of Russia, or luxuriating in the balmy atmosphere of Greece. The sky is genuine English, here a portion of blue, there a rolling mass of white clouds. Like that of England, too, it seldom continues for twenty-four hours the same. The winters are extremely long and severe; the roads are often blocked up with snow; and the wind on the Bosphorus is frequently so violent, that all communication with the villages far up the channel is cut off. The countries on the Adriatic, Dalmatia and Albania, partake of the warm temperature of Italy; but are also subject to droughts, and to sudden and violent north winds. The climate of the Lower Albania, or ancient Epirus, is colder than that of Greece; spring

does not set in before the middle of March; but the summer's heat is oppressive in July and August; in which months many streams and rivers are dried up, and the grass and plants are withered. The vintage begins in September; heavy rains fall in December, and are succeeded in January by some days of frosty weather.

SOIL AND VEGETATION. — A great difference may be observed in the vegetable productions of the provinces within the basin of the Danube, and of those to the south of the central mountains; in the southern provinces the mountain sides are covered with forests of fir, yew, pine, ash, cedar, holm, oak, plane, maple, carob, sycamore, beech, walnut, and chestnut-trees. Towards the north, however, the most common trees are the ash and the lime; the carob, the sycamore, and the plane never grow but when forced by artificial means or by cultivation. The heights of the Danube are clad with apple, pear, cherry, and apricot-trees, whole forests of which may be seen in Wallachia; which extend beyond the Balkans, and cover the hills of Thrace, Macedonia, and Epirus. The olive and the orange-tree thrive beyond the 40° only near the sea, but never flourish in the interior; where the cold is too severe. The climate to the south of the same parallel is wholly different. Apple and pear-trees disappear; the olive then becomes the most common fruit-tree, and the plantations in the southern regions are interspersed with the laurel, and the large-caped myrtle. The vine is grown over the whole country, but the grapes produced on the banks of the Danube are very different from those of the coasts of the Archipelago. In the latter region they contain a great quantity of saccharine matter, while those of Wallachia are watery and acid. Strong and generous wine might, however, be obtained from the vineyards of Servia and Herzegwoina, where they are sheltered from the cold of winter, and the scorching heat of summer. Indeed, were proper attention bestowed on the cultivation of the grape, the vineyards of Turkey would not be inferior to the finest in the world.

In Bosnia the hills are covered with firs, pine-trees, and birches; the plants chiefly cultivated are barley, oats, polygonum, fagopyrum, rye, potatoes, hemp, flax, and plum-trees for brandy. Turkish corn does not grow well, except in the deep sheltered valleys; and vineyards are found only near the banks of the Save. On the higher ridges in the south of Bosnia there is, below the forests of fir and pine, a zone of elms, which rises to the height of 3800 feet on the southern declivities; oaks occur lower down, and on the borders of the Albanian low country, are chestnut-trees, and vineyards. The greater part, however, of Bosnia seems better adapted for the rearing of cattle than for the production of grain. In Servia, wheat, maize, and millet amply repay the labours of the husbandman; tobacco, flax, and hemp are grown in large quantities; and whole districts are covered with apple, pear, and cherry-trees. The lower parts of the hills are covered with forests, which are mostly composed of oaks, interspersed with some ashes, a species of tilia, a great many wild pear-trees, some apple and cherry-trees, and a few hazels. In central Servia, elms occupy the plateaux, oaks occur on the sides of the mountains, and fir-trees near the summits. In the higher hills farther south, even fir-trees disappear, and the summits afford only alpine pasturages. In the valleys of the Morava and the Toplitza, and the defiles of the mountains, the Bulgarians cultivate their fields and gardens in a most admirable manner. The valleys are covered with villages, where maps only indicate a wilderness, and the cultivated fields extend far up among the hills. Vines, however, do not thrive well in the Morava valley, except round Nisha, Leskovacz, Uranja, Urkup, and near Pristina. Indian corn is cultivated in the lower valleys, where the Servian mountains protect them against the north winds. In Bulgaria the common temperature is sufficiently mild to ensure the cultivation of the vine, corn, tobacco, and various kinds of fruit. The extensive forests are varied by different trees, the beech, the pine, and the oak; and the sides of the mountains abound with fertile pastures. In Wallachia the mountains and several islands in the Danube are covered with forests of oak, pine, and beech. The pastures are fertile in aromatic plants. The fields of maize, wheat, and barley, fine melons, and a variety of other fruits, and whole forests of apple, plum, and cherry trees, bear ample proof of the productive qualities of the soil; but not more than a sixth part of the soil is cultivated. Wheat and barley are cultivated throughout Moldavia. Millet is also a common crop. The cultivation of fruit-trees and esculent plants is not in a very advanced state. The melon, however, thrives throughout the province; but the grape is the most valuable of the Moldavian fruits.

The southern base of the Balkans is remarkable for the exuberance of its vegetation, which consists of gardens of roses, jasmine, and wild lilac, vineyards, and forests of all kinds of fruit trees; but without the olive tree, the *anis*, or the *lepleb*. The

adjacent plains, however, are destitute of trees, and consist chiefly of fields under cultivation, and of pasture grounds, which are partly marshy, and have a black soil. The plain of Adrianople is celebrated for its roses, from which large quantities of attar are made. This region extends to the low hills which border the Black Sea, the Propontis, and the Archipelago. The soil of Macedonia is more fertile than the richest plains of Sicily, and there are few regions of the world so productive as the peninsular districts on the Archipelago. The land, in some of the valleys, yields the most luxuriant crops of wheat; cotton and tobacco are also grown to a great extent. Macedonia is likewise famous for its wines; corn, and different leguminous plants are profitably cultivated in the interior. In Southern Macedonia we find a Mediterranean vegetation, the evergreen-oak, the cypress, Grenada tree, oriental plane, the walnut, the fig, &c. The olive is cultivated to the south of Saloniki. Thessaly abounds in oil, wine, cotton, silk, and wool. Larissa is surrounded by a country fruitful in oranges, lemons, citrons, and pomegranates. The same district produces fine figs, excellent melons, grapes, almonds, olives, cotton, and tobacco.

The Albano-Dalmatian flora is connected with that of Italy. The olive rises to the first heights, beyond which the high country is noted for its fertile fields, excellent pasturage, and lofty forests. The basin of Skutari is, however, so much protected from the north winds that the heat is oppressive during summer, and the climate is on this account favourable for the growth of Mediterranean plants, as the pomegranate and the orange tree. The olive is also found here, though its true native country commences more to the south, at Durazzo. Mostar, likewise protected on the north by the high mountains of Bosnia, is, like another Nice, surrounded with gardens of pomegranates, olives, and orange trees, rising in terraces, and forming a fertile oasis in the stony calcareous soil of Herzegowina. In Lower Albania, the ancient Epirus, oak trees of every kind arrive at great perfection. The plane, the cypress, and the manna-bearing ash appear on the coast beside the laurel and the lentisk; but the forests of Pindus consist chiefly of cedars, pine, larch, and chestnut. Many of the mountains are dry and sterile; such as are sufficiently watered are covered with herbage, or with the wild vine, and thick groups of elders; in spring their sides are clad with flowers. The violet, the narcissus, and the hyacinth, appear in the same profusion as in the mild districts of Italy. Cotton and silk are cultivated; but the olive, for want of proper care, does not yield an abundant harvest. The Amphilochian peach, the Arta nut, and the quince, are found in a wild state in the woods, and in the uncultivated land.

ANIMALS.—The Thessalian horses were celebrated for their symmetry and strength, and have been improved by crossing with a Tartar breed, which was introduced by the Turks. A great many horses are reared in Moldavia, but those bred in the mountains are the most valuable. Although small, they are not inferior in strength and speed to the Russian horse; those of the plains are larger, but not so swift. The cattle of Wallachia are large and strong, many thousands of which are annually exported to Bosnia and Constantinople. The meadows and pastures are of a rich and excellent quality, and large herds of beeves and flocks of sheep are fattened upon them. Sheep abound in Wallachia, Macedonia, and Thessaly; but the goat is more valued by the inhabitants of the mountains. The wild boar, the roe, and the fallow-deer frequent the forests. The principal carnivorous animals are the fox, the wolf, and the bear. A species of wolf, smaller than that of the hills, has been observed on the plains; it haunts the banks of the Dannbe, and finds shelter in the marshes, or among the reeds. The partridge and the bustard abound in the valleys. The lion was not uncommon at one period in the southern parts of Turkey, and in the time of Aristotle frequented the region between the Achelous in Acarnania and the Nessus in Thrace; but it has been long since extirpated.

PEOPLE.—The dominant people are the Osmanlee, or Othmanlee, or Ottoman Turks, a branch of the great Toorkee family of Central Asia; who are dispersed, more or less, over the whole country. There are, however, various other races, some of them more numerous than the Turks, who inhabit different provinces, and are also found scattered. These are the Roumi or Greeks, Arnauts or Albanians, Bulgarians, and other Sclavonians, Wallachians, Armenians, Jews, Gipseys, and Franks.

The OSMANLEE have been generally considered as members of the Caucasian variety of mankind; but learned Orientalists have at last succeeded, by the aid of the Chinese annals, in identifying them with the Hiong-nu, a people who lived to the north-west of China, many centuries before the Christian era, and carried on frequent and bloody wars with the Celestial empire. From that region their migrations can be traced westward, till they finally settled in those parts of Asia and south-eastern Europe where they are now found. The Osmanlee and their brethren, the Tartars of Kazan,

Astrakhan, and the Crimea, have indeed the physical characteristics of Caucasians; but the inhabitants of the country further east, as the Nogays, Kirghises, Turcomans, and others, who speak pure Turkish dialects, are known to have a different organization, approaching nearly to the Mongolian character. It is therefore inferred that the Turks were originally members of the Mongolian variety, and that the portion of them which now exhibit Caucasian features, must have acquired them by intermixture with the Caucasian races whom they invaded and subdued.—(*Prichard on the Ethnography of High Asia. Journal R. Geog. Soc. Lond.* IX. 192.) In accordance with this theory, we find a recent traveller asserting, that any one who has paid even but slight attention to physiognomy, will, after a short residence in Turkey, perceive that the Turks belong to three essentially different classes: 1. the original Turk or Mougol; 2. the modern Turk, or Caucasian: and, 3. the moncrel Turk, or mixed breed. The Mongol Turks are by far the most numerous and the most indolent: their stature is generally short, frame thick-set, complexion dark, with a round face, thickish lips, widely distant eyes, and sunk features. The Caucasian Turk, on the contrary, is taller, has a longer forehead, well-formed face, aquiline nose, short upper lip, full chin, and clear complexion; while the mixed or mongrel Turk bears an affinity to one of the first two classes, in proportion as his descent is of remote or modern relation. Osman, the founder of the Imperial dynasty, is said to have been a pure Mongol; but the late Sultan was, and the present Sultan is, a pure Caucasian, a circumstance thought to strengthen the belief which has long prevailed, that the imperial family are not the genuine descendants of Othman. The greater part of the chief Pashas and grand officers of state are also of the Caucasian family.—(*Turkey and the Turks, by John Reid*, p. 100.) But, though the Turks may be physically divided into three separate classes, yet, in a moral point of view, they may be considered as one; such is the levelling character of their religion, that all personal distinctions are at once brought down, and set aside by the law and the prophet. The character of the Turks is, however, a question on which there is the greatest difference of opinion among European writers and travellers. Influenced by prejudice or feeling, and forming their conclusions from imperfect knowledge, or writing merely to serve a party purpose, these persons have given such conflicting accounts of the Turks as can scarcely be reconciled, or even considered as applicable to the same people. But, after a careful consideration of these conflicting statements, we are inclined to the opinion that, in respect of moral character, the Turks are not much, if at all, inferior to the generality of their European neighbours; while to some of them they are decidedly superior. Their character, however, varies in different provinces, some of them being more barbarous than others; but, considering the pernicious system of government to which they have been subjected for centuries, it is more surprising that they possess any good qualities at all, than that they are not so thoroughly humanized as some more favoured nations. They are indeed very ignorant, but, at the same time, very simple-minded, and seem fairly entitled to the reputation of being a devout, honest, and well-disposed people. The Osmanlee spurn the name of Turk, which they consider as a term of contempt, synonymous with *barbarian*; but glory in that of Osmanlee, as expressive of valour and polish. The Turkish language is everywhere throughout the empire the language of government, and generally that of trade. It is indeed the only language that will afford a means of communication with all the various tribes and races scattered over Turkey. Besides the Osmanlee, there is another race of Turks, called the *Dobrujee*, or *Dooroodschee*, who occupy the eastern part of Bulgaria, between Shumla and the Black Sea, and are divided into two hordes, the *Orak* and the *Orumbet*.

The HELLENES, called ROUMI (i.e. Romans) by the Turks, and GREEKS by Europeans, the mixed descendants of the ancient Greeks, Romans, Macedonians, Thracians, and other tribes, who formerly possessed the country. They are very numerous in Thessaly, Lower Albania, Macedonia, Thrace, and Candia, and are found also in Wallachia and Moldavia. They bear everywhere a very indifferent moral character; but form a strange contrast to the saturnine Turk, or the taciturn Armenian; for they are active and enterprising, versatile, loquacious, lively, vapouring, and disputatious, continually hunting after distinction. The character of the Greeks is deeply imbued with credulity; and their religion is a tissue of the most degrading superstitions; but they are quick of perception, fond of quibble, and delight in sophistry. They receive the impress of every mould, and the impulse of every agent; but are sadly deficient in honesty and stedfastness of purpose. They are of pure Caucasian lineage, their features are generally noble, and regular; their eyes are large and black, eyebrows arched, complexion brown, hair dark, most frequently black; their stature above the middle size, thick-set, and muscular, yet handsome and elastic. Upon their upper lip they generally wear a moustache; beards are worn only by their priests and men in authority. The Greek women are decidedly handsome in figure, which is not injured by artificial means, beautiful in features, and elegant in manners. Their eyes are large, black, and sparkling, their air languid, complexion pale, hair black, teeth white and regular, and stature short. They are possessed of great natural shrewdness; but few of them are educated; and their moral character is but little elevated.—(*Reid*, 132.)

The ARNAUTS, ALBANIANS, or SKIPITARS, form the majority of the population of Albania, but are also found in great numbers in Roumelia and Bulgaria. They were probably a tribe of the ancient Illyrians, who migrated from the northern mountains in the declining period of the Roman empire; but it is not to be imagined that a primitive tribe, or one which has remained unmixed during twenty centuries, exists in a country like Turkey, inhabited by so many different nations confounded with each other. Yet the Albanians are easily distinguishable by their physiognomy, temperament, and character, from the Greeks and the Turks. They are strong, active, sober, and patient of fatigue; their happiness consists in action, and their habits are warlike; but of glory and patriotism they have no conception; their services may be purchased by any government; and, at home, they too often exercise the trade of robbers. They are, indeed, a rude and barbarous people; most of them are professors of Islam; and but few are very scrupulous about the observance of its precepts.—(*Malte Brun*, VI. 189.)

The BULGARIANS derive their name from an ancient Turkish or Tartar people who settled on the Volga in the fourth century, and moved afterwards to the countries between the Don and the Bog, and latterly to the south of the Danube, where they founded a kingdom, whose monarchs waged very sanguinary wars with the Greek empire. But the Bulgarians being fewer in number than the people whom they conquered, lost their nationality, and in the course of two centuries became entirely Sclavonized. They were converted to Christianity in A. D. 860, and, from savage warriors, have softened down to a peaceful, industrious, and hospitable people. They are Christians of the Greek church, and form, next to the Armenians, the most respectable and most valuable class of the population of the empire. The other Sclavonic races are the inhabitants of Moldavia, Servia, Bosnia, Croatia, and Herzegowina, who are all members of the Greek church, but vary considerably in character, and language, in the different provinces.

The SERVIANS are a very industrious race; and, by their indomitable courage, have secured the independence of their country, or at least the right of self-government, which is the utmost that can be expected by a small nation surrounded by more powerful neighbours. They are the descendants of a colony of Servians or Sclavonians which migrated from Gallicia in the seventh century; and they have preserved their nationality in its full integrity. Their language is an intermediate idiom, partaking of the Russian and the Polish. The VLACHS, WALLAKS, or WALLACHIANS, who give their name to Wallachia, and are spread in great numbers into the adjoining provinces, appear to be the descendants of the ancient Dacians and of the Roman colonists settled among them after the conquest

of Dacia by the Emperor Trajan. They call themselves *Rumunyi* (*i. e.* Romans), and retain a traditional pride of ancestry in spite of their present degradation. Their language is soft, abounding in vowels, and derives most of its words from the Latin, with only a small intermixture of the Sclavonic. The pronunciation nearly resembles that of the Italian; and it is a remarkable fact that the inflection and terminations of the words have a much greater similarity to those of the modern language of Italy than to those of the Latin; a circumstance which, as there has been no connection between the countries since the time of the Romans, would go to prove either that the vulgar language of Rome was more simple than is commonly imagined, or that, in both cases, the changes which have taken place are those which a polished language naturally undergoes when mixed with others, or simplified by the usage of uneducated and foreign people. It is difficult to determine how far the Wallaks have any title to their claim of Roman descent. The Roman colonists generally retreated across the Danube when Dacia was abandoned; but some of them may have remained; and from such the Wallaks of Hatzeg, in Transylvania, trace their descent. The rest are content with the mixture of Roman and Dacian blood, which one may suppose to have taken place between the conquerors and the conquered; and the features of the Wallaks resemble more those of the Dacians on Trajan's column than those of the Romans or the modern Italians. Their modern foreign name is said to be derived from the Illyrian word *Vlach*, a herdsman, or shepherd. But, besides the Wallachians of the Danubian provinces, there are various tribes of the same name, who occupy the ridges of Pindus and Olympus, descending in winter with their flocks into the low countries of Thessaly and Macedonia. They are a hardy race, less ferocious than the Arnauts; sober, industrious, cleanly, and in high repute throughout Greece as shepherds. The MONTENEGRINS, who inhabit the southern part of Herzegowina, are the bravest, but at the same time the most savage and uncivilized of the southern Sclavonians. They possess a country surrounded by high mountains, which is quite inaccessible to their enemies, and of which the Turks have never enjoyed more than a nominal domination. The Turks are at present content to receive a small tribute, leaving the government and administration of civil affairs to the *Vladika*, or archbishop of Montenegro, who is under the protection of Russia. The people, though they have apparently conformed themselves to some of the Russian laws, have preserved with great fidelity the larger part of their national customs.

The ARMENIANS of European Turkey are comparatively a small body; and are a portion of that vagrant nation, who, like the Jews, expelled from their original country by foreign invaders, are now found scattered over all the regions of south-western Asia, everywhere preserving their national language, manners, customs, and religion. They are a most industrious and honourable people, and are highly esteemed by their Osmanlee rulers. There are still greater numbers of the other two dispersed races, the *Jews* and the *Gipseys*, who bear the same character, preserve the same manners and customs, and pursue the same sort of avocations in Turkey as everywhere else. The *Franks* are people collected from all parts of Europe, and are but few in number.

The estimates formed by European statists of the population of Turkey are entirely conjectural, and differ widely in amount. We find the following statement of the total population, and of the numbers of the separate races, in the Weimar Almanack for 1840, which is, perhaps, as near the truth as can be reached. It is taken, we believe, from a work of Mr. Urquhart. Osmanlee, 700,000; Sclavonians and Bulgarians, 6,000,000; Albanians, 1,600,000; Greeks, 1,180,000; Wallachians, 600,000; Jews, 250,000; Gipseys, 200,000: Armenians, 100,000; Franks, 50,000; total, 10,680,000, under the direct dominion of the Padishah; to which number is to be added the population of Wallachia and Moldavia, 1,500,000, forming a total population of 12,180,000 for the whole of Turkey in Europe.

RELIGION. — All the Osmanlee, and great part of the Albanians, are Moslem; the Greeks, Wallachians, Moldavians, Servians, Montenegrins, and Bulgarians, are members of the Greek Church; the Armenians adhere to the Armenian Church; the Franks belong to the various religious sects of *Frankistan* (Europe); and the Jews are followers of the law of Moses.

The law and the religion of the Moslem being both founded on the Koran, the clergy, and the lawyers form but a single order, named the *Chain of the Ulema* (*i. e.* of the learned), at the head of which is the Grand Mufti, or Sheikh-ul-Islam, who alone holds his office for life. He is the fountain of law, and the representative of the Khalif, or Sultan, in his spiritual capacity; and as all new laws, and even the question of peace and war, must have his sanction, he thus participates in the legislative powers of the Sovereign, and bears a share in all the movements of the government. The chain of the Ulema consists of various ranks, and admission into it, and promotion to its highest dignities, are nominally open to all; but here, as every where else, birth, wealth, and official influence, are of more value than the personal merits of the candidates. For the instruction of its members there are schools or colleges, named *mudreses*, established in all the imperial mosques; and the first step of promotion is obtained by the student, when, after completiug the required period of study, his name is inscribed in the list of those who aspire to legal offices. If he then acquit himself well in the prescribed trials, he obtains a *medrese*, or professorship, of the lowest income; and afterwards advances by regular steps to the highest rank of the medreses, that of the Suleimaniyeh, out of which the senior muderis are promoted to the rank of Mahrej-Molla, or superior judges, a body who are eight in number, and hold office only for a lunar year. The next step of promotion by seniority is to one of the four superior mollaships of Adrianople, Brusa, Damascus, and Cairo; the next to the two titular mollaships of Mecca and Medina; one of whom is further promoted in turn to the rank of Istamboul-effendi, or Master of the Police of Constantinople. The next step from this office is to that of Kazi-asker of Anadoli; then to that of Kazi-asker of Roumili; and, last of all, to the supreme rank of Grand Mufti. Of course very few can reach these high offices; and the greater part of the students are content with the rank of simple cadis or judges of Naib, or sub-delegates of the judges in the towns and villages throughout the empire.

Minister of War and Commander-in-Chief of all the regular troops; the Seraskier, or Commander-in-Chief of the troops of Anadoli; the Capudan Pasha, or High Admiral; the Minister of Commerce; the Captain of the Guard; the Minister of Finance; the Minister of Foreign Affairs (an office formerly held by the *Reis Effendi*, or Chief Secretary); the Chaoushbashi, or executor of the judgments of the Divan; the Hakimbashi, or Chief Physician; and the President of the Board of Health; 5. Ministers of the second class, namely, the Reis Effendi or Secretary of State; the Treasurer of the Sultan's income; the Beilikshi-effendi, assistant to the Reis Effendi in the executive department of his office; the Master of the Ceremonies; the Director of the Wakuffs, or charitable institutions; the Interpreter of the Porte; and the Director of the Customs. The Council of Ministers is called the *Divan*, from the circumstance of their meeting in a certain room in the palace, which has no other furniture than a *divan*, or wooden bench placed along the wall, about three feet high, and covered with cushions. It is here that laws are made, suits decided, firmans issued, troops paid, and the representatives of foreign sovereigns prepared for their introduction to the august presence of the Sultan. The imperial court itself is usually called by Europeans, by the French designation of the *Sublime Porte*, a name derived from the *Bab-Humayon*, the principal porte or gate of the outer wall of the palace, from which the imperial edicts are issued. But the principal officers of the household frequently possess great power and influence, and exercise more control over public affairs than the ostensible ministers, who are sometimes only their instruments or tools. The Sultan has no legal wives; but he chooses several of the *odalisques*, or females of the palace, generally three or four, never exceeding seven, who bear the title of *Kadine*, or lady, and have each a separate establishment. At his death these are removed to the old palace; but the Sultana Validé, or Sultan's Mother, remains in his palace, and is sometimes allowed to interfere and exercise a predominant influence in public business.

For administrative purposes the empire is divided into provinces called *eyalets*, the larger of which are governed by Pashas of three tails, with the official title of *vizier*; and the smaller, by Pashas of two tails, with the title of *mirimiran*. The eyalets are subdivided into districts called *livas* or *sandjaks*, each of which is under the charge of a Pasha of one tail, with the title of *mira-liva*, or *sandjak bey*; the cities and towns are governed by *mutselims*. These provinces are usually called *pashalics* by Europeans. *Pasha*, however, is not an official title, but is merely a personal honour, like knighthood in Europe, conferred by the Sultan. There are three ranks of pashas (or *bashaws*, as the word used to be spelled by old English writers;) the first or highest class have the privilege of bearing a standard of three horse-tails; the second of two; and the third of one. The pasha is invested with the full powers of absolute government within his province; is the chief of both the military and the financial departments, and of police and criminal justice; with the power of life and death, of making peace and war; in short, of doing what he pleases, so long as he can purchase and secure the favour of the Sultan and his ministers, or set them at defiance. The provinces have hitherto been sold to the highest bidder; the successful pasha, of course, makes it his business to re-imburse his outlay by every species of extortion; and exercises his power in the most tyrannical and reckless manner. Nor is this system of venality confined to the sale of provinces; corruption seems still to pervade every department of the state, civil, legal, and ecclesiastical; and, under its baneful influence, the provinces have been made little better than deserts, and the empire has been brought to the verge of ruin. The late Sultan Mahmoud made many vigorous efforts to reform abuses, and his successor Abd-ul-mesjid, has issued a Hatti-scheriff, or edict, dated 3d November 1839, promising to endeavour by new institutions to secure for the provinces of the empire the benefits of a good administration.

FINANCES.—The revenues of the state are raised by a variety of imposts; but as no accounts are published by the government, we have not the means of stating correctly the amount which reaches the imperial treasury. The Christians and Jews are subjected to a haradz or poll-tax, and other vexatious imposts, from which the Moslem population are free. In the simple institutions which have formed the safeguard of the empire against internal abuse, and foreign encroachment, direct taxation was an essential element. Besides the haradz levied on the rayahs or infidel subjects, in lieu of military service, the whole regular revenue used to be derived from the *miri*, a sort of property-tax, assessed and levied by each community or township separately. A certain sum was fixed as the contribution of each village or district, proportioned to its means, and each inhabitant paid his share according to a rate assessed by the

communal council. When, however, Mohammed II. introduced the system of farming the revenue, he superseded the functions of these councils. The members retained their office and title of *ayan*, but had no longer any control over the pashas, who had purchased their offices, and thereby become owners, or farmers of the revenue. These municipalities, however, still exist, and are acknowledged by the government, but their power is in abeyance; yet it is principally to them that Turkey is indebted for the preservation of its social organization, amidst so many misfortunes, and so long a continuance of misrule. Indirect taxes have also been introduced, similar in character to our excise and customs; and certain duties are now levied on the export and import, the transit, and the sale of merchandise. It is asserted that, of late years, the general revenues of the empire have been in so flourishing a condition, as to have actually left a surplus over the expenditure.

ARMY AND NAVY.—The celebrated corps of Janissaries was at first formed of slaves and captives; but its ranks were soon filled with the bravest of the Osmanlee; and, as a military brotherhood affords some chance of protection against arbitrary power, all crowded to the muster-roll of the Janissaries. The multitudes, however, of which the order at last consisted, were not all subject to military discipline, and only served to fill the empire with turbulence and confusion, without increasing its real strength. The number of Janissaries enrolled, at the close of last century, was about 400,000; pay was issued for 60,000; but not more than 25,000 men could at any time be mustered during the Russian wars. The corps was originally formed as a protection to the Sultan against his powerful subjects, the military or feudatory chieftains; but soon becoming corrupted, it substituted the danger of a pampered and licentious soldiery. Bajazet II., within a century and a half after the organization of the body, formed a plan for their destruction; and Murad IV. destroyed great numbers of them, without, however, exterminating them entirely. Selim III. prohibited the recruiting of the corps, and this act cost him his life. The suppression of the Janissaries at last became essential to the security of the Sovereign and the State; and by one deadly blow, dealt by the late Sultan Mahmoud, that haughty soldiery, to whose predecessors the empire owed the largest share of its extent and glory, was totally extinguished in 1826.

A sense of their declining strength has induced the Sultans, since the beginning of last century, to aim at introducing some military reforms, and to endeavour, by the adoption of European tactics, to retrieve the tarnished glory of their arms; but small success attended their efforts, till the reign of the late energetic Sultan Mahmoud. After the destruction of the Janissaries, Mahmoud determined that the nizam-jedid, or new military force, should adopt the European dress and tactics. He found, however, his Moslem subjects so hostile to these innovations, that he was obliged to enrol only very young men, whose prejudices were not very deeply rooted, and merely retained a small number of old soldiers to incorporate with the new levies, which were raised by conscription, mostly in Anadoli. The French system of tactics was that selected for the infantry, and French officers were appointed as their instructors; but, though the soldiers possess zeal, diligence, and habits of great attention, when under instruction, their instructors have hitherto failed in forming them into an efficient army.

An important part of the army formerly consisted of the spahis furnished, in time of war, by the timariots, or great feudal proprietors of lands in Anadoli, to the amount of about 20,000 good cavalry; but Sultan Mahmoud destroyed these fiefs; and the cavalry soldiers are now levied like the infantry, by conscription; subject to the same system of instruction. The horses are strong and active, and, though not large, have more bone than those of Arabia, and are admirably calculated for light cavalry. The riders are armed with swords and lances, and are generally finer men than the infantry. The artillery are, however, the best soldiers in the army, and work their guns with great dexterity. The soldiers, Marshal Marmont says, are better fed than any other troops in Europe; their magazines are filled with stores, and the regiments have large reserves; their pay is twenty piastres a-month, the whole of which they receive; and, in short, every thing has been done that could promote the comfort of the soldier. The instruction is conveyed in a mild and explanatory manner; harshness is, indeed, unnecessary, as the men are naturally orderly and well disposed, and shew great anxiety to acquire a knowledge of their duties. Owing to their habits of sobriety, offences against discipline are unfrequent. For small offences the soldiers are liable to be caned; and for those of a graver nature, they are subject to the same punishment that would be inflicted on civilians. At

the commencement of the year 1840 the force of the army was estimated at 94,000 infantry and artillery; with 25,000 regular, and 100,000 irregular cavalry.

The Osmanlee have never been a maritime people, nor have they paid any attention to the art of navigation; their military navy, after its triumphs in the fifteenth century, was long neglected, till the Sultan Mahmoud infused his energy into this department, as into every other, and succeeded in creating a very respectable fleet, which he left to his successor. At the time of his death, however, the Capudan Pasha carried off the fleet then at sea, and delivered it up to the Pasha of Egypt. At the commencement of 1840, the number of ships, including, we presume, those at Alexandria, was stated to be ten sail of the line in serviceable order, and five unrigged; 10 frigates on service, one in dock, and 4 unrigged; and 3 steam-ships; besides several corvettes, and other smaller vessels. Before the Greek insurrection, the fleet was manned by the Greeks of the Archipelago; and their pay was furnished by the Greek nation. The patriarch of Constantinople was empowered, by an express order of Government, to impose the requisite sum, called *millahiye*, or the sailors pay, upon the Greek inhabitants of the capital, and, through their archbishops and bishops, upon those of the provinces. The fleet is now manned by landsmen trained in harbour, and is commanded by officers equally ignorant of seamanship, and of naval tactics.

MANUFACTURES AND TRADE. — Turkey is not a manufacturing country; and the people make no pretensions to rival the science and capital of Britain. But their fertile territory and genial climate enable them to supply many of the materials for foreign manufacture; and these with their other agricultural products they are content to raise, and to receive whatever can be furnished to them cheapest and best in return. There are, nevertheless, several places distinguished for the production of excellent manufactured articles. The carpets of Anatolia frequently combine economy and comfort in use with elegance of pattern; while in the beauty and durability of the colour they are equalled only by those of Persia, which surpass them in delicacy and costliness. The Turks, however, have never attained the art of making woollen cloths, except of the coarsest kind; but other branches of manufacture are shewn to be active in the country, from the increased importation of cotton twist, where it is entirely used. The coarser and more common articles of their manufacture, such as muslins, ginghams, and handkerchiefs, have given way before those of England; but the finer fabrics of silk and cotton still maintain the competition, and are likely to do so, from their superior quality, beauty, and durability. Silk stuffs are made at Constantinople and Saloniki; the braziers and ironsmiths of Shumla have carried their art to great perfection; good steel is made at Bosna-Serai, Scutari, Karatovi, and Constantinople; and fire-arms at Semendria, Grabora, and other places. The grand commercial principle of Turkey is unlimited freedom of trade; and though the late Sultan Mahmoud, under evil influence, endeavoured to enforce prohibitions on the export or import of certain articles, yet these prohibitions, and all monopolies, have been again abolished, and the trade is now only limited and restricted by the extent of the supply and demand. The principal articles of export are: horses, beeves, and swine, tanned and raw hides, wool, wine, tobacco, cotton, currants, almonds, figs, dates, and other fruits, olive oil, wax, honey, opium, raw and spun silk, camlet, carpets, morocco leather, gall-nuts, valonia, madder, gum-dragon, sponge, copper, alum, &c.; while the articles imported consist of corn, and every sort of manufactured and colonial produce.

Commercial relations have long been maintained between England and Turkey, and till a recent date there existed in London a Turkey Company, which possessed the exclusive privilege of trading to the Levant. The trade, however, once carried on by the company had gradually dwindled away; the origin of our present trade with Turkey is but of recent date. Before the last war between Britain and Turkey, in 1807, only two or three British vessels proceeded annually to Constantinople with assorted cargoes. Of these, cotton goods formed but a small proportion; and a quantity not much larger was sent to Smyrna. When Malta became a depot for our trade in the Mediterranean, the Greeks, imbued with an almost intuitive talent for commerce, began to make purchases there of British manufactures; and sent from that island every variety of goods likely to suit the market, chiefly to Smyrna, from which the capital was supplied. An English merchant, who had conceived a just opinion of the capabilities of the traffic, established a house at Constantinople in 1812, which for several years had the whole command of the direct trade with England. From that period Constantinople became a rival mart with Smyrna, and has at length com-

riages of any sort, being mere tracks formed by long use; and only a few will admit European carriages. It is, therefore, the custom to travel on horseback; ladies occasionally make use of bad waggons. In European Turkey, the common beasts of burden are horses and asses; in Asiatic Turkey, camels are also employed. For the accommodation of travellers there is abundance of inns, called *han* or *khan*, or, when in small villages, *meyhane*. In these the traveller generally finds during summer every comfort, if he can adapt himself to Oriental customs. Throughout the empire, both in Europe and Asia, there is a great posting establishment, consisting of a series of posts, placed at various distances, from 3 to 16 hours, and extending along most of the great lines of road. In these, horses are kept for the use of the government couriers, called *Tartars*, who form a separate corporation, and are distributed over the empire at the residence of each pasha, where they live in a house set apart for themselves, called the *Tartar-han*. They are generally a good sort of people; and though they drink a good deal of brandy, are always sober when on the road, and intemperate only when they arrive at the end of their journey, or when they have plenty of money, and are in a large town. The Tartars may be engaged by private travellers, as conductors of their journey; but a government order is necessary for the supply of post-horses, which are furnished at a very low rate. When carrying government dispatches, the Tartars travel without intermission, at so rapid a rate that few ordinary travellers are able to accompany them; but, when hired, especially by a traveller, the Tartar acts as his servant, but never mixes with the other servants, dining alone, to maintain his dignity. A *firman*, obtained at Constantinople from the Sultan, gives a traveller the right, not only to have a Tartar as his companion and protector, but also to be put into private lodgings, in the towns and villages, generally in the houses of Christians, who are so accustomed to this regulation, that many have a part of their house expressly set apart for foreigners, to prevent them from seeing their wives and families.

DIVISIONS.—Turkey is usually divided by European geographers into nine provinces or regions, namely, Roumelia, including the ancient Macedonia and Thrace; Thessaly; Albania; Herzegowina; Bosnia and Turkish Croatia; Servia; Bulgaria; Wallachia; and Moldavia. These divisions we shall follow in our topographical description. But for administrative purposes, the country remaining under the direct dominion of the Padishah is divided into four eyalets, which are again subdivided into livas and sandjaks.

The EYALET OF ROUM-ILI comprises Thessaly, Albania, and the western part of Roumelia, and is divided into the livas of *Ioanina*, *Saloniki*, *Monastir*, *Trikhala*, *Scutari*, *Ochrida*, *Avlona*, *Kustendil* or *Ghiustendil*, *El Bassan*, *Perserin* or *Prisrend*, *Dukagin*, *Uskup*, *Delvino* or *Delbino*, *Velitschterin*, *Cavala*, and *Alaja-hissar* or *Krukhovacz*.

The EYALET OF BOSNIA comprises Bosnia, Croatia, and Herzegowina, and is divided into the livas of *Widdin*, *Kiliss-Bosna*, *Izvernik* or *Zvornik*, *Ada-i-kebir*, and *Trebigne*.

The EYALET OF SILISTRIA comprises Bulgaria and the eastern part of Roumelia, and is divided into the livas of *Nicopoli*, *Chirman*, *Viza* or *Wisa*, *Kirkilissa* or *Kirkliseh*, *Silistria*, and also includes the fortress of Belgrade.

The EYALET OF THE JEZAYRS OR ISLANDS comprises the coasts of Thrace and all the islands of the Archipelago, with Cyprus; but many of these are now included in the new kingdom of Greece. This eyalet contains the livas of *Gallipoli*, *Metelin*, *Rhodes*, *Lefcosia*, *Chio*, *Samo*, &c.

§ *Cities and Towns.*

1. *Roumelia.* CONSTANTINOPLE (called by the Turks STAMBOUL, or ISTAMBOUL), the metropolis of the Ottoman empire, and the chief city of Islam, is situate on a hilly promontory at the southern entrance of the Thracian Bosphorus, in N. lat. 41° 1′ and E. long. 28° 55′. The city is built on seven hills with their intervening valleys, and forms an irregular triangular-shaped area, pointing to the east; having its south side washed by the Sea of Marmora, and its north by the waters of the Golden Horn, which, extending five miles inland from the Bosphorus, forms one of the finest harbours in the world. The west side is formed by a triple wall which stretches across from the harbour to the sea. The total circuit of the city is between 11 and 12 miles, of which each of the three sides occupies nearly four, the harbour side being considerably the shortest. Within this enclosure the city forms a confused mass of narrow, winding, steep, and dirty streets, crowded with wooden houses, and interspersed with numerous mosques, the principal of which crown the summits of the seven hills with their massy domes and lofty minarets, and give to the city, from a distance, an appearance of magnificence which a closer examination dispels. The point of the promontory is occupied by the Serai or imperial palace (called *Seraglio* by the Franks), which consists of a group of buildings of various forms and dimensions, in the midst of numerous courts and gardens, the whole being surrounded by a high wall. The principal buildings in the city are the mosques, of which there are twenty dignified with the title of *humayoun* (imperial). The first of these is the ancient church of the Holy Wisdom (*Ayia Sophia*, most absurdly converted by Europeans into a female Saint Sophia), founded by Constantine, and rebuilt in its present form by the Emperor Justinian, in the sixth century. Externally, it is a large square building, crowned with cupolas; but, inside, it exhibits the form of a Greek cross, the intersection of which is surmounted by a very flat dome, 115 feet in diameter, and 180 feet above the floor. In front is an ancient belfry; and its Moslem masters have added a beautiful minaret at each of the four corners. This mosque closely adjoins the Serai. Nearer the south end of the same hill is the Ahmedya, or Mosque of Sultan Achmed I., which is not only the chief of all the mosques, but also the only one in the empire that has six minarets. It is the State Church, or Cathedral, of Constantinople; for to it the Sultan generally repairs on the two great festivals of the Bairam, accom-

panied by his whole suite; and it was here that Sultan Mahmoud appealed to his assembled people for their assistance to crush the Janissaries. The Suleimaniyeh, the most splendid monument of Ottoman architecture, and built under the greatest of the Ottoman Sultans, Suleiman the Magnificent, in the middle of the sixteenth century, by Sinan, the greatest architect in the empire, stands on the top of the second hill, and contains, within its sacred precincts, the mausoleum of the founder, his consort, and his children. These, and all the other mosques, are built after the model, or in imitation of St. Sophia's; but the latter is greatly surpassed by the Suleimaniyeh. The general plan of them all is the same; they contain, within their outward enclosure, a fore court, a garden or place of graves forming a back court; and, between the two, the sanctuary itself, the mosque, which, if small, is called *mesjid* (the place of worship), if large, *jami*, (the assembler.) Of the latter there are said to be 100 in the city and its suburbs; and it is only in them that, on Fridays, the prayer for the Sultan is pronounced from the minber, or speaker's pulpit. As in Islam all instruction is founded on religion, and jurists are at once theologians and lawyers, it is natural that mosques should be the central points around which scientific and literary establishments should be grouped. Thus in the Constantinopolitan mosques are founded the mudreses and the libraries; and of these institutions Constantinople possesses about 300.

Besides the church of the Holy Wisdom, there are several other remains of Roman antiquities, as a monolithic Egyptian obelisk, another obelisk formed of several pieces, and appearing to have been once covered with brass, and a brazen column formed of the bodies of three twisted serpents, in the Atmeidan or Hippodrome, an open area adjoining the Serai, 250 paces long by 150 broad, and originally formed in the ancient Byzantium by the Emperor Severus; the burnt column in the street of Adrianople; the column of Theodosius in the palace garden; the cistern of Constantine, now called *Binderik*, or the thousand and one pillars, and the *Yerebatan Serai*, or subterranean palace, two ancient reservoirs, both situate near the burnt column; and the *Bosdjekan-kemeri*, or aqueduct of the Emperor Valens, connecting the third and fourth hills, and consisting of two rows of arches, partly ruinous, though still serving to convey water.

Constantinople contains a number of covered bazaars, which have more the appearance of a row of booths in a fair, than of a street of shops; yet the arrangement and exposure of their various and gaudy articles would astonish a person familiar even with the splendour of London. Not only these bazaars, but those which more resemble open streets, are severally allotted to particular trades and articles of merchandise, after the manner of Athens and Rome, and of this city when under the dominion of the Greeks. Water is to the Orientals the symbol of the principle of life, and the words of the Koran, "By water everything lives," is almost universally inscribed on the great fountains, some of which form the finest ornaments of the city. Baths are a luxury indulged in by all classes, and of these useful establishments there are about 130 dispersed through the city. Some of them are built of marble, but in general their external appearance is no way remarkable. Internally, they are divided into a number of circular rooms, lighted from cupolas, and containing the baths, with all their necessary appendages. The supply of water is brought by aqueducts, partly above and partly under ground, from seven reservoirs or *bends*, in the neighbourhood of Belgrade, a village 15 miles to the north of the city. For the reception of strangers, there are 180 *khans* or inns, which are just so many large stone barracks or closed squares, and have, like the baths, every recommendation except architectural elegance. They generally contain a range of warehouses and stables on the ground floor, and ranges of small chambers in galleries above, which are kept neat and clean by the servants of the khan, and are fitted up for the time with the carpets and slender wardrobe of the occupiers. These useful structures are the work of sultans and other munificent individuals; so that strangers, with the exception of a small fee to the servant, are gratuitously lodged, and, during their sojourn in the city, are masters of their rooms, of which they keep the keys. They are open to men of whatever quality, condition, country, or religion; and have contributed to attract the merchants and the merchandise of the furthest Moslem countries of Africa and Asia to the Imperial city. During fires or insurrections, their iron gates are closed, and they thus afford complete security to the persons and the property of the merchants.

Connected with the Imperial Court, are two buildings in Stamboul which require notice; namely, the *Eski Serai*, or Old Palace, and the *Yedi Koulleler*, or Seven Towers. The former is a large walled structure in the heart of the city, used as the residence of the cadines of the deceased sultans and their attendants; the latter is an ancient castle at the south-western corner of the city, close by the sea. Three of the seven towers have disappeared; those remaining are 200 feet high; but the whole is ruinous, and garrisoned only by a few soldiers. It was originally built soon after the foundation of the city, was repaired and strengthened by Mohammed II., and afterwards became the chief garrison of the janissaries, and a state prison.

Outside the city walls, and beyond the harbour and the Bosphorus, are several towns and villages, which may be called the suburbs of Constantinople. Immediately adjoining the wall, to the westward of the city, are the villages of *Eyoub*, *Otakdgiler*, *Merla-hane*, *Balukli*, *Kutchuk-Baluklı*, and *Buyuk-Sal-hane*; on the north side of the harbour are *Galata*, *Pera*, *Top-hana* and *Fundukli*, *St. Demitri*, *Cassim-Pasha*, *Haas-kioy*, and *Soudlejeh*; on the east side of the Bosphorus is the large town of *Scutari*, about nine furlongs from the Seraglio point, and *Top-hana*. *Galata*, the largest of the suburbs, is the principal seat of trade, and the usual landing-place from the Sea of Marmora. It extends along the north side of the harbour, near the entrance, and up the slope of the adjoining hill which is occupied by Pera, and from which it is separated only by a wall with gates, which are closed at night. The dwelling-houses of Galata are built of wood, but the warehouses are of stone, arched, and provided with iron doors and shutters, as a precaution against the frequent fires. As a further precaution, a watch is set upon a lofty tower which commands an extensive view, and from which the alarm is given. There is a similar tower, called the Seraskier's, in Stamboul, near the palace. Galata contains the Imperial custom-house, a Roman Catholic church, a convent of Dominicans, and one of the Capuchins; and a number of Greek and Armenian churches, but only one mosque. *Pera* is the head-quarter of diplomacy, and the residence of the European ambassadors and consuls, and is chiefly inhabited by Franks. It is devoid of any Oriental character, and bears much resemblance to a second-rate Italian town. *Top-hana* forms a continuation of Galata along the shore to the eastward, and derives its name from the cannon foundry established here. It contains also the artillery barracks: and its fine quay is the usual place of embarkation for Scutari and the villages on the Bosphorus. *Fundukli* a straggling village along the shore continuous with Top-hana to the north. *Cassim-Pasha* is an extensive suburb to the west of Galata and Pera, from which it is separated by extensive burying-grounds. It possesses few attractions for strangers. The suburb of *St. Demitri*, occupying a height above Cassim-Pasha, and wholly inhabited by Greeks, was almost entirely consumed by fire in 1832. On the heights behind Cassim-Pasha and St. Demitri is the *Ok-meidan*, or Place of Arrows, where the sultans used frequently to exercise themselves in shooting with the bow and arrow. *Eyoub* is a beautiful and picturesque suburb, at the north-west corner of the city, extending along the upper part of the harbour, and surrounded by gardens and cemeteries thickly planted with cypress. It takes its name from Eyoub or Iob, the companion and standard-bearer of the Prophet Mahomet, who was killed during the first siege of Constantinople by the Saracens, A.D. 668, and was buried here. His burial place was revealed in a vision to the conqueror, Mohammed II., who erected a mosque on the spot. The mosque is an elegant building of white marble, and is the place where the sultans are in-

augurated, by being girded with the sword of Othman, the founder of the empire. No Christian is allowed to enter the mosque, or to reside in the village. As a burial-place Eyoub is held in great veneration, and, next to those of Scutari, its cemetries are the most remarkable of any near the capital. *Scutari*, like Rome and Constantinople, stands on seven low hills, on the east side of the Bosphorus. Its structure in every respect resembles that of the city itself; it contains eight mosques, five of which were built by sultanas and three by sultans. Its ancient Greek name was *Chrusopolis* (Gold-town), probably from its being the place where the Persian tribute was collected. Its modern name of *Uskudar* (Italianized into Scutari) is a Persian word, meaning a courier. Scutari is, and has been from the remotest period, the post station for Asiatic couriers, the great rendezvous of caravans, and the place where travellers to and from the east commence and terminate their journeys. In front of the town is the *Kis-Koulasi*, or Maiden's Tower, built on an insulated rock in the Bosphorus.

The Bosphorus itself we have already described. Its great branch, the Golden Horn, extends nearly five miles inland, with a width varying from two furlongs to five, but gradually narrowing near its termination, where it receives the "Sweet waters" of the rivulet called by the ancients *Lukos* or *Lycus*. The water is deep enough to float the largest ships close to the land; and there is room sufficient for 1200 sail. The steepness of its banks, and its great depth of water, which is subject to no variation from tides, afford peculiar facilities for loading and unloading vessels. The Imperial naval arsenal, *Ters-hana* (the place of shipwrights), is situate near the upper end of the harbour, in the suburb of Cassim-Pasha; the inclosure comprises docks, workshops, stores, and steam-engines. The artificers are chiefly Greeks and Armenians; but the director is, or was recently, an Anglo-American, a man of great talent and reputation, who has constructed ships of the most enormous size. The *Bagnio* or prison is close to the Arsenal, and behind it are the picturesque ruins of the palace of the Capudan-Pasha. In 1837 an elegant wooden bridge, resting on boats, was constructed across the harbour, immediately below the arsenal, which forms a communication between Stamboul and Pera. Ships pass it by means of two draw-bridges. Besides the ships floating in the harbour, the surface of the Golden Horn is covered with a countless number of boats, both large and small, which ply for hire, like the wherries on the Thames. Some of these boats or *caiques* (kaw-eeks) are extremely elegant, and the dexterity of the caiquejee (boatman) makes them glide with great rapidity over the smooth surface of the water. Large and heavy boats, rowed like Thames barges, start at short and regular intervals from Scutari, Top-hana, and the Baluk-bazaar (fish-market), which are crowded with passengers for the villages on the Bosphorus. Steam-boats have lately made their appearance in these quiet waters, to the great annoyance of the caiquejees, whose frail vessels are in danger of being overset by the commotion raised by the wheels.

Constantinople and its suburbs are peopled by a motley assemblage of Turks, Greeks, Armenians, Jews, Franks, and natives of the East, to whom separate quarters or districts are allotted; though in certain parts some of them dwell promiscuously. The Ottomans themselves chiefly occupy Stamboul; but within its walls are also the quarters of the Armenians, Greeks, and Jews. The Armenians have two quarters, one alongside the sea of Marmora, and the other alongside the harbour, very near the middle of each side. These form the busiest, the most valuable, and most respectable part of the population; they are the bankers, the corn merchants, goldsmiths, physicians, surgeons, bakers, builders, braziers, jewellers, weavers, hucksters, in short, the general mechanics, labourers, and men of business. They are mild, persevering, sober, patient, and honest, but skilful in their dealings; and some of them are very wealthy. The Turks highly esteem them, and prefer them to any other people for the management of their commercial and financial transactions. The *Roumi*, or Greeks, called also *Yesirs* or slaves by the Turks, are likewise an important class. They are very much scattered throughout the city, owing, it is supposed, to most of their ancient churches having been allowed to remain, and thus to induce a portion of the people to reside in their vicinity. But the greater number, and the most influential part of them, reside in a district called the Fanar, adjoining the harbour, towards the north-west corner of Stamboul. The Greeks have become almost proverbial for their intriguing character, duplicity, and dishonesty; they are the inveterate enemies of the Turks, and almost all favourably disposed towards Russia. The Fanariotes are the most respectable of the class. But the Greeks of the suburbs are, according to a late traveller (*Reid*), a class of thieves, liars, swindlers, and assassins; a worse set, he says, it would be impossible to find. The Jews are nearly all of Spanish extraction, and understand more or less the Spanish language. There are, however, to be found Jews from Persia, Arabia, Tunis, France, Italy, Germany, Poland, Greece, and Asia Minor; of whom the least respectable are the Greek and the Smyrniot. They have two districts assigned to them; the one named Baleta, on the south side of the harbour, to the west of the Fanar, and the other Haskoi, or Haas-kioy, on the north side; but they are also found in all the Christian quarters, and among the villages on the Bosphorus. Their quarters are the most densely peopled, but at the same time the dirtiest and most squalid portion of the city. The Jews are not confined to mercantile pursuits; but are found exercising the callings of tinsmiths, carpenters, shopkeepers, coffee-house-keepers, tailors, bootmakers, and weavers. The most respectable of them have warehouses in the *hans*; but many of them infest the streets, where they are exceedingly troublesome to strangers; and such is their pertinacity, that violent means are necessary to drive them off. They are a persecuted race here as elsewhere, but still they thrive. In the street they assume the appearance of poverty; but many of them are wealthy, and possess houses richly furnished. The Franks form a motley and varied class, consisting of English, Scotch, Irish, Maltese, and Ionian-British subjects; Americans, French, Italians, Swiss, Prussians, Austrians, Hellenic Greeks, and Russians; all of whom enjoy the protection of their own national laws, which are administered by their consuls. Their number in 1839 was calculated as follows:—Scotch, 120; English, 80; Irish, 21; Maltese, 2000; Ionian-British, 4000; Hellenic Greeks, 2350; Americans, 20; French, 700; Italians, 2600; Prussians, 440; Austrians, 2000; Germans, 3500; Russians, 4000;—total 18,231. The Scotch, English, Irish, and French, are the most respectable; some of the others preserve a decent character; but the mass of them, says Reid, are the most practised rogues, thieves, assassins, gamblers, swindlers, and villains, that ever existed in any city. Pera has long been known as the head-quarters of intrigue and villany; and neither London nor Paris is said to be able to produce a proportionate number of daring ruffians. They seem to be the offscourings of the capitals of Europe; and it is no wonder that the Turks despise the nations whom they represent. Of the total amount of the population the most conflicting estimates have been formed, varying from about 230,000 to upwards of a million. Mr. Reid says that the population of the city and suburbs was stated to him, by an Armenian who had good means of information, to be, at the end of the year 1838, in round numbers, 846,000; of whom 500,000 were Turks; 200,000 Armenians; 100,000 Jews; 28,000 Greeks; and 18,000 Franks and other strangers. But, besides the human inhabitants, there is another class of occupants which form one of the wonders of Constantinople. The dogs are not the property of any one, but are supported by all. Their litters are never destroyed; they are the only scavengers, and may be constantly seen prowling along the edge of the water in search of bodies that may be washed ashore. The dogs are never domesticated, and mosques and other inclosures are carefully guarded from their intrusion. They are susceptible of the plague, but hydrophobia is unknown among them. They have all their peculiar districts, where they observe the most rigid police among themselves; and, should a vagrant invade his neighbours' territory, the whole party immediately assail him.

The receptacles for the dead are not the least interesting or important objects in Constantinople;

they are far more picturesque and commodious than those for the living, and occupy hardly less extent of ground. The people of every creed have distinct cemeteries. Those of the Moslem population are distinguished by the dark cypresses with which they are planted, and by their turbaned stones of white marble. A cypress is always planted at each Mussulman's grave; and, as no grave is opened a second time, their burial grounds have become vast forests, extending for miles round the city and its suburbs. Multitudes of turtle doves frequent these gloomy abodes, and hold a divided sway with bats and owls. Burying within the city is strictly prohibited. The favourite burial place on the European side is the cemetery of Eyoub; but there are also large cemeteries between Cassim-Pasha and Pera and Galata, and along the outside of the western city wall. The cemeteries of Scutari are, however, the largest, the most beautiful, and the most celebrated. The principal one occupies a very large space of ground to the south of the town, and is richer in monuments of illustrious and distinguished men than any of the cemeteries of Constantinople, or of the other villages. Scutari stands on the sacred soil of Asia, and the Turks having a presentiment of their expulsion from Europe, prefer being buried on this holier ground, where they shall be safe from the infidel's tread. The plane, the mulberry tree, and the terebinth or turpentine tree, shade the cemeteries of the *rayahs*, or Christian subjects. The cemetery of the Armenians is pre-eminently beautiful. Beyond Pera are extensive cemeteries belonging to every race.

Constantinople was founded by a colony of Greeks about 658 years B. C., and bore for nearly a thousand years the name of *Byzantium* (Latin, *Byzantium*), derived from Buzas or Byzas, the leader of the colony. Byzantium, however, in its greatest extent, occupied only the two most easterly of the seven hills. In the year 328 of the Christian era, Constantine the Great founded at Byzantium a new city, which was destined to rival Rome, and called it *Roma Nova*; but his own name ultimately prevailed as its designation. For eleven centuries it remained the capital of the eastern portion of the Roman empire; till it was taken by storm, in 1453, by the Turks under Mohammed II., who made it the capital of his empire, and there his successors have fixed their almost uninterrupted abode.

A number of villages, villas, castles, and palaces line the shores of the Bosphorus, forming so many appendages to the metropolis. These our limits permit us only to name. Commencing from Fundukli, on the European side, we find *Dalmabaktche, Beshik-tash, Orta-kioy, Armaout-kioy, Bebec, Roumili-hissar* or castle of Europe, at the narrowest part of the channel, *Balta-liman, Stenek, Yeni-kioy, Kalender, Therapia, Chefeh-kioy, Buyuk-dereh, Sariyeri, Yeni-mukala, Roumeli-kavak, Buyuk-liman, Kazuljee-fort*, and *Roumeli fanaraki* or European lighthouse. On the Asiatic side, commencing from Scutari, we find *Kous-Goundjouk, Starrou, Beglerberg-kioy, Chengel-kioy, Yeni-kioy, Anadoli-hissar* or Castle of Asia, at the mouth of a rivulet called *Giuksou* or the Sweet Waters, *Kandijeh-kioy, Indjir-ki y, Beikos, Yuli-kioy, Sultanieh*, watering-place, *Omourjevi, Unkiariskillessi* or the Emperor's steps, *Fort Joucha*, behind which rises the *Joucha-dagh* or Giant's Mountain, *Anadolikavak, ancient Genoese Castle, Keteli-liman, Phulbournou Pilar-bournu, Anadoli-fanaraki* or Asiatic lighthouse. Besides these, we may mention the *Eagtche-kioy* and *Belgrade*, to the north-west of Buyukdereh, *Sekeri-kioy, Ierli-kioy, Demirchi-kioy, Kila* or *Kilia*, and *Scombre-kioy*, to the north; and *Bourgourli-kioy*, to the eastward of Scutari. In the Sea of Marmora, between 5 and 12 miles S.E. of the city, are the PRINCE'S ISLANDS, a group of picturesque and beautiful hills, rising abruptly from deep water. They are nine in number, and are much resorted to in summer by the rayahs, or Christians of Constantinople.

ADRIANOPLE (or *Andrinople*, the *Ederneh* of the Turks), the first Ottoman capital in Europe, and now reckoned the second city of the empire, is situate partly on a hill and partly on the banks of the Tundja, at its confluence with the Maritza, in an elevated plain, 135 miles W.N.W. of Constantinople. It has now the appearance of desolation; the streets are covered with grass, and the houses seemingly deserted. The only objects of interest are the mosque of Sultan Selim II., which is regarded as the most magnificent temple of Islam, but built in the usual form, with a massy dome in the centre, and four very elegant minarets; and the bazaar of Ali Pasha, 300 paces long, and presenting a more striking appearance than any of the covered bazaars of Constantinople. Adrianople was built by the Roman emperor Adrian, from whom it takes its name; it is the residence of a British consul; and its population is vaguely estimated at 100,000. *Demotica*, on the Maritza, 30 miles S. of Adrianople, is a flourishing town of 15,000 inhabitants, the see of a Greek archbishop, and noted for its manufactures of fine pottery, silk, and wool. *Enos*, on the south side of a bay at the mouth of the river, has 7000 inhabitants, and may be considered as the port of Adrianople.

The other principal places in Roumelia are: *Philippopoli* (*Filibe* of the Turks), a large town with 30,000 inhabitants, 90 miles W.N.W. of Adrianople, and noted for its manufactures of silk, cloth, and cotton. *Tatar-bazardjik*, 23 miles W. of Felibe, on the great road from Belgrade to Stamboul, is a large town with 10,000 inhabitants. *Eski Sagra*, at the foot of the Balkan, in the midst of well-cultivated fields, has manufactures of carpets, and 18,000 inhabitants. *Kaisanlik*, in the defiles of the Balkan, has 10,000 inhabitants. *Idirno* or *Selimno*, near the important pass of the Irongate, 60 miles N. of Adrianople, has an important fair, and manufactures of woollen cloth, fusils, carbines, and rose water. Population 20,000. *Ouroundjora* is important for its trade and its fair, which is frequented by merchants from Asia Minor, Armenia, the Crimea, Russia, Germany, and Poland. *Kirkilisse*, 30 miles E. by N. of Adrianople, is the capital of a liva, and is inhabited by numbers of Jews, who furnish a great part of the butter and cheese consumed at Constantinople. *Gallipoli*, at the northern entrance of the Dardanelles, on the west side of the strait, is a large town, the capital of the eyalet of the Jezayrs, with 17,000 inhabitants, and a great trade. It is also noted for excellent leather. *Rodosto*, a large trading town on the north side of the Sea of Marmora. *Saloniki* (ancient *Thessalonica*), the most commercial city in European Turkey after Constantinople, is situate at the head or northern extremity of the large bay to which it gives its name. It is noted for its manufactures of leather, cotton, carpets, silk, copper, steel, and iron; it is the seat of a Greek archbishop, a grand molla, and the grand hakam of the Jews, a sort of high-priest of that people, who are here very numerous. Population about 70,000. *Ienidje Vardar*, west of Saloniki, is noted for its industry, and extensive plantations of tobacco; population 7000. In its vicinity are the ruins of *Pella*, the birth place of Alexander the Great. *Karaceria*, 35 miles W. of Saloniki, is noted for cotton and dye works, and marble quarries. *Vodina*, 46 miles N.W. of Saloniki, near or upon the site of the ancient *Edessa*, the first capital of Macedonia, and the burial place of her kings. It is now the see of a Greek bishop. *Serres*, a large town, a few miles west of lake Takinos, with manufactures of cotton, wool, and tobacco, is the centre of the cultivation and trade of cotton in European Turkey. *Orphano*, a commercial town on the bay to which it gives its name. *Drama*, a thriving town, with manufactures of calico and tobacco, 72 miles E.N.E. of Saloniki, in the vicinity of which are the ruins of *Philippi*, where was fought the great battle which decided the fate of the Roman world, 42 B. C. *Monastir* or *Eitoglia*, 95 miles N. by W. of Saloniki, a large town with 15,000 inhabitants, is the residence of the Roumeli-valiey, or master of the police of all Roumelia. *Kastoria*, 65 miles W. of Saloniki, on the west side of a beautiful mountain lake, is the the see of a Greek archbishop. Its vicinity is inhabited by the *Kastarrers*, a mixed race of Servian and Wallachian origin. In the valley of the Vardar: *Uskup* or *Scopia*, the capital of a liva, and the see of a Greek archbishop, is noted for its buildings, its fine situation, and its tanneries; population 10,000. *Kopvili, Kiupruli, Keupeurleu*, or *Keuprulu*, a small town of 4000 inhabitants, is noted for its stone bridge over the Vardar. *Istib* or *Istip* (ancient *Stobi*,) a small town noted for its iron and steel works. *Karatova*, a straggling town noted for an argentiferous copper mine,

and for the manufacture of copper vessels and utensils. In the upper basin of the Struma, or Karasu: *Kustendil* or *Ghiustendil*, a small town with sulphureous warm baths, and 8000 inhabitants, is the see of a Greek archbishop. *Dupinja* (*Dupnixza* or *Dobnitza*), in a high valley east of Kustendil, is noted for its iron mines; *Stromza* or *Strumnitza*, or *Ostroumja*, formerly noted for its fortifications, is now known only for its thermal springs; *Petrovich*, noted for excellent tobacco. *Melinik*, the see of a Greek archbishop. In the basin of the Morava: *Pristina* or *Piristina*, on the river Ibar, a considerable town with 10,000 inhabitants, is the residence of the inspector of the mines of Macedonia, and the see of a Greek bishop. *Kossova*, 10 miles N. by E. of Pristina, is a small town noted for two great battles gained by the Turks in 1389 and 1448, and for the monument of Sultan Murad I. who was killed there. *Novo Berda* is noted for the silver mines in its vicinity. *Vrana* is noted for its forges and manufacture of scythes and arms.

The gulfs of Contessa and Saloniki are separated by a large peninsula, the ancient *Chalcidice*, which subdivides into three, and projects far into the Archipelago. The most northerly of these is the celebrated Mount *Athos*, now called by the Greeks *Agion Oros*, and by the Franks *Monte Santo* (both names meaning *Holy Hill*). It forms a mountainous ridge 25 miles in length, and 4 in breadth, rising abruptly from the water; and having its lower parts covered with forests of oak, pine, and chestnut. Near the S.E. extremity, the summit reaches to the height of 6349 feet above the level of the sea, in N. lat. 40° 10′, and E. long. 24° 20′ 30″. From a remote period the mountain has been occupied by a number of Greek monks, who live in a sort of fortified monasteries, of which there are about twenty in the Peninsula. The ecclesiastics not only cultivate the ground, and plant vines and olives, but also rear vast numbers of bees, whose wax they export to a large amount, from the port of *Alrara*, on the east side of the Peninsula. The isthmus which connects the Peninsula with the continent is about a mile and a half across and only 15 feet above the level of the sea. It still retains traces of the canal dug through it by Xerxes, King of Persia, for the passage of his fleet, B.C. 480.

2. *Thessaly*. *Yeni-shehr* (ancient *Larissa*), a large town on the south bank of the Salambria, which, before the war, had a population of 30,000, and was one of the most flourishing towns in Turkey. It is noted for its manufactures of silk, cotton, leather, and tobacco, and for its red dye, is the centre of the trade of Thessaly, and the see of a Greek archbishop. It has a fine bridge of ten arches. *Trikhala, Tricala, or Tirhala*, 36 miles W. of Larissa, a considerable town, is the residence of the Pasha, governor of the province, and the see of a Greek bishop. To the westward are the defiles of *Agrafa*, leading into lower Albania, and the *Meteora* (high places), a series of monasteries built on scarped and isolated peaks, to four of which the ascent is made by a rope and basket. They are formed of natural caverns, or of chambers cut in the rock. The number was formerly 24, but is now reduced to ten. *Tournavos*, a small town, is noted for the manufacture of light stuffs, of silk and cotton tissue, known in commerce by the name of bourres de la Grèce. *Ambelakia*, in the vale of Tempé, is a large town with 6000 inhabitants, most of whom are employed in the manufacture of the red cotton thread, which is considered the best in Turkey. *Baba* or *Baba-hassan*, whose inhabitants are employed in the same branch of industry, but are exclusively Mahometans. *Pharsala* or *Sataljik*, 23 miles S. of Larissa, is memorable for the victory gained by Cæsar over his rival Pompey; and is still important for the industry and trade of its inhabitants, who amount to 5 or 6000. *Zagora*, a village near the sea, is noted for the cultivation of silk: it formed, or still forms, a sort of republic, governed by its own laws, and acknowledging only the authority of the Sultana Validi. *Volo*, a small town, which gives its name to a gulf, and represents the ancient *Demetrias*. *Tikeri* or *Trikiri*, a small town with a fine harbour, at the entrance of the Gulf of Volo. Due north of Larissa, about 30 miles distant, is the celebrated Mount *Olympus*, now called *Elymbo* or *Olympo*, also *Lacha* or *Lakha*, a giant mass, which rises with two peaks, named St. Stephano and St. Elias, to the height of 9754 feet above the level of the sea, in N. lat. 40° 5′ and E. long. 22° 21′. The ridges forming its southern base are separated from the ridges of *Œta*, by the vale of *Tempé*, a deep gorge, through which the Salambria has forced its way to the sea.

3. *Albania*. IOANINA, IANINA, YANINA, or YANIA, a large well-built town, occupies a picturesque situation on the western side of the large mountain lake to which it gives its name. It is an open town, but commanded by two strong citadels, the one of which occupies a peninsula in the lake, and the other, named Litharitza, a scarped rock in the centre of the town. Ioanina is celebrated in modern times as the residence of Ali Pasha, the Vizier of Albania, under whose rule it attained a great degree of prosperity, and a population of 30,000; but these are now reduced to a few thousand Albanians and Jews. The other principal towns of Southern Albania are: *Mezzovo, Konitza, Premithi*, and *Klissura*, noted for their fortifications; *Argyro-Castro* or *Ergir-Kastri, Delonia, Delbino* or *Delvino, Philates* or *Philoti, Paramithia, Souli*, so celebrated for the long struggle of its inhabitants, the Suliotes, against Ali Pasha; *Arta, Salagora; Preresa*, at the entrance of the Gulf of Arta, and near the site of the ancient *Nicopolis*, built by Augustus to commemorate his victory at Actium; *Parga, Butrinto, Chimera* or *Kimera*. In Middle Albania: *Avlona* or *Valona*, with a good harbour, *Tepelene*, the birth-place of Ali Pasha, *Ducates*, the chief town of the numerous Albanian tribe of Japys, *Berat* or *Arnaout Beligrad, Elbassan* or *Ilbassan, Durazzo* (ancient *Durrachion* or *Dyrrachium*), a small town with a harbour on the Adriatic. In Upper Albania: *Ochrida* or *Ochri*, a considerable town on the north side of a large mountain lake, drained by the river Drin; *Dukagin*, the capital of a liva; *Perzerendi, Prizrendi* or *Perzerin; Alessio, Alise* or *Lesch*, a considerable town with a harbour, at the mouth of the Drin, and containing the tomb of the famous Scander-beg; *Croia* or *Ak-Serai*, whose castle, now demolished, was Scander-beg's residence; *Scutari* (*Iskanderi* of the Turks, *Scodrr* of the Albanians, *Scodra* of the Illyrians), a large, fortified, and flourishing town, at the south end of a large lake, in the bottom of a warm valley, with a population of 20,000; *Dulcigno* (Turkish, *Olgun*), a small seaport, formerly the resort of corsairs or pirates, who infested the Adriatic; *Antirari* (*Tivari* of the Turks, *Bar* of the Illyrians), a seaport town, with 6000 inhabitants, and a considerable trade in salt and oil.

4. *Bulgaria*. SOPHIA (*Traditza* of the Bulgarians), a large town, situate in the midst of high mountains, between the rivers Isker and Nissava, 300 miles W.N.W. of Constantinople, on the high road to Servia, with celebrated baths, and 46,000 inhabitants. *Ichtiman*, a small town at the entrance of the famous pass of the Balkan named *Soulu-Denbend* or *Trojan's Gate*, from the remains of a gate attributed to that Emperor. *Samakof*, a small town in a high valley, noted for its mines and flourishing works in iron; in the vicinity of which is the defile named *Kiu-Derbend* (Girl's Pass), 35 miles N.E. of Sophia. *Bergoracz* or *Berkofja* is noted for a rich silver mine, 48 miles N. of Sophia. *Mustapha-palanka*, and *Nizza* or *Nissa*, both noted for their fortifications, in the valley S.W. of Sophia. *Shumla* (*Schoumna* or *Choumla*), a large town 110 miles N. by E. of Adrianople. Is distinguished for the industry and commerce of its inhabitants, who amount to 18 or 20,000. It is situated in the centre of a convexity or rent of the chalk beds which occupy this part of Bulgaria, and which have been mistaken by geographers for offsets of the Balkan. It contains a citadel and redoubts on the chalk hills, which have enabled the Turks more than once to make an obstinate defence, and to prevent the passage of the Russian armies in this direction. *Rutshuk*, a large fortified town on the south bank of the Danube, with a population of 30,000 Turks, Greeks, and Armenians, who carry on a considerable trade with Vienna in indigo, corn, and cloth. *Silistria* or *Dristra*, a large fortified town on the Danube, with 20,000 inhabitants. Its fortifications were completely repaired and extended by the Russians, who kept possession of it for several years after the peace of Adrianople, in 1826, as a key to Turkey; but a late traveller (*Spencer*) calls it "an ill-fortified town, now in a more

ruinous state." *Nicopoli*, on the Danube, a fortified town, occupies a picturesque situation, partly on the brow of a range of chalk cliffs, and partly in a narrow valley. Population 10,000. *Sistova* (*Sestov* or *Schstab*), a large town of 20,000 inhabitants, on the Danube, with tanneries, manufactures of cotton, and a flourishing trade. *Widdin* or *Vidin*, a large fortified town, also on the Danube, with 20,000 inhabitants, and considerable trade. In eastern Bulgaria are: *Bazardjik* (Little Market), a small trading town in an important position; *Varna* or *Warna*, on a small bay of the Black Sea, a fortified town, which defied the Russian arms, till lost in the late war by the purchased treachery of its governor, Yusuf Pasha. *Nassova* and *Hirsova*, both on the Danube; *Iskchi*, midway between Ibrail and Ismail, where the Russians used to place their pontoons for the passage of the river in their wars with Turkey; *Toultcha*, a fortified town at the separation of the Sulinian and Georgieffian arms of the Danube. To the south and east of Shumla, *Karnabat* and *Pavarradi*, places rendered important by their position on the great military roads through the defiles of the Balkan; and Demir-kapi (the Iron Gate), a celebrated defile leading from Islivno in Roumelia, to Stareka in Bulgaria.

5. *Bosnia*, *Croatia*, and *Turkish Dalmatia*.—BOSNA-SERAI (*Serajevo* in Illyrian), a large town on the Migliazza or Miliaska, an affluent of the Bosna, stands on an elevated plateau, surrounded with woody mountains. It is inclosed by walls 12 feet thick, and the upper city is defended by small forts. The town contains a palace built by the Sultan Mohammed II., numerous mosques and baths, and about 70,000 inhabitants, who not only carry on a great trade, but also manufacture, to a large extent, military arms, metal plates, iron and copper utensils, goldsmith work, wool, cotton, and leather. It is the head-quarters of the principal hereditary captains who govern Bosnia under the Sultan, whose vizier a Pasha of three tails, resides at *Travnik*, a small town, with a citadel and 8000 inhabitants, 50 miles N.W. of Bosna-Serai. In the immediate vicinity of the latter are the baths of *Serajevska*, and a few miles further to the north and north-west, *Varesch*, *Visoko*, and *Kressero*, small places, noted for their forges and iron mines. The other principal places of Bosnia are: *Vraduk* and *Maglai*, towns on the Bosna, with strong citadels; *Fointza*, a village near Travnik, with rich iron mines; *Tuzla*, noted for its rich salt springs; *Srebernik*, the capital of a sandjak; *Zwornik* or *Isvornik*, a large town with 14,000 inhabitants, and lead mines in its vicinity; *Jaicza*, a small town, with a citadel, and a nitre manufactory, and formerly the residence of the Catholic kings of Bosnia; population 2000; *Baniabouka*, a large, busy, and commercial town on the Vertas, with 15,000 inhabitants, is one of the principal fortresses of Bosnia. In Croatia are: *Bihacz* and *Novi*, small fortified towns on the Unna; *Kamengrad* and *Starai Maidar*, noted for their forges and iron mines, and also for a silver mine at the former. *Behir* or *Ottotcsan Gradisca*, and *Brod*, fortified towns on the Save. In Dalmatia: *Mostar*, on the Narenta, a small fortified city, with 000 inhabitants, and noted for a bridge of a single arch of 300 feet span; *Lirno*, a town with 4000 inhabitants, on the great road from Austrian Dalmatia to Bosnia, which renders it a place of considerable trade; *Trebigno*, a fortified city, the see of a Catholic bishop, with 10,000 inhabitants.

6. SERVIA, formerly a province of the Turkish empire, is now a sovereign principality, acknowledging the supremacy of the Sultan, and paying a tribute. It has an area of about 12,000 square miles, and 380,000 inhabitants. In the beginning of the present century, Czerny-Georges, a Servian in the service of Austria, formed the design of freeing his country from the Turkish yoke, and raised an insurrection, which was continued for several years, till he was taken and beheaded by the Pasha of Widdin. After his death the war was still continued; but at length the Turks, finding it beyond their power to reduce the rebels, agreed to resign Servia to a native governor, who should have the management of its internal policy, while the Sultan should still controul its external relations. Milotsch Obrenovitsch, a man who had risen to distinction during the troubles, was chosen prince by the chiefs of the nation assembled at Kragojevacz, whose election was confirmed by the Sultan, and the dignity guaranteed to him and his heirs; but he has been deposed by the senate, and the government seems to be at present in a very unsettled state. The country is nevertheless said to be improving with silent but astonishing rapidity, and to have already made immense progress in public instruction, administration, order, and industrious activity. The only town of any importance is *Belgrade*, at the confluence of the Save and the Danube, and on the right bank of the latter river. It is a large but decayed town, presenting a most picturesque appearance, from the number of its domes and minarets peering from among the dark cypresses with which they are surrounded. The town is inclosed with half-ruinous walls, gates, and towers, and has a citadel built on a bold promontory, once considered the bulwark of Turkey on this side, but now completely neglected and falling to decay. It has a Turkish garrison, and a Pasha dependent on the Vizier of Silistria. The seat of the Servian government is sometimes at Belgrade, and sometimes at *Kragojevacz*, 75 miles to the S.E. *Semendria*, the former capital of Servia, has fallen completely to ruin. *Gladova* or *Scala Kladova*, a very small and miserable Wallachian town, in the north-eastern corner of Servia, is only remarkable as the place where the navigation of the Lower Danube commences below the Irongate. In its vicinity are the remains of the bridge erected across the Danube by the Emperor Trajan, to facilitate the subjugation of Dacia, now consisting only of a solid shapeless mass of masonry on each side, and of 13 pillars or piers in the bed of the river, which are visible at low water. The distance between the two abutments is 3900 feet. Higher up the river is a small island containing the fortress of *New Orsova*, belonging to the Turks. *Hassan Talanka*, 12 miles S. of Semendria, a small fortified town. *Kruschevacz* or *Alajahissar*, nearly in the middle of Servia, is the see of a Greek bishop, and has a castle where several sovereigns of Servia have resided. *Schabacz*, a small fortified town on the Save. *Novi Bazar*, or *Ieni Bazar* (Newmarket), a large fortified town, with 7 or 8000 inhabitants, is the chief town of the district of Rascia. *Misvi* is a fortified town, with 4000 inhabitants, and the see of a Greek bishop.

7. WALLACHIA extends along the north side of the Danube, from New Orsova to the mouth of the Sereth, and northward to the Carpathian mountains, which separate it from Transylvania. Its greatest length is about 275 miles, and its greatest breadth 150; the superficial area is about 30,000 square miles, and the population amounts to 950,000. This province, and Moldavia were, till lately, ruled by governors, with the title of Hospodar, chosen from the Greeks of Constantinople, and vested with regal authority; the choice, however, was determined by purchase. By the treaty of Bukharest, in 1812, the Russian Czar acquired the right of interfering in matters connected with the religion of the people, and in cases of outrages committed by Turkish officers against the Christian subjects in the principalities; and by the treaty of Adrianople, in 1829, this power of interference was so greatly extended, that they are now completely under the controul of the Czar, and little else than Russian provinces. To the Sultan they pay a small annual tribute, and he still appoints the Hospodar for life, from a list of nominees presented by the boyars or nobles, and prepared of course at the dictation of Russia. The government, however, is of the worst possible kind; every department is in miserable disorder; the people are divided into two classes of tyrants and slaves; and the country is ill cultivated and thinly inhabited by a wretched population. *Bukharest*, the capital, is a large town with 80,000 inhabitants, situate on the navigable river Dombrovieeza, in an extensive marshy plain. It has few or no manufactures, but a considerable trade. The other remarkable places are: *Tergovist*, formerly the capital, but now almost in ruins, with a population reduced from 30,000 to 5000; *Ployesti*, a large town, with a well frequented fair; *Waleni* and *Kimpuria*, frontier towns north of Bukharest, with custom-houses, and noted for the rock salt which is dug at *Slanikal* near the former, and at *Okna-*

Teleaga near the latter; *Giurgewo*, a commercial town, composed chiefly of huts, on the left bank of the Danube, opposite Rutshuk; *Ibrail* or *Braiow*, on the left bank of the Danube, 15 miles above the mouth of the Sereth, was once a fortress of some celebrity, though now demolished; but a new town is rising out of the ruins, and the inhabitants carry on a very considerable trade in exporting raw produce. To the west of Bukharest are: *Ardjisch* or *Kurtea d' Arjish*, a small town, noted for a monastery, the church of which is considered the finest in Wallachia. It stands on the great road to the Rothen-thurm pass, leading through the mountains into Transylvania. *Krajova*, a small but regularly-built and flourishing commercial town, with 8000 inhabitants. *Iglas*, a small commercial town above the confluence of the Alouta with the Danube. *Rimnik*, a small town on the Alouta, near the northern frontier, with a very rich salt mine, that of *Okna-mare*, in its vicinity.

8. MOLDAVIA adjoins Wallachia to the north-east, being separated from it by the river Sereth and its affluent the Milkov; and is bounded on the east and north by the river Pruth, which divides it from Bessarabia, and on the west by Transylvania and the Buckowine. Its extreme length is 220 miles, and its extreme breadth 110; its area 16,000 square miles, and the population 450,000. The government is exactly on the same footing as that of Wallachia, and the country is as ill governed, and in an equally wretched state. The principal towns are: IASSY, the capital, a large town, with 40,000 inhabitants, situate on a height near the river Bachliu; *Galacz* or *Galatz*, a large wooden-built town on the Danube, may be considered as the port of both principalities. It is said to contain already 20,000 inhabitants. It carries on a great trade, chiefly in exporting the raw produce of the country, as tallow, harricot beans, corn, cheese, barrel staves, wax, flax, hemp, wool, bestial, skins and hides, wine, &c. The principal articles of import are iron, olives, cotton, sugar, and coffee. Vessels of 300 tons come up to the quay. *Niamtz*, near the north-western frontier, is noted for its picturesque situation and a large monastery, containing an image of the Virgin in massive silver, which is visited annually by great numbers of pilgrims. *Okna*, 98 miles N.W. of Galacz, in a valley with rich salt mines, whose productiveness rivals the best in Europe.

9. CANDIA (*Kriti* or *Kirid* of the Greeks and Turks, the ancient *Creta* or *Kreté*), is a large island, forming the southern limit of the Archipelago, about 160 miles long, varying in breadth from 6 to 35, and containing an area of 3200 square miles. It is almost wholly covered with rugged and barren mountains, which increase in elevation towards the west, where they are snow-capt even in June. *Ida*, now *Psiloruti*, the loftiest peak, rises in the centre of the island to 7674 feet above the level of the sea. The mountains abound with grottoes and caverns, one of which, at the foot of Mount Ida, answers in essential particulars to the ancient accounts of the famous labyrinth. The mountains are clothed with woods of oak, chestnut, walnut, and pine; the plane, cypress, myrtle, wild olive, vine, carob, aloe, arbutus, Indian fig, and many fine fruits and vegetables, grow spontaneously; and the ground is covered with aromatic herbs. The wild boar, wolves, and goats are met with in the forests; game is plentiful; birds of prey are numerous; and reptiles are few. The chief productions are, oil, silk, wine, raisins, carob, valonia, wool, oranges, lemons, wax, honey, linseed and almonds, cotton, flax, &c. The pastures are good, and cattle abundant, but the exportation of them is prohibited; wheat, barley, and oats are grown, but not in sufficient quantity for home consumption. The manufactures are few and inconsiderable; the principal article is soap, of which there are 24 works, producing annually about 3000 tons. The roads are nearly impassable, even for mules. Population, in 1839, 158,000, of whom 100,000 were Greeks and 44,000 Turks. Crete has been possessed for several years by the Pasha of Egypt, but is now restored to the Sultan. The principal towns are *Candia*, *Retimo*, *Khania* or *Canea*, and *Splakia*. There are several small islands along the coasts, the principal of which are *Stan-diu*, opposite Candia, and *Gozo*, on the south-west coast.

As further illustrative of Turkish Geography, the explanation of the following list of words of frequent occurrence may be useful.

Aghach, or **Agadj**, *a tree*.
Ak, *white*.
Altun, *golden*.
Bactche, or **Bagtché**, *a garden*.
Bala, *upper*.
Balkan, *a chain of hills*.
Bashi, *a head*.
Bazaar, *a market*.
Bendt, *a reservoir*.
Bournu or **Burun**, *a cape*.
Bunar, *a spring*.
Buyuk, *great, large*.
Chai, *a river*.
Dagh (Tagh), *a mountain*.
Davan, *a mountain-pass*, or *range of mountains*.
Demir, *iron*.
Denghiz or **Dengis**, *a sea*, or *lake*.
Derah, **Dereh** or **Deré**, *a valley*.
Deir, *a convent*.
Diyar, *tents*.
Egri, *crooked*.
Eski, *old*.
Ghieul, gheul, gol or **kol**, *a lake*.
Grada, Grade, *a fortress*.
Gumish, *silver*.
Hissar or **Ilisar**, *a castle*.
Ieni or **Yeni**, *young, new*.
Illjah, *hot springs*.
Jik, *sign of diminutive*.
Kaleh, *a castle*.
Kapi or **Kapousi**, *a gate*.
Kara, *black*.
Kasbah, *a market-town*.
Khanah, *a house*.
Keban, *a gorge, a pass*.
Kelisch or **Kelisah**, *a church*.
Keui, kieui, kioy, koi or **kul**, *a village*.
Kizil, *red*.
Koom, *sandy plains, deserts*.
Koulassi, *a tower*.
Kopri or **Kupri**, *a bridge*.
Kutchuk, *little*.
Liman, *a bay*.
Maden, *a mine*.
Menzil, *an inn*.
Oosek, *high*.
Ovah, *a plain*.
Palanka, *a stockade*.
Phanar or **Fanal**, *a light-house*.
Planina, *a chain of hills*.
Sari, *yellow*.
Seral, *a palace*.
Shehr, *a town*.
Skellessi, *steps, a landing-place*.
Sou or **Su**, *a water*, or *river*.
Tel, *a mound*.
Tuzlah, *a saltern*.
Yeni, *young, new*.
Yeshil, *green*.

Elis, on the west, and Achaia, on the north coast of the Morea, are in general hilly, with numerous small river valleys, but rather dry. The Cyclades and the other islands in the Archipelago are almost all steep and rocky; Eubœa is traversed throughout its whole length by a ridge of hills, and is separated from the mainland of Eastern Greece, by a very long channel or strait, so narrow at the middle as to be spanned by a bridge.

The mountains which cover so large a portion of Greece are partly wooded, and partly naked; the woods are more abundant on the west side, and less frequent on the east. The low country susceptible of tillage probably does not amount to two-fifth parts of the surface, and not more than a twelfth part of it is actually under cultivation. It is generally bare of wood; and the want of inclosures, the profusion of weeds and brushwood, the thinness of the population, and the ruinous condition of the few cottages, combined with the crumbling remains of the noble structures of antiquity, give it a deserted, desolate, and melancholy aspect. Towards the end of summer, the hills and fields appear parched; yet Greece combines in the highest degree every feature essential to the finest beauties of landscape, with the exception of large rivers; and travellers of taste have wanted words to describe the magnificence of the views which it affords. It is the combination of its towering mountains and rich sheltered plains, with so many spacious and beautiful inland seas and bays, broken by headlands, encircled by mountains, and studded with islands, that makes Greece surpass in picturesque beauty every other country in Europe, and perhaps in the world. The effect of such scenery, aided by a serene sky and a delightful climate, on the character of the Greeks, cannot be doubted. "Under the influence of so many sublime objects, the human mind becomes gifted as by inspiration, and is by nature filled with poetical ideas." Greece consequently became the native country of taste, science, and eloquence, the chosen sanctuary of the muses, the model of all that is graceful, dignified, and grand in sentiment or action.

CLIMATE.—The climate is variable in character, but generally very mild; the winter, indeed, is so temperate, that it frequently passes over without any frost. In ordinary winters the thermometer rarely falls below the freezing point; and during the greatest cold it never falls more than 6° or 8° below it. Snow is scarcely ever seen on the low plains; on the loftier mountains it generally begins to fall about the middle of October, but the summits are not permanently covered till the latter part of November. The summer's heat is considerable and is continued; almost every year it attains its maximum of 104°; but this high temperature does not continue for more than one or two days. In July and August the heat almost daily exceeds 86°; and, as the nights at this season are not cool, and there being scarcely any rain to refresh the air, the heat would become nearly intolerable, were it not for the sea-breeze which sets in generally before noon, and produces so powerful an effect, that there is occasionally more heat at seven or eight o'clock in the morning, than at mid-day, when the wind is blowing. Rain seldom falls in summer; from the first of July till the first of October, an extraordinary dryness prevails; and it often happens that there is not a single day's rain in July and August. Autumn, winter, and the beginning of spring constitute the rainy season; but the heaviest rains fall at the end of autumn and the beginning of winter. December and February are usually the most stormy months; January is often very fine. Storms in summer are of rare occurrence, except in mountain districts; the season for tempests is the close of autumn and the beginning of winter; but it cannot be said that storms are frequeut. Hail is scarcely known. Clouds are seldom seen in summer; and it is not unusual for a whole month to pass without a cloud, except on the loftiest mountains; and even there they are infrequent. Mount Delphi, however, and St. Elias in Eubea, are almost constantly covered with clouds. During summer, the wind frequently blows from between the north and the east for fifteen days together, or even a month; it is warm, and seems to occasion disease. The south winds, on the contrary, are refreshing and salubrious. The wind is often very strong at Athens; and during the heat of summer it blows the dust and sand even into the houses, and walking is rendered very disagreeable. Earthquakes are common in the season of the violent rains; but they are usually very slight, and are sometimes scarcely felt. At Athens, during the three years 1833-4-5, there were the average number of 87 days of rain, and eleven in which there were storms. The mean temperature was 60½°. *(Climat de la Grèce; par M. Peytier, Bulletin de la Societé de Geographie; Juin* 1837.) But the local diversities of the country have a great effect in modifying the characteristics of the climate; M. Peytier's observations apply chiefly to Attica and the eastern districts of the Morea. In Attica, which, being freely exposed to the sea-breeze, has somewhat

of an insular climate, the winter sets in about the beginning of January. About the middle of that month snow falls, but is seldom seen for more than a few days. Gentle rains fall about the middle of February, after which spring commences. In the beginning of March the vines and the olives bud, and the almonds are in blossom; in May the corn is reaped. In the interior plains and valleys, which are encircled by mountains, and cut off from the direct influence of the sea, the winters are much colder, while the summers are comparatively warmer. At Tripolitza, in Arcadia, the snow has been found 18 inches thick in January, with the thermometer at 16° Fahrenheit; and it sometimes remains on the ground for six weeks. In Bœotia likewise, it sometimes lies for several weeks to a great depth; while the summer is there hotter than in Attica. The coolest weather in all parts of Greece is accompanied by a north-east wind; the north and north-west winds are serene and dry. The zephyr or west wind is famed for its balmy softness; the south-east, south, and south-west winds are all humid, and the east wind still retains its character of a morning breeze, as described by Aristotle. The siroccо is sometimes felt, blowing from the south-east, and producing its usual effects on the human constitution, a feeling of oppression, a dull headache, with general lassitude, and uneasiness in the limbs. There are few diseases peculiar to Greece; but the country suffers greatly from malaria, which prevails chiefly in August and September, and produces fevers; even Attica, though it possesses a dry soil, is not exempt from this infliction. These fevers occurring frequently, destroy the constitution, and produce goitres and scrofulous diseases. Coughs, catarrhs, and apoplexies are prevalent in some districts; and elephantiasis and leprous affections are more common than in other countries. The plague occurs at irregular periods, and has sometimes made great ravages. (*Holland, Hobhouse, Clarke, Pouqueville*, &c.)

Soil and Vegetation. — The most common cultivated products, are wheat, barley, maize, and rye; oats in small quantity; rice in marshy spots; mullet, peas, beans, tares, sesamum, anise, cotton, and tobacco; and, notwithstanding the most wretched system of agriculture, the produce is large. The most fertile districts are the plains of Bœotia, Sicyon, Argos, Messenia, and Arcadia. In Arcadia wheat yields twelve for one; in Argos, ten; at Eleusis, twelve. The produce of good soils, in favourable seasons, is generally estimated at ten or twelve for one; and that of the best soils, in very favourable seasons, from fifteen to eighteen for one. The soil of Attica is too light for wheat; and consequenely barley, as in ancient times, is the prevailing crop. Cotton is cultivated to a considerable extent, principally in Bœotia and the Morea, and is a more profitable, but more precarious crop than corn, as it requires clear sunshine, copious dews, and light rains, to make it succeed. Tobacco is cultivated only to a small extent. The olive is cultivated throughout Greece; but that of Attica is still distinguished, as in ancient times, by its superior excellence. It requires a dry soil, a sheltered situation, and a warm exposure, and therefore is not adapted to the rich moist plains of Bœotia and Thessaly. Vines are cultivated on a small scale; but the wines have an unpalatable harshness, owing to the resin and the lime which are mixed with them. The Corinthian grape or currant is almost peculiar to the Morea and the Ionian Islands; it is found in the greatest perfection along the southern shores of the gulf of Lepanto, on some points of the opposite coast, and in Cephalonia, Ithaca, and Zante. It succeeds best in plains near the sea, with a western exposure, and prefers a dry, light soil. Madder grows wild in abundance, and is cultivated in Bœotia. The mulberry-tree has become an object of increasing importance, and the produce of silk is considerable. The fruit-trees which grow in the fields and gardens, besides the vine and the olive, are the almond, pomegranate, orange, lemon, citron, banana, fig, peach, apricot, quince, plum, and others of a more common kind. The date-tree grows, but does not bear fruit. The melons, water melons, and gourds are excellent, and form a considerable part of the subsistence of the inhabitants. Their culinary vegetables, of which they have no great variety, are spinage, artichokes, cabbage, cauliflower, carrots, beans, lettuce, and celery. The forests produce the oak, kermes-oak, cork-tree, pine, larch, ash, plane, aloe, wild olive, sweet chestnut, the manna-ash, the turpentine-pine, various dye-woods and plants, and a vast variety of flowers and aromatics.

Animals. — The wild animals are the bear, wolf, lynx, cat, boar, stag, roebuck, goat, badger, marten, fox, weasel, jackal, hare, and hedgehog. The bears are rarely seen, but the wolves are numerous; and to guard the flocks and cattle from their ravages, dogs of a fierce and powerful breed are kept. Hares are very abundant, but are not much hunted. Of birds, there are very large vultures, various kinds of falcons and owls, the cuckoo, roler, kingsfisher, ducks of several sorts, the domestic goose and

turkey, storks, partridges, pigeons, quails, snipes, teal, blackbirds, goldfinches, nightingales, boccaficas, swallows, martins. Greece, as it abounds in mountains covered with herbage, is eminently a pastoral country; and the management of sheep is better understood than any other branch of rural economy. The modern breeds of sheep, however, have declined much from the ancient in beauty and value. The mutton is but indifferent, the wool is of inferior quality, and the weight of the sheep is only from thirty to fifty pounds. The flocks of Arcadia and Hellas, especially those which feed on Parnassus, are considered the best. A black-woolled breed is very common. As in Spain, the flocks migrate, at the approach of winter, from the inland mountains to the low valleys near the sea, and return to the hills in April. Goats are also numerous, and are shorn along with the sheep. Beeves are less abundant; the oxen are chiefly used for labouring, and the cows for breeding; and as both the Greeks and Turks prefer mutton to beef, the number of sheep killed is incomparably the greater. In all parts of the Morea, buffaloes, which are handsome animals with fine skins, are used in husbandry, and, when unfit for labour, are killed for food. The horses of the Morea are little to be admired for their beauty, but are active, vigorous, and sure-footed; asses are numerous, but diminutive in size; and mules are used as beasts of burden. Bees are objects of considerable attention. Honey is everywhere abundant; that of Hymettus in Attica still maintains its ancient pre-eminence, and is there produced in great abundance. Silk worms are also becoming an object of increasing importance; and the produce of silk is already considerable. The country is infested by troublesome and even noxious insects, more particularly in the low plains, and during warm weather. The seas, lakes, and rivers abound with a variety of fish, and seals are found on the coast.

PEOPLE. — The dominant race are the HELLENES, whom all Europeans concur in calling GREEKS. The Hellenes claim to be the descendants of the ancient people who rendered this country so illustrious by their writings, their deeds of valour, and their cultivation of the fine arts; but they have unquestionably received a large proportion of barbaric blood, particularly by intermixture with the Sclavonians. They are a rude and unenlightened people, with all the vices of slaves, and few redeeming virtues; but they are ingenious, active, enterprising, and restless; and, now that they have recovered some degree of national independence and civil liberty, they may be able to turn their talents to account in acquiring a portion of the civilization and learning of Western Europe. Their language is the *Romaic*, so called from the word *Romaioi* or Romans, a name which they assumed, or acquired, during the period of their subjection to the Roman Empire of Constantinople, and from which their Turkish name *Roumi* is also derived; but they have now abjured it, and resumed the ancient names of *Hellenes* and *Hellas* as the proper designations of themselves and their country. The Romaic bears a much closer resemblance to the Hellenic, or ancient Greek, than the Italian does to the Latin; and it has even been said by a very distinguished modern Greek scholar that if we take the Attic as a standard, the ancient Doric differs as much from it as the present living dialect. (*Encyc. Brit., art. Greece*, p. 741.) The Hellenes all belong to the Greek Church, which is one of the most corrupted branches of Christianity; but having no sovereign pontiff, and no decrees of infallible councils to obstruct it, it is more susceptible of amendment than the Catholic Church of the West. The priests freely admit, and are thankful for the Bible. This circumstance, together with the general progress of unfettered education, will no doubt soon be productive of the happiest effects upon the present character of the Hellenic nation, which, at best, is rather equivocal.

The *Arnauts* or *Albanians* are very numerous; of whom colonies or parties have settled from time to time in various parts of Hellas. Nearly all of them belong to the Greek Church; and they have, with few exceptions, preserved their national manners, dress, and language, though many are likewise able to speak Romaic. They chiefly inhabit Attica, Bœotia, Phocis, Argolis, and the islands of Hydra, Spezzia, Coulouri, and Andro; but have also several villages in Arcadia, Achaia, and Messenia. In the rest of the Morea, in all the other islands, in Etolia and Acarnania, a great part of Thessaly, and Lower Macedonia, the population is exclusively Greek. The *Mainotes*, who inhabit the ridges and valleys of Mount Taygetus, in the peninsular promontory between the gulfs of Kolokythi and Koroni, boast of their descent from the ancient Spartans; and the histories of Leonidas and Lycurgus, who are represented partly as saints and partly as robbers, still figure in their popular traditions. They are a wild and lawless race, living under a sort of patriarchal feudal government exercised by hereditary chiefs, and seem to be really the descendants of the free Laconians,

terranean, but also with more distant countries. Their exports consist principally of raw produce, as cotton, corn, tobacco, olive oil, timber, wool, silk, honey, currants, figs, hides, dye-stuffs, drugs, with some wine, cheese, butter, live-cattle, capots or cloaks, coarse woollens, and a few slight fabrics of silk and cotton. The imports from western Europe consist of manufactured goods, colonial produce, and peltry; from Turkey, coffee, flax, timber, rice, drugs, and some manufactured articles. There are in the country no roads, in the English sense of the word; and the transport of goods and travellers is effected on the backs of horses, asses, and mules.

CITIES, TOWNS, and REMARKABLE PLACES.—ATHENS, the capital of the kingdom, and one of the most celebrated cities in the world, is situate in the province of Attica, about five miles from the coast of the north-eastern side of the Gulf of Egina, in North lat. 37° 58′, and East long. 23° 46′. It is built in a plain surrounded by hills, and watered by the rivers Cephissus and Ilissus; and has been almost entirely rebuilt since 1834, when it became the seat of Government. New streets have been laid out, the old streets levelled and widened, and many houses erected in the modern style; but most of the town still consists of narrow winding lanes, with mean, clay-built houses. The principal public buildings are the royal palace, a large new structure of Pentelic marble; the mint; the royal stables; a military hospital, and a barrack. The population already exceeds 17,000, of the most heterogeneous description of persons of all nations. Athens is the seat of a university, and has a gymnasium, a high school, and other institutions for education. Great efforts have been made to secure the public health, by clearing and repairing the ancient sewers, and draining the marshes which have been formed by the rivers. The antiquities of Athens are, however, still the principal object of attraction. The ancient *acropolis*, or citadel, is built on a rocky eminence rising abruptly from the plain, and contains within its walls the remains of the Parthenon, the glorious temple of the tutelar deity and name-mother of the city, the virgin goddess Pallas-Athené; and another temple, almost entire, of the same goddess in her character of *Iolias*, or protectress of the city; a beautiful Ionic structure, connected with the temples of Erectheus and Pandrosus. The entrance to the acropolis is at its west end, which was once adorned with a splendid gateway, called the Propylæa, of which several portions still remain. Beyond the gate was a small temple of Victory, the fragments of which have been recently discovered under ground, and the building completely restored. In the lower town is the temple of the demigod Theseus, built after the year 469 B.C., when his bones were brought to Athens from Scyros, by Cimon the son of Miltiades. This is a Doric peripteral building, perfectly entire, except the roof, which has been recently restored; it is now converted into a museum or receptacle for antiquities. There are also the temple of the Winds, an octagonal tower, with figures of the winds on its sides; the monument of Lysicrates, called also the lantern of Demosthenes; the tribunal of the Areopagus; the Pnyx, or place of public assemblies; the ruins of the temple of the Olympian Jupiter, &c. Five miles from the city is the harbour of *Porto Leone* (ancient *Piræus*), where several large houses have been built, and some good streets lined with low but respectable houses. The harbour consists of a land-locked basin, with a narrow entrance, but with very deep water inside, and is large enough to accommodate a great number of heavy ships. The government are erecting a pier for extending the accommodation for vessels. The communication between Athens and the Piræus is formed by an excellent road, and omnibuses ply between them at all hours. On the adjoining promontory are the remains of the tomb of Themistocles. Twenty miles N.E. of Athens, are the village of *Marathona*, and the plain of *Marathon*, so celebrated for the victory gained there by the Athenians over their Persian invaders, B. C. 490; and 25 miles S.E. is Cape Colonna, the ancient *Sunium*, containing the remains of a temple of Pallas-Athené, from which the Cape derives its modern name of *Colonna* (pillar-cape). In the gulf westward of Athens is the island of *Salamis* (modern *Coulouri*), in the strait between which and the mainland was fought the great naval battle between the Greeks and the Persians in the year 480 B. C. On the coast of the gulf behind Salamis is the village of *Lepsina*, containing the ruins of the temple of the goddess Demeter (called by the Romans *Ceres*), where were celebrated in ancient times the Eleusinian mysteries. Westward from Lepsina, and also near the coast, is the ancient *Megara*, which was burned and demolished by the Greeks and Turks, during the late war, and is now little better than a mass of blackened ruins.

Lebadea or *Livadia*, the chief town of Bœotia, is situate on the summit of a rock, at the source of the river Hercyna, 50 miles N.W. by W. of Athens. It contained in the time of the Turks about 1500 houses. In the S.E. part of Bœotia are *Thiva* or *Thebes*, a poor village, on the site of the ancient *Thebæ*, the city of Pindar, Pelopidas, and Epaminondas, of which scarcely a vestige remains; and *Kokla*, the ancient *Platææ*, now untenanted. About 40 miles N. by W. of Livadia, is the famous pass of *Thermopylæ*, a narrow defile between Mount Œta and the sea, leading from Phocis into Thessaly. *Castri*, 30 miles W. of Livadia, represents the ancient *Delphi*, so renowned for the temple and oracle of the god Phœbus-Apollo. *Talanti* or *Talanta*, 22 miles N.N.E. of Livadia, an episcopal city, with 5000 inhabitants.

In Western Hellas the only places worthy of notice are Lepanto and Missolonghi. *Lepanto*, called also *Nepakto*, and by the Turks *Ainabakhti*, the ancient *Naupactus* or shipbuilding-place, is a small fortified archiepiscopal city, with a harbour on the north side of the Gulf of Lepanto, near the entrance, and a citadel crowning the top of the hill, on the slope of which the town is built. *Missolonghi*, on the north side of a bay or lagoon of the Gulf of Patras, a small fortified town, is famed for the sieges it underwent during the late war of independence, and for the death of Lord Byron, which happened there in 1824.

In the Morea:—*Napoli di Romania* or *Nauplia*, the capital of Greece for several years, before the king removed to Athens, is a well-built city, strongly fortified, and possesses an excellent harbour; near the head of the gulf to which it gives its name. Nearly all the trade of the Morea centres here; consequently great activity prevails at the port; but its confined situation and the neighbouring marshes render it unhealthy. Its fortress of the *Palamedi*, which has been called the Gibraltar of Greece, and deemed impregnable, stands on the top of a lofty and precipitous rock, 720 feet above the level of the sea, and is inaccessible on all sides except the east, where it is connected with a range of barren rocky hills. Another fortress, called *Itch-Kali*, is built on a peninsular rock rising above the town, at the foot of the Palamedi. Before the removal of the court, Napoli contained 9000 inhabitants, but the number is now considerably reduced. To the west and north of Nauplia, and at the distance of a few miles, are the ancient cities of *Argos*, *Tiryns*, and *Mycenæ*. The first is a straggling town of ruinous houses, with a deserted citadel on the hill behind it, the celebrated *Larissa*. *Tiryns* has completely disappeared, but its citadel remains, a perfect specimen of cyclopean architecture, erected about the year 1379 B. C. Near the village of *Arabata* are the ruins of *Mycenæ*, once the capital of Agamemnon, built by the demigod Perseus about 1300 years B. C., and destroyed by the Argives about 466 B.C. The citadel still exists, occupying the top of a steep hill, and containing specimens of Hellenic masonry of various ages; the most ancient parts being in the same style as the walls of Tiryns. The treasury of Atreus, called also the tomb of Agamemnon, is built under the slope of the hill, and consists of a massy vaulted subterranean chamber, 47½ feet in diameter and 50

high, and connected by a door with a smaller chamber about 23 feet square. *Corinth* or *Korinth*, one of the finest cities of ancient Greece, was, during the late revolutionary war, reduced to ashes, and now presents only a mass of ruins, and a complete picture of desolation. A few new houses have recently been built, and lines marked out for the formation of new streets; but little progress has yet been made in restoring the city. It is situate in a very unhealthy plain, near the S.E. corner of the Gulf of Lepanto; but, being only 8 or 9 miles from the Gulf of Egina, it long formed an entrepot for the trade of Greece, merchants preferring to transport their goods across the isthmus, rather than sail round the stormy shores of the Peloponnesus. The citadel, called *Acrocorinthus*, is built on the top of a hill 1800 feet high, and is considered the strongest fortress in Greece next to that of Nauplia. The hill shoots up majestically from the plain, and forms a conspicuous object at a great distance: being seen from Athens, 44 miles in a direct line. *Patras* or *Padras*, a considerable town with 500 inhabitants, on the north-west coast of Achaia, has been recently enlarged and almost rebuilt with wide regular streets, but is subject to fevers occasioned by malaria. *Vostitza*, a sea-port town with 2000 inhabitants, 20 miles E. of Patras. About 15 miles from Vostitza is the convent of *Megaspelion* (big cave), in the face of a precipice, with from 250 to 300 monks, who possess large landed estates, chiefly in Elis. In the church is a miraculous image of the Panagia, or All-holy virgin, said to have been the work of St. Luke. *Tripolitza*, formerly the Turkish capital of the Morea, and a flourishing town, with 20,000 inhabitants, in a cold plain, 3000 feet above the level of the sea, and 22 miles W. by S. of Nauplia, is now a heap of ruins, with not a single house or inhabitant remaining. The ruins of *Mantinea*, now called *Palæopoli* (old town), are situate 8 miles N. of Tripolitza; and 13 miles S.W. of Tripolitza, near the banks of the Roufia, are the ruins of *Megalopolis* (big town), which was six miles in circumference, but of which little now remains except the theatre, still very perfect. Further down the river, about 13 miles from its mouth in the Ionian sea, are the ruins of the temple of the Olympian Jupiter, where the Olympic games were celebrated every fourth year by the assembled Greeks, and which once contained the statue of that god, formed by Phidias of ivory and gold, and considered one of the seven wonders of the world. *Kalamata*, the capital of Messenia, is a considerable sea-port town on the north side of the Gulf of Koroni. *Marromati*, a wretched village of a few huts, stands on the site of the ancient *Messene*, 11 miles N.W. of Kalamata, and at the foot of the steep hill of *Ithome*. The ruins of Messene are magnificent specimens of the grandeur and solidity of the Hellenic military architecture. *Navarino*, on the S.W. coast of Messenia, a fortified town near the southern entrance of a noble basin formed by the island of Sphagia (ancient *Sphacteria*), memorable for a battle fought on 20th October 1827, in which the Turkish and Egyptian fleets were destroyed by the combined British, French, and Russian squadrons, and which ended, in effect, the revolutionary war in Greece. *Navarino Vecchio*, the ancient *Pylos*, occupies a lofty promontory at the northern entrance of the bay. *Arcadia* ancient *Kuparissia* or *Cyparissia*: is a miserable ruined town, on the north-west coast of Messenia, about a mile from the sea, on the narrow summit of a rocky ridge. It has some trade, but only an open roadstead for ships; on which account most of its exports are conveyed to the island of *Proti*, or *Prodano*, for shipment. *Sparta*, so renowned in the history of ancient Greece, and afterwards so long deserted, has been constituted the capital of the new province of Lacedæmon. Sparta is situate in a plain near the right bank of the Basili-potamo (ancient *Eurotas*), about 20 miles from the sea; a plan has been formed for rebuilding it, and some of the public buildings are already in progress. *Mistra* or *Misitra*, 3 miles N.W. of Sparta, was formerly a large Turkish town on the slope of a hill; but the upper town is now quite deserted, and the acropolis is in ruins. *Monembasia* or *Napoli di Malvasia*, on the east coast of Laconia, is a considerable town, on the south side of an insulated hill, which is connected with the mainland by a bridge. The island is only half a mile in length and about 300 yards in breadth, of which the town occupies about one-third, with the houses piled above each other, and a castle on the summit of the rock, but separated from the town by a perpendicular cliff. All the coast within sight of the town consists of uncultivatable rocks.

ISLANDS.—The inhabited islands are:—*Hydra*, *Spezzia*, *Poros*, *Egina*, *Augistra*, *Salamis*, *Scopelos*, *Helidromia*, *Scinthos*, *Scyros*, *Syra*, *Tinos*, *Miconos*, *Andros*, *Cea*, *Thermia*, *Naxos*, *Paros and Antiparos*, *Siphnos*, *Seriphos*, *Cimolos*, *Milo*, *Polycandros*, *Sicinos*, *Ios*, *Amorgos*, *Santorin*, *Anaphe*, *Astypalæa*, *Eubœa*. *Egripo* (corrupted to *Negropont* by the Franks), the capital of Eubœa, a large town built on the site of the ancient *Chalcis*, at the narrowest part of the Euripus, or Strait which separates Eubœa from the continent. It was formerly the capital of the Turkish eyalet of the Jezairs, the usual residence, and under the immediate command, of the Capudan Pasha; but many of the best houses are of Venetian construction. The strait is divided into two unequal parts, by a small square castle on a rock, which communicates with the Bœotian shore by a stone bridge, 60 or 70 feet long, and with the Eubœan shore by a wooden draw-bridge, 35 feet long. On the south side no vessel but boats can approach Egripo; on the north side there is no difficulty. Before the revolution Egripo contained 16,000 inhabitants. *Syra*, the capital of Syra, a large and rapidly-increasing commercial town, is built on a conical hill, which is covered to the top with white-washed buildings, and crowned by a monastery. The harbour is one of the best in Greece, with safe anchorage, and a good light-house. The population in 1827 was only 6000; in 1837 it had already increased to 21,000. Syra is a free port; and the principal exports are figs of the finest quality. *Arna*, in Andros, an episcopal city, with a seaport, and 5000 inhabitants. *Naxia*, in Naxos, the see of a catholic archbishop, and of a Greek bishop. *Antiparos* contains a famous grotto, or deep cave, formed naturally in the limestone rock. *Milo*, in the island of the same name, contains the remains of an unfinished amphitheatre, cyclopean walls, a temple of Venus, and other antiquities. *Hydra* is a singularly interesting city, rising in dazzling whiteness and beauty on the amphitheatric slope of a barren rock, on the west side of the island of Hydra. The streets are precipitous and uneven, but remarkably clean; and the quay is lined with warehouses and shops; the dwelling-houses are built in the most substantial manner. Several monasteries are perched on the cliffs, and the churches and religious establishments amount to 100, some of them possessing ornaments of great value. The harbour is neither spacious nor secure. A few fishermen and others, driven from the continent by the oppression of their Turkish rulers, first raised here the nucleus of a town; and numbers of other people from Albania, Attica, and the Morea, crowded to it, till at length its population, in 1825, amounted to 40,000. The population does not now amount to more than half the number. In 1813 it possessed 375 vessels, with a burden of 45,000 tons, and 5420 sailors; but its trade was almost entirely ruined by the war of independence, in which its mariners took a principal part. *Spezzia* is built on the eastern shore of the island of the same name, at the entrance of the gulf of Nauplia, and contained, in 1825, 3000 inhabitants. The streets are better than those of Hydra, and the houses are equally good; the port is good and well-frequented; and the citizens are mostly engaged in commercial pursuits. They possess many fine vessels, and furnished sixteen ships, besides fire-ships, to the Greek navy during the late war. The climate is so salubrious that invalids are frequently sent thither for the restoration of their health; the women are esteemed the most beautiful in Greece. *Egina*, a newly built seaport town, in the island of Egina, in the middle of the gulf to which it gives its name, contains a museum, a library, and a school. The climate of the island is delightful, and the atmosphere is so pure, that epidemic fevers, the scourge of the Morea, are almost unknown in it. Egina was formerly celebrated for the richness and beauty of its ornaments, but almost the only remains consist of a few tombs, vestiges of wells, and a mosaic pavement. Near the S.E. end of the island, on the top of a hill of moderate height, are the ruins of the temple of Zeus Panhellenios (the Jupiter of all the Hellenes), consisting of 23 columns, still entire,

and the greater part of the architrave. These ruins are, however, thought by some antiquaries to be rather the remains of the temple of Pallas-Athenè (Minerva).

GULFS, BAYS, STRAITS.—The *Gulf of Zeitoun*, the *Channel of Talanti*, and the *Channel of Egripo*, together, form the strait called by the ancients *Euripus*, which divides Eubœa from the mainland of Greece. The Euripus has been always famous for its tides or currents, which flow sometimes the one way and sometimes the other, with such force as to turn mills at Egripo, even in the face of a contrary wind; but the nature, extent, and periodical intervals of these currents are not yet exactly ascertained. *Gulf of Egina*, between Attica and Argolis. *Gulf of Nauplia*, in Argolis. *Gulf of Kolokythi*, and *Gulf of Koroni*, both on the south coast of the Morea. *Gulf of Arcadia*, on the west coast. *Gulfs of Patras* and *Lepanto*, between the Morea and Hellas. The latter is a land-locked gulf, extending about 75 miles E. and W., with a breadth of 10 or 12, having the *Bays of Corinth* and *Lisa d'Ostro* at its east end, the *Bay of Salona* on its north side, and communicating with the Gulf of Patras by a strait only about a mile across, which is defended by the two castles of Rumeli and Morea. *Gulf of Arta.*—(See *antè*, p. 596.)

CAPES.—*Komiro*, *Kandili*, *Kili*, *Chersonisi*, *Doro*, *Mantelo*, and *Karysto*, in Eubœa; *Marothon* and *Colonna*, in Attica; *Skillo*, *Maleo* or *St. Angelo*, *Matapan*, *Gallo*, *Konello*, *Katakolo*, *Klarenza*, *Kologria* or *Papas*, in the Morea: *Bakari* and *Skropha*, in Western Hellas.

RIVERS AND LAKES.—The *Hellada* (Sperchius) drains a long narrow valley between Mount Œta and Othrys, and falls into the Gulf of Zeitoun. *Mavropotamo* (Cephissus) flows through Phocis and Bœotia into the lake of Topolias. *Asopo* (Asopus), in southern Bœotia, flows into the Channel of Egripo. The *Cephissus* and *Ilissus* flow through the plain of Athens into the Gulf of Egina. *Planitza* (Inachus) in Argolis. *Basili-potamo* (Eurotas) falls into the Gulf of Kolokythi. *Pyrnatza* (Pamisus) flows through Messenia into the Gulf of Koroni. *Lousi* (Neda) flows past Phigaleia into the Gulf of Arcadia. *Roufia* (Alpheus) drains the south-western part of Arcadia, and flows through Elis into the Gulf of Arcadia. Its principal affluent is the *Ladon*, from the north of Arcadia, where it has its source in the *Lake of Phonia* (Pheneos), which, being surrounded by mountains, emits its waters through a subterrancan channel. *Iliaco* (Peneus) in the north of Elis. *Fidari* (Evenus), and *Aspropotamo* (Achelous), both in Western Hellas. The latter is a large river which rises in Albania, 100 miles north from its mouth. Besides the lakes already mentioned are: The *lakes of Umbrakia*, *Great Ozero*, *Little Ozero*, *Arakhori*, *Angelo-Kastro*, and *Saurovitza*, in Western Hellas. The *Lake of Zaraka* (Stymphalus), N.W. of Argos, and surrounded by mountains which divide its basin from that of the Lake of Phonia. This lake has been supposed to send its water by a subterranean channel to the Planitza.

MOUNTAINS.—(See *antè* p. 152-3.)

IONIAN ISLANDS.

The Ionian Islands form a sovereign state, consisting of seven principal islands, and a number of smaller ones adjacent, lying along the coasts of Albania, Hellas, and Morea. The names, dimensions, and population of the seven larger islands are stated in the following table:—

Names.	*Length.*	*Breadth.*	*Area in Square Miles.*	*Population in 1836.*	*Relative Population.*
Corfu,	41	19	227	65,107	287
Kephalonia (Cefalonia),	30	18	348	63,197	182
Zakunto (Zante),	25	13	156	35,348	226
Santa Maura,	22	8	180	17,175	95
Thiaki,	14	3	44	9,644	219
Kerigo (Cerigo),	19	13	116	8,707	75
Paxo,	4	2	26	5,064	195
			1097	204,242	186

The smaller islands are: *Merera*, *Fano*, *Samothraki*, *Diaplo*, to the N.W., and *Vido* on the east side of Corfu; *Anti-paxo*, to the S. of Paxo; *Meganisi*, *Kalamo*, *Kastus*, *Arkudi*, *Atoko*, S.E. of Santo Maura; *Kerrigotto*, *Nautilus*, *Porrel'i*, *Porri*, *Ovo*, *Kouphenisi*, *Dragonera*, S. and S.E. of Cerigo. All the islands, both large and small, belong to the same great calcareous formation which prevails over Greece. Their surface is so remarkably mountainous that they do not contain a sufficient quantity of arable land to produce the corn required by the population; and, were it not for the vine, the olive, and the currant, which they produce abundantly, they could support but a small number of inhabitants. The climate resembles that of the neighbouring continent, except that the sea renders it more uniformly temperate and more humid. Snow often falls in winter; and lies on the mountains, but rarely on the plains. Sudden and furious squalls are frequent; and the sirocco or hot wind occurs at certain periods. The harvest is in June; earthquakes are very frequent, but not very destructive; malaria prevails in low situations in autumn; and the itch, which is common in some places, instead of being eradicated by medical means, is rather cherished by the people, from a strange notion that it is a preservative against the effects of the malaria. In other respects the climate is agreeable and healthy.

PEOPLE.—The people are of the same race as those of the adjacent continent; and the Ionians partake in the physical configuration of the Greeks. The complexion in healthy persons inclines to olive. Their eyes are almost universally brilliant and full, and generally dark; the hair generally brown or black; the beard copious; stature, middle-sized; constitution, sanguineo-choleric; gestures, vivacious; gait, erect and elastic; and their speech voluble and emphatic.

RELIGION.—The Greek church predominates, there being only about 3000 Roman Catholics, and 5000 Jews. At the head of the Greek church is a Protopapa, elected by ballot in an assembly of the clergy and nobles, and confirmed by the patriarch of Constantinople; the Catholics are under the charge of an archbishop. But both clergy and people are extremely unenlightened, and their religion consists of the grossest superstitions, which even the British government deems itself obliged to countenance.

EDUCATION.—At Corfu is a university, and also a seminary for priests of the Greek church. In each of the islands there is a "secondary school," maintained at the public expense, in which the ancient Greek and Latin, and the modern Greek, English, and Italian languages, arithmetic, and ele-

mentary mathematics, are taught. In the chief town of each island is a central school, supported at the public expense, for reading, writing, and arithmetic, and for training the village schoolmasters; there are, besides, district schools, on the same plan as the central, partly maintained by government and partly by private subscription. The district and village schools are under the superintendence of the head masters of the central schools; the whole being overlooked by an inspector-general. The whole establishment for education is under the charge of the commission for public instruction. The number of public schools in the islands, in 1836, was 138, which were attended by 2949 scholars.

GOVERNMENT.—The government is one of the worst specimens of oligarchy or exclusive aristocracy; the authority of the state being vested in magistrates and councils chosen by the nobles only, to the exclusion of the mass of the people, and administered principally for their behoof. The Ionian islands formerly belonged to Venice; but at the peace of 1815 were placed under the protection of the King of Great Britain, who is represented by a Lord High Commissioner, and he again in each island by a President whom he appoints. The legislative authority is vested in an assembly of forty members, elected for five years, who meet in session every two years. The executive power is vested in a senate, composed of five ordinary members and a president, who are elected from the legislative assembly. The municipal government of each island is vested in a council of five members and a president. The judicial authority in each island is vested in three tribunals, a civil, a criminal, and a commercial; and there is, besides, in each a court of appeal; and petty courts, held by justices of the peace, for minor pleas and offences. At the seat of government is a high court of appeal, consisting of four ordinary members, two English and two Greek; and two extraordinary, namely, the Lord High Commissioner and the President of the Senate. Trial by jury does not exist. A new code of laws has been digested for the islands. The military defence is placed in the hands of the protecting sovereign, and the regular military establishment consists only of British troops, to the number of about 3300. There is, however, a corps of militia in each island. The general charge of preserving the public tranquillity being directly and immediately connected with the military establishment, the high police of the "United States of the Ionian Islands" is placed under the direct management of the Lord High Commissioner; the sovereign has the right to occupy the fortresses, and maintain garrisons; and the military force of the islands is under the orders of the British Commander-in-Chief. The average revenue is about £176,000 sterling; and the average expenditure about £177,000, besides the pay of the regular troops and munitions of war.

PRODUCTIVE INDUSTRY.—Agriculture is still in a very rude state, and the implements of husbandry probably as primitive as they were in the days of Ulysses. The olive is the principal product; the vine is generally planted in the plains and valleys, and corn on the declivities of the hills. In Corfu and Zante soap to the value of £12,000 is annually made and exported; and also considerable quantities of common earthenware. Silk shawls, coarse linens, coarse woollen blankets, and goat-hair carpets and sacking, are also manufactured. The amount of the tonnage of vessels entered in 1836 was 273,853, and cleared, 272,415, of which only 22,606 entered, and 23,475 cleared, were British.—*(Martin's Colonies, &c. 591, &c.)*

The principal natural productions of the islands; the number of acres cultivated and uncultivated; and the numbers of live stock, in the year 1836, are stated in the following table:—

Articles of Produce and Live Stock.	*Corfu.*	*Cephalonia.*	*Zante.*	*Santa Maura.*	*Thiaki.*	*Cerigo.*	*Paxo.*	TOTAL.

—(From Tables of Revenue, &c. Colonies, 1836. Presented to Parliament 1839.)

CITIES AND TOWNS.—CORFU, the seat of government, situate on the east side of the island of Corfu, in N. lat. 39° 37′, E. long. 19° 56′, is a fortified town, with narrow and irregular streets, and ill-contrived houses; a cathedral containing the body of its tutelary deity, St. Spiridion, several Greek and Catholic churches and chapels, a university, gymnasium, ecclesiastical seminary, and several primary schools. Population 17,000. Corfu has a citadel on a projecting rock, and two other fortresses, one of them on the Island of Vido, which, when the works now in progress are completed, is expected to be nearly impregnable. The harbour is safe and commodious; and Corfu is the principal seat of the foreign trade of the islands. *St. Gago*, in Paxo, contains 4000 inhabitants. *Santa Maura*, in Santa Maura, 5000; *Vathi*, in Thiaki, 2000; *Argostoli* and *Lixuri*, both in Cefalonia, the former with 4000, the latter with 5000 inhabitants. *Zante*, on the eastern side of the Island of Zante, is a large town, with an imposing appearance, on the face of a hill, and containing 18,000 inhabitants. Zante contains a large plain, bordered by mountains, and covered with vineyards and olive groves, presenting that appearance of luxurious fertility which has procured for it the name of *fiore di Levante*—the flower of the Levant; but recently it has suffered severely from repeated earthquakes.

MEDITERRANEAN SEA.

This great inland sea, which has been in all ages the principal theatre of the commercial and maritime transactions of the European and Western Asiatic nations, extends in a direction nearly E. and W. about 2350 miles, with a breadth varying from about 100 to 650 miles, and covering an area of about 1,000,000 of square miles. Its northern coasts are formed by Europe and Asia Minor; its eastern, by Syria and Palestine; its southern, by Africa; while towards the west it gradually diminishes in breadth till it terminates with the Strait of Gibraltar, only 13 miles across in the narrowest part. The depth varies considerably. The depth of the Atlantic, on the outside of the Straits, is from 50 to 60 fathoms, but the channel deepens as it proceeds eastward, until, a little within Gibraltar, it reaches 1000 fathoms, and soon after gets beyond soundings. The Mediterranean is also very deep towards its eastern extremity; but between Sicily and Africa it is only from 30 to 100 fathoms deep; there seeming to exist in that quarter a submarine chain or shoal, which may be considered as an extension of the rock formations of Italy and Sicily, with deep water on both sides. A strong current perpetually sets into the Mediterranean through the Straits of Gibraltar; and although there is an opposite eddy on each side, yet the reflux is not nearly equal to the quantity flowing inward. It receives also the surplus waters of the Black Sea, which flow with a constant stream through the Dardanelles; but the rivers which fall into it are the contributions of a smaller extent of territory than the river basin of any other inland sea, in proportion to its area. The disposal of the waters thus constantly flowing into it, is considered by some philosophers to be sufficiently accounted for by evaporation from so large a surface in a warm climate; while others, on the contrary, maintain that there is a submarine current flowing outward through the Straits of Gibraltar, and thus making room for the lighter waters of the ocean that flow in the opposite direction. Tides are but little felt. They are perceptible only in certain parts of the sea, and seldom rise more than six inches above the mean level. Mr. Trevelyan, however, ascertained, by a series of observations at Antium, in the summer of 1836, that the tides are perfectly regular, and rise there to 14 inches. In the more easterly parts of the Mediterranean the tides are shewn by recent surveys to be much greater, though at the furthest west they may be scarcely perceptible. To the eastward of Sicily a tide is raised, which flows up the Adriatic, and rises in that comparatively narrow channel to nearly four English feet at new and full moon, and half that height at neap tides, alternately covering and laying bare the bottom of the Venetian lagoons. The Mediterranean being nearly surrounded by lofty mountains, at no great distance from its shores, is, in consequence, much exposed to storms, and to sudden gusts of wind, which raise short broken waves, more disagreeable, however, than dangerous to experienced seamen. In the western parts of the Mediterranean the temperature of the water below 200 fathoms is constantly about 55° Fahrenheit, which is much higher than that of the ocean in northern latitudes. The sea produces abundance of fish, the principal varieties of which are mentioned among the articles of productive industry of the countries along its shores.—(See *anté*, p. 138 and 139.)

ASIA.

GENERAL DESCRIPTION.

PHYSICAL GEOGRAPHY.

ASTRONOMICAL POSITION.—Between 1° 20′ and 78° N. latitude; and between 26° and 190° E. longitude.

DIMENSIONS.—The greatest length from N. to S., in the direction of the meridian, or from Cape Romania in Malaya to Cape Taimura in Siberia, exceeds 5300 miles; and the greatest breadth from W. to E. along the fortieth parallel of N. latitude, or from Baba Burun in Asia Minor to the east coast of Japan, is about 5600 miles. The superficial area is about 17,500,000 square English miles, or four times the extent of Europe.

BOUNDARIES.—*Northern:*—the Arctic Ocean. *Southern:*—the Indian Ocean. *Eastern:*—the Pacific Ocean. *Western:*—the Ural Mountains, and the River Ural, the Caspian Sea, the range of Caucasus, the Strait of Yenikaleh, the Black Sea, the Channel of Constantinople, the Sea of Marmora, the Dardanelles, the Archipelago, and the Levant, all which separate it from Europe; and the Isthmus of Suez and the Red Sea, which separate it from Africa.

GENERAL ASPECT.—The surface of this large continent is very diversified. The northern portion of it forms a plain rising gradually from the shores of the Arctic Ocean, intersected by a number of very large rivers, and exposed without shelter to the piercing blasts of the north. The southern portion, which stretches along the Indian Ocean, is composed likewise of comparatively level regions, exposed to the burning heat of the tropical sun; while the central region consists of a series of elevated plains and mountains, from which rivers flow in every direction to the neighbouring seas. This central region, however, is not, as was till recently supposed, a uniform table-land of great elevation, supported on all sides by lofty mountains; but appears, on the contrary, to be occupied by long ranges of mountains, with intervening plains and valleys, some of the latter of which have no great elevation. Among the numerous mountains which intersect the surface, four great chains or systems may be distinguished, stretching nearly parallel to each other, in the direction of east and west, or south-west and north-east, and named by modern geographers the *Altai;* the *Teean-shan;* the *Kwan-lun* or *Quan-lun;* and the *Himalaya.* These, with their numerous ramifications, occupy the greater part of the continent.

MOUNTAINS.—The chain of ALTAI, properly so called, occupies a space of scarcely more than 7° of longitude; but the name is usually given to the northern boundary of a mountainous region which extends from the sources of the river Irtish to the sea of Okhotsk. Between the Irtish and the Chulym, the most easterly affluent of the Obi, or between the meridians 83° and 86°, the chain consists of an extensive mass of high rocks, furrowed by narrow valleys and rapid rivers. Its culminating point lies N.W. of Lake Ubsa; to the east of which the chain divides into three ranges, of which the middle takes the name of *Tang-nou,* and extends eastward to the lake Kossogol. The most northerly range is named *Sayans-kean,* or *Mountains of Sayan;* the most southerly, *Ulangom-ula;* and the three ranges, between 98° and 102° E. long., join the mountains which encompass the lake Baikal, and are usually called the *Baikalian Mountains.* Farther east a chain shoots eastward, under the name of *Kentei,* and the *Mountains of Daouria,* and afterwards joins the *Iablonnoi-krebet* (chain of Apples), the *Khing-han,* and the *Aldan Hills,* which, stretching along the west side of the sea of Okhotsk, under the name of *Stanovoi,* extend to the north-eastern extremity of Asia, and terminate at Behring's Straits. The mean latitude of the Altai is between 50° and 51° 30′; the name, which is said to mean *Golden,* has probably been given to it on account of its great metallic riches. Although the top of the chain is said by the Chinese to reach the Milky-way, yet probably no part of it attains a greater elevation than 11,500 feet. The highest part of the range, so far as is yet known, extends east and west between the Bukhtarma, an affluent of the Irtish, and the Koksun, an affluent of the Obi. The most westerly of its higher summits, the *Holborukha,* loses its snow in May, but is covered with it again by the end of July: farther east is a loftier summit, the *Skhtskhebenikha;* but the highest is the *Bielukha,* or *Byeliicha,* which lies in the meridian of the Chinese military post of Chingistei, on the Bukhtarma, and rises, according to M. Gebler, who visited it in 1833, to about 11,000 feet above the level of the sea, and about 7000 above the surrounding mountains; it is covered with perpetual snow, which terminates, downwards, in immense glaciers. From this lofty mass a range branches off to the E.S.E., extending, as we have said, to the extremity of Asia; but the supposition that it formed the northern wall of a very high table-land is so far from the truth, that the steppes around the lake Zaisang, on the

south side of the chain, and certainly the steppes near the lake Balkashi, are not more than 1918 feet (300 toises) above the level of the sea. Westward from lake Zaisang the chain of Altai is prolonged, under the parallel of 49° or 50°, by a series of isolated hills and groups of small mountains, through an extent of about 540 miles, as far as the steppe of the Kirghis, and ends abruptly about 10° to the eastward of the meridian of the Urals. Among the secondary chains connected with the Altai are, 1. The *Mountains of Kolyvan*, between the rivers Irtish and Biya, which are rich in gold and silver; 2. The chain which Humboldt proposes to call the *Great Altai*, whose culminating point is about 2° of latitude to the south-east of the lake Ieke-Aral-noor, and which unites the Altai with the Tecan-Shan; 3. The *Tarbagatai* chain, which extends to the south-west of lakes Zaisang and Alaktougul, and separates them from lake Balkashi, for nearly 500 miles. In some places snow is said to lie on this chain during the whole year, which indicates an elevation of about 6000 feet. The chain is connected with the Altai by a series of low hills, running parallel to the south side of Zaisang, at the distance of about twenty miles. The Tarbagatai chain is considered as forming the north-western boundary between the Russian and the Chinese empires. The great volcanic mountains of Kamtschatka may either be considered as connected with the Altaian system, or, perhaps, more properly with the maritime chain to be afterwards mentioned.

The second great chain, called by the Chinese TEKAN-SHAN (or in French THIAN-CHAN), and by the Türkee nations TENGRI-DAGH, both of which names signify sky mountains, or mountains which reach the skies, extends from west to east nearly along the 42° parallel of north latitude. The culminating point appears to be that mass of hills, remarkable for three snow-clad peaks, which lies nearly in the centre of Asia, upon the confines of Kansu, in the Chinese empire, and is celebrated by the name of *Bükhda-ûla* (Holy Hill), the *Bogdo* of Pallas, the *Siue-shan* (snow hill), and the *Pe-shan* (white hill) of the Chinese, about 85° E. long. From Bukhda-ûla the Tecan-shan stretch east ward towards Barkoul, beyond which they suddenly fall to the level of the great desert of Cobi: but, after an interruption of about 10° of longitude, another chain, called *Gadjar* or *In-shan*, appears at the great bend of the Yellow river, following the same direction from west to east, which may be regarded as a prolongation of them. About 112° E. long. the Gadjar becomes confounded with a snowy chain called *Ta-hang*, and with a chain running north and south under the name of *Khinghan ula*, which forms a union in this quarter between the Tecan-shan and the Altai. The chain which may be considered as the principal, appears to stretch still further east, till it becomes connected on the one side with the *Mountains of Corea*, and on the other with the chain which extends along the coast of Mandchuria. Westward from Bükhda-ûla, the chain of Tecan-shan is prolonged, between Gulja (Ele) and Kuchu, and then between the lakes Temürtü and Aksü, to the north of Cashgar, under the name of *Müz-tagh*, or *Müsart*. From the point where the Bolor-tagh crosses the chain at right angles, the Müz-tagh continues its course without interruption, under the name of *Asferah-tagh*, to the south of the Sihoon, towards Khojend and Urateppeth, in Ferghana. The chain of Asferah, called also the ridge or chain of *Pamer*, separates the waters of the Sihoon from those of the Amü, and presents a group of lofty mountains, some of which are covered with perpetual snow. The chain then turns to the south-west, nearly in the meridian of Khojend, and in this direction, as far as Samarcand, is called *Ak-tagh*, or *Al-botom*; farther to the west, on the banks of the Kohik, it sinks into the plains of Bokhara and Mawer-ul-nahr. Besides the divisions of the chain already mentioned, there are several secondary ranges connected with the Tecan-shan; as, 1. The *Ala-shan*, a chain which runs along the west side of the great bend of the Hoang-ho, and appears to connect the Gadjar with the northern part of the great nucleus of Hoho-nor, named *Nan-shan* or *Kilian-shan*, belonging to the chain of Kwan-lun; 2. The *Ala-tagh* or *Alatau*, which extends northward from the Tecan-shan into Turkestan, crossing the course of the river Choui; and, 3. The *Ming-bulak*, to the north of Khokand, and nearly parallel to the Asferah.

The Chain of KWAN-LUN, KUEN-LUN, or QUAN-LUN, extends nearly along the thirty-fifth parallel of north latitude, bearing also the names of KULKUN and TARTASH-DAVAN, and commencing about the 70° E. long., to the westward of the *Tsüng-ling* (Blue or Onion Mountains), which are connected with the Bolor-tagh, and, according to the Chinese geographers, form its southern portion. From this point the chain runs eastward, and after crossing Thibet in two branches under the name of *Tsüng-ling*, to the north, and *Ngari*, *Tsang*, and *U*, to the south, forms in Eastern Thibet the *Kuenlun* of the Chinese, a mountain mass of prodigious height, which, in their mythological geography, is called the king of mountains, the highest point of the whole earth, the mountain which touches the pole and supports the sky; it is, in short, the Olympus of the gods of the Buddhists, and the Tao-sse. This great mass is supported on the north by the snowy chain of the *Nan-shan* and *Kilianshan*, which also extends west and east. Between the Nan-shan and the Tecan-shan the mountains of *Tangut* bound the edge of the desert of Cobi, and that and other contiguous chains form the country of Kham, Western Setchuen, and Yun-nan. In Thibet the Kwan-lun is connected with the Himalaya by several lofty chains, whose peaks are covered with everlasting snow.

The HIMALA, HIMMALA, HIMACHEL, or HIMALAYA (Abode of Snow) mountains extend in a general direction north-west and south-east. From the meridian 69° 10′ east, where it is connected with the Hindoo-koh, the chain extends to the east and south-east, along the northern frontier of India, Assam, and Birmah, and penetrates into the Chinese province of Yun-nan, where, to the westward of Yungchang, it exhibits sharp and snowy peaks. It turns abruptly to the north-east, on the confines of Hoquang, Keang-si, and Fuh-kien, and extends with its snowy summits near to the ocean, where we find, as if it were a prolongation of the chain, the *mountains of Formosa*, which are snow-capt during the greater part of the summer, shewing in this latitude an elevation of at least 12,049 feet. Westward, the chain of Himalaya forms, or is connected with, the *Hindoo-koh*, or *Indian Caucasus*, and the *Paropamisan mountains*, which extend in a westerly direction through five or six degrees of longitude, and then inclining to the north-west, appear to terminate before reaching the Caspian Sea. In the same direction, however, after a short interruption, the chain of *Elburz* appears, extending along the south side of the Caspian, and connected with the Caucasus and the mountains of Armenia. The culminating points of the Himalayas are found on the frontier of India, between 76° and 90° E. long., where they present a series of snow-clad peaks, many of which are from four to five miles of perpendicular height above the level of the sea; and one of them, the *Dhwalagiri* or White-mountain, rises to the enormous elevation of five miles and a half. The Himalayas, though running nearly in the same direction, are not exactly parallel with the Kwan-lun; but approach them so nearly in the meridian of Attok and Jellalabad, that between Cabul, Cashmere, Ladakh, and Badakhshan, the Himalayas seem to form only a single mass of mountains with the Hindoo-kho and the Tsüng-ling. In like manner the space between the Himalayas and the Kwan-lun, further east, is more occupied by secondary chains and isolated groups of mountains than the table-lands between the Altai and the Tecan-shan, and between the latter and the Kwan-lun. Consequently Thibet and Kashi cannot properly be compared in respect of their geological structure, with the high longitudinal valleys which are situate between the eastern and the western Andes. Nor is the level of these countries equal throughout; for the mildness of the winters and the cultivation of the vine in the gardens of H'lassa indicate the existence of deep valleys or circular depressions. The courses of the Indus and the Sanpoo, in opposite directions, also indicate a depression of Thibet to the north-west and the south-east. From this watershed, which is situate nearly in the meridian of the Jewahir, and Mount Cailasa or Cailas (in Chinese *O-new-ta*, and in Thibetan *Gang-dis-ri*), the chain of *Kara-korum-padishah* stretches to the north-west, towards the Tsüng-ling; and the snowy chains of *Hor* and *Zsang* to the east. The

Kara-korum chain forms the watershed between the affluents of the Indus on the one side, and the rivers of Yarkhand on the other. The *Hor*, at its north-western extremity, is connected with the Kwan-lun, and its course from the eastern side is towards the Tengri-noor. The *Zzang*, which is to the south of the Hor, bounds the long valley of the Sanpoo, and extends from north to east towards the *Neën-tsin-tangla-gangri*, a very lofty mountain which, between H'lassa and the Tengri-noor, terminates in Mount *Nem-shun-ûbashi*. Between the meridians of Ghorka, Katmandhû and H'lassa, the Himalayas send off to the north, towards the right bank, or southern border of the valley of the Sanpoo, several spurs covered with perpetual snow, the highest of which is the *Yaria-shamboy-gangri* (the snowy mountains in the country of the self-existing God), to the westward of the lake Yamruk-yumdzo or Paltee. Subordinate to the Himalayas and the Kwan-lun, the following chains may be mentioned: 1. The *Yung-ling*, which runs north and south, separates, by a long series of snowy peaks, China from Thibet, and joins the chain of *Pe-ling*, which bounds Shansi to the south, and has several snowy summits. On the frontier of Honan it becomes lower, and runs north-west towards Shansi, where it joins the Ta-hang. In Shansi itself, a secondary chain, called *Loung*, stretches from the Pe-ling north-west to the Hoang-ho, where it rises to the snow line, and unites with the Ala-shan. In general, the Pe-ling marks the boundary between the basins of the rivers Hoang-ho and Yang-tse-kiang, terminating near the sea, between their mouths. The *Nan-ling*, rising from the extremity of the Yun-ling, at a great distance from the Pe-ling, approaches the latter as it advances eastward, and sends off to the north-east several branches, which accompany the windings of the Yang-tse-kiang, even to its mouth. The mountains of *Yan*, to the north-west of Pekin, and the *Ta-hang*, to the west, in Shansi, appear to belong equally to the Tecan-shan and the Kwan-lun. 2. The *Sub-Himalayas*, which extend along the south side of the great chain, and form with it the valleys of Nepaul, Bootan, &c. 3. The chain which, under the names of *Yomadoung* and *Anapektouiou*, extends from the upper end of the valley of Assam to Cape Negrais. 4. The *Birman-Siamese* chain, which extends north and south, between the valleys of the Saluen and the Meinam, from the confines of Yun-nan through the peninsula of Malaya to Cape Romania. 5. The chain which traverses Laos, and forms the eastern boundary of Siam, separating the valley of the Meinam from that of the Maykuang. 6. The chain of *An-nam*, which forms the watershed between the affluents of the Maykuang and the numerous rivers of Tonkin and Cochin-China. 7. The *chain of Suleiman*, which extends from north to south, nearly parallel with the river Indus, and whose branches form the numerous secondary chains which traverse Affghanistan and Beloochistan, losing themselves in the table-land of Kerman on the one side, and terminating at Cape Jask on the other. Its principal summits are, *Suffid-koh* (White hill), west of Peshawer, about 14,000 feet above the level of the sea, and *Takht-i-Suleiman* (Solomon's Throne), 31° 38′ N. lat., 11,000 feet. The loftiest peaks of the Himalayas are supposed to be those of *Dhwalagiri* (White hill), nearly in the meridian of Benares, and *Chumulari* in Bootan; their elevation being calculated, though not exactly ascertained, at about 28,000 feet. Farther west, various parts of the range have been approached, and even crossed by Europeans, and the elevation of the summits pretty nearly ascertained. The *Southern*, or *Hither Himalayas*, which separate the feeders of the Sutlej from those of the Pabur, Roopir, and Andrytie, vary from 16,992 to 19,512 feet, and the passes from 15,000 to 16,000; the *Jummotri peaks*, or *Bunderpooch mountains*, from 20,122 to 21,155; *St. George*, *St. Patrick*, and the *Pyramid*, above Gangoutri, 22,240, 22,385, and 20,966; *Roodra-Himala*, 22,390; *Surga-Rooer*, 23,441; a cluster extending from Kedarnath to Budrinath, six peaks, 22,130 to 23,441; and three contiguous peaks, 19,178 to 21,683; *Jewahir* four peaks, 22,385 to 25,741; *Dhaibun*, in Nepaul, 24,640, and *Gotsainthan*, also in Nepaul, 24,740.

The BOLOR, BELUR, or BULYT-TAGH (Cloudy Mountains), extend in a direction transverse to that of the preceding chains, being connected with the Tsûng-ling on the south, and united on the north to the chain which passes to the north-west of Cashgar, under the name of Cashgar-davan. Of the northern part of the chain very little is known; but, in its middle portion, it forms or consists of the table-land of *Pamer* or *Pamir*, which is elevated 15,600 feet above the level of the sea, and is overtopped by mountains which rise several thousand feet higher. From Pamer, a chain of very lofty mountains, the *Hindoo-koh* of the Western Asiatics, extends in a S.W. direction, terminating with a lofty snow-capt mountain, named *Koh-i-baba*, 48 miles W. of Cabul, and being connected with the Himalayas at the valley of Punjsheer, N.E. of that city, forms the watershed between the basins of the Oxus and the Indus. From the same part of Pamer, the Belûr is continued almost straight S. till it join the Himalayas, separating in its progress the hill country of Chitral from Little Thibet; while a third branch extends in an easterly direction, towards the chain of *Kara-korum*, which, as already mentioned, separates the basin of the Indus from that of the river of Yarkhand. It thus appears that the chains of Hindoo-kho and Karakorum may either be considered as diverging ranges of the Belûr-tagh, or as constituent parts of the western prolongation of the Kwan-lun. Though their elevation has not been ascertained by measurement, they appear to be much higher than the Himalayas, for they form a complete watershed between India and Central Asia, while, on the contrary, the Himalayas are interrupted and broken through in many places by the streams which flow from the northern ranges and the hill country which lies between them.

The URALS, or UMALIAN MOUNTAINS, which belong in common to Europe and Asia, extend rom north to south, through 20° of longitude, from the Arctic Ocean to the Sea of Aral. Compared with the preceding chains, the Urals are very low in their general elevation, though some of them reach the limit of perpetual snow, a circumstance which is not remarkable in their high latitude. Where the road from Moscow to Siberia crosses these mountains, the chain is about 40 miles broad, but the ascent and descent of the road are so nearly imperceptible, that were it not for the precipitous banks everywhere to be seen, the traveller would hardly suppose he was crossing a range of hills. The average elevation of this part of the range seems not to exceed 1350 feet, though some rocky masses rise perhaps a thousand feet higher; and the base upon which the chain rests is itself 900 feet above the level of the sea. Beyond 58° 20′ the chain presents several summits which attain between 2000 and 3000 feet; but the highest part of the range is situate to the north of 59°, and the highest of all, the *Daneshken-kamen*, lies to the north of 60°. The summits of this northern part of the range have been ascertained to rise to between 8000 and 9000 feet above the level of the sea; but the principal summits are detached mountains, to the eastward of the main range. Lateral branches also extend eastward to a considerable distance into the plain. The principal chain bears successively from north to south the names of *Poyas*, the *Verkhûturian Urals*, the *Urals of Iekaterinburg*, and the *Bashkirian Urals*. Several low branches diverge into the governments of Arkhangel and Vologda; but the principal subordinate or diverging chains are connected with the Bashkirian Urals. The *mountains of Obtsheisyrt*, which diverge from the western slope of the principal chain, are really nothing more than a long table-land of undulating hillocks extending into the government of Orenburg; forming, however, the northern limit of the depression which surrounds and contains the Caspian Sea. The *chain of Mooghajar* extends into the country of the Kirghiz, and seems to be connected with the plateau called the *Ust-Urt*, between the Caspian Sea and the Lake Aral. Subordinate to this last-named chain, or part of the same group, are the *Great Bürzouk*, a chain of low hills, which extends in a series of rocky cliffs along the northern shore of the Aral, spreading out towards the west, and turning into the isthmus; and the *Little Bürzouk*, which are situate a little farther to the south-east, and terminate with a promontory at the north-eastern corner of the Aral. The *mountains of Novaia Zemlia* may also be considered as an orographic connection or prolongation of the Urals. Their principal summit is *Glassowsky*, about 2500 feet above the level of the sea.

The remaining mountains of Asia, those of the south-west, have been classed by the French geographers as one group, which they call the WESTERN or TAURO-CAUCASIAN SYSTEM. The grand nucleus, or centre of the system, is formed by the high table-land of Armenia, and the lofty mountains which intersect and overtop it. From the stupendous peak named *Macis* by the Armenians, *Agri-dagh* by the Turks, and *Ararat* by Europeans, two ranges diverge to the westward, forming between them the long valley of the Murad or Eastern Euphrates. The southern of these are the *Mardin Mountains* (*Mons Masius* of antiquity), which are merely a prolongation of the *Taurus*, which extends into Asia Minor. The northern branch is named by the Turks *Kus-dagh*, *Kizildjeh-dagh*, *Ayhir-dagh*, and *Ala-dagh*; by the Armenians *Dagh-e-dagh*, and *Macis*; and to the north of it are two long narrow valleys drained by the Karasu and the Aras. Farther north the mountains of *Tschildir* and *Ismik* separate the table-land of Armenia from the lowland on the Black Sea, and are connected with Agri-dagh by irregular ranges and clusters of mountains, which separate Armenia from Georgia and Azerbijan, under the names of *Klardjethi*, *Tassi*, *Medira*, and *Sdorin Georgas*, or *Lower Caucasus*.

From Armenia these chains of mountains diverge towards the west, which may be considered as forming so many different groups. The first chain encloses the upper basin of the Euphrates, and passing that river above Samosat, advances toward the west, under the names of *Taurus*, *Jebel-Kurin*, and many other designations, along the south coast of Asia Minor, terminates in various promontories and islands in the south-western part of the peninsula. The mountains of Rhodes and Cyprus may be considered as its dependencies. The second of the three chains proceeds also into Asia Minor, to the northward of Taurus, and its eastern part corresponds with the *Anti-Taurus* of the ancients. Extending in different directions, and with many interruptions, it intersects all the interior of Asia Minor, and is ultimately divided into numerous branches, which terminate on the shores of the Archipelago. The third chain likewise extends into Asia Minor, along the southern coast of the Black Sea, at no great distance inland. Towards the south and south-east three other chains are detached from the central nucleus, two of which, however, may be considered as merely branches of the Taurus, while the third seems to be a prolongation of this chain itself. To the westward of the Euphrates, Taurus sends off several branches southward, the most westerly of which reaches the sea, and separates Syria from the ancient Cilicia. This is the *Amanus* and *Pierius* of the Latin geographers, but now bears the name of *Alma-dagh*. It terminates between the Gulf of Scanderoon and the mouth of the Orontes; but is only divided by the narrow channel of that river from the *mountains of Syria*, which may be considered as the prolongation of the branch of Taurus. Commencing with the lofty peak of *Jebel-el Akra* (*Mons Casius*) and *Mount St. Simeon*, which connects them with Alma-dagh, the Syrian mountains extend southward, nearly parallel with the eastern shore of the Mediterranean Sea, under the names of *Jebel Akra*, *Jebel Chakrinah*, *Jebel Kraid*, *the mountains of the Nozaries*, *Lebanon*, and many others. *Lebanon* forms two branches; the western being the *Libanus* of the Latins, which terminates on the coast near Sidon, while a branch extends southward through Judea, forming the watershed between the basin of the Jordan and the Mediterranean Sea; the eastern is the *Anti-Libanus*, which extends under various names, and with several interuptions, into the deserts of Arabia, beyond the Dead Sea. The second chain is detached in the eyalet of Diyarbekr, extends into Mesopotamia, and terminates at the Euphrates in the *mountains of Sinjar*; and seems to be the *Mons Masius* of the Latins. The third chain, the most remarkable of the three for its elevation and its length, is detached from Armenia, to the south of the Lake of Van, and under the names of *Aglan-dagh*, *Elvend*, *mountains of Kurdistan*, *Louristan*, *Bukhtiari*, &c. extends far to the south-east, forming the boundary between the plains of Assyria and Babylonia on the one side, and the lofty table-land of Iran on the other. It seems to be finally lost in the deserts of Kerman. The northern part of the chain seems to correspond with the ancient *Niphates*; the southern prolongation with the ancient *Zagrus*. Subordinate to this chain, and nearly parallel with it, is the long ridge of *Jebel Hamrin* or the *Hills of Hamrun*, which cross the bed of the Tigris above the 35° N. lat., and extend to the south-east, forming the northern border of the alluvial plains of Babylonia and Chaldæa. To the east of Zagrus the numerous ridges, which form a sort of net-work over the surface of Persia, may also be considered as dependancies of the Tauro-Caucasian system. From the east side of Armenia a lofty chain is detached to the south-east, which, under the name of *Elburz*, passes to the south of the Caspian Sea, and terminates in Khorassan, though it may be considered as prolonged in the *mountains of Nishabor*, which rise in the same direction, after a little interruption, and are connected with the great chain of the Himalayas. To the north of Armenia, a chain stretches through the pashalics of Kars and Akhaltsike, in the latter of which it forms the southern boundary of Imeritia, and then stretches in a north-easterly direction, and joins the Caucasus in Georgia, forming there the watershed between the affluents of the river Rioni, which flows to the Black Sea, and the Kur, which flows to the Caspian. The great range of *Caucasus*, which forms the northern part of the Tauro-Caucasian system, extends along the north-eastern coast of the Black Sea, across the isthmus, and terminates in a series of low hills in the peninsular promontory of Abcheron, on the west side of the Caspian Sea; but covers with its branches the *Daghestan* or hill country, which extends to a considerable distance to the northward of Abcheron. The length of the principal chain of Caucasus exceeds 700 miles, while its breadth is only from 60 to 120. The loftiest summits are found near the middle of the chain, and are covered with perpetual snow. The snow line along the chain varies from 10,000 to 11,000 feet above the level of the sea. The *mountains of the Crimea* are an orographic dependancy of Caucasus, in the line of which they lie, and from which they are separated only by the Strait of Yenikaleh, and the alluvial delta of the river Kouban.

TABLE OF THE ELEVATIONS OF THE PRINCIPAL SUMMITS OF THE TAURO-CAUCASIAN SYSTEM.

	Feet.
1. ARMENIA AND ASIA MINOR,—	
Agri-dagh, Macis, or Ararat, N. lat. 39° 35′, E. long. 44° 12′, First peak,	17,265
" " " " Second peak,	12,162
Sepan, or Supan-dagh, N. side of the Lake of Van,	11,000
Ali Ghuz, N.W. of Erivan, in Russian Armenia,	12,000?

Summit of Lebanon, Jebel Sannin, N. of Baalbec,	11,050?
Mount Tabor,	2,053?
Mount Carmel,	2,250?
3. Caucasus and Elburz,—	
Elbûrz, highest peak of Caucasus, 43° 5′ N. lat., 42° 50′ E. long.,	17,796
Kasbec, 42° 40′ N. lat., 44° 41′ E. long.	15,345
Pass of Dariel, leading from Vladi-Kaukas to Tefiis,	8,000
Tchatir-dagh, S.E. coast of the Crimea,	5,110
The Peak of Demavend, in the range of Elbûrz, between Irak and Mazenderan, 52° E. Long.	14,700
Mountains of Karalini, between Armenia and Georgia,	6,000

The Mountains of Arabia, though they may also be considered as part of the Tauro-Caucasian system, and are so classed by Balbi, yet seem to be really so little connected with it, that we shall be justified in treating them as a separate group. We know, indeed, very little about them. Arabia seems to be, like Persia, an immense table-land surrounded and intersected by mountains, but with their elevation and direction we have little acquaintance. The best known ranges seem to be those which extend, at various distances, along the coasts of the Red Sea, the Arabian Sea, and the Gulf of Oman, attaining an elevation between 6000 and 9000 feet, and forming the boundary of the table-land of the interior.

The Mountains of India are classed by Balbi as dependencies of what he calls the Altai-Himalayan system; but they are so completely separated from the Himalayas that neither geographically nor orographically can we admit the correctness of his classification. The most northerly chain of the Indian mountains, named *Aravulli*, extends about 350 miles from N.E. to S.W., through Rajpootana, with an average elevation of about 3600 feet, and forms the western boundary of a hilly region which sends its waters to the Ganges. The *Vindhyia* and *Sautpoora mountains* are two parallel ranges, which stretch from west to east, along the valley of the river Nerbuddah, and are connected at their eastern extremity with a mountainous region which occupies the central portion of India, and terminates, on the one side, at Rajmahal on the Ganges, and on the other, near the sea-coasts of Orissa. Their average elevation does not exceed that of the Aravulli. The *Western Ghauts* extend in a continuous line along the south-western coast of India, from the valley of the river Tuptee to the valley of Coimbatoor, where they are connected with the *Nilgherries*, the loftiest mountains of the Peninsula. The *Eastern Ghauts* follow, in like manner, the line of the south-eastern coast of India, but form a less continuous and less regular chain than those of the west. Both chains may be considered as prolonged by the hills which extend southward from the valley of Coimbatoor, and terminate at Cape Comorin; though it is rather with the eastern than with the western Ghauts that the latter seem to be connected. The *Mountains of Ceylon* form a detached group of great elevation in the centre of the island. (See India and Ceylon.)

The Japanese or Maritime Chain includes all the mountains which are found in that long chain of islands which extends from Kamtschatka to the Channel of Formosa; and should properly include the mountains of Kamtschatka also. The two extremities of the chain, the mountains of Kamtschatka and Formosa, seem to be its loftiest portions; the whole chain is a series of volcanoes.

Table of the Elevations of the Japanese Chain.

	Feet.
Klutchevskaia, or Klioutshevskvi, N. lat. 56° 8′,	16,512
Koriatskaia, 58° 19′,	11,215
Kronotskaia, 54° 8′,	10,625
Shivelutsh, S.E. peak, 56° 40½′,	10,591
——— N.W. peak, 56° 40′,	8,716
Jupanovskaia, 53° 35½′,	9,060
Avatchinskaia, or peak of Awatshka, 53° 17′,	8,760
Tolbatschinsk,	8,346
Villuchinskaia 52° 43½′	6,750
All these are in Kamtschatka.	
The peak of Jeso,	7,680
Mountains of Formosa, probably	12,000

Volcanoes. — Asia contains very few volcanoes in proportion to its vast extent. 1. The principal are found in Kamtschatka, to the number of five, of which the *Klioutshevskoi* or volcano of *Tolbatschik*, is the most formidable. Next to it are the *Avatsha* and *Kamtshatskaia*, besides which there are eight smaller ones 2. The *Djenkyet*, in Indo-China, between Moyeip and Tavay. 3. The *Pe-shan*, *Pih-shan* of the Chinese, or *Eshikbash* of the Turks (goathead), on the northern slope of the Tecan-shan (42° 35′ N. lat., 80° E. long.), between Koutche, in Little Bukharia, and Koigos, on the banks of the Elee, and the *Ho-tcheou*, upon its southern slope, not far from Turfan (42° 40′ N. lat., 90° E. long.), are very remarkable as being the most distant volcanoes from the sea yet known. According to the reports of the Chinese, the Pe-shan, which they also name *Ho-shan* and *Aghi* (fiery mountain), sends forth fire and smoke without intermission. Of the present state, however, of the mountain, we have no very certain information. It is not known whether the name *Pih-shan* implies that its summit reaches the line of perpetual snow, or whether it merely denotes the glittering hue of a peak covered with saline substances, pumice stone, and decomposed volcanic ashes. From Chinese history it appears indisputably to have been, in the first century of our era, a volcano in the strictest sense of the word, vomiting forth torrents of lava. At present, it would appear to be rather a solfatara. For a long time it has ceased to eject lava, but it produces ammoniacal salt in such abundance that the inhabitants of the country often pay their tribute to the Emperor in that commodity. The mountain is full of caverns and crevices, which in spring, summer, and winter, are filled with fire to such a degree that during the night the surface appears to be illuminated with thousands of lamps, and it is then unsafe for any person to approach it. It is only in winter, when the snow has extinguished the fire, that the sal-ammoniac is gathered; the salt is found in the form of stalactites, which are detached with difficulty. To the eastward of Pe-shan, the whole northern slope of the Tecan-shan presents volcanic phenomena. Lava and pumice-stone are found there, and even considerable solfataras, which are called "fiery places." The solfatara of *Urumtsi* (46° N. lat., 84° E. long.), 40 leagues westward of the meridian of Ho-tcheou, at the foot of the Bükhda-ûla, is five leagues in circumference; in winter it is not covered with snow, but is supposed to be full of ashes. If a stone be thrown into it flames issue forth, as well as black smoke, which continues for some time.

Sixty leagues eastward from Pe-shan is a lake of very considerable size, the different names of which, in the Chinese, Kirghiz, and Calmuck languages signify "warm, salt, and rusty water." The volcano of *Turfan*, or *Ho-chow* (City of fire), emits an uninterrupted column of smoke, which at night appears like a flaming torch. About 230 miles north of Urûmtsi, in a plain adjoining the river Khobak, which falls into the little lake Darial, there is a hill whose sides, though they do not smoke, are very hot, and yield a considerable quantity of ammoniacal salt. Besides these four places hitherto known, Pe-shan, Ko-chow, Urûmtsi, and Kobok, there is an insulated conical mountain, Araltube, in the Lake Ala-kûl, which has been in a state of ignition in historical times. It is situate in the volcanic territory of Bishbalikh to the W. of Kobok and to the N. of the Pe-shan, at the distance of 60 leagues from each. We are thus acquainted in the interior of Asia with a volcanic territory of upwards of 2500 square leagues, distant 300 or 400 leagues from the sea, and occupying one-half of the long valley between the Altai and the Tecan-shan. The chief seat of volcanic action seems to be in the Tecan-shan; on the north side of the Tarbagatori and the Lake Darial the action becomes weaker; on both sides of the Tecan-shan violent earthquakes are felt, and betweeen the lakes Balkashi and Ala-kûl they are said to be very common. The city of Aksû was entirely destroyed by one in the beginning of the 18th century. The Caspian Sea likewise appears to be surrounded by a volcanic territory. On the east side there are hot springs at *Soussac*, in the Karatau mountains, near the city of Turkistan; on the south and the west sides, three volcanoes are still in activity, *Demavend*, *Ararat*, and *Seiban-dagh*, besides many others which are now quiescent. The chain of Caucasus abounds with trachytes, porphyries, and warm springs, and numerous mud volcanoes appear on the isthmus between the Black Sea and the Caspian. But it is in the islands that the volcanoes are most formidable. A continuous line of volcanic action commences on the north with the Aleutian Islands, and extends first eastward for 230 miles, and then southward without interruption to the Moluccas, where it branches to the E. and N.W. The N. portion of this volcanic belt is the long peninsula of Alashka in N.W. America, from which it extends through the Aleutian islands to Kamtschatka, in the S. part of which are a number of active volcanoes. The belt then forms a train of volcanic mountains extending through the long line of the Kurile Isles, nine of which are known to have been in eruption, besides Jeso and Niphon, where the burning vents are very numerous, slight motions of earthquakes almost incessant, and violent shocks experienced at distant intervals. Between the Japanese and the Philippine islands the communication is preserved by several small insular vents. *Sulphur Island*, in the Loochoo cluster, emits sulphureous vapour; and Formosa suffers greatly from earthquakes; in Luzon are three active volcanoes; there was also an eruption in Mindinao in 1764. The belt is then prolonged through Sanguir and the N.E. end of Celebes, by Ternate and Tidore, to the Moluccas, whence a great transverse line runs westward through Wetter Ombay, Panter, Flores, Sumbawa, Lombok, Bally, Java, and Sumatra, ending with *Barren Island*, a very active volcano in the Bay of Bengal. In Java alone there are 38 large volcanic mountains, many of which continually discharge smoke and vapour. The volcanic belt is prolonged in another direction through Borneo, Celebes, Banda, Papua, New Britain, New Ireland, and various other islands in the Pacific.

DESERTS.—Asia presents a great number of deserts and steppes, several of which are of immense extent. With little exception, all the northern part of Asiatic Russia may be regarded as an immense steppe, interspersed with marshes; in the southern part of the same region are many smaller steppes and salt plains, among which may be mentioned the great steppe of the *Kirghis*, N.E. of Lake Aral; *Ischim*, between the Irtish and the Tobol; and *Baraba*, between the Irtish and the Obi. But the most remarkable deserts are those sandy plains that occupy the greater part of the south-west and central regions of the continent, extending, with little interruption, from the shores of the Atlantic Ocean to the north-east of China, through a space equal in length to 130 equatorial degrees of longitude, or upwards of 9000 miles, more than a third part of the earth's circumference. This tract does not indeed form one continuous desert; for, besides the *oases*, or islands, with which it is sprinkled, it is interrupted, in the eastern part of Africa, by the narrow valley through which the river Nile conveys its tropical waters to the Mediterranean Sea. A little farther east it is nearly intersected by the Red Sea, which leaves only the narrow isthmus of Suez to connect the deserts of Africa and Asia. To the east of Arabia, it is again interrupted to a considerable extent by the Persian Gulf and the plains watered by the rivers Euphrates and Tigris. To the east of Persia, the river Indus separates the deserts of Beloochistan from the desert in the N.W. of Hindostan, while the gigantic mountain chains of Himalaya, Hindoo-koh, and Kwan-lun form a complete separation between the deserts of Persia and India, and those which occupy the interior of Asia. On the east of the Red Sea, this desert occupies nearly the whole peninsula of Arabia to the extent of more than 1000 miles in length, and from 700 to 900 in breadth, exhibiting everywhere the same character as the African Sahâra. The deserts of Persia are nowhere so extensive as those of Arabia, their continuity being more interrupted by ranges of mountains and well watered fertile valleys, which form the inhabited portions of the country. The deserts of the interior bear the names of *Cobi* or *Gobi*, *Shamo*, and *Tola*, but are very little known to Europeans. *Gobi*, in the Mongol language, means a *naked desert*, and is equivalent to the *Shamo* or *Hanhai* of the Chinese. They extend almost continuously about 2000 miles in length, with a breadth of from 200 to 300. Marco Paolo says, that it takes a month's journey to cross the desert from N. to S., but to go through it lengthways would occupy a whole year. The journey, he says, is entirely through sands and barren mountains, in which water is found every day; yet at some of the resting places it is so scanty as scarcely to suffice for a caravan of 50 or 100 persons with their cattle. In three or four places the water is salt and bitter, but in general it is very good. In the whole journey across the desert no beasts or birds were to be seen, and it was reported that many evil spirits resided there, and occasioned wonderful illusions to travellers. The eastern part of the desert was crossed by Mr. Bell of Antermony, in 1720, in the train of a Russian embassy. He was twenty-eight days in passing from the river Tula, on its northern border, to the first cultivated land on the south side, where he found to his great satisfaction a small brook of fresh water, and some Mongolian huts. The desert exhibited everywhere a level surface, mostly overgrown with rank grass, and occasionally interrupted by patches of sand and gravel; but in the middle there was a belt of sand 20 miles across, so loose as to be blown about, and raised into hillocks by every blast of wind. During a later Russian embassy, in 1830, a series of heights was ascertained across this part of the desert, from Kiakhta to Pekin, and it was found that the pass leading over the mountain chain, to the south of Urga, and to the north of the river Tula, is only 5000 feet above the level of the sea; and that on the southern border of the desert, not far north of Pekin, the highest passes through the mountains which are traversed by the great wall rise only to 5525 feet. Between Urga and the great wall lies the desert, which, however, is not a perfectly level plain, but sinks towards the middle, where it is about 3000, and in some places only 2600 feet above the level of the sea, and forms a long flat valley, which is the proper desert, extending east and west. Its surface is covered with sand, abounds in salt, and exhibits everywhere the traces of its having once been the bed of a sea. Farther west, towards Hami, the country appears to rise considerably; but beyond this it would appear to be furrowed again by the valley of the large river Yarim, which forms the drain of the hill countries of Kashgar and Yarkhand, or Little Bukharia, and terminates in the Lake of Lop. In Western Asia, *the Deserts of Turkestan* occupy the greater part of the surface of that country, the only cultivable portions of it, below the mountains, being the narrow strips of land along the rivers, within

reach of irrigation by their waters. The northern parts form *steppes*, which afford pasturage to the herds and flocks of the wandering Kirghiz; in the central region, along the Aral, are the two extensive sandy deserts of *Kara-koum* (black sand) and *Kizil-koum* (red sand); and, in the southern region, the wide-spread deserts of Turcomania, extending from the Caspian Sea, along the northern frontier of Khorassan.

PLAINS, VALLEYS, AND TABLE-LANDS.—On the northern side of the Altai range, and indeed over the whole of the northern part of Europe and Asia, the elevation of the ground is very inconsiderable. From the plains of Brabant, it is possible to travel eastward to the Steppes which border the western declivity of the Altai, and Chinese Zoungaria, from the Scheldt to the Lenisei, over 80 degrees of longitude, without meeting with a single elevation exceeding 1200, or 1300 feet; and even on the south side of the Altai, along the banks of the Upper Irtish, and the borders of Lake Zaisang, and through a great part of the steppe of the Kirghiz, the elevation has been found, by barometrical measurement, scarcely to exceed 1900 feet above the level of the sea. Of the countries lying farther south, between the Altai and the Himalayas, we have a very imperfect knowledge; but it is worthy of remark, that the countries situate between the Kwan-lun and the Teean-shan, have a general inclination from west to east; while the valley of Zoungaria, between the Teean-shan and the Altai, is inclined to the west; being closed on the east, beyond the meridian of Pekin, by the Khingkhanula, a mountainous crest, which runs S.S.W. and N.N.E., while to the west it is entirely open, on the side of the Tchoui, the Sarasou, and the lower Sihoon. It is quite otherwise with the country between the Himalayas and the Kwan-lun, which is closed to the west by the Bûlyt-tagh, which separates Little from Great Bukharia, and from Cashgar, Badakshan, and the Upper Jihoon or Amoodaria. The whole region, indeed, between the parallels of 30° and 50° N. lat., and between the meridians of the Bolor range and Lake Baikal, contains a vast extent of country, whose elevation probably does not exceed that of the plains of Bavaria, Spain, and Mysore.* There is, moreover, every reason to suppose, that plains of the same order of elevation as those of Quito and Titicaca, occur only in the bifurcation formed by the junction of the Himalayas and the Kwan-lun, in the group of mountains surrounding lake Hoho-nor, and in Gobi, to the north-west of the In-shan. But in the south-western portion of the continent there is a series of elevated table-lands, which form a characteristic feature, almost peculiar to Asia. The interior of the peninsular region, which extends from the Archipelago to the Caspian Sea, is occupied throughout nearly its whole length by the high regions of Phrygia and Armenia, which are not indeed exactly a table-land, but consist rather of a series of valleys and plains, of various degrees of elevation, from about 2000 to 6000 feet above the level of the sea. The elevation of the plain of Kutahya is 6000 feet; of Sivas 3894; and of Erzroum, the capital of Turkish Armenia, 5600. The peninsula of Arabia is in like manner almost entirely occupied by table-lands, which, in the northern district, slope towards the Persian Gulf and the Euphrates; but their elevation is unknown, though, from the height of the bordering mountains, it may be conjectured to be between 3000 and 4000 feet. The interior of Persia is also occupied by a table-land, intersected by a network of mountains, and leaving only a very narrow border of lowland along the Persian Gulf, the Indian Ocean, and the Caspian Sea. The elevation generally exceeds 3000 feet, though at Koom it is so low as 2046. The city of Ispahan is situate in a valley 4140 feet, and Tehran in a plain 3786 feet above the level of the sea. India likewise contains several detached table-lands. The table-land of Taxila, which occupies the northern half of the Punjaub, has a considerable elevation; the table-land of Malwah, or Central India, supported on the south and west by the Vindhya and Aravulli mountains, has an elevation of about 2000 feet, but slopes north-eastward to the Jumna; the table-land of the Deccan, supported on the west by the Western Ghauts, has an elevation of about 2000 feet, but slopes considerably to the eastward, in which direction all its waters flow; the table-land of Mysore, in southern India, lying in the angle formed by the meeting of the Eastern and the Western Ghauts, has an elevation exceeding 3000 feet, but is of no very great importance.

But the most singular feature in the formation of the Asiatic continent is the depression of considerable portions of its surface below the general level of the ocean. The Caspian Sea, and a considerable tract of country around it, have been found, by levelling across the isthmus, to be about 81 or 82 English feet lower than the surface of the Black Sea. The depression of the Dead Sea, in Palestine, and the basin of the river Jordan, have been found, by barometrical measurements, to be still greater; but different observers vary in their estimates, from about 500 feet to 1400, as the amount of the depression below the level of the neighbouring Mediterranean. In these operations, however, the barometer seems to be a very deceptive instrument; for it indicates the depression of the Caspian to be more than 300 feet, while it is found, by levelling, to be only 81; probably the depression of the Dead Sea and the Jordan will be found to follow the same proportion. North-east of the Caspian and the Aral commences a very remarkable region of small lakes, comprising the groups of Balek-koul, and Koum-koul, which seems to indicate, at some remote era, the existence of a great mass of water in the interior of Siberia, communicating with the lakes Aksakal and Aral. It extends to the north-east, between the rivers Tobol and Ischim, and may be traced eastward beyond Omsk, through the steppe of Baraba, to Sourgout beyond the Obi, through the country of the Ostiaks of Beresov, and even to the marshy shores of the Arctic Ocean. The geological appearances of this tract render it probable that, formerly, it was entirely covered with a mass of water, of which the Caspian and the Aral are the most considerable remaining portions. The Chinese also have a tradition of the existence of a salt lake in the interior of Siberia, which traversed the course of the river Ienisei; and the salt plain which surrounds the oasis of Hami is expressively called by them the *Dried-up Sea* (Han-hai.)

SEAS, BAYS, GULFS.—1. In the Arctic Ocean: *Gulf of Ienisei* and *Gulf of Obi*, respectively the estuaries of these two great rivers. 2. In the Indian Ocean: the *Red Sea*, *Gulf of Arabia*, *Gulf of Oman*, *Persian Gulf*, *Arabian Sea*, *Bay of Bengal*, *Gulf of Martaban*. 3. In the Pacific Ocean: *Chinese Sea*, *Gulf of Siam*, *Gulf of Tonquin*, *Yellow Sea*, *Sea of Japan*, *Sea of Okhotsk*, *Gulf of Anadir*.

STRAITS.—*Strait of Babelmandel*, which connects the Red Sea with the Gulf of Arabia; *Strait of Malacca*, between Malaya and Sumatra; *Channel of Formosa* at the south, and *Strait of Formosa* along the west side of the island of the same name; *Bhering's* or *Behring's Strait*, at the north-eastern extremity of Asia, separating it from America.

RIVERS.—Asia contains some of the largest rivers in the world. They may be arranged in five classes, according as they flow into the seas and oceans which surround the continent, or into inland lakes. 1. The *Ienisei*, with its affluents the three *Tonguskas*; the *Obi*, with its affluents the *Irtish*, *Ischim*, and *Tobol*; the *Olenets*; the *Lena*; the *Indigirka*; and the *Kolima*; all flow to the Arctic Ocean. 2. The *Rioni*, and *Kizil-Irmak*, fall into the Black Sea; the *Sarabat* and *Meinder*, into the Archipelago; the *Aaxi* or *Orontes*, into the Levant. 3. The *Euphrates* and *Tigris*, *Indus*, *Ganges*, *Brahmapootra*, *Irawady*, *Saluen* or *Thaluen*, fall into the Indian Ocean. 4. The *Meinam*, *Maykaang* fall into the Chinese Sea; the *Yang-tse-kiang*, *Hoang* or *Whang-ho*, and *Amour* or *Saghalien*, into

* The plains of Bavaria are 1660; of Spain, 2240; of Mysore, 3000; Quito, 9000; and Titicaca, 13,000 feet (1986 toises) above the level of the sea.

the Pacific. 5. The *Ural* or *Jaik*, *Kur* and *Aras*, *Kizil sen*, to the Caspian; *Amú* or *Oxus*, and *Sihon* or *Jaxartes*, fall into the Sea of Aral; the *Chuee* or *Tchoui*, from the lake Ili or Ele, into lake Balkash; the rivers of *Yarkhand* and *Cashgar*, into the lake Lop; or, perhaps, as it is alleged, into the Whang-ho.

LAKES.—Asia contains the largest lake in the world, which, from its size and its saltness, has been dignified with the name of Sea. The CASPIAN SEA is situate in the western part of the continent, between 36° 35′ and 47° 25′ N. lat., and 46° 15′ and 55° 10′ E. long. Its greatest length along the meridian is about 760 miles, but measured in a curve line along the middle of its breadth, from its north-eastern extremity to the coast of Mazenderan, it exceeds 900; with an average breadth of 200. Its area is computed by Arrowsmith to be 118,000 square geographical miles, or nearly 160,000 square English miles. The Caspian is bordered on the north and north-west by the Russian empire; on the south and south-west by Persia; and on the east by Turkestan. The coast-line is irregular; but the only considerable bays are, the Gulf of Mertovi or Dead Gulf, in the north-east, and the Balkan on the east coast. The south and south-west coasts are closely hemmed in by lofty mountains, which in some places leave a narrow intervening strip of low land, and in others, particularly on the west coast, exhibit a precipitous rocky shore. On the north-west and north it is bordered by the low steppes of Astrakhan; and on the east by the sandy deserts of Turkestan, which present a series of high cliffs and sand-hills approaching close to the shore. Its depth is very variable. Along the north coast the water is very shallow for 20 miles from the land; along the east, west, and south shores, the depth is sometimes 150 feet; and at one place near the middle no bottom has been found at 2800 feet. In several places the bottom seems to descend by terraces. The water is less salt than that of the ocean, and particularly near the mouths of the rivers, but is somewhat more bitter. Its level has been found, by levelling across the isthmus, to be about 81 feet below that of the Black Sea; but the north and south winds exercise a powerful influence in varying the level of the water at its opposite ends. Hence its variations have a range of from four to eight feet, and strong currents are generated both with the rising and the falling of the wind. Some difference is also occasioned by the snow melting in summer; and the lake is said to be subject to periodical variations of an anomalous kind; increasing and decreasing in its bulk through periods of about 30 years. The islands which it contains are few and unimportant; and, for the most part, those which are elevated are without water and vegetation. The low islands are often mere sand-banks, overgrown with reeds. There are few deep and secure harbours; and, as the winds are liable to sudden changes, the navigation is rather dangerous: Baku is indeed the only harbour in which a vessel can ride with safety in stormy weather. The rivers which flow into it are the Volga or Wolga, the great drain of the south-eastern declivity of Russia; the Kouma, the Terek, the Kur, and the Aras, all from the declivities of Caucasus; the Kizilozen, and many others, from Persia; and the Ural, from the southern parts of the Ural mountains. The climate is less temperate than might be expected from the latitude; its northern gulfs are frozen in winter, and the ice at the mouth of the Volga does not break up till April. In the south, however, the summers are very hot and humid, and in consequence unhealthy, though productive of the most luxuriant vegetation in Mazenderan. The shores of the Caspian are frequented by multitudes of aquatic birds, as storks, herons, bitterns, spoonbills, geese, and ducks; and the waters abound with fish. The sturgeon is the principal object in the fisheries; but for delicate eating, the sterlet is preferred. There is also the beluga *(acipenser huso)*, which attains such an enormous size, that one is a heavy load for three horses. The Caspian likewise contains a species of seal, porpoises, salmon, and a kind of herring; indeed it has been remarked that it contains all the varieties of sea animals which are found in the Black Sea, except those which arrive in the latter periodically from the ocean for the purpose of spawning. The species of shells and sea plants are not numerous.

The SEA or LAKE of ARAL, to the eastward of the Caspian, is nearly a fourth part of its size; and, further east, are many smaller lakes of the same character, which receive rivers, but have no outlet. The principal of these are the *Balkashi-noor* or lake *Tenghiz*, the *Alak tou-gul*, the *Khassel-cash*, the *Ulen*, the *Aral-noor*, the lakes *Buteng* and *Lob*, the *Tengri-noor* and *Bouka-noor*, all in Central Asia; and the *Pangkung* in Thibet; towards the west are several of the same kind which are much better known, as the lakes of *Urumiah* and *Van* in Armenia; the great salt lake of *Koch-Hissar* in Asia-Minor; and the *Dead Sea* in Palestine. All these lakes, or seas, as they are sometimes called, are salt; the waters of some of them are intensely so, and even bitter. Of freshwater lakes, with outlets, the principal are: the *Baikal*, in Eastern Siberia; *Zaisang*, formed by the Irtish; the *Lake of Eriran*, in Armenia; the *Lake of Tiberias* or *Sea of Galilee*, in Palestine; the *Po-yang*, and *Tongting*, in China; the *Bhawanshad*, *Mana-arovara*, and *Paltee*, in Thibet.

ISLANDS.—The numerous islands of the *Archipelago*; *Cyprus* in the Levant; *Ceylon*, *Andaman*, and the *Nicobar islands*, in the Bay of Bengal; *Hainan*, and *Formosa*, in the Sea of China; the *Viju-coamu*, *Loo-choo*, *Japan*, and *Kurile* islands in the Pacific Ocean. To the south-east of Asia, between the Indian and the Pacific Oceans, is a multitudinous group of islands, which have usually been considered as belonging to Asia; but they have now been formed, along with the islands of the Pacific Ocean, into a new division of the globe, named OCEANIA or OCEANICA; and, though this classification is far from being unobjectionable, yet, as it has been adopted by most modern geographers, and has come into popular use, we shall adhere to it; the more particularly on this account, that if any of those islands are ascribed to Asia, it is difficult to draw a line of distinction between them and those whose inhabitants are fairly beyond the pale of Asiatic character and manners.

CLIMATE.—Nearly all the circumstances which unite in giving a mild climate to Europe, are reversed in the case of Asia. Its northern boundary extends beyond the parallel of 70°, and between the mouths of the Lenisei and the Lena, reaches even to 75°; it everywhere attains the winter limit of the polar ice, and during the short summer of these high latitudes, there is only a narrow belt of water between the ice and the land. The north winds, unobstructed by mountains, blow over a plain of ice, and their cooling influence is not counterbalanced by hot deserts of sand in the southern portion of the continent; there being no land under the equator, opposite the length of Asia, except the narrow strips of Sumatra, Borneo, Celebes, and Gilolo. Consequently, the Asiatic countries situate in the temperate zone, are not warmed by ascending currents of heated air, similar to those which rise from the deserts of Africa, and exert so beneficial an influence on the climate of Europe. The position of the great mountain chains, and the general elevation of the country, likewise contribute to diminish the temperature; the Himalayas and Kwan-lun presenting an effectual barrier to the warm winds in their progress from the equator, while the high plains and groups of mountains, which occupy the centre of the continent, retain the snow till late in the summer, and produce descending currents of air which lower the temperature of the surrounding countries. There is, moreover, no sea of any considerable extent on the western side, and consequently, the western, or predominating winds, are land winds, whose severity is increased by the great enlargement of the continent towards the north. The result of all these circumstances is, that the eastern part of Europe, and the whole of Asia to the north of the 35° N. lat. have what Humboldt calls an *excessive* climate, meaning by that term, a climate in which the temperatures of summer and winter differ greatly from the mean temperature of the year, or, in plainer language, where the winter is excessively cold, and the summer excessively hot. In Europe, on the contrary, there is less difference between the temperatures of summer and winter, and both approach nearer the mean temperature of the year.

The height of the snow-line on the mountains of Asia has hitherto been very imperfectly determined; but in a general view, it may be regarded as much greater than in Europe, or even in America, under the same parallel. It appears, from the Report of Messrs. Lenz and Kupfer to the Imperial Academy of St. Petersburg in 1829, that the limit of perpetual snow on Mount Elbûrz is 11,000 English feet, while on the Pyrenees, under the same latitude, it is, according to Ramond, at the height of only 8690 feet. The great influence of local circumstances on the position of the snow-line, is strikingly exemplified in the case of the Himalayas. On the south side of these mountains, under the parallel of 30° or 31°, the snow line is estimated at 12,400 feet; while on the north side, towards Thibet, snow disappears in summer at the enormous height of more than 20,000 feet. This remarkable difference is ascribed by Humboldt to the powerful radiation which takes place in summer from the high plains of Thibet, to the small quantity of snow which falls in winter, when the temperature sinks below 10° of Fahrenheit, and to the serenity and clearness of the atmosphere on the northern side of the mountain chain; circumstances which, at the same time, increase the radiation from the plains, and facilitate the transmission of the heat to the higher regions.

The effect of the very diversified local circumstances of the Asiatic continent, an example of which we have just now given, is such, that its *physical climates*, generally speaking, seldom correspond to the astronomical climates.

MINERALS.—There is no precious or useful mineral which is not found in this immense continent. The following table exhibits the countries which are most distinguished for their mineral wealth.

Mineralogical Table of Asia.

DIAMONDS:—*India*, kingdom of the Nizam, Baladghaut region, Bundelcund, Sumbhulpour, Gundur, Ceylon; *Asiatic Russia*, Perm and Orenburg.

OTHER PRECIOUS STONES:—*Birmah; Siam; India; Asiatic Russia*, Perm, Orenburg, Tomsk, Irkutsk, &c.; *Chinese empire*, China, &c.; *Persia*, Khorassan, &c.; *Independent Turkestan*, Badakshan.

GOLD:—*Japan*, Niphon, Sado, &c.; *Chinese empire*, Thibet, Yunnan, &c., country of the Lolos, Hainan; *Asiatic Russia*, Perm, Orenburg, Tomsk, &c.; *Birmah; Annam*, Tonkin, Cochin China, &c.; *Siam; Malaya; Assam*, &c.

SILVER:—*China; Russia*, Tomsk, Irkutsk, &c.; *Japan*, Bungo; *Ottoman empire*, Armenia, Asia Minor.

TIN:—*Birmah; Siam; Malaya*, Ligor, Queda, Selenga, &c.; *China; Annam*.

MERCURY:—*China; Thibet; Japan; India; Ceylon*.

COPPER:—*Japan*, Sourounga, Atsingo, Kuno-kuoni, &c; *Russia*, Perm, Orenburg, Tomsk, Georgia, &c.; *Ottoman empire*, Asia Minor, Armenia; *Chinese empire*, Yunnan, Kouei-cheou, Thibet; *Annam; India*; Nepaul, Agra, Ajimere, Nellore, &c.; *Persia*, Azerbijan.

IRON:—*Russia*, Perm, Orenburg, Tomsk, Irkutsk; *India*, Cashmere, Nepaul, Bengal, Bahar, Oude, Agra, Berar, Nellore; *China*, Shensi, Thibet, Bootan; *Siam; Annam*, Tonkin, &c.; *Ottoman empire*, Diyarbekr; *Affghanistan; Seik territory*, Peshawer; *Persia*, Fars; *Japan*.

LEAD:—*China; Russia*, Irkutsk, Tomsk, Georgia; *Siam; Japan*, Jeso; *Persia*, Fars; *Arabia*, Muscat; *Ottoman empire*, Asia Minor, Armenia.

COAL:—*Chinese empire*, the northern provinces of China; *Ottoman empire*, Syria, near Beyroot, &c.; *India*, Bengal, Cutch. Valley of the Nerbuddah, &c.

SALT:—*Chinese empire*, Pe-che-le, and other provinces of China proper; *India*, Gujerat, Ajimere, Bengal, Lahore, Allahabad, Agra, Orissa, Coromandel, Arracan, Ceylon, &c.; *Russia*, Steppe of Ischim, Baraba, &c., lakes of Koriakov, not far from the Irtish, lake Inder, &c., Shirwan, Armenia, &c.; *Persia; Arabia*, Yeman; *Ottoman empire*, Anatolia, Cyprus, &c.

VEGETATION.—The vegetation is extremely rich and various. All the natural families of plants appear to have representatives in Asia, for the vast extent of the continent includes climates of the most opposite character. From the lowly vegetation which composes the Arctic flora, to the gigantic trees and generally luxuriant vegetation of the Indian regions, we find in Asia every intermediate kind. Sometimes the extremes appear to exist even in the same country; for example, where the Himalayas present an Arctic vegetation in their higher regions, while, not far below, the vegetation of warm climates is found in full luxuriance. But most of the countries of Asia have a homogeneous and characteristic vegetation of their own. To attempt, however, to particularise them, would be an idle work; the bare enumeration of them might fill our volume, but would contribute little to the edification of our readers. We shall, therefore, confine our notice here to a few plants of the highest value, not only in the countries which produce them, but in the most distant regions of the earth.

Of all the productions of the vegetable kingdom, that which has been the greatest favourite with man in every age, is the *vine;* the juice of which is a beverage sought after in every country which civilization has reached. It is not, however, a very general production of the earth; the cultivation of it is confined to narrow limits, for excess of heat seems as unfavourable to its growth as too much cold. Its southern limit is where the mean temperature of the climate is between 69° 8′ and 71° 6′ Fahrenheit; and its northern limit, 47½° or 48°, where the temperature of the coldest month does not fall below 34°. It is only within the middle regions of the temperate zone that the vine comes to perfection, but within those limits it is found throughout western Asia. The finest grapes are produced in Asia Minor, Syria, and Palestine; but the vine is still found in its wild and native state in the forests of the ancient Colchis (at the eastern end of the Black Sea), climbing to the tops of the loftiest trees. Farther east the grapes and the wines of Shiraz and Mazanderan enjoy the highest repute in Persia. Vines are also found native along the upper banks of the Oxus, in Kashgar to the east of the Belur, in Kunawar, the British portion of Little Thibet, and also in Malwah or Central India. They are also cultivated in the gardens of H'lassa in Great Thibet; and, in China, on the shores of the Eastern Ocean, the vine is as plentiful, and the luxury of wine-drinking is as highly appreciated as in Europe. In France, Germany, and Hungary, the vine is the produce of art; farther south, and in the regions emphatically called *the East*, the vines are to be seen in their full native luxuriance, as delightful to the eye, as their produce is grateful to the palate. In all ages the vine has been a favourite theme with the poets of the East. The wine-bibbing Anacreon is notorious, and Hafiz, the national lyric poet of Persia, avows himself a most devoted admirer of this glorious beverage; and, indeed, the wine of Shiraz, the place of his birth and of his burial, is so highly esteemed, that the Persians say, that if Mohammed (who forbade the use of wine to his disciples) had tasted the pleasures of Shiraz, he would have prayed God to make him immortal there.

Next in repute to the vine is the olive, which is likewise confined to temperate climates, and is indigenous to *Syria*, along the eastern shores of the Black Sea, and at Tukht-i-Suleiman, near the Indus. The cultivated olive is easily reared in all parts along the shores of the Levant which are free from the visitation of frosty winds. It produces a very fine oil, which is in general use in all the countries where it is grown, and the history of the tree appears to be as old as the human race; for it was the leaf of an olive tree plucked off that Noah's dove brought to him in the ark.

Tea, which affords a wholesome and exhilarating beverage to all the nations of the eastern, central, and northern regions of Asia, and has become a necessary of life in Britain, is produced abundantly

in the southern provinces of *China;* the best is grown upon the hills of the province of *Fuki-en*. It has also been lately discovered to be indigenous in *Assam*, within the limits of the British territories, and has been found to be perfectly adapted to the soil and climate of the Nilgherries in Southern India.

Rice is a necessary, and indeed the very staff of life, to the Hindoos, Indo-Chinese, and Chinese, who value it so highly, that they pity the Europeans for having no rice at home, and wonder how they can exist without it. It is produced abundantly in the well-watered plains of those countries, and requires great heat as well as abundant moisture to bring it to perfection. The same character is enjoyed by the date-tree in Arabia, and the neighbouring hot and sandy countries of the south-west. Its fruit there forms a principal article of food; and the simple people wonder how Europeans contrive to live without it. But for more detailed accounts of these and of the other vegetable productions of Asia, we refer to our special descriptions of the countries into which the continent is divided.

ANIMALS.—The mountains of Asia divide the continent into three zones, and this geological character of the country affects the distribution of the animals. In the central zone, which is composed of high mountains, or extensive sandy plains, we find, the Bactrian, or double-humped camel, the *tarpan*, or wild horse, the *jaghatai*, another species of horse so fleet, that the Mongols designate them the coursers of the sun; several kinds of horse-tailed beeves, whose flowing tails are the ensigns of military rank throughout all the east; at least two species of antelopes, the *zeren* or yellow buck, which is as fleet as the jaghatai, and the *saiga*, which is almost blind. Panthers are found in the western regions; and also a singular species of cat, the *manul*, the original of the Angora cats. The Indian tiger has been seen in Siberia, even as far north as the head of the Obi; it is still common in Mazanderan and Azerbijan; and appears to range northward to the borders of the Keroulun and Orchon in the country of the Khalkas, and as far as the Altai. Tigers likewise abound in China, and those which appear occasionally in Siberia, are natives of Mongolia, where they are hunted every year by the Emperor of China. Troops of several species of dogs, jackals, and wolves, prey upon the antelopes, asses, and wild horses. All the mountains are inhabited by the musk animal; the Altai by the *argali* or Siberian rock sheep; the southern mountains by the *egagre* or wild goat; Caucasus by the egagre and the chamois. The western prolongation of this zone, which extends through Persia and Arabia, is overrun by antelopes and gazelles; lions, panthers, caracals, and other sorts of cats, jackals, and monkeys. The mountains and table-lands produce also the *onager*, or wild ass, the original of those beautiful and fleet asses so much esteemed in the east. The single-humped or proper camel, is the aboriginal native of Arabia only, but is found also wherever the Arabs have settled.

In the northern zone, the river-banks, and the vast forests of Siberia harbour innumerable troops of rein-deer, elks, brown, blue, and black foxes, bears, gluttons, and several species of martins and squirrels. Along the shores of the Arctic Ocean the great polar bear preys on every living creature. In the waters of the ocean are found seals and various kinds of cetacea. The lake Baikal, in spite of its fresh water, and its great distance from the sea, has also, like the Caspian, its particular species of seals.

In the southern zone every region teems with life. In India are several species of antelopes and deer, which were till within these few years unknown in Europe. In Thibet are swarms of blue antelopes whose horns, which fall annually, have more than once reminded English authors of the fabulous unicorn. There is also found the *Chitkara*, with four horns. In Bengal are the charming white spotted *axis;* in the forests of Orissa is found the *jungle-cow*, the wild original of the domestic beeves of India. In India there are few lions; but numerous fierce tigers ravage this, and the warm countries further east and south. Over the same regions is spread the black-skinned, half naked buffalo, with horns turned back, both wild and tame, delighting in the muddy banks of the seas, lakes, and rivers. Between the Ganges and the Indus the forests abound with squirrels, peacocks, pheasants, and jungle-cocks. Several species of bears, one of which was for a long time considered to be a sloth, inhabit the forests among the Ghauts. The *elephant* and the *one-horned rhinoceros* live in the forests, but it is in the countries S.E. of India that these animals attain their largest size. There also are found the two-coloured *tapir*, which ranges from Malacca to the southern provinces of China; *ourangs, gibbons*, and various other kinds of monkeys. In the Ganges alone 250 kinds of fish have been described by Buchanan, which furnish abundant food for the alligators with which its waters abound.

The birds are various in every zone, and adorned with rich plumage. Gigantic vultures tyrannize over the banks of the Indus, where are likewise found great numbers of eagles, falcons, buzzards, and screech-owls. Swarms of parroquets, of every variety of colour, inhabit the continent and the neighbouring islands.

Of domestic animals the elephant claims the pre-eminence, and is confined chiefly to the lowlands of India, Birmah, and Siam, being seldom seen in the mountainous region to the north. The camel is found over a far wider extent of country; it consists of two species, the one with two humps, the other with only one. The former, usually called the Bactrian camel, is comparatively rare, and seems to be indigenous to the great deserts of north-eastern Asia, and the table-land of Pamer, being only to be found in the south-west when taken thither by travellers. The one-humped species, usually misnamed the dromedary, is, on the contrary, the real camel, and is spread over Arabia, Persia, western India, and northern Africa, where it is the common beast of burden. The dromedary, properly so called, or racing camel, is only a variety of this latter species, is generally of a lighter form, and better adapted for rapid travelling or flight. The other domestic animals of southern and western Asia, are horses, mules, asses, buffaloes, beeves, sheep, and goats; of the central and eastern regions, chiefly horses, cattle, and sheep; the yak of Thibet and Pamer, and the bushy-tailed bull of Thibet seem to supply the place of the camel among the mountains, where they are used as beasts of burden. In the rigorous climates farther north, where the cattle become stunted in size, and can scarcely subsist, their place is supplied by the rein-deer, which furnishes the people both with food, and with the means of transport. During part of the year they subsist upon its flesh and milk; its skin furnishes them with the principal part of their dress, and its horns with various utensils. In Kamtschatka, and the other north-eastern regions, dogs are trained to draw sledges in winter over the frozen snow.

The southern countries of Asia produce reptiles, many of which are armed with the most fatal poisons; they are all hideous to the sight, and some of them are of prodigious size and muscular strength; but they are scarcely found beyond the Altai. All sorts of insects, as musquitoes, gnats, ants, flies, most of them noxious and destructive, swarm in the southern regions; even during the short summer so: the north the mosquito and other troublesome insects abound in the woody regions of Siberia. But the most mischievous of all these winged creatures is the locust, which appears occasionally in the sandy regions north-west of India; and is found in countless swarms in Arabia and Syria. It is also frequently found to the north of the Altai, at the sources of the Irtish, whence it extends its destructive flight as far as the Crimea and the southern provinces of Russia in Europe.

PEOPLE.—Asia contains a great variety of tribes and nations, most of which will be enumerated in the subsequent table. Of these the five principal races, the Hindoos, the Chinese, the Tatars or Tartars, the Arabs, and the Persians, seem to have divided among them as a kind of inheritance, the continent and the adjoining islands, and still occupy the greater part of them. The origin of these races

is buried in the most remote antiquity, and has formed a very fertile subject of discussion among antiquarian philologists and physiologists. The Hindoos and the Arabs are generally considered as belonging to the Caucasian or white race of mankind, though, in respect of language, they are entirely different; the former appearing to be allied to that family whose various dialects have been classed together as the Indo-Germanic, and who seem to have spread from a common centre, somewhere in south-western Asia, into Europe on the one side, and Persia and India on the other; while the Arabs, on the contrary, belong to the Semitic family, who seem to have been always confined to the great peninsular region, which extends from the mountain ranges of Taurus and Zagrus to the Mediterranean and Red Seas, the Persian Gulf, and the Indian Ocean. The ancient Medes and Persians seem to have belonged to the Indo-Germanic family and to the Caucasian variety; but the modern Persians are a very mixed race, formed by the commingling of Persians, Arabs, Turks, Tartars, Mongols, and natives of the Caucasian Isthmus. The Tatars or Tartars differ entirely from the Hindoos and the Arabs in features, complexion, and form, as well as in manners and language. They all speak the Turkee or Turkish language, and form the majority of the population of Turkestan, the western part of Chinese Tartary, and the southern provinces of Russia; are spread in various tribes throughout Persia; and constitute the original stock of the Osmanlee or Ottoman Turks, who have long been the dominant people of south-western Asia. It has been doubted whether the Osmanlee are of the Caucasian or of the Mongolian variety; but some of the other branches of the family, who speak the purest Turkish dialects, are unquestionably Mongolian; though they must be distinguished from the Eastern Mongols, who speak languages apparently of different origin. The Chinese, according to the institutes of Menu, were originally a military tribe of Hindoos, who, abandoning the ordinances of Brahma, migrated eastward, and laid the foundation of the Chinese empire; but this theory seems to be extremely improbable. The Chinese are unquestionably of the Mongolian variety; and their monosyllabic language and figurative alphabets seem to have no analogy with any of the languages or alphabets of India. According to M. Balbi, all the nations and tribes of Asia may be classified according to their languages, as in the following

TABLE.

The SEMITIC FAMILY.—The *Jews*, who are scattered over a great part of Asia, but are found in the greatest numbers in Ottoman Asia and Arabia. Many are also met with in India, Persia, Turkestan, and China. The *Arabs*, who are the most numerous and powerful branch of this family, occupy nearly the whole of Arabia, the greater part of Syria and Mesopotamia, with parts of Khuzistan and Fars in Persia; they have likewise several settlements on the coasts of Malabar and Coromandel, in Turkestan, and in the regions of the Caucasus.

GEORGIAN FAMILY.—The *Georgians*, in Georgia and Imeritia; the *Mingrelians*, the *Sevanes*, and the *Lazes*, at the eastern extremity of the Black Sea.

ARMENIAN FAMILY.—The *Haikans*, commonly called Armenians, form the great mass of the population of Armenia; they are also numerous in Georgia, Shirwan, and Azerbijan; and are scattered, besides, through all the commercial cities of Turkey, Persia, India, Turkestan, and even in some parts of China. The *Abasses* or *Abme*, who inhabit Abakhasethi, or the Great Abassie; several tribes of whom are vassals of Russia. The *Natoukhashi*, one tribe of whom are notorious for their predatory habits.

PERSIAN FAMILY.—The *Pernans*, *Parsees* or *Guebers*, of whom the greater number are settled in Gujerat and Konkan in India, and in Yezd in Iran. They are found also in smaller numbers in Kerman, Moultan, and at Baku in Shirwan. The *Tavjiks*, better known under the name of *Iranes* (pronounced *Eerawnee*) or *Persians*, who are believed to be the descendants of the original Arab conquerors who overspread Persia during the most brilliant period of Islam prosperity, form the principal mass of the population of Iran, and are likewise the most numerous and polished nation of this family. The *Bukharians*, who are the indigenous people of Great Bukharia, and of the principal towns of Chinese Turkestan. They are also found dispersed as merchants in the large town of Siberia, Central Asia, and China. The *Kurds*, and the *Lourees*, in Kurdistan and Louristan. The *Affghans* or *Poushtaneh*, in Affghanistan and the north-western parts of India, and in Rohilcund, in the north-east of India. The *Belootshees*, who possess the south-eastern parts of old Persia and the country of Sinde, on the lower part of the Indus.

HINDOO FAMILY.—This is one of the most numerous families on the globe. Their habitat extends over the whole of India, to the north of the Tuptee and Godavery. The principal branches of this family are: The *Moguls*, originally composed of Turks, Bukharians, and Persians, who speak the Hindoostanee language, and originally formed the ruling class in the Mogul empire; they are found principally in Hindoostan or Northern India. The *Seikhs*, the ruling people of north-western India; the *Bengalees*, who form the mass of the people of Bengal, and some parts of the bordering provinces; the *Mahrattas* who occupy the western part of the Deccan, and parts of Mahra, Khandeish, and Gujerat; the *Singalese*, in Ceylon; the people of the *Maldives*; the *Zinganees* or *Gipseys*, a numerous tribe scattered over Europe and Western Asia, and found also in some parts of Northern India.

MALABAR FAMILY.—This family comprehends the people who inhabit that part of India which lies between Cape Comorin and the Tuptee and Godavery. The principal branches are: the *Malabars*; the *Tamul*, who inhabit the Carnatic; the *Telinga* or *Teloogoo*, who extend from Pulicat to Orissa.

The *Garrows*, the *Kathes*, the *Gonds*, the *Bheels*, and other tribes, who have dwelt from time immemorial in India, do not belong to the families which form the great mass of the people of that country. They are more or less distinguished by their savage and barbarous customs.

THE CHINESE FAMILY are the most numerous on the globe. The *Chinese* form nearly the entire population of China; they are also settled along the coasts of Hainan and the west coast of Formosa, in Siam, Malacca, Singapore, Penang, Ceylon, Calcutta, Mauritius, and have even found their way to Brazil. The *Mianmai*, or *Miajamma*, or *Birmans*, are the principal occupants of the basin of the Irrawady. The *Moans* or *Peguans* inhabit Pegu. The *Tai* or *Tai-nai* (pronounced *Tie*), called also *Laos*, *Shyans*, *Shans*, and *Siamese*, are the ruling people of Siam, and occupy the whole of Laos. The *Annamites*, subdivided into *Tongkinese*, who are the most numerous, and *Cochin-Chinese*, who have become the ruling people of the empire of Annam. The *Sian-pi* or *Coreans*.

THE JAPANESE FAMILY, spread over all the empire of Japan, where they form nearly the entire population. In respect of power and civilization, they occupy the first rank among the Asiatics. The *Loochooans* are a branch of the same stock.

The *Miaotees*, the *Lolos*, the *Mientings*, are numerous tribes who are found in China, but do not belong to the Chinese stock. The inland savages of Hainan, the *Kemoys* in the mountains which separate Laos from Cochin-China; the *Play* or *Karens* in Birmah, are other savage tribes unconnected with the more civilised nations among whom they live.

The TUNGOUSE FAMILY.—The *Tungouses*, subdivided into *Mandchews*, and the proper *Tungouses*. The former have been, since 1664, the ruling class in China, and are very advanced in civilization. They form one half of the inhabitants of Liaotung, and the entire population of Mandchusia, as far as the confluence of the Oussuri and the Amour. The proper Tungouses, who are inferior to the others in civilization, are confined to the Russian empire, where they are spread over the third part of Siberia, from the Lenisei to the sea of Okhotsk. The Mandchews present a remarkable phenomenon in

the history of civilization. It is scarcely 250 years since they were nomades, ignorant of the elementary arts of reading and writing, whereas they now possess a rich literature, particularly valuable for the knowledge of the literature of China, which they have communicated through the medium of translations from the original works. It is the Mandchew, and not the Chinese, which forms the language of the Court of Pekin.

The MONGOLIAN FAMILY.—*Mongols, Kalmucks,* and *Burates.* The Mongols, subdivided into *Mongols* properly so called, *Khalkas,* and *Sharaigol,* or *Mongols* of Thibet, occupy Mongolia and a part of Thibet, along with Hoh-nor, in the Chinese empire. Some of them are also found in Asiatic Russia. The *Kalmucks* or *Olet* inhabit a great part of Soongaria. The *Burates* are found in the government of Irkutsk.

The TURKEE FAMILY.—The *Osmanlee,* or *Othmanlee,* or *Othman* or *Ottoman Turks,* are the dominant people in the Ottoman empire, and the principal and most civilized branch of this family. They are most numerous in Asia Minor. The *Usbecks,* or *Uzbecks* or *Uzbegs,* are the dominant race in Independent Turkestan. The *Turks* of Siberia, or *Touralians,* who are the pretended *Tartars* of Siberia, or *Touranian Tartars* of geographers, are spread over the governments of Tobolsk, Tomsk, and Irkutsk. The *Turcomans,* subdivided into a large number of stocks and branches, are spread over Affghanistan, Turkestan, Ottoman and Russian Asia. In Persia they have for more than a century been the dominant race. The *Kirghiz,* subdivided into *Bourouts* or Eastern, and *Kazak* or Western. A part of the Bourouts are tributaries of China; the greater part of the Kazaks are vassals of Russia; the remainder are independent. The numerous tribes which have been named appear to speak dialects of the Turkee language. The following tribes speak kindred languages: the *Sakha* or *Yakoutes,* in Ienisseisk and Yakoutsk, the most eastern and northern of all the people of this family, and also the least civilized; the *Tshouwashes,* named improperly *Mountain Tartars* by the Russians, wander over a part of Orenburg.

The SAMOIED FAMILY.—The *Tawghi,* extending from the Ienissei to the Lena, are the most northern people of the old world. The *Ouriangkhai* are the most southern tribe of this family. The most of them are found within the Chinese empire, between the Syanian mountains and those of Altai and Khangai; the rest are found in Russia.

The IENISSEIAN FAMILY.—The different tribes of this family are usually confounded by geographers with the Ostiaks, who belong to the Finnish stock. They are chiefly confined to the government of Ienisseisk; the *Denka,* the *Imbask,* the *Toumpokolsk,* the *Kottes,* and the *Assanes,* are the principal tribes.

The KORIAK FAMILY comprises only the small and savage tribe of this name, which is found at the north-east of Asia, in the districts of Okhotsk, Kamtschatka, and the country of the *Tshouktsi.* (Chuckchee.)

The ANDON-DOMSI or YOUKAGHIRES, are a scanty race, whose tribes inhabit the country between the Yakoutes and the Koriaks, along the Icy Ocean, from the Iana to the Kolyma.

The KAMTSCHATDALE FAMILY, very few in number, and chiefly fish-eaters, occupy the peninsula of Kamtschatka.

The KURILIAN FAMILY.—The *Kurilians* or *Kuriles* inhabit the Kurile islands and the southern point of Kamtschatka. The *Ainos* or *Iesos* occupy the island of Iesso. The *Tarakai* or *Ainos* of Tarakai or Soghalien; the *Giliaki* occupy that part of Mandchuria to the east of the Oussouri, and are named *Fuka,* or *Kedjen,* by the Mandchews.

The URALIAN or TSCHUDE FAMILY.—The *Vaugules* or *Mansi,* who are found between Kourgan and Beresov, in the government of Tobolsk; the *Ostiaks,* distinguished as the *As-Iakh* or *Ostiaks of the Obi, the Ostiaks of Kirsnor, of Iougan, of Narym,* &c.

THE MALAISIAN FAMILY; the aboriginal natives of Formosa: the *Malays,* who form the principal part of the population of the peninsula of Malacca, and the neighbouring islands. We must, however, except the mountains in the interior of the peninsula, which are inhabited by a negro race of an entirely different origin.

Besides these native Asiatic families there are numerous colonies of Europeans in most parts of Asia; *Greeks* in the Ottoman empire; *Russians* in Siberia; *English, Scotch, Irish, Portuguese,* and a few *French,* and *Danes,* in India; *Dutch* in Ceylon, Java, and the Moluccas; *Spaniards* in the Philippines.

GOVERNMENT.—If we understand by a *despot* an absolute monarch, who disposes of the property, the honour, and the lives of his subjects, employing them with indefinite and uncontrouled authority, we nowhere in the civilized states of Eastern Asia find sovereigns of this kind, notwithstanding all the declamations to which the governments of those countries have been subjected. Everywhere manners, ancient customs, received opinions, and even errors, form more embarrassing restraints upon power than written stipulations, which tyrants can so easily get rid of by force or fraud. It is only in some Moslem states, and particularly in Persia, that we meet with the most hateful despotism, and that degrading servility which has been usually attributed to all the nations of Asia. The kings of Asia have been taken for despots because they are approached on the bended knee. They have, indeed, assumed to themselves the titles of gods upon earth, vicegerents of Allah, brothers of the Sun and Moon, asylums of the universe, and similar designations, and they have been considered as such, without obstacles opposed to their *will* by religion, customs, manners, and prejudices being taken into account. The governments of Ottoman Asia, Persia, Russia, Bukharia, and others in Turkestan, India, Chin-India, China, Japan, and some of the islands are despotisms, differing in degree.

Besides the ancient republics, established in the Greek cities of Asia, and in Syria and Palestine, we find in the centre of the continent, tribes whose political institutions are pre-eminently republican. The principal of these are the Affghans between India and Persia.

Asia likewise contains many nations whose governments may be compared to those of the European kingdoms of the middle ages; such were the Mahrattas before the downfall of the Peishwa, and the Affghans before the late subversion of the kingdom of Kabul; and such are still the Beloutshees, the Mongols, the Kalmucks, the Mandchews, several Turkee tribes, and some nations of Caucasus, particularly the Circassians and Abassians. Even the empire of Japan is, properly speaking, nothing else than a feudal monarchy, ruled by a prince, who may be compared to the French mayors of the palace. Some nations are entirely free, as the Bedwin Arabs, the Kurds, and several tribes of Caucasus and Syria. The small nomadic nations of Asia, and many of the Arab tribes have a pastoral or patriarchal government, which is generally hereditary in certain families; others are governed by the elders, and form republics. Thibet, Boutan, and parts of Arabia, have a sort of theocratic government. The imams of Sanaa and Muskat are a sort of political high priests invested with temporal power, while the rulers of Thibet and Boutan are absolute pontiffs, bearing the titles of Dalai-lama, Bogdo-lama, and Dharma-lama, and are considered as emanations of the Deity himself. In general we may say that Asia affords examples of every possible kind of government, from the most licentious republicanism to the most atrocious despotism.

DIVISIONS. In the following description of the different countries of Asia, we shall consider them under the following heads:—*Ottoman Asia* or *Turkey; Arabia; Persia; Affghanistan; Beloochistan; India; South-eastern Peninsula; Chinese empire; Turkestan; Russian Asia; Japan.*

TURKEY, OR OTTOMAN ASIA.

ASTRONOMICAL POSITION.—Between 30° and 42° N. latitude, and 26° and 49° E. longitude.

DIMENSIONS. — The greatest extent of Turkey in the direction of the meridian, from north to south, is about 850 miles, and from east to west, about 1200; but, measured diagonally, from Constantinople to the mouth of the Euphrates, the extent is 1400 miles, and from the southern border of Palestine to the north-eastern extremity of Turkish Armenia, about 1100. The area, however, by no means corresponds with a square of these dimensions; for the outline is so much indented by seas on the one side, and by the sandy deserts of Arabia on the other, that the superficial extent hardly exceeds one-half of that square, or about 500,000 square English miles.

BOUNDARIES.—*Northern*:—The Black Sea and the Russian province of Imeritia. *Southern and South-western*:—Arabia and the Mediterranean Sea. *Eastern*:—Persia and Russian Armenia. *Western*:—The Archipaligo, Dardanelles, Sea of Marmora, and Channel of Constantinople.

GENERAL ASPECT AND CLIMATE.—This extensive region consists of at least three portions, which are geographically distinct, namely, *Asia Minor* and *Armenia; Mesopotamia, Assyria* and *the low countries watered by the Euphrates and Tigris;* and *Syria*, including *Palestine* or *the Holy Land.*

Armenia and the northern part of Kurdistan, form an elevated table-land, or series of plains and valleys, some of which are 5500 feet above the level of the sea, intersected and overtopped by ranges of mountains several thousand feet higher. This table-land is, however, a fertile corn country, and abounds also in pastures, though the climate is cold, and in winter the country is covered with deep snow. It is separated from the low country on the Black Sea, in the eyalet of Trebisond, by a triple range of mountains, which attain their extreme elevation of 6000 or 7000 feet, at the distance of twenty-four miles from the sea, and are covered with forests to the height of about 4500 feet; but, farther up, the country in general is bare of trees, except in some recesses of the mountains, where forests exist, even in the more elevated central parts. The passes from the coast are numerous; but, with the exception of those which follow the courses of the larger rivers, they are difficult, and many of them are open only in summer. The soil is for the most part fertile, and the country well watered. From Armenia two ranges of mountains proceed westward into the peninsula of Asia Minor; the one the ancient *Taurus*, which stretches parallel to the shore of the Mediterranean Sea, and then dividing into a number of branches, which intersect the western part of the peninsula, and form as many fertile valleys, watered by fine rivers, terminates on the shore, or in the islands, of the Archipelago. The other chain, *Anti-Taurus*, extends into the interior of the peninsula in a south-westerly direction, and is probably connected with Taurus in the neighbourhood of Kaisariyah, and also with the lofty mountains which, under various names, occupy the country between the Kizil-Irmak and the Sea of Marmora. The central part of the peninsula, supported on all sides by these mountains, forms a series of elevated table-lands, nearly destitute of trees, but abounding with pasturage, which affords a plentiful subsistence to the flocks of the wandering Turcomans. The plain of Kutahya is 6000 feet above the level of the sea; and that of Sivas, 350 miles farther east, about 3900. Some of the valleys are so completely surrounded by mountains as to have no outlet for their waters, which, in consequence, not only overflow large tracts of country in the rainy season, but also form a number of permanent lakes. The south coast presents an irregular outline, with a very bold front to the sea; an almost continuous mass of lofty mountains presses close upon the shore, and at some points forms the coast, terminating in bold promontories. Near the eastern end, however, the mountains are distant from the sea, and leave room for the wide plains of the ancient Cilicia. The west coast presents a very irregular outline, consisting of deep bays, with long peninsulas, promontories, and islands. The northern coast, along the Black Sea, is also lofty and rocky, with deep water close to the shore, and is lined with ranges of mountains at no great distance inland, covered with trees; the forests of which are so extensive, that, in one place, the Turks have given them the expressive designation of *Agatch-denyis*, sea of trees. The nucleus of some of these mountain chains seems to consist of granite and other primary rocks; but in various places these are associated with beds of marble and quartz rock, hippurite limestone, and schists; tertiary and lacustrine marine deposits, ancient and modern igneous rocks, and recent aqueous accumulations. The micaceous schist and associated rocks occupy, however, a very important place in the geology of Asia Minor, and form nearly all the mountain chains which intersect the western portion of the peninsula. The hippurite limestone, the only representative of that vast system of rocks which occupies a large portion of Europe, and is usually termed secondary, is even sparingly displayed in the north-western part of Asia Minor. Tertiary lacustrine formations occur in almost every valley, and marine deposits are found in several places. Volcanic rocks are of frequent occurrence; trachyte is abundantly scattered over the western part of Asia Minor; the whole country between Is nik and Kutahya appears to consist of agate or chalcedony, the strata being beautifully varied; and, in the centre of the peninsula, the lofty peak of *Arjish-dagh* (anc. *Argæus*) which rises to the great elevation of 13,000 feet, consists entirely of volcanic rocks and scoriaceous cinders, having its sloping sides studded all round with numerous cones and craters. *Hasan-dagh*, to the south-west of Arjish, is also volcanic, and rises to the height of 8000 feet; and 90 miles east of Smyrna, *Kulah*, a volcanic peak, rises to 2780. But the most singular portion of Asia Minor is the volcanic district of *Katakecaumené*, or the burned-up region, about 90 miles eastward of Smyrna, which bears a striking resemblance to the volcanic region of Auvergne. It extends about 19 miles east and west, and about 8 from north to south, and consists of volcanic mounds, which rise partly amidst the lacustrine limestone of the valley of the Hermus, and partly on the slope of the schistose hills which bound it on the south. The mounds consist of

scorise and lava, and are referable to two epochs, indicated by the difference in their state of preservation, and the appearance of the lava streams. The older cones are low and flat; their craters have disappeared, or are marked by a slight depression, and all their prominences seem to have been smoothed by time. They are also covered with vineyards, which produce the Katakecaumene wine, celebrated from the time of Strabo to the present day; and the streams of basalt or lava which have flowed from them are level on the surface, and covered with turf. The newer volcanoes, only three in number, though they have been extinct for more than 3000 years, preserve all their characters unaltered; the craters are perfectly defined, and their lava streams are black, rugged, and barren.—(*Hamilton, Trans. Royal Geological Society, Lond.*)

It, says Mr. Fellows, a line b drawn upon the map to include the elevated table-land of the interior, and the field of burnt or volcanic matter, it will precisely trace the boundaries of the ancient Phrygia on the north, west, and south; following even the singular forms which it projects into Caria, Lycia, and Pamphylia. The cold, from the great elevation of the country, is so severe that no plants are to be seen, but such as are found in the Highlands of Scotland, where they suffer less from severity of climate than here. The summer is of very short duration. On descending from this elevated country, every diversity of climate is met with, till the traveller reaches the productive valleys of the rivers, and the warmer lands on the coast. During summer the heat becomes intense as the morning advances, but before noon a cold breeze descends from the mountainous country, which brings with it a refreshing coolness, accompanied by a shade of clouds, and not unfrequently by flying showers. In the early part of the evening the heat again becomes oppressive, and the dews are very heavy. To the intense cold of the winter it must be attributed, that neither the aloe nor the cactus, nor any succulent plant is to be seen in the country; the frosts of winter being too severe for them. Orange and lemon trees are with difficulty preserved in the sheltered valleys; the olive seldom flourishes, even in a similar situation; and they are all inferior in growth to those of Sicily, Calabria, and Greece. The extremes of the seasons are farther shown by the migration of the animal kingdom, which takes place to a great extent. The scenery of Lydia and Mysia is varied and beautiful, the hills being well wooded with splendid forest trees. In the forms of the mountains there is more of beauty than of grandeur; the peculiar feature is the great contrast between the hills and the valleys, the latter being so level as to appear to have been formed by lakes. In Bithynia the scenery is of a bolder character, its fine mountain range of Olympus, giving it a resemblance to Switzerland; its valleys are also richly covered with luxuriant woods. The flat-topped hills and immense table-lands of Phrygia, which are often swampy, and seldom produce a tree, present more of the wild and the dreary, than of the picturesque. Pisidia, including the Taurus, again, partakes of the Alpine character; but the woods are not so finely grown as in Bithynia. The extreme beauty of Pamphylia is derived more from distant effects than from near views. The marble mountains, which form the distant horizon, shoot their jagged peaks of silvery rock, sometimes capped with snow, against the clear sky, while their bases are washed by the blue sea, which they enclose in their wide-stretched arms. Lydia is more mountainous, and resembles, while it far exceeds, in the boldness of its cliffs, and the richness of its vegetation, the scenery of Parnassus. Its valleys, and particularly that of the Xanthus, are of peculiar beauty. Caria abounds in scenery of the most picturesque kind, its coasts being broken into bold headlands, whose ranges, continued into the sea, rise into rocky islands. The south-east of Lydia is less beautiful, and much resembles Sicily or Calabria; but, on approaching Smyrna, this district contains valleys equal to those near Salerno or Naples.—(*Journal written during an Excursion in Asia Minor, by Charles Fellows.* London, 1838. Pp. 300-303.)

The country watered by the Euphrates and the Tigris, forming the south-eastern region of the empire, is bounded on the north by the table-land of Armenia, and the lofty ridges of Taurus; on the east by the long line of mountains (anc. *Zagrus*) which, under the names of the mountains of Kurdistan, Louristan, Bukhtiari, &c., divide it from the table-land of Iran; on the west and south-west, by Syria, and the deserts of Arabia; and on the south-east it barely touches the Persian gulf. Assyria, including Taurus, is distinguished by its structure, its configuration, and its natural productions, into three zones or districts; by structure into a district of metamorphic and plutonic rocks; a district of sedimentary formations; and a district of alluvial deposits: by configuration into a district of mountains; of stony or sandy plains, and of low watery plains: by natural productions into a country of forests and fruit-trees, of olives, wine, corn, and pasturage, or of barren rocks; a country of mulberry-trees, cotton, maize, sesame, tobacco, or of hardy labiate and composite plants, or barren clay, sand, pebbly or rocky plains; and a country of date trees, rice, and pasturage, or a land of saline plants, liquorice, reeds, sedges, and rushes. The first of these districts comprises the hilly and mountainous country commonly called Taurus, which is composed of many different chains. Taurus consists of a central nucleus of granite, gneiss, and mica schist, associated with limestones, diorites, and diallage rocks; of lateral formations of diallage rocks, serpentines, actynolite rocks, steaschists, slate-clays, and outlying sandstones and limestones. The mean elevation of the crest of the Taurus varies in different places from about 2900 feet to 5650. To the south of the main chain lies the plain of Diyarbekr, 2500 feet above the level of the sea, and separated from the mountainous district of Arghana by ranges of indurated chalk. The climate of Taurus presents cold winters with much snow, and hot summers. In some of the valleys the natives themselves complain of the excessive summer heats. The influence of warm days and cold frosty nights in spring, is to forward vegetation and yet preserve the snow. In March, the almond tree, pear, medlar, and laburnum are in blossom in the valleys. The most remarkable feature, however, is the abundance of trees, shrubs, and plants, in the northern, and their comparative scantiness in the southern districts. Among the useful and cultivated plants may be mentioned the vine, fig-tree, almond, olive, wheat, triticum spelta, hordeum hexastichon, and h. distichon. Gall nuts, pears, apples, and apricots, are abundant. The roots of astragalus christianus are eaten; the rhus coturnus is used for dying skins red; and the rhamnus catharticus and valantia articulata for dying yellow. The second district, comprising the plains of *Syria, Mesopotamia*, and *the Country to the east of the Tigris*, to the mountains of Kurdistan, consists of cretaceous and supracretaceous deposits, here and there interrupted by plutonic rocks, of the feldspatho-pyroxenic family. The character of the plains varies with the elevation and latitude, as well as with the quality of the soil, and from the presence or absence of moisture. The upland of feldspatho-pyroxenic rocks, which extends from Jezirah to Tel Sakhan near Nisibin, and which has a mean elevation of 1550 feet, is a stony wilderness, amidst which there is little or no cultivation, and where, nevertheless, numerous flocks of sheep and herds of cattle obtain a scanty subsistence during a great part of the year. The great plains of northern Syria, with a mean elevation of 1300 feet, of Northern Mesopotamia, from Urfa to Rakkah, and from Nisibin to El Hathar, and the Chaldæan plain, east of Nineveh, that of Arbil and of Altun-Kupri, present characters pretty nearly similar, an almost uniform level, with a soil possessing good agricultural qualities, but barren from want of irrigation. The exceptions to this are where the plains are intersected by hills, or in spots at the heads or on the banks of rivers or rivulets, where they can be irrigated, and which, in consequence, become the permanent residence of agricultural tribes, the seat of cultivation and prosperity, or the temporary resort of nomadic Arabs and Turcomans. Fertile districts of this kind are abundant; the plains of Urfah and Harran are watered by numerous streams. The climate is characterized by great dryness, combined with very great variations of temperature; Fahrenheit's thermometer has been observed at 115° in the shade, in the month of August, while, in winter, it has fallen as low as

12°. From the Mediterranean Sea to the Tigris, there is an increase of cold in the same parallels from west to east; which is not the case, however, in the plains east of the Tigris, which, being sheltered by the mountains of Kurdistan, have a more temperate winter. The influence of Taurus, which is clad for so many months with snow, is considerable in reducing the winter temperature; and on the plains of northern Syria and Mesopotamia, from the want of sheltering hills, causes the vegetation to be really less southern than that of Sicily and Andalusia. At the same time, the long extent of littoral mountains, Amanus, Cassius, and Lebanon, adds to these unfavourable circumstances, by impeding the passage of mild breezes from the Mediterranean Sea. Notwithstanding these circumstances, the direct heat of the sun, increased by radiation and the equality of level, is almost without a moderating influence; for evaporation is nearly null, and hence, where the winter temperature is so low, the summer heats are intense. It is on this account that there are few annual and tender plants, while the woody and tough stems of vivacious species, resist better such opposite influences. For two months in the year, October and November, vegetation is dormant, everything is burnt up, and no new forms appear; but, after this period, clouds from Lebanon, and changes of temperature on the mountains to the north and the east bring down, over Mesopotamia and Adiabene, moderate but refreshing rain. The brown and fallow colour of the ground changes, grasses begin to increase and spread, and notwithstanding the subsequent frosts and storms, some compositæ bud, without flowering; but the succession of vegetation is kept up by those families which have succulent roots, nodes, or bulbs, which preserve moisture, so as to maintain life even in the dryest soil. Sleeping during the summer heats, they awake to activity with the first rains, and some send forth prematurely their leaves and even buds in October. They are soon, however covered with snow, and blasted by the wintry winds; till early in spring, when the same precocious plants make their appearance with all that vivid beauty of colour and variety of form, which have lent to the poet and the painter their not always fabulous pictures of the East. The absence of trees on these great plains is a phenomenon difficult to account for. The vegetation is ephemeral, or consists of succulent and herbaceous biennials. Willows, however, grow on the banks of the Euphrates; and the oriental plane, near springs and tombs, rises to an enormous size. The desert described by Xenophon, extending from the Khabour to Rehoboth, still preserves the features of his day, "full of wormwood; and if any other kinds of plants grow there, they have for the most part an aromatic smell." Wild asses or horses are still met with; but ostriches are rare.

The alluvial plains of Babylonia, Chaldæa, and Susiana, which form the third district, have their northern limit a few miles above Felujah; on the west they are bounded by a line of rock and sand not far from the Euphrates; and on the east, by the Hamrun hills, a long range composed of tertiary sandstones, with salt, gypsum, and limestones, which crosses the Tigris above the 35° N. lat. The plain, in the north-western or upper portion, has a slight but well-defined southerly inclination, with local sinkings above Felujah, undulates in the central districts, and then subsides into mere marshes and lakes. The soil of the northern part is pebbly, and this is succeeded lower down by a continuous formation of clayey soil covered with mould, dust, or sand, or the more tenacious clay of frequent inundations. The modern accumulations are still very great. Numerous canals, extending from the one river to the other, at certain seasons inundate the whole country, and leave permanent marshes in some places. But the natural level is everywhere altered by artificial works, as mounds, walls, mud-ramparts, and dykes; elevated masses of friable pottery are succeeded by low plains inundated during a great part of the year, and the old beds of canals are visible in every direction. There is still some cultivation and some irrigation; flocks pasture in meadows of coarse grass; and the dusky encampments of the Arabs are occasionally met with; but, except on the banks of the Euphrates, there are few remains of the date-groves, vineyards, and gardens, which adorned the country in the days of Xenophon; and still less of the labour and population which must have made a garden of such a soil in ancient times. Babylonia, strictly so called, extends only to the marshes of Lemlun, (32° N. lat.), the soil of which consists for the most part of a soft alluvial clay and mud, containing only river and lacustrine shells. The greater part of the basin, which stretches forty miles along the Euphrates, and extends many miles on each side, is occupied by water or vegetation, where large herds of buffaloes feed; and in some places, during summer, the mud is covered with luxuriant crops of rice. Below Lemlun, there is little indication of change; a gradual elevation of soil, so gentle as to be scarcely perceptible, but affording ground fit for cultivation in the dry months, leads to plains of wide extent, only a few feet higher than the marshes, which form the ancient territory of Chaldæa. The vegetation is characterized by saline plants, the river banks are fringed with shrubberies of tamarisk and acacia, and occasionally with groves of poplar. Below Suk-el-Sheikh the country is occupied by an almost perpetual inundation, and at Omu-el-bak (mother of musquitoes), the waters spread out like a great lake, extending to the verge of the horizon, and are only here and there interrupted with groves of date trees and huts. To the south of these great inundations, as far as the confluence of the Euphrates and Tigris, the land is covered by an aquatic vegetation, chiefly by a kind of agrostis, which, like the cane-brake of North America, has the appearance of the true reed of northern Europe. These tracts present every where great uniformity of feature, a boundless growth of plants of the same kind, interrupted by lakes and ponds, or intersected by artificial canals. The character of the country below Kornah is very similar, being fringed with date-trees along the river sides, and beyond these it is inundated at one season, and forms a naked plain at the other, without a moss or a lichen to feed the piping sand-grouse; a barren and desert waste of mud and sand, covered with water for nine months in the year. The banks, however, are lined with groves of date trees, and at times afford a rich pasturage for buffaloes. Villages are numerous, but the population is scanty. (*Ainsworth's Researches in Assyria, Babylonia, Chaldæa, &c.* London, 1839.)

Kurdistan, which forms the north-eastern portion of ancient Assyria, and extends also into Persia, presents an immense succession of hill and valley, with delis and plains of exhaustless fertility, and towering mountains. The summits of the great range of Zagrus rise to upwards of 14,000 feet; their ridges are clothed with forests as far up as 6000 feet; above that height the country is less covered, though in some of the recesses there are forests even in the more elevated spots. The trees are walnut, beech, pine, oak, cedar, white and red mulberry, cherry, apple, pear, medlar, and apricot, juniper, wild plum, wild rose, wild madder, and vine. The climate is excessively cold during the greater part of the year; and the hills are covered with snow for eight months.

Taurus, in its progress westward from the Euphrates, sends forth several spurs into Syria, the principal and most westerly of which bears the names of *Alma-dagh* and *Jawur-dagh*, the ancient *Amanus* and *Pierius*, which terminate near the mouth of the Orontes, and form the boundary between Syria and Asia Minor. On the south side of the mouth of the Orontes, *Jebel el-Akral* (Bald-hill), the ancient *Casius*, rises abruptly to the height of 5318 feet, and is continued to the east by the *Jebel Chaksinah* and the hills of Antioch, as far as to the southern valley of the Orontes. To the south the hills of Antioch are continued by the *Jebel Kraad* to the *Nosairi Mountains*, which extend southwards, in connection with *Lebanon*. About 34° N. lat. the chain divides into two ranges, the eastern and the western; the former being the *Libanus*, the latter the *Anti-Libanus* of the Greeks, which enclose between them the long narrow valley of *El Bekaa*, or Hollow Syria. The western branch terminates near the sea-coast, to the southward of Sidon; while the eastern branch, in nearly the same parallel, divides again into two ridges, the one of which passes into Arabia, along the eastern side of the valley of the Jordan. The other extends southwards, along the western side of the

Jordan, forming the watershed between the basin of the Dead Sea and the valleys which send their waters to the Mediterranean, and covering the interior of Judea with a wilderness of barren mountains. *Mount Carmel* forms a bold promontory on the south-western side of the Bay of Acre, and has an extension south-eastwards till it joins the mountains of Judea. Farther south, these mountains become connected with the rocky chains which traverse the Petræan Arabia, and fill up the space between the Gulf of Suez and the Gulf of Akaba. The diverging range of the Libanus, which forms the north-eastern part of the valley of the Upper Jordan, was the *Hermon* of Scripture; and farther south were the mountains of *Gilead*. These mountain ridges form a number of valleys, the principal of which extend north and south; but besides these is a great number of transverse valleys along the sea-coast as well as in the interior. The crest and acclivities of the *Nosairi Mountains* are almost uniformly barren and destitute of forests; their outline is tame, and the general elevation of the chain hardly exceeds 1000 feet. They are steep towards the *Valley of the Orontes*, which lies between them on the west, and the *Jabel-Shaehanhou* on the north-east, and is called *El Ghab*. The valley is inhabited by a mongrel race of Arabs and Fellahs, who live, in winter, in a few villages dispersed over it, of which they cultivate only the land adjacent to their dwellings. On the approach of hot weather they retire with their flocks and herds to the eastern mountains in search of pasture, and to escape the swarms of flies and gnats which infest the Ghab at that season. Towards the west the Nosairi Mountains descend in irregular hills into the plain of Jebilee. *El Bekaa* (the Κοιλη Συρια, Koilé Suria of the Greeks, *Cale Syria* of the Latins) is a beautiful valley between the two branches of Lebanon, drained by the river Leitani. It is about 90 miles in length, by 11 of average breadth, and is the richest and the most beautiful part of Syria. The *Valley of the Jordan* extends about 175 miles from the sources of the river to the southern extremity of the Dead Sea. From the Lake of Tabariah to Ain el Arus, 12 miles south of the Dead Sea, where it meets the Wadi-el-Arabah, it is called *El Ghor*. On the east side of the valley, between the two lakes, the mountains rise almost precipitously from the river, but on the west there is a narrow strip of level ground of singular fertility. To the north of the Dead Sea the country opens into the plain of Jericho, 18 miles in length by 7 in breadth, walled in by an amphitheatre of hills, which concentrate the rays of the sun, and make it very hot and parched. It produces, nevertheless, good crops of wheat, barley, and balm. The whole valley of the Jordan is considerably below the level of the Mediterranean Sea; but the exact amount of the depression has not yet been ascertained. The *Valleys of Galilee* are generally small, but beautifully wooded; and between Galilee and the ridge of Mount Carmel lies the great *Plain of Esdraelon*, extending south-east from the Bay of Acre, and watered by the river Kishon. It is called in Scripture the Valley of Jezreel or Megiddo; and is exceedingly fertile, and well adapted for growing corn; but it is uncultivated, and only affords a rich pasture to a few scattered herds. The *Plain of Haouran* lies to the south of Damascus, between Hermon and Gilead, and the Jebel Haouran. It is famous for its wheat, and contains many scattered hummocks, which are the sites of villages. All these hummocks, the round stones found in the fields, and the whole mountain of Haouran, consist of black basalt. The houses are entirely built of this stone, even to the doors, and present rather a sombre appearance. The plain is inhabited by Turks, Druses, and Arabs, and is also visited in spring and summer by Bedwins. The rocky wilderness called *El Ludja* and the *Jebel Haouran* comprehend all the uneven country which extends along the eastern side of the plain of Haouran, from near Damascus to Bosrra, and is supposed to be the ancient *Trachonitis*. The plain of Haouran itself is the ancient *Auranitis*.

The great Syrian desert and its borders are not a bare wide waste of sand. Its surface consists generally of a fine black soil, covered in winter with a long lank grass and herbs, and peopled with antelopes, wild asses, and boars. In summer, however, the grass and the herbs are burnt up, and the inhabitants are then obliged to betake themselves to the borders of the cultivated country. In the interior, indeed, sandy tracts are met with, but even there a scanty herbage is to be found. Along the side of Syria are numerous ranges of hills which divide the country into small plains; but eastward from Palmyra, the desert presents a boundless level surface as far as the eye can reach. In summer the soil is parched and cracked into innumerable fissures by the heat, and the vegetation is destroyed; but no sooner do the winter rains commence than the herbage shoots up with astonishing luxuriance. In summer, the herds and flocks feed on the dry dead herbage, and are obliged to congregate near pools and wells; but in winter the Bedwins spread over the desert, and make long journeys, their flocks and herds no longer requiring water, as the plants then become juicy and full of sap. After the heavy rains, a species of vegetables somewhat like mushrooms springs up in immense quantities in different parts of the desert, some of which are celebrated for their abundant produce of this article. The Bedwins gather and eat them, after boiling them with butter-milk or melted butter; when they are esteemed a great delicacy. The Arabs of the desert belong to the great Aeneze tribe, and, during the former Turkish dominion of Syria, were quite independent; but under the Egyptian rule they were obliged to acknowledge the supremacy of the Pasha, and even to pay him tribute.

Syria has three distinct climates. The tops of Lebanon, which are for the most part covered with snow, diffuse a coolness over the interior, while the lowland sea-coasts are subjected to heat and moisture, and the eastern lowland adjoining Arabia are exposed to a dry and scorching heat. The seasons and the productions consequently vary. In the mountains the winter lasts from November to March, and is sharp and rigorous; no year passes without falls of snow, which often cover the ground, for months together, to the depth of several feet. The spring and autumn are agreeable, and the summer is not oppressive. In the plains, however, as soon as the sun has passed to the north of the equator, a sudden change takes place to overpowering heat, which continues till October; but to compensate this, the winter is so temperate, that orange-trees, dates, bananas, and other delicate fruits grow in the open field. A few hours are sufficient to produce the change from spring to winter. If natural advantages were duly seconded by art, we might, in a space of 50 miles, bring together, in Syria, the vegetable treasures of the most distant countries. Besides wheat, rye, barley, beans, and cotton, which are cultivated every where, there are several objects of utility or pleasure peculiar to different places. Palestine abounds in sesamum which affords oil, and in dhourra resembling that of Egypt. Maize thrives in the light soil of Baalbec, and rice is cultivated with success along the marshy borders of lake Houle. Sugar-canes have been introduced at Beyrout and Saide; indigo grows without culture on the banks of the Jordan, and only needs a little care to make it of good quality. The hills of Latakia, and indeed all the mountains, produce tobacco. Olives grow at Antakia and Ramli to the height of the oak. The white mulberry thrives admirably on Lebanon and along the coast, and forms the wealth of the Druses, in consequence of the beautiful silk produced by its worms; and the vine raised on poles, or creeping on the ground, furnishes red and white wines equal to those of Bourdeaux. The clusters are remarkably large, and the grapes are often of the size of plums. Jaffa boasts of her lemons, Gama of dates and pomegranates, Tripoli of oranges, and Beyrout of figs. Aleppo is unequalled for pistachio nuts; and Damascus possesses every kind of European fruit; apples, plums, and peaches grow with equal facility on her rocky soil. Niebuhr was of opinion that the Arabian coffee shrub might be cultivated in Palestine. The mountains which diverge from Taurus in northern Syria are richly wooded; and large supplies of oak and yellow pine have recently been drawn from them for the use of the Egyptian navy. Cotton is also produced in considerable quantity in the same region, but, being raised from an annual plant, the crop is exposed to great vicissitudes. Syria possesses all kinds of domestic animals common in Europe, with the buffalo and the camel besides. The gazelles take the place of our deer; and instead of wolves there are jackals, hyænas, and ounces. But the ravages

of none of these animals are so mischievous as those of the locust. Unusually mild winters generate this insect in swarms in the Arabian deserts, from which, in bodies like clouds which darken the sky, it descends on the plains of Syria, consuming in its progress every particle of vegetation. The approach of these formidable swarms spreads general terror, and their visits are followed by certain famine. The only hope of the Syrian under this calamity is in a bird called *samarmar*, which devours the locusts, and in the south-east winds, which drive them into the Mediterranean. In the summer of 1836 an invasion of this insect took place, threatening destruction to every thing green in the province. To destroy them ere they could take the wing was the only chance, and Ibrahim Pasha, it is said, set not only all his army to pursue them, but every village was called upon to send out parties against the common enemy. There is, however, a species of locust which furnishes a tolerable article of food for man.

Samaria is a hilly country, with intervening valleys, which produce abundance of wheat, silk, and olives.

Judæa lies farther south, occupying the most southern part of Syria, between the Mediterranean and the Dead Sea. The ground rises from Jaffa towards the mountains of Judea, in four terraces. The sea-shore is lined with mastic trees, palms, and prickly pears; higher up are vines, olives, sycamores, and lemon trees, with groves of evergreen oaks, cypresses, and acacias, and turpentine trees. The ground is covered with rosmary, citisus, and hyacinths. Some remains are still to be found of the walls which the ancient inhabitants built to support the soil on the slopes of the hills; of the cisterns in which they collected rain water, and of the canals by which these waters were distributed over the fields. These labours necessarily produced a prodigious fertility under a burning sun, where a little water was the only requisite to keep the vegetable world alive. The flocks of the Arabs still find in it nutritious pasturage, and the wild bees hoard up in the holes of the rocks a fragrant honey, which is sometimes seen running down their faces. But the central hills of Judæa and the country to the eastward are of a very different character, being dry and barren, and ending at last, along the Dead Sea, in a dreary desert, a wilderness of mountains, where both ancients and moderns tell us they have found nothing but stones, salt, sand, ashes, and a few thorny shrubs.

GULFS, BAYS, STRAITS.—In the Black Sea, the *Gulfs of Samsoun* and *Sinub* or *Sinope*; in the Sea of Marmora, the *Gulfs of Ismid* and *Moudania*; in the Archipelago, the Gulfs of *Besike* or *Besika*, near the entrance of the Dardanelles, *Adramyti*, *Sandarli*, *Smyrna*, *Vourla*, *Scala-nova*, *Asyn-kalesi*, *Cos*, *Symi*; in the Mediterranean, the Gulfs of *Marmorici*, *Macri*, *Satalia* or *Adalia*, *Iskenderoon* or *Scanderoon*, and the *Bay of Acre*.

CAPES — *Batoum*, *Foudji*, *Kourehlih*, *Zephira*, *Aio-Vasili*, *Poslepei*, *Vona*, *Jasoun*, *Thermeh*, *Tcherchenbeh*, *Indjeh*, *Kerempe* (ancient *Carambis*), *Baba*, *Kirpeh*, and *Kara Bournou*, all on the north coast of Asia Minor. *Cape Janisary*, at the entrance of the Dardanelles; *Paba Burun*, *Kara Burun*, and *Krio*, on the west coast; *Khelidonia*, *Anamour*, *Karadash*, on the south coast of the peninsula; *Khynzir*, *Kosyt*, *Ra-el Shakaa*, *Mount Carmel*, on the coast of Syria.

ISLANDS. — *Cyprus* (*Kupros* of the ancient Greeks, *Kybris* or *Kibris* of the moderns), situate towards the north-east corner of the Mediterranean, and one of the largest and most fertile islands in that sea: length, 140 miles; breadth, 63; superficial area, 3600 square miles. Formerly very flourishing, rich, and populous, it is now almost deserted, and full of ruined towns; but is still famed for excellent wine, cotton, and other products. It possesses great fertility, oranges, olives, raisins, figs, vines, and cotton, thrive amazingly, not excepting even the sugar-cane. The population is supposed to amount to about 60,000, of whom two-thirds are Greeks. *Towns.*— *Nicosia* (*Lefkosia* of the Turks), in the centre of the island, is situate in a fine plain, bounded by lofty mountains; population, about 4000 families. *Larnaka*, on the south coast, is the chief seat of commerce, and the residence of the European consuls. The ancient harbour is choked up; but the roadstead is good, and considerable traffic is carried on with Malta, Egypt, and Smyrna. *Famagosta* (the ancient *Arsinoe*, afterwards *Ammokhostos*), the capital of the island when in possession of the Venetians, stands on the east coast, and still exhibits many proofs of its former grandeur. *Paffo* (anc. *Paphos*), on the south-west coast, is now a mere village, but contained in former times the temples and groves of Aphrodité-Kupris (the Cyprian Venus), the goddess of love and beauty. *Rhodes* (Rhodes), near the south-west coast of Asia Minor, 46 miles by 12, and containing 460 square miles, enjoys a delightful climate, the heats of summer being cooled by the lofty hills which occupy its centre. Rhodes was renowned in ancient times for the great wealth and civilization of its people, and for the wisdom of its laws, to which it owed its long independence. It acquired a new distinction in the middle ages, when it became the residence of the knights of St. John of Jerusalem. It is now almost deserted, but is still of some importance from the fortifications and ship-building yards of its chief town, in the north-east of the island, which bears the same name, and which appears to occupy very nearly the site of the ancient Rhodus, one of the most flourishing, commercial, and splendid of the Greek cities. The Rhodians were celebrated for their navigation, and for the enterprising spirit which led them to send colonies to many parts of the then known world: they possessed for some time the dominion of the sea, and their maritime laws form the basis of the modern maritime code of Europe. The city presents no traces of its former splendour; its only public buildings are two Gothic castles, and some massy Gothic churches, now converted into mosques. It contains a population of about 5000 Turks and 1000 Jews; but no Christian is allowed to reside within the walls. The rest of the island, however, is occupied almost entirely by Greeks, to the number of about 14,000. *Samos*, 50 miles south of Smyrna, and separated by a channel, only about a quarter of mile wide, from the promontory of *Mycale*, is about 60 miles in circuit, and was famous for the worship and temple of Juno, who was said to have been born in the island. It is very fertile, rises abruptly from the sea to a great elevation, and its people were long famed for their industry; but they suffered very severely in the late war of independence, and the island is now mostly deserted and desolate. *Scio* (ancient Greek *Chios*, modern *Khio*), a beautiful and fertile island west of Smyrna, celebrated among the ancients for its wine (the *Chian*), and in latter times for its college, rich library, printing press, and numerous and industrious population, is now deserted, and covered with ruins. It was invaded by a host of Turks in 1822, the whole Greek population murdered or carried into slavery, and their property plundered or destroyed. Some barren islets or large rocks, named *Spalmadoré*, so occupy the space between Scio and the mainland as to render the passage very dangerous in stormy weather. *Mytilini* (*Lesbos*), north-west of the Gulf of Smyrna, contains 435 square miles, with a population of 40,000, who are principally maintained by their trade in oil. It is also celebrated for oysters. *Taushan* and *Tenedos*, small rocky islands near the entrance of the Dardanelles. The latter produces a wine more esteemed than any other in the Archipelago. *Marmora*, famous for its marble quarries, *Kalolimno*, *Rabi*, and the *Prince's Islands*, in the Sea of Marmora. *Kos* (*Istankhio* of the Turks), *Astropalaia*, *Nisyro*, *Piscopi*, *Symi*, *Khalkhi*, *St. John*, *Eskriti*, *Plaka*, *Adelphi*, *Staxida*, *Cazo*, *Scarpanto*, *Kalimno*, *Lerita*, *Zinari*, *Lero*, *Patmo*, *Gaitharo*, *Furni*, *Nikaria*, all off the south-west coast. *Grambousa* and *Khelidonia Isles*, off Cape Khelidonia, *Provençal*, south-west of Selefkeh. *Kefkem*, a small Island to the east of Cape *Kirpee*, in the Black Sea.

RIVERS.—The *Joruhh* rises in Armenia, and flows into the Black Sea at Batum. The *Jekil-Irmak* (green river), rises to the south-west of Tokat, flows through the eyalet of Sivas, passes Tokat, where

it is called Tokat-Su, Amasia, and Charsambah, below which it falls into the Black Sea. The *Kizil-Irmak* (red river), formed of two branches, the one rising on the frontiers of Sivas, the other in the Hassan-dagh, flows first west, then north, and falls into the Black Sea, between Sinub and Samsoun, after a course of 570 miles. It is the ancient *Halys*, and the largest river of Asia Minor. The *Sakaria (Sangarius)* is formed of two branches, one from the neighbourhood of Angora, and the other from the Emir-dagh, joined by the *Purak* from Kutaya, and has a course of 250 miles into the Black Sea.

The *Kodus* or *Surabat (Hermus)*, rises in Murad-tagh, and falls into the Gulf of Smyrna, after a course of 190 miles. The *Mendere* or *Meinder (Maeander)*, has a western course of 160 miles into the Archipelago south of Samos. It is celebrated for its windings, from which all similar windings on rivers have been called meanders.

The *Sihoon* rises near Bostan, and flows south-west past Adana into the Mediterranean. The *Jihoon* has a nearly parallel course, a little to the eastward, and falls into the Gulf of Scanderoon.

The *Aazi* or *El-Asi* (the rebel), the ancient *Orontes*, rises on the east side of Anti-Libanus, north of Damascus, flows north and north-west through a long valley to Antakia, where it turns south and south-west, and falls into the Mediterranean after a course of 225 miles. It is a rapid and troubled river, flowing near the foot of the An-arian mountains, where it forms numerous marshes. To the north-east of Antakia the streams which descend from the valley of Taurus form a large lake, *Aggi* or *Ozjo-denghi* (White sea), which empties itself by one stream, called the *Kara-su*, into the Orontes. The *Leitani (Leontes)* rises at the northern end of the valley El Bekaa, and flows south by west into the Mediterranean, a little to the north of Tyre. The *Jordan*, *Orden* or *Sheryn*, rises in a small lake, called anciently *Phiala*, in Mount Hermon, flows south into lake *Hoolya* (the *Waters of Merom*), and passes onward through the lake of *Tabariah (Sea of Galilee)*, and then flows with a winding course through a spacious valley called El Ghor, and falls into the Dead Sea. In the higher part of its course, the Jordan, after it leaves lake Tabariah, flows between banks which are often picturesque; and in spring it fills its deep channel, moving along with great rapidity. The *Zerka (Jabbok)* flows from Jebel Haouran westward into the Jordan, nearly midway between the two lakes. The *Mandhour* flows also from Jebel Haouran to the Jordan, a few miles south of lake Tabariah. The *Kison* flows through the plain of Esdraelon into the south side of the bay of Acre. The *Kefr, Zerka, Kasab, Arsouf, Petra, Roubin, Sorek, Besor* or river of Gaza, all flow into the Mediterranean Sea.

The EUPHRATES is formed by the union of two large streams in Armenia. The *Murad* or southern, generally called the eastern branch, rises not far from Bayazid, in the mountains named Ak-dagh, flows first northerly, and then west and by south, about 300 miles, collecting in its progress the numerous streams which pour down from the mountains on both sides of the long narrow valley through which it flows. The northern or western branch rises about 20 miles to the N.E. of Erzroum, and passes westward within a few miles of that city, under the name of the *Frat* or *Kara-su*. It then flows west by south through a succession of long narrow defiles, till it meet the Murad, about 7 miles above the lead-mines of Keban-maden. The united stream flows on in the direction of the Kara-su, and then makes a long circuit through the Taurus under the parallel of 38° N. lat. After clearing the mountains, the river forms a double cataract, 22 miles above Samosat, and flows for 100 miles in a direction a little to the south of west; then proceeds for another 100 miles nearly south, till it reaches the latitude of Haleb, when it turns to the south-east, and continues in that general direction to the head of the Persian Gulf; the whole length of its course being variously estimated between 1500 and 1700 miles. The general description of the Euphrates, for some distance below Bir, is that of a river of the first order, struggling through high hills, in an exceedingly winding course, as it endeavours to force its way over a rocky bed, from one natural barrier to another, the velocity of its current varying from rather more than two miles to four and a half per hour, according to the season and the nature of its bed. It is in this part of its course that it makes its nearest approach to the Mediterranean Sea, at the gulf of Scanderoon; the shortest straight line between them being about 100 miles, and the bed of the river at Bir being 628 feet above the level of the sea. Although the stream is in many parts quite uninterrupted by cataracts, it is frequently obstructed above Annah, and a little below that place, by a rocky bottom, and is shallow enough in some places for camels to pass in the autumn without burdens, the water rising to their bellies, or being four feet deep. The Euphrates is here enclosed between two parallel ranges of hills, and its banks are for the most part thickly covered with high brushwood, and timber of moderate size; the "eternal tamarisk," as the members of the late expedition call it, accompanying the river throughout its whole course. A succession of long narrow islands, either wooded or cultivated, is found in many parts, and on some of these are small towns; the borders of this ancient stream being still well inhabited, not only by Bedwins but by permanent residents. Fifty or sixty miles below Hillah the river enters a low tract, called the *Marshes of Lemlun*, where the navigable channel is very narrow, winding, and intricate. These marshes extend about 25 miles in a straight line, but 50 by the channel of the river, which here divides into innumerable small canals, leaving the main channel about 120 feet in breadth, and in some places not more than 45. From the marshes downwards there is a fine broad stream, for 190 miles, to Kornah, where the Euphrates and the Tigris meet, 1100 miles below Bir, by the course of the river. From Bir to the sea, the average inclination of the channel is 6.354 inches a mile; but this is much affected by rapids, as at Annah. Through all that distance it is everywhere navigable by boats of a particular construction, which draw little water. Though rudely built, they are numerous, and carry on much of the internal traffic of the country. Some years ago public attention in Britain having been directed to the Euphrates as a channel of communication with India, it was minutely surveyed by Captain Chesney, whose report being favourable, an expedition was sent out under his command, to try its practicability. Two iron steam-boats were built at Bir, and after many delays and dangers, the descent of the river was accomplished, but the disadvantages of the route have in consequence been found to be too numerous and too serious to be easily obviated, and all that has been gained by the attempt is the addition it has made to the knowledge of the geographer and the naturalist; though, as usual in such cases, there are people who still maintain the practicability of the route.

The TIGRIS, the companion and the rival of the Euphrates, has its principal source in the mountains of the country of Zoph, in Armenia, about 5000 feet above the level of the sea. A rising ground prevents it from proceeding to the Euphrates, while a deep ravine opens a passage for it towards Diyarbekr, whence it pursues its rapid course through a rugged territory with a great declivity, collecting the waters from the south side of the same range of mountains which send their northern streams to the Murad. Its extreme rapidity, in this part of its course, the natural effect of local circumstances, has procured for it the name of *Tigr* in the Median tongue, *Diglito* in Arabic, and *Hiddekel* in Hebrew, all of which denote *the flight of an arrow*. As the Tigris and the Euphrates approach each other, the intermediate land loses its elevation, and is occupied by meadows, marshes, and deserts. Above Baghdad, the rivers are only about 20 miles apart, but they afterwards separate to a distance of 110 miles, and finally meet at Kornah, about 134 miles from the sea. The Tigris is, generally speaking, a rapid river, and in this respect it has been contrasted with the Euphrates, which has been called a gently flowing stream. But this comparison will apply to the rivers only in the upper parts of their course; for lower down, they both flow onward for several hundred miles through the same plain, with more or less rapidity, according to circumstances. Below Baghdad the Tigris has a moderate current; but in its course from Mosul to that city, it passes over several ledges of rock; and

above the 32° N. lat., rushes through the hills of Hamrûn, where it has cut a channel only 150 yards wide. The rapidity of the stream of the Euphrates varies at different places; in the depression of the plain, it is often not a mile an hour; but over the dry ground it runs nearly three miles an hour; the upper Euphrates averages from three to four. The Tigris, in the plains, flows often less than one mile an hour, and averages one and a half throughout. At Mosul, in the time of flood, it averages not more than four miles an hour. *(Ainsworth's Researches, &c.)* Captain Mignan was much struck with the force and rapidity of the Euphrates at Hillah, from his having always heard it asserted that the Tigris flowed more swiftly. "At this point," he says, "the attribute (sluggish) is inapplicable; for at the time I am writing the stream is pursuing its course at the rate of three knots and a half an hour, whilst the Tigris flows at scarcely three. From the house in which I lodged (about two furlongs from the bridge of Hillah), I could distinctly hear the rushing of the water beneath the bridge, whereas it is never audible at Baghdad, not even to those who live on the brink, and opposite the floating bridge. Hence I conceive that the epithet 'sluggish,' when applied to the majestic Euphrates, is improper. In May 1828, I again crossed these rivers, and ascertained their respective velocity. The Euphrates flowed past Hillah at seven knots an hour, and the Tigris at five knots and a half," (at Baghdad we presume he means). — *Travels*, pp. 121—122. There has also been considerable discrepancy in the opinions of travellers, respecting the relative size of these rivers. The Euphrates has certainly the longest course, but it is more weakened by the supplies drawn off for irrigation; and at Hillah its width is only 420 feet, while that of the Tigris at Baghdad is more than 600. Both rivers overflow their banks in spring, when the snow melts on the mountains of Armenia; the Euphrates rises to the perpendicular height of 12 feet, the Tigris about 20 at Baghdad; and, when the fall of snow has been very great during the preceding winter, the country between and beyond the two rivers, in the lower part of their courses, becomes a vast lake,

The Tigris, during the whole year, contains a sufficient body of water for moderate-sized boats heavily laden, up to Baghdad; and, during the greater part of the year, as high as Mosul and Diyarbekr. The great and only difficulty navigators have to contend with, arises from the savage character of the people on its banks, who plunder every stranger that falls into their power, and not unfrequently murder them.

The only affluent of the Euphrates worthy of notice is the Khabour, a large stream which joins it at Kirkesiah from the north-east. The principal affluents of the Tigris are the *Great Zab*, the *Little Zab*, the *Toak*, the *Odorneh*, and the *Diyalah*, from Kurdistan; and the *Mendeli*, from the south-western declivities of the mountains of Louristan. The two great rivers are, however, connected by several canals, the principal of which is the *Shat-el-Hie* or *Hye*, which extends 160 miles from the Tigris at Kut Aamarah, 241 miles above Kornah, almost due south to the Euphrates, 90 miles above Kornah. It is dry in summer, but in winter it is about two fathoms deep, and was recently passed by a steam-vessel. Both rivers seem to have frequently changed their course through the alluvial plains.

The united stream of the Euphrates and Tigris is called the *Shat-el-Arab* (River of the Arabs), and flows with a somewhat winding course, in a direction nearly south-east from Kornah; entering the sea by a single channel called the *Khorè-el-Bussrah*, over an extensive bar, which has only a depth of three fathoms at high-water, and a bottom of soft oozy mud. It is described as being everywhere broader than the Nile, and its waters much deeper, while the banks are more thickly covered with groves of date trees, and more on a level with the surface of the water, so as to be more easily irrigated than any part of Egypt, except during the inundation; but in other respects there is a striking contrast between these classic and noble rivers. Ships which can pass the bar may be easily navigated up to Bussrah. The tide ascends the Euphrates 60 miles, and the Tigris 35 miles above Kornah. Not far below Kornah the Shat-el-Arab is joined by the *Haweeza* or *Kerkah*, a large river from Louristan; and below Bussrah it communicates, by the *Hafar* canal, with the *Karoon* or *Kûran*, and as was supposed till Chesney's expedition proved the contrary, by the *Jerahi* also: the three rivers together forming seven mouths. The four eastern mouths belong to the Karoon and the Jerahi; the fifth, named *Khoré-omeyah*, leads directly into the Shat-el-Arab, and is believed to be navigable by ships drawing 10 feet water; but being so close to the main body of the river, its passage is never attempted. The *Khoré-el-Bussrah*, the principal entrance into the river, and the only stream now navigated by ships, has been already described; and the seventh, *Khore-Abdallah*, is supposed to have been once a mouth of the Euphrates, when that river reached the sea by a channel of its own, before it was united with the Tigris at Kornah. At present it is rather a creek or inlet of the sea, than the mouth of a river. It is said to be four times as broad from land to land at its entrance as the Shat-el-Arab is at the same point, and it continues to be twice as broad throughout its whole length; the depth of water in mid-channel, decreasing from ten fathoms at the entrance to five fathoms at the head.

LAKES.—The great LAKE OF VAN, in Armenia, situate between 38° and 39° N. lat., and 42° and 44° E. long., extends nearly 80 miles in length from S.W. to N.E.; the eastern half has only a breadth of from 5 to 9 or 10 miles; in the middle it suddenly expands to a width of 37 miles, but contracts again at the west end to 15 or 16. It occupies the bottom of a valley, or, as M. Dubois calls it, a volcanic amphitheatre, surrounded with lofty mountains; its waters are bitter, except at the mouths of the rivers, where they are sweet enough to be drunk by cattle. A species of herring or sardinia is taken in abundance at some seasons, and is salted, and exported to all parts of Asia Minor. The beauty of this lake has been celebrated by almost every Armenian writer both in prose and verse. It contains two considerable islands, with Armenian convents, one of which bears the name of *Akhtamar*, which is also the Armenian name of the lake. The Turks call it *Arjish*. A few small vessels ply upon the lake; and a singular substance is found floating on its surface, which the people gather, and use in washing clothes. This is an alkaline salt, composed chiefly of carbonate of soda and chloride of sodium or sea salt.—(*Southgate*, II. 306.) The lake is 5,467 feet above the level of the sea.

The great *Tuzla*, or *Salt Lake of Koch-Hisar*, situate nearly in the centre of Asia Minor, is said to be 30 leagues in circumference; it is narrow, while its length extends nearly 50 miles. The water is so extremely salt that no fish or other aquatic animal can live in it; even birds are afraid to touch it, as their wings become instantly stiff with a thick coat of salt; and anything thrown into the lake is soon covered with that substance. The remains of a causeway formed across the lake are almost concealed under a case of salt, and the bed of the lake at some places consists of a thick crust of solid salt. The salt is a government monopoly, and is collected at only four places.—(*Hamilton, Journal R. Geog. Soc. Lond.* VIII. 147.) The surface of the lake is 2,500 feet above the level of the sea. It is called by the people in the neighbourhood *Tuz-choli* (salt desert), because it is nearly dry in summer; but sometimes *Tuz-goli* (salt lake), *Agi-gol* (bitter lake), or Kock-hisar-goli (lake of Kerk-hisar.)—*Ainsworth's Journal, R. Geog. Soc.* X. 298.

The DEAD SEA, called by the Arabs *Bahr Lout* (Lot's sea), and *Bahr Mutneh* (stinking sea), and by the Latin geographers, *Lacus Asphaltites* or *Mare Mortuum*, is situate in the southern part of Palestine, between 31° and 32° N. lat. and 35° and 36° E. long. Its dimensions have not yet been exactly ascertained; but it probably extends about 50 miles in length from N. to S., and from 7 to 20 in breadth. In July 1835 Mr. Costigan, an Irishman, with a Maltese sailor as his servant, spent eight days in making the tour of this lake in a boat, but was so worn out with his exertions, that he died before he could

give an account of his voyage. His servant, however, had observed the coast and soundings with the eye of a sailor, and told Mr. Stephens, who found him at Beyrout, that they had moved in a zigzag direction, crossing the lake several times; that every day they sounded frequently with a line of 175 brachias each about 6 feet; that they found the bottom rocky and of very unequal depth, sometimes ranging 30, 40, 80, 20 brachia, all within a few boat's length; that sometimes the lead brought up sand, like that of the neighbouring mountains; that they failed but once to find the bottom, and in that place there were large bubbles all around for 20 paces, rising probably from a spring; that, in one place, they found on the bank a hot sulphureous spring; that in four different places they found ruins, and could clearly distinguish large hewn stones, which seemed to have been used for buildings; that at the south end of the lake a long tongue of high land projects into the water, and is composed of solid salt, which has at a distance the appearance of an island, the extremity being higher than the isthmus. In March 1837 it was again surveyed in a boat by Messrs. Moore and Beke, who found its depth in some places to exceed 300 fathoms; and, from several observations on the temperature of boiling water, and by the barometer, they estimated the level of its surface to be 500 feet below that of the ocean. Professor Schubert has estimated the depression, as indicated by the barometer, to be 568 or 600 feet; but M. Russegger has carried his estimate, also by barometer, to the enormous amount of 1060 feet. Its waters are intensely salt, and their taste is of the most nauseous kind, salt, bitter, and sulphureous, and so pungent that the eyes smart severely for some time after being dipped in them. It has been found to contain, in 100 parts, 0.920 of muriate of lime; 10.246 of magnesia; 13.360 of soda, and 0.64 of sulphate of lime. The south-western side of the lake is skirted by a long low ridge about 150 feet high, the whole mass of which consists of solid rock salt, covered with layers of soft limestone, marl, and other substances, through which the salt breaks out, and appears on the sides in precipices 40 or 50 feet high, and several hundred feet long. Often also the salt is broken off in pieces which are strewed along the shore like stones, or accumulated at the foot of the precipices. The extreme saltness of the lake is thus easily accounted for; the Arabs carry salt from the Dead Sea to all parts of Palestine for common use. The principal supply of water is derived from the river Jordan, which, even two or three miles above its mouth, is impregnated with the salt and bituminous matter of the lake; but, in the rainy season a great supply is also derived from the south; for not only the waters of the valley El Arabah, but those also of the western desert, far to the south of Akaba, flow northwards to the Dead Sea. Nothing can be more dreary than the scenery round this lake; the soil is without vegetation, and furnishes food for neither bird nor beast. The water is extremely buoyant, and the air above it has a feeling of oppressive weight. Asphaltum or bituminous matter is found floating on its surface; but whether or not it contains fish seems not yet positively ascertained.—(*Stephen's Incidents of Travel.* New York, 1838, vol. II. ch. 14 and 15. *Journal R. Geog. Soc. Lond.* vol. IX.)

The *Lake of Tabariah* or *Sea of Galilee*, is situate about 70 miles N. from the Dead Sea, in a basin surrounded by lofty but naked hills, about 500 feet below the level of the Mediterranean Sea, according to Professor Von Schubert. It is about 16 miles in length by 9 in breadth, and is celebrated by all travellers for its grandeur and picturesque beauty. The water is of a greenish hue, and abounds with fish, some kinds of which are said to be found only in this lake and in the Nile: it is perfectly clear and sweet, though it receives several hot salt streams so impregnated with gases that they change the colour of the stones over which they pass. The Jordan flows through the middle of the lake with a strong and perceptible current. Long-continued storms are unknown, but the lake is occasionally subject to whirlwinds, squalls, and sudden gusts from the hollow of the mountains. There is no navigation upon it, nor even a fishing boat.

The *Aggi* or *Oeja-denghis* (White Sea) is formed by the streams which descend from the valleys of Taurus, to the north east of Antioch, and empties itself by one stream, the Kara-su, into the Orontes. It is about 10 miles long, by 4 or 5 broad, and affords a navigable passage along its west side, to Murad-pasha on the upper Kara-su, and through the lower Kara-su and the Orontes to the sea. Besides these, there are in Syria, the *Bahr-el-Margi*, or Lake of the Meadow, which is the receptacle for the streams that water the plain of Damascus. In summer it is only a pestilential marsh, but in winter it becomes a considerable lake. The *Lake of Homs*, formed by the Orontes; and the *Sea* or *Salt Lake of Gebaul*, to the south-east of Aleppo. In Asia Minor there are a great many other lakes; the principal of which are: The *Lakes of Isnik, Abullionl*, and *Manigas*, on the south side of the Sea of Marmora; *Egredir*, a beautiful sheet of water about 30 miles in length, surrounded by lofty mountains, which are clothed with wood, and emitting at its south end a copious stream, which is said to fall into another very large lake, 35 or 40 miles in circumference, at the distance of four hours' journey; *Eber*, *Ak Shehr*, *Beg-Shehr* or *Kereli*, *Sidi-Shehr* or *Sogula*, the *Ak-Ghiaul* (White lake), *Ocharidak*, a salt lake, from which great quantities of salt are collected; all to the north of the Gulf of Adalia. *Gheuljik* (Little lake, 50 miles N.W. of Diyarbekr, between Kharput and Arghana-Maden, 12 miles long by 3 or 4 broad, and 4,453 feet above the level of the sea. The water is fresh, though usually said to be salt.—(*Ibrand, Journal R. Geog. Soc. Lond.* VI. 208.) It is also called *Gaukcheh* (Sky-blue), and by Mr. Ainsworth, *Gorjik-Goli*.

PEOPLE.—The *Osmanlee* are the dominant race, being spread over all the empire, but are most numerous in Asia Minor, which they seem to consider as their proper country. (*See Turkey in Europe.*) Besides the Osmanlee there is a great number of other *Turks*; those in Armenia, and along the eastern frontier, take that name, which completely distinguishes them from their western brethren, who spurn it. Next to the Turks in number are the *Arabs*, who form the principal part of the population of Syria, and of the south-east provinces. (*See Arabia.*) The *Montefyk* Arabs possess the country between Bussorah and Baghdad; their aggregate number is about 200,000, of whom 70,000 are fit for war. The *Annizah* and *Jerboa* are the other great Mesopotamian tribes. Among these tribes it has always been a part of the Turkish policy to foment a jealousy and maintain a balance of power, as otherwise they might, by confederating, drive them out of the country. The *Kurds* or *Koords*, the descendants of the ancient *Carduchii* or *Cardueni*, inhabit and give their name to a region to the south-east of Armenia, extending about 300 miles in length, and half as much in breadth, and presenting an endless succession of hill and valleys, dells and plains of exhaustless fertility, and towering mountains. They speak the Persian language with a mixture of Arabic and Chaldæan terms, and are mostly Mahometans; but their religion is conjoined with various superstitions, which seem to be the remains of the ancient Magian faith. About a tenth part of them are Nestorian Christians, or Chaldæans, who inhabit the wild mountainous region to the south of the lake of Van, round *Julamerk*, their chief town. But whatever be their religious profession, they are a very uncivilized and lawless race; their country from time immemorial has been the scene of turbulence, robbery, and warfare; and they have seldom, if ever, been more than nominally subject to any of the great empires which have prevailed in this part of Asia. Kurdistan is at present nominally divided between Persia and Turkey, without being really subject to either. The Kurds are divided into numerous tribes, and also into two classes, the nobles or gentry, who spend their time in idleness or warfare, and the slaves, serfs, or peasants, who perform all the agricultural labour, and who appear to be of a different race from their lawless masters. Many Kurds are found beyond the limits of Kurdistan, scattered through Armenia, Asia Minor, and Northern Syria, where they lead a wandering pastoral life, like the Turcomans, and sometimes prove very troublesome neighbours to the inhabitants of the plains. Everywhere the name

of *Kurd* seems to be considered as nearly synonymous with robber. The *Turcomans* are, like the Osmanlee, a branch of the great Türkee family; but, like the Kurds, they lead a pastoral and unsettled life; they are, however, by far the most numerous and most civilized of the nomadic tribes of Asia Minor. They live in tents during summer, but have generally fixed villages for their winter quarters; they possess large herds of camels, buffaloes, goats, and sheep; they also breed horses, and sell them, with milk, butter, and meat, in the towns and villages, taking in return, arms, clothes, and money. Their women spin wool and make carpets. Each camp is under a chief, whose power is regulated by customs and circumstances, the abuse of which is restrained by public opinion. They pay so much a tent to the pashas for the privilege of pasturing over the unenclosed and uncultivated parts of the provinces. A large portion, also, of the Moslem population between Baghdad and Mosul, call themselves Turcomans, and speak the Turkish language. The *Yorukhs* are another nomadic people of Asia Minor, who live in tents all the year round, but almost exclusively in the mountains; and, when in the neighbourhood of towns, they generally act as charcoal burners, and supply the townspeople with that article. They also cultivate a little ground. The *Yezedees* are a singular race, who principally inhabit the mountain range of Sinjar in Mesopotamia, between the rivers Euphrates, Tigris, and Khabour; but are found also in great numbers in Kurdistan, and near Mosul, and a good many in the eyalet of Diyarbekr. There seems to be no doubt that they derive their origin and name from Yezid the son of the Caliph Moawiyah, who destroyed the race of Ali; although it is said by some that they are descended from a saint named Yezid, who lived about the same time (in the seventh century). Being detested by the Persians, on account of the destruction of the house of Ali by Yezid, and by the Arabs, as worshippers of the devil, they have been driven into the strong and isolated hills of Sinjar, and the rugged mountains and defiles of Kurdistan. Their religion (see *antè*, p. 124) is a strange mixture of worship of the devil with the doctrine of the Magians, Mahometans, and Christians; but religion, or religious ceremonies of any kind seem to be merely nominal among those of Sinjar, though those in Kurdistan practise various religious observances. Their manners and customs are very simple; their chief articles of food are barley bread, onions, figs, and grapes, either fresh or dried, according to the season; wheaten bread is very rarely seen. No kind of wine or spirituous liquor is used by them. They are of the middle size, with clear complexions, regular features, black eyes and hair, thin, muscular, and well-proportioned limbs. Their character is rather superior to that of their neighbours. They are brave, hospitable, and sober, faithful to their promises, much attached to their native soil, but cruel and vindictive, considering their proper means of support to be robbery and theft. They differ from the surrounding tribes in not being polygamists; and all the tribes intermarry with each other. They used to keep the whole country between Mosul and Nisibin in a constant state of alarm; but in 1837 they were reduced to subjection by the pasha of Diyarbekr, and registered as tributaries of the Sultan —(*Forbes; Visit to the Sinjar Hills in* 1838, *&c. Journal R. Geog. Soc. Lond.* IX. 409.)

The *Armenians*, one of the most ancient nations in the world, were the original possessors of Armenia, where, however, they now form only about a seventh part of the population, the rest of the inhabitants being chiefly Turks and Kurds. They call themselves in their own language *Hai-kani*, and are distinguished by an elegant form and an animated physiognomy. Being constantly exposed to the wars waged by the great neighbouring potentates, they have been forced in a great measure to leave their country; and, though originally a brave and warlike people, they have now become distinguished for their peaceful character, and their willing submission to the government of every country in which they live. Devoted to commerce and manufactures, they have prospered wherever they have settled, finding their way to places inaccessible to Europeans; and their scattered colonies now extend from Hungary and Venice to Calcutta, and even to China; and from St. Petersburg and Moscow, to the deserts of Africa. In their own country, as well as elsewhere, they generally live in large families, in a state of happy unanimity, under the patriarchal rule of their oldest member; but this family attachment is found to be quite compatible with insensibility, injustice, and perfidy towards persons of a different race. Their religion is a branch of the Oriental Christian Church (see *ante*, p. 119). There are, besides all these races, a great many Greeks spread over the country, but chiefly in the western parts of Asia Minor, who are also found along the southern coasts, and in the towns of Syria and Palestine; preserving everywhere their national characteristics and religion.

Syria being successively invaded by the Persians, the Greeks, the Romans, the Saracens, the Latin Crusaders, and the Turks, presents a very mixed population. The aboriginal Syrians form but a very small proportion. Turks are found in the towns, and used to be the only civic functionaries. Many Arabs are settled throughout the country as cultivators, and many Bedwins are also to be met with. The total population of Syria is estimated at from 1,250,000 to 1,500,000, of whom two-thirds are Moslem, and the greater part of the remainder Christians. In the northern eyalet of Aleppo are hordes of Turcomans and Kurds; and the mountains between Aleppo and Damascus are occupied, in great part, by the single tribes *Ansarians*, *Druses*, *Maronites*, and *Motoualis*. The *Ansarians*, called variously *Neceres*, *Nocres*, *Nocires*, *Nassarians*, *Nassaris*, *Ensyrians*, *Anzeyrys*, and *Ismailys*, occupy the mountains which extend from Antakia to the river Kebir, and are generally considered as a Mahometan sect, said to have been founded in the seventh century by one Nassar. But very little is in reality known about them or their religion; it appears, however, that they were established where they are now found, long before the Ottoman conquest; and all that can be said of their religion is, that it is a mixture of Mahometanism and idolatry. Their chief seat, and the residence of their emir, is *Masiat*, or *Maszyad*, a castle, 40 miles N.E. of Tripoli. The *Druses*, about 150,000 in number, dwell among the hills and in the valleys of western Lebanon, as far south and east as the Leitani or Quasmie river. Their origin is uncertain, but they are, with some probability, believed to be the descendants of the ancient *Ituræi*, a brave people, who possessed the same country in the times of the Romans, and, according to Niebuhr, the proper form of their name is *Durzi*, or *Turzi*, according to more modern authority, *Derze*, for *Duruz*. They are under the government of an emir, who resides at *Deir-el-Kamar*, House-of-the-Moon, a town situate midway between Lebanon and the sea, about 12 miles E.N.E. of Saide. Their religion is involved in mystery, though they are said to believe in one supreme being, who appeared for the last time incarnate in the person of Hakem, Khalif of Egypt, about A.D. 1030. This pretender to divinity was supported in his pretensions by a prophet, who came from Persia into Egypt; both the khalif and the priest perished by violence; but their doctrines survived, and their proselytes, persecuted as usual by the sect then in power, are said to have taken refuge in Lebanon. The Druses have found it their interest to tolerate differences of opinion in religious matters, and they have therefore united in a body, at different times, to oppose the crusaders, the sultans of Aleppo, the Mamelukes, and the Ottomans. After the Ottoman conquest of Syria, the Druses often descended from the mountains to harass the conquerors; but after the middle of the 16th century they became subject to the Porte, and, for the payment of yearly tribute, were allowed to maintain an almost undisturbed independence. They are in general fierce, restless, and enterprising, and their bravery even approaches to rashness. In time of extremity they can muster 20,000 men, horse and foot, armed with firelocks, the larger proportion being cavalry. The Druses, who compose two-thirds of this force, are a stout and well-made people, with a cheerful and rather reckless expression on their round faces, which are in general beardless, and rather fair. They wear their hair beneath the light Syrian turban, for in Lebanon neither the faith nor the customs of the Turks have ever been very fashionable. Some of them entertain very peculiar notions respecting religion; but as a body

they are said to be quite indifferent to it, following the Maronites or the Turks just as they find it convenient. On the mountain their emir is a Christian; when he visits the towns on the coast, he is a believer in the Prophet; he resides in a large and costly palace called *Beteddin*, close by Deir-el-Kamar. The Druse women wear tantooras, or horns, on the head, supporting a sort of veil, which gives them a very singular appearance. The Fellahs of the Ledja, south of Damascus, are also Druses; and to the east of Sanamein is a ridge of hills, called *Jebel ul Druse*, or the mountain of the Druses, the inhabitants of which are here governed by a prince of their own, independent of the emir beshir.

The *Maronites* occupy the hill country between Beyrout and Tripoli, called *Kesrouan*, *Kerouan*, or, improperly, *Castarouan*, and live in villages and hamlets round the convent of *Kannobin*, the seat of their patriarch. Being divided into various tribes, each cultivates his own little territory. They live peaceably and frugally in the bosom of their families, and beneath their humble roof the Christian traveller meets with a kind and hospitable welcome. The sound of bells and the pomp of processions attest the full liberty of conscience here enjoyed by the Christians. Two hundred monasteries rigorously adhere to the rules of St. Anthony, and numerous hermits have taken up their abodes in the grottoes and caverns of Lebanon. The Maronites derive their name from Maron, a saint of the fifth century, whose proselytes, having been stigmatised as heretics, sought refuge in the Kesrawan. After long braving the Saracen and the Turkish power, they were reduced at last by Sultan Murad III. in 1585, who penetrated into their country, compelled them to acknowledge his supremacy, and to pay a yearly tribute. In every other respect they remained uncontrolled. They have been received into the communion of the Roman church, which, however, according to its usual custom with heathen converts, still connives at their retaining some of their old opinions and practices, and particularly at the marriage of their priests. Their devotion, superstitious as it is, is fervent and steady, and throws an agreeable interest over their little territory, surrounded as it is by the darkness of Islam. Their numbers are about 150,000. The Maronites recognise no distinctions of rank, and have scarcely any form of government; the villages form so many little communities, and settle peacefully among themselves the disputes which elsewhere afford such a handle to governors to plunder and oppress their people. In personal quarrels, however, they exercise the barbaric right of vengeance, their religion having failed to impress upon them the most essential part of its morality, the forgiveness of injuries. They are all armed, and, when their strength is called out, can muster 35,000 men. Their monks cultivate the ground, and practise all the necessary handicraft trades. The priests are supported by the bounty of their flocks, which they are obliged to eke out by the cultivation of land, or the prosecution of a trade; even the bishops have only revenues equal to about £60 sterling a-year. But for this poverty the clergy are compensated by the great respect paid to them by the people, who kiss their hands whenever they meet them.

The *Montoualis* or *Metualis*, are Shiahs, or heterodox Mussulmen, who worship the Khalif Ali and his descendants, while they curse Abubekr, Omar, and Othman. They formerly occupied the valley El-Bekaa, and sometimes rendered themselves very formidable to the Turks. They are supposed to be ancient Syrians, though, as a distinct sect, their name does not occur before the 18th century. Their name signifies *Sectaries of Ali*. The Montoualis are now very much reduced, and are chiefly to be found in Eastern Lebanon, and among the Maronites. Their Emir resides at Baalbec; but the lower part of the valley is occupied by Turks.

The Arabic language predominates over the whole country; and the old Syrian tongue is spoken only in a few districts, chiefly in the neighbourhood of Damascus and Lebanon. The Arab and Turkish part of the people are Mussulmen. Of the Christian sects the most numerous are those of the Greek church; the Jacobites have also many adherents; and there are besides some European Christians, Armenians, Nestorians, and Jews. In fact, no country presents a greater assemblage of different creeds.

GOVERNMENT.—See TURKEY IN EUROPE.

PRODUCTIVE INDUSTRY.—Throughout the vast regions of Ottoman Asia agriculture is in the most wretched state, with the exception only of a few small districts, and the neighbourhood of the large towns. Manufacturing industry is a little more flourishing, particularly in the larger towns. It may even be said, that in dying cotton, silk, wool, and skins, the Turks surpass, or at least equal the most perfect European specimens of the same kind. But, generally speaking, there seems to be a complete stagnation of industry, enterprise, and energy. The principal arts and manufactures of Asiatic Turkey are: The silk stuffs of Aleppo, Damascus, Mardin, Baghdad, and Brusa; the cotton stuffs of Mosul, Damascus, Aleppo, Guzel-hisar, Diyarbekr, Smyrna, and Manisa; the cloth of Brusa, Tokat, Amasia, Trebizond, Rizah, Mardin, Baghdad, and Diyarbekr; the ordinary cloth of Khanak-kalesi, Guzel-hisar, and Hillah; the camlets and shawls of Angora; the carpets of Brusa, Kara-hisar, Pergamo, Aleppo, Damascus; the leather of Konieh, Kaisariyah, Kuskin, Diyarbekr, Orfa; the saddles of Aintab; the bridles of Urfah; the tobacco of Latakia; the opium of Kara-hisar; the stoneware of Khanak-kalesi and Hillah; the soaps of Damascus, Baghdad, and Aleppo; the cutlery of Damascus; the copper utensils of Tokat and Erzroum, and the glass of Mardin and Hebron.

COMMERCE.—Few countries in the world are better adapted than Ottoman Asia for being the centre of an immense commerce. Accordingly, from the highest antiquity, and during all the middle ages, this country was the seat of the greatest commerce in the world; but from want of safety to travellers, of great roads, of navigable canals, and encouragement on the part of the government, its present commerce is scarcely the shadow of what it was in former times. The central position, nevertheless, of these fine provinces between Europe, Asia, and Africa, the rich productions of their soil, the numerous products of the industry of some of their great towns, and the caravans of Damascus and Baghdad which convoy to Mecca the pilgrims of Europe and Eastern Asia, contribute still to give great activity to their commercial relations. The internal commerce, which is the most considerable, is carried on by caravans, as in other parts of Asia. Erzroum, Kara-hisar, Tokat, Angora, Brusa, Smyrna, Bussrah, Baghdad, Diyarbekr, Aleppo, Mosul, and Damascus, are the principal resort of the caravans from Persia, Arabia, and Europe. The maritime commerce is carried on almost entirely by Europeans except only at Bussrah; the English, the French, the Dutch, the Russians, and the Austrians, have the greatest share of it. Smyrna, Latakia, Tripoli, Acre, and Beyrout, are the principal places in the Levant; Trebizond is the principal mart on the Black Sea. The Armenians, and next to them the Jews and the Greeks, are, of the native population, most given to commerce. The principal articles of export are: silk, cotton, wool, leather, tobacco, copper, camels'-hair, goats'-hair, opium, saffron, gall-nuts, turpentine, storax, raisins, figs, and other dried fruits, the wine of Cyprus, skins, turkey-leather, and other articles of native manufacture, and several manufactured articles which are imported from India, Persia, and Arabia. The principal articles of import are: silk-stuffs, cloths, needles, watches, and other hardwares, mirrors, and other glass-ware from Bohemia and Venice, paper, tin, Nuremberg wares, porcelain, colonial produce, and many other articles. Arabia, Persia, and India, furnish a great part of the precious products of their soil, and the last country sends the produce of its numerous handicrafts. (See TURKEY IN EUROPE.)

DIVISIONS.—For administrative purposes, Asiatic Turkey is divided into 20 governments called *eyalets*, which are subdivided into departments, or shires called *Sanjaks* and *liwas*: some of the lat-

ter, however, being independent of the pasha, or governor of the eyalet within which they are geographically situate. Both classes of divisions are very unequal in respect of extent and population. Many wandering and mountain tribes, and, indeed, large tracts of country are only tributary; some are merely vassals, and others quite independent. The following table of these divisions is given by Balbi in his *Abrege*, as the nearest approach he could make, with the assistance of M. Jollannin, to the true administrative divisions of Ottoman Asia.

Eyalets.	*Chief Towns and Remarkable Places.*
I.—ASIA-MINOR, OR ANADOLI.	
ANADOLI. .	*Kutahya*, Is-nikmid or Is-mid, Brusa or Prusa, Moudania, Kidonia or Haivali, Pergamo, Sart, Smyrna, Guzel-hisar, Allah-Shehr, Ayasalouk, Antalia or Adalia, Ak-hisar, Kara-hisar, Angora, Kanghri, Kastemuni, Sinub, Boli, Bartine or Bartan, with several tribes of vassal Turcomans.
ADANA. . . .	*Adana*, Tarsous, Sis, Baias, Anemour, Selefkeh, Alaue or Alaia, and several Turcomans.
CARAMANIA.	*Konieh*, Laranda or Karaman, Ak-shehr, Ak-serai, Nikde, Gouronk, Maden, Kirshehr, Kaisariyah, Ladik.
MARASH. . .	*Marash*, Bostan, Aintab, Malatiyah, several tribes of Turcomans and Kurds.
SIVAS. . . .	*Sivas*, Tokat, Yuzgat or Ouscat, Amasia, Merzifoun, Chorum, Vizier-pasha, Unieh.
TREBIZOND.	*Trebizond* or *Trapezus* or *Taraboum*, Kerasun; Lazistan, the country of the Lazis, and independent tribes, lies along the coast east of Trebizond.
II.—ARMENIA, WITH PART OF KURDISTAN AND GEORGIA.	
ERZROUM. .	*Erzroum*, Kamakh, Maden, Erzingan, Kara-hisar, Gumushkhaneh, Baibout, Toprak-kalah.
KARS. . . .	*Kars*, Ani, Ardanuji.
VAN. . . .	*Van*, Mûsh, Betlis, Khoshab, Bayazid.
SHEHRZUR OF OTTOMAN KURDISTAN.—	*Kerkuk*, Shehrzur, Erbil, Baian, Suleimaniyah.
III.—MESOPOTAMIA OR ALJEZIRA, WITH ARABIAN IRAK.	
BAGHDAD. .	*Baghdad*, Meshed-Ali, Hillah, Meshed-Hussein, Anna, Nisibin, Mardin, Bussrah, Kornah.
DIYARBEKR.	*Diyarbekr* or *Kara-Amid*, Maden, Siverek.
RAKKA. . .	*Rakka*, Orfah, Bir, Tor, Khabour.
MOSUL. . .	*Mosul*, Elkosh.
IV.—SYRIA OR ELSHAM.	
ALEPPO. . .	*Haleb* or *Aleppo*, Killis, Alexandretta or Scanderoon, Beilan, Antakia or Antioch, Shogr or Jeer-shogr.
DAMASCUS. .	*Damascus*, Hamah, Homs, Tadmor or Palmyra, Jerusalem, Bethlehem, El Khalil or Hebron, Rayah or Jericho, Nablous or Sichem, Gaza, Ramlah, Jaffa.
ACRE. . . .	*Acre* or *Akka*, Beyrout, Sidon or Saide, Sour or Tyre, Nazareth or Nasra, Tabariah.
TRIPOLI. . .	*Tripoli* or *Tarabolous*, Latakia.

Cities and Towns in Asia Minor and Armenia.

SMYRNA (*Ismir* of the Turks) lat. 38° 29′ N., long. 27° 11′ E., is situate at the bottom or eastern extremity of the gulf of the same name, and is built in the form of an amphitheatre, on the slope of a hill, the top of which is crowned with a ruinous castle. Without being beautiful, Smyrna presents an agreeable appearance, and contains some well-built houses, which belong chiefly to the Franks, and form a pretty quarter of the town. The streets are narrow and dirty, with the exception of those which are covered. To its position Smyrna owes the rank which it holds among the most important trading places in the world. The extent and safety of its road for shipping, and the facility of its communications with the interior, have made it the general emporium of the Levant. The trade in dry fruit is immense. Smyrna now forms a small eyalet, governed by a pasha of three tails, and has a population of about 130,000, of whom 10,000 are Jews of Spanish origin. The Frank quarter is inhabited principally by the English, French, Dutch, and Italian merchants, with their families and servants, whose persons and property are exempt from Turkish rule; and in civil, commercial, or criminal matters, they recognise no other judges than their own consuls. In the magnificent cassino, which was built by subscription, are found all the principal periodical publications of Europe, and in the theatre an amateur company plays Italian comedies. There is also a Greek college; and a gazette is published in French. The summer heat is very great; the thermometer in July, in a cool room with the shutters closed, varies from 78° to 83°, and in the shade out of doors, from 84° to 94°; but the heat is generally tempered by a fine westerly breeze called the *imbat*, which continues from mid-day till sunset. Occasionally, however, hot winds blow from the south and burn up the country. In the immediate neighbourhood are the pretty village of *Bournabat*, where most of the Franks have their country houses, and the villages of *Bouja* and *Sedi-Kewi*, remarkable for their fine plains and numerous population.

Manissa (*Magnesia*), 25 miles N.E. of Smyrna, is a large town, with a flourishing trade and extensive plantations of saffron. It also contains a ruined fortress, and the tombs of Sultan Murad II. and his family. Population 100,000. *Fokia*, 25 miles N. W. from Smyrna, a flourishing town with a good harbour, built on the site of the ancient *Phocæa*, so renowned for its colonies in Spain and Gaul, among which the most distinguished was Masailia (Marseilles). *Vourla*, a small town, 20 miles W. by S. of Smyrna, built near the site of the ancient *Clazomenæ*, still contains traces of the mound formed by Alexander the Great. *Chesmeh*, *Chismeh* or *Tchesme*, 40 miles W. by S. of Smyrna, a small town situate on a bay, where the Turkish fleet was destroyed by the Russians in 1770. *Ayasalouk*, (Moon-town) 40 miles S. by E. of Smyrna, a miserable Turkish village, represents the ancient *Ephesus*, the remains of which are at a little distance, and consist of shapeless ruins and stone walls. The harbour is now only a pestilential marsh. *Scala-nova*, 45 miles S. by E. of Smyrna, a flourishing commercial town with a harbour, contained, before the Greek revolution, 20,000 inhabitants. *Palatia*, near the mouth of the Meander, a wretched assemblage of huts, appears to represent *Miletus*, one of the most flourishing commercial cities of antiquity. The ruins of its vast theatre are still to be seen. It is situated upon a brackish lake, connected with the Meander by a channel two miles long. *Gussi-hisar* (*Tralles*), 64 miles S. E. by S. of Smyrna, is a flourishing trading town, with cotton manufactures, and 30,000 inhabitants. *Tireh* or *Tirra*, 47 miles S.E. of Smyrna, a modern town, is nearly as large as Smyrna, though less populous. *Cassaba* or *Durgutli*, 35 miles E. of Smyrna, is a large town, with about 6000 houses. *Sart* (*Sardes*), 50 miles E., is a miserable village inhabited by a few Turks, on the

site of the splendid capital of the Lydian kings. The principal ruins consist of those of the great church, the temple of Cybele, and the tomb of Alyattes, the father of Crœsus, which consists of a conical hill of earth 200 feet high and 4000 round the base. Similar monuments of smaller size are found at a little distance. *Ak-Hissar* ancient *Thyatira*, 50 miles N.E. of Smyrna, is a town of 6000 houses, situate in a fertile plain, and surrounded by groves of delicious gardens. *Akhi-Serky* or *Ak-Serky*, ancient *Thiatira*, 35 miles E. of Smyrna, is said to contain more than a dozen of Christian churches, and the bulk of its population is Christian. *Pergamo* or *Bergamo*, 45 miles N., is a large and still flourishing town in the valley of the *Caicus Grimakeo*, although only the shadow of the ancient residence of the kings of Pergamus. Its magnificent temple of Æsculapius, its celebrated library, inferior only to that of Alexandria, and the invention of parchment (*charta pergamena*), give a distinguished place in history to this ancient city. *Hairadi*, named *Kidonia* by the Greeks, on the gulf of Adramyti, founded towards the end of the 15th century, became for a short time one of the most industrious, commercial, and polished cities of Asia Minor. It possessed numerous manufactories, a fine college, a library, a printing press, beautiful churches, 3000 houses, and 35,000 inhabitants, all of which disappeared in the late war between the Greeks and the Turks. Since 1821 Kidonia has been only a heap of ruins.

Brussa, or Prusa, lat. 40° 5′ 30″, long. 29° 1′ 45″, 63 miles in a straight line S. by E. of Constantinople, is situate in a fine plain 21 miles in length, behind which, to the south, rise the snowy heights of Olympus. The ordinary houses are of wood, the streets very narrow but clean and well-paved, and altogether it is a very fine city. It is overlooked by an old castle situate on a rocky and picturesque eminence, and is surrounded by extensive suburbs. The most remarkable buildings are the cathedral, the principal mosque, a large building, which dates from the Ottoman conquest of the city; the mosque of the Sultan Orkhan, with his tomb, and a well-frequented college; and the mosque of the Sultans Orkhan, Murad, and Bayazid. The city contains also a number of fine khans, built with stone, magnificent baths, and beautiful fountains. Formerly the capital of the kings of Bithynia, it was afterwards the capital of the Ottoman empire till the taking of Adrianople. Population 60,000. The adjoining plain is covered for miles with mulberry trees, which supply abundant food for the silk-worms that furnish the staple produce of the place. The adjoining mountains abound in the finest pasturage, timber, underwood for fuel, and springs of the purest water, which is profusely supplied to every part of the city. From the foot of Olympus there issue mineral waters, with a strong sulphureous odour, and of the temperature of 167° to 190° Fahrenheit, which are conducted into baths for the use of the citizens.

Modania, 17 miles N.W. of Brussa, a town on the gulf to which it gives its name, serves as the port of Brussa. *Isnik* or *Smirk*, a wretched pile of huts, which stand upon the site of *Nicæa*, the ancient metropolis of Bithynia, is celebrated for the first general council held there by the Christians in A.D. 325. Its thick walls, its towers, and gates are still in good preservation; 37 miles N.E. *Ismimid* or *Ismid*, 62 miles N.E., the ancient *Nicomedia*, an early residence of the kings of Bithynia, was made the capital of the Roman empire by Diocletian. No vestiges of its former magnificence remain. It contains about 700 families, and has the appearance of a modern town. *Aboulyont (Apollonia)*, situate on an islet in the lake to which it gives its name, contains 2000 inhabitants, who are chiefly fishermen, and live almost entirely upon the produce of the rich fishery of the lake, which is of considerable size; 20 miles W. of Brussa. *Mikhalich*, a large straggling town of 15,000 houses, 35 miles W. of Brussa. The south coast of the Sea of Marmora is overspread with celebrated ruins, among which the principal are those of *Cyzicus* (now *Balkiz*), one of the finest and most flourishing cities of Asia. Its remains are still to be seen not far from *Peramo*, a miserable village on the east side of the Peninsula, formerly the island of Cyzicus. *Foungar-bashi* or *Boumar-bashi*, southwest from the Dardanelles, a village supposed to occupy, or at least to be near to, the site of the ancient *Troy* or *Ilium*. There are no remains of the city, but on a neighbouring rock behind to be *Pergamos* (the citadel) are the ruins of buildings in irregular polygons, a cistern cut in the rock, and three heroic tombs, or barrows. Some marble pillars and other remains at *Chiblack* point out the site of *New Ilium* built by Alexander the Great, ruined by Sylla, and rebuilt by Julius Cæsar. *Novoli*, another village with antiquities, marks the site of *Dardania-Troas*, a city entirely ruined and deserted, but whose ruins still attest its ancient magnificence.

Kutahya (*Cotaeum*), 180 miles E.N.E. of Smyrna, 80 S.E. of Brussa, a large town, built in a picturesque situation, on the slope of Mount Pursak, and watered by the river Porsak, is considered the capital of Anatolli. Among its buildings the only one remarkable is an old mosque of singular architecture. Population 50,000. In the immediate neighbourhood is *Tunkali*, a place with famous warm baths. *Sol-Gaza*, 30 miles E. by S. of Kutahya, a ruin and village, is remarkable for its fine mosque, and still more for a Phrygian monument in its neighbourhood, visited by Colonel Leake, who, inferring from the words "To King Midas" cut upon its side, believes this tomb cut in the rock and covered with sculptures like those of Mycenæ, may be attributed to one of the Phrygian kings of the dynasty of Midas. If this be the case, it must have been formed between 570 and 740 years B.C. *Eskishehr*, a small town 30 miles N.E., the ancient *Dorylæum*, and important for its warm baths. *Tursa*, a small village, where the road begins to ascend the *Domanu-dagh*, a high mountain upon which there has been long established an hospice like that of the Great St. Bernard, to assist travellers wandering in the snow; for which purpose large dogs are kept. *Izmir*, a wretched village 7 miles S.E. of Brussa, deserves attention on account of its magnificent ruins of a great Hellenic city, and of a temple of Jupiter, which is said to be equal to the most remarkable Greek buildings yet remaining. *Karas-sar* (called also *Afioun-kara-hissar* Opium Black Castle), 54 miles S.S.E. of Kutahya, so called from the immense quantity of opium (*Afioun*) which is collected in its neighbourhood, and to which, as well as to its woollen manufactures, it owes its flourishing condition. Population about 60,000.

Konieh (*Iconium*), lat. 37° 50′, long. 32° 45′, 300 miles E. by S. of Smyrna, is a large town, in a rich and well-watered plain. Among its numerous mosques is remarked that of Selim, built on the model of Saint Sophia. Here is also the convent of the Mewlevis, founded by Jelaleddin Rumi in the 13th century, and the chief of all the establishments of the same kind in the empire. Konieh still possesses considerable trade and manufactures, and numerous medresses or colleges. The great flat plain to the east is dry in summer, but is flooded and impassable in winter. Population about 50,000. *Lazik-gehi-Karaman* or *Yurugun Ladik* (ancient *Laodicea*), is a small town 25 miles N. by W. of Konieh. *Karaman* or *Laranda*, 60 miles S.S.E. of Konieh, a large commercial town, near the ruins of *Laranda*, which have supplied materials for its buildings. *Ak-shehr* White Castle, 72 miles W.N.W., a flourishing city, is the seat of an archbishop, with 15,000 houses. The medresse or college of Bayazid, and the principal mosque, are remarkable buildings. *Ereghli (Heraclea)*, a small town, 84 miles E. by S. of Konieh, near a large swampy lake, which appears to be a continuation of that of Konieh, and emits its waters through a tunnel in the limestone ridge which bounds the plain to the south.

Tokat (Armenian *Erkegin*, Greek *Eudoxia*), lat. 39° 53′, long. 36° 40′, on a branch of the Kizil-Irmak, is a large town, with narrow but well-paved streets. It stands at the mouth of a long, steep, narrow, rocky defile, which widens a little on approaching the city, on the bank of a mountain stream, but so surrounded on three sides by lofty mountains, that the heat concentrated in the narrow valley sometimes becomes intolerable. The valley for about three miles above the town is filled with gardens and vineyards, and a number of rills of water run through it. The town is not esteemed healthy, autumnal fevers being very prevalent. Population about 30,000. As a commercial mart the import

tance of Tokat has passed away. *Kaisariyah*, 160 miles E.N.E. from Konieh, the ancient *Mazaca*, capital of Cappadocia, afterwards called *Cæsarea*, in honour of the Emperor Tiberius, is situate at the foot of the mighty and constantly snow-capt Mount Arjish, 4200 feet above the level of the sea. It is surrounded by a wall quite dilapidated, and has a castle within on the same level as the city; but neither of them could offer any resistance to cannon. It contains 8000 houses, 5000 Turkish, 2500 Armenian, and 500 Greek. The villages in the neighbourhood are large and populous, and the Christian inhabitants here display their riches and luxury in their country houses more than in any other part of Turkey. Kaisariyah is the principal commercial mart in the central part of Asia Minor; the inhabitants are remarkable for their activity and enterprise, and the natives are found assiduously following their pursuits in the remotest corners of the empire. The climate is warm in summer, and not severe in winter, and still it is not reckoned very healthy. The products of a warm climate, as melons, figs, pomegranates, and grapes are yielded; but the plain is neither fertile nor well cultivated, except merely around the town. The bottom of the mountain is covered with gardens, which produce fruits, and the yellow berry used in dyeing, for which Kaisariyah is so celebrated. The ruins of a more ancient town, destroyed by an earthquake, are close by. *Yuzgat*, 96 miles N. by W. from Kaisariyah, grew into importance under the fostering care of the Chapwaan Oglu family, who fixed their residence here; and from an insignificant village it became a considerable and flourishing town. It is a neat, clean, walled town, situate in a narrow valley, overlooked on all sides by rising grounds. N.W. from Yuzgat about 20 miles, is *Boghas-keni*, a village, near which are the remains of an ancient town, supposed to be *Tavium*.

South-east of Tokat lies the extensive eyalet or pashalic of Sivas, the capital of which is *Sivas*, the ancient *Sebaste* (so called in honour of the Roman Emperor Augustus, whose Latin title *Augustus*, the Greeks rendered in their own tongue *Sebastos*), 50 miles S. by E. of Tokat, situate in a plain, from 4 to 6 miles in breadth by 16 or 20 in length, watered by the Kizil-Irmak, and noted for grain of superior quality. The climate is severe, though remarkably healthy. The town covers a large area, within which are many ruins. It contains about 5000 Turkish, and 1200 Armenian families; and its position is very favourable for an important commercial city. The access from the Black Sea is easy, and has been facilitated by a military road. The city is situate in the centre of a district abounding in the first necessaries of life, and of a country which would require extensive supplies. The route by Sivas is the best to reach Malatiyah, Kharput, and Diyarbekr. The bazaars are extensive, and the khans numerous, and both are well supplied with goods. *Egin*, situate in a deep valley on the right bank of the Kara-su, or Western Euphrates, about 115 miles E. by S. of Sivas, contains 2700 houses, of which 2000 are occupied by Mahometans, the rest by Armenians; among whom the goitre is a frequent disease. *Arab-gir*, 30 miles first S. then S.W. from Egin, 15 caravan days (about 270 miles) from Aleppo, and only 11 (198 miles) from Trebizond. The town is situate in the midst of a forest of fruit trees, and contains about 6000 houses, of which 4800 belong to Mahometans, and 1200 to Armenians. The latter are principally engaged in manufacturing cotton goods from British yarn, and there are about 100 looms at work. The place is, in consequence, in a thriving condition, and is one of the most interesting towns in the interior as regards Trebizond. The climate is severe, and much snow falls in winter; but the summers are cool. *Keban-Maden*, 20 miles S. from Arab-gir, is situate in a ravine, near the Euphrates, in the neighbourhood of an argentiferous lead-mine, in which the greater part of its inhabitants, 400 or 500 families, are engaged. The mine produces annually about 1000 pounds of silver, and 195,000 pounds of lead. *Kharput*, 30 miles S.E. of Keban-Maden, is situate on an eminence at the termination of a range of mountains, overlooking an extensive, beautiful, and productive plain, and contains 1720 families. *Malatiyah*, 105 miles S.E. of Sivas, with *Aspusi*, 6 miles distant S.W. among the hills, may be considered as one town, containing 3923 families, who used to spend the seven summer months at Aspusi, and the five winter months at Malatiyah; but now confine themselves chiefly to the former, while Malatiyah is, in consequence, nearly deserted.

TREBIZOND (*Trapezus*), lat. 41° 1′, long. 39° 40′ E., on the southern coast of the Black Sea, has been a place of importance since its foundation by the Greeks in ages beyond the reach of authentic records. The town is built on the slope of a hill facing the sea, part of it being surrounded by a castellated and lofty wall, and is in the shape of a parallelogram (τραπεζους), whence it derives its name. On each side of the walled portion of the city is a deep ravine, filled with trees and gardens, and both ravines are crossed by long bridges. Overlooking the city is a citadel, which is rather dilapidated and neglected, and is commanded by neighbouring heights. There is no harbour for ships; but a small open bay at the east end of the town is used as an anchorage during the summer. After the autumnal equinox the Turkish and European vessels resort to *Platana*, an open roadstead 7 miles W. of Trebizond; but British vessels anchor at all seasons at Trebizond, and the anchorage there, even in winter, appears to be quite as secure as that of Platana. The city contains between 25,000 and 35,000 inhabitants, of whom between 3500 and 4000 are Greeks, from 1500 to 2000 Armenians, and the remainder Mahometans. Its present importance depends almost solely on its being the most convenient port of debarkation for merchandise destined for Armenia and Persia. *Kara-hisar*, 85 miles S.W. of Trebizond, contains 2500 houses, and has a considerable trade with the coast and the interior. *Keraun* (anc. *Cerasus*), is the port on the Black Sea with which its communications are most active, and is distant about 60 miles N. by W. The town is built around an old castle on the top of the isolated hill. Near the town are extensive mines of rock alum, from which it takes the distinctive appellation of *Shebh-khaneh* (alum-office, or alum works.) *Niksar*, the ancient *Neo Cæsarea*, 70 miles W. of Kara-hisar, is situate amidst a forest of fruit trees, on the east side of a very extensive and remarkably rich plain, watered by the Char-Shambah. *Gumish-Khaneh* (place of silver), on the river Kharshut, 40 miles S. by W. of Trebizond, a town which has grown up amidst the mines of argentiferous lead in the neighbourhood. These mines were once rich in silver, but the produce is now very small, and the people are, in consequence, reduced to great poverty. The whole district abounds in ores of copper and lead; but few mines are worked, and those which are in operation produce little from the ruinous system of management pursued. *Treboli*, a town, with copper mines, at the mouth of the Kharshut, 50 miles W. of Trebizond. *Surmenah*, *Rizah*, *Atenah*, *Khopah*, are places on the coast east of Trebizond, each consisting only of a street of shops, with one or more coffee-houses, and a khan or two. The inhabitants live in cottages scattered singly over the country. Rizah is an important and fertile district, with the most extensive bazaar on the coast, and is famous for the manufacture of a cloth, Mr. Brant calls it *linen*, made of hemp, and used throughout Turkey for shirts. *Unieh* (*Œnoë*), 130 miles W. from Trebizond, on the coast, a dirty town, built of wood, but occupying a most beautiful situation, and carrying on a thriving trade in cotton-stuffs, fruit, and wine.

Amasia, the ancient metropolis of Pontus, the birth-place of Mithridates, and of Strabo the geographer, stands on the west bank of the Jekil-Irmak, at its confluence with the *Chekr*, 60 miles from the sea. *Chorum*, 40 miles W. of Amasia, is a large town, situate in the midst of an extensive plain, through which a small stream flows southward to the Jekil-Irmak. It is inhabited by bigoted Mussulmans; there is scarcely a Greek or Armenian in the town, and, owing perhaps to its isolated position, a Frank was never seen in it before it was visited by Mr. W. T. Hamilton in October 1836. *Marsiwan* or *Merzifoun*, 30 miles W.N.W. from Amasia, is a town of 4000 houses, according to M. Fontanier, and possesses rich copper mines. *Samsoun* (*Amisus*), on the coast, midway between the Kizil-Irmak and the Jekil-Irmak. Population about 2000. *Sinub* (*Sinopè*), a very ancient Milesian colony, and afterwards capital of the kingdom of Pontus, still contains about 5000 inhabitants, and

the town is in a miserably ruined state. It contained in 1836 only about 150 Armenian and 300 or 400 Moslem families. The latter are nearly all Kurds; Kurdish is the common language; and indeed the whole pashalic of Bayazid forms a part of Kurdistan. *Mûsh, Moosh, Mousb*, a considerable town, with 5000 inhabitants, the residence of an hereditary Pasha, about 90 miles S.E. of Erzroum, in the valley of the Murad, or Eastern Euphrates. The Armenians of Mûsh have five churches, one of which, called the church of the forty steps, is said to be 1300 years old. About 15 miles S.W. of Mûsh, is the monastery of *Changuri*, a famous place of Armenian pilgrimage. *Bedlis, Betlis*, or *Bitlis*, a well-built commercial town, in a picturesque situation at the meeting of three valleys, a few miles from the south-west corner of the lake of Van, on the banks of a stream running to the Tigris, contains about 2000 Moslem and 1000 Armenian families.—(*Journal R. Geog. Soc. Lond.* VIII. 72.) *Van*, situate near the east side of the great lake to which it gives its name, in a large plain, studded with villages and gardens, is noted as one of the bulwarks of the Ottoman empire in its contests with Persia, and is a strong and commercial city, with about 12,000 inhabitants. It appears to have been in ancient times a place of great importance; it has been always called by the Armenians *Shamiramakert* (Semiramis' town), and the people of the neighbourhood still venerate the memory of the Assyrian kings, whose names they have preserved, in connection with several localities. The citadel is built on an isolated hill, believed by some travellers to be artificial, in the interior of which there are are large caverns and vaulted rooms, where remains of statues and other ancient objects are still sometimes found. But the most interesting relics are the inscriptions, in arrow-headed characters, which cover the entrance and the sides of the hill. Ruins and relics of the same kind are found not only in vicinity of the city, but in all the surrounding country. South-west of Van is *Erdremid* or *Artemid*, the ancient *Artemita*. The banks of the lake, particularly the eastern and southern sides, are very mountainous, and are partially covered with wood; the soil is fertile, and the pasturage excellent. Van is the seat of a Pasha, who is dependent on the Pasha of Erzroum.

§ *Cities, Towns, &c., in Syria and Palestine.*

HALEB (*Khelbon* of Ezekiel, *Chalybon* and *Berœa* of the Greeks, *Aleppo* of the Franks), situate on the banks of the Koikb, in N. lat. 36° 12′, and E. long. 37° 12′, was, of all the Ottoman cities, inferior only to Constantinople and Cairo in extent, population, and wealth; while, in respect of salubrity, the elegance and solidity of its buildings, and the neatness of its streets, it was superior to both of these. It is encompassed by walls three miles in circuit; but the suburbs were so extensive, that the total circumference was estimated at seven miles, and the population at 250,000. The city stands low, with nothing in the surrounding country that can add beauty or importance to its position. It is protected by a strong castle on the top of an immense mound, of a circular form, and surrounded by a wide ditch. By two successive earthquakes in 1822, more than half the city was destroyed, and its finest buildings ruined or considerably injured; and the destruction was almost completed by another earthquake in 1830. It is very slowly recovering from these disasters; and is still a large and important city, with a population of nearly 60,000 souls. Formerly its commerce placed it in the first rank among the cities of Asia, and it was the grand emporium of Syria, Arabia, Mesopotamia, and Armenia. It is still the emporium of Northern Syria, and is connected in extensive commercial transactions with Diyarbekr and the upper parts of Anatolia, and with Merdin, Mosul, and Baghdad. Since 1832, several British merchants have established houses at Aleppo. The principal manufacture of the city is that of stuffs, which are famous throughout the East, which is still extensively carried on. They consist of silk stuffs, with gold and silver thread; silk and cotton, flowered and striped; and striped cotton only, called nankeens. There are about 4000 looms employed, and about 4800 persons, men and children, producing an yearly value of about £250,000 sterling. The chief attractions of Aleppo are its gardens, which are watered by the Koikb, and produce abundance of fruit and vegetables, among which the pistachio nuts are much celebrated. The townspeople are chiefly dependent for water on an aqueduct, attributed to St. Helena, which still brings water from a distance of several miles. Aleppo is about 60 miles from the sea on the one side, and is equally distant from the Euphrates on the other.

In the eyalet of Aleppo: Scanderoon, Iskenderûn, or *Alexandretta*, 60 miles W.N.W. of Haleb, is a small town situate in the midst of pestilential marshes, on the southern shore of a fine gulf, which penetrates 26 miles inland from Ras Khanzir, gradually diminishing in breadth from 10 miles to 7. The bay is bordered on the south and east sides by the lofty mountain ridges of Amanus, which, in some places, rise gradually from the sea, and, in others, are two or three miles inland, leaving between them and the shore small plains composed of a rich light soil. The harbour of Scanderoon consists of a fine bay running in south-east from the gulf, and protected from all winds; it is capable of containing in perfect security from 30 to 35 sail of ships. *Latakia* (anc. *Laodicea*), 90 miles S.W. by W. of Haleb, near Cape Ziaret, is a small town with a well-sheltered harbour, which has also now become one of the ports of Aleppo. *Antakia* (anc. *Antiochia*, or *Antioch the Great*), 60 miles W. of Aleppo, on the banks of the Orontes, once the proud capital of Syria, with 700,000 inhabitants, is now a ruinous town, with houses built of mud and straw, narrow dirty streets, and a population of less than 20,000. Its ancient walls, about five miles in circuit, are still mostly standing, but are in a very decayed and mouldering condition. The river, which is from 100 to 150 feet wide, and is crossed by a substantial bridge, was formerly navigable to the sea, and might easily be rendered so again, for larger vessels than the boats which are used upon it. The fall of the stream scarcely exceeds 5½ feet a mile. *Suadeah*, a small town in a plain north from the mouth of the Orontes, near which is *Kepse*, in the ruins of the ancient *Seleucia Pieria*, the port of Antioch, where the masonry of its magnificent harbour is still in so good preservation, as to be capable of repair. *Jeboul*, 20 miles S.E., a small village in the Valley of Salt, so called from a large *sibkah*, or salt marsh, where a great quantity of salt is gathered. *Sermein*, 22 miles S.W., another small village, with numerous cisterns cut in the rock, and several caves inhabited by the natives. *Edlip*, a small town of 1000 houses, surrounded with olive trees, 30 miles S.W. *Reiha* and *Benin*, two little towns, containing ruins, 40 and 45 miles S.W. *Famiah* or *Kalat-el-Medyk*, 70 miles S.S.W., upon the Orontes, occupying the site of the ancient *Apamea*, where the kings of Syria had established their principal stud, and where they maintained 500 elephants. Its rich pasturages still attract a number of Bedwins, and the abundant fishery in the lake *El Taka*, which communicates with the Orontes, produced to the governor, at the date of Burckhardt's visit, £3000 a-year. *Hamah*, 93 miles S. by W., the *Hamath* of Scripture, and the Greek *Epiphania*, a large town on the Orontes, an industrious, commercial, and flourishing town, the mart for supplying the wants of the Arab tribes, who roam over the deserts between Syria and the Euphrates. Ali-Bey gives it a population of 100,000; Burckhardt, of only 30,000. *Homs*, 115 miles S. by E., the ancient *Emesa*, famous for a splendid temple of the sun, whose priest, Heliogabalus, was elected Roman emperor, A.D. 218. The plains of Homs have been the scene of two great and decisive battles; the first ending with the defeat of Zenobia, queen of Palmyra, by the Roman emperor Aurelian; and the second, 7th July 1832, when nine pashas of three tails, with their respective forces, were defeated by Ibrahim Pasha, and their army put to flight. *Palmyra*, 160 miles S.E. by S., the *Tadmor* of Scripture, a mass of splendid ruins in an oasis in the desert, the remains of a great commercial city which attained the height of its prosperity in the third century, when its queen, Zenobia, defied the arms of Rome. The present inhabitants are a few Arabs, who occupy about 30 mud huts among the ruins,

and obtain a subsistence by cultivating a few detached spots, and feeding some flocks of goats and sheep. Two small streams impregnated with sulphur run among the ruins, and are lost in the sands. In the seventh century Palmyra was still so fortified, as to stand a siege from the Kalijh Merwan, but after that period it seems to have fallen gradually to decay. *Beilan* or *Bylan*, a small town near the western entrance of the great pass, leading between Mounts Rhosus and Amanus from Aleppo to Scanderoon. From Beilan to Scanderoon the descent is very striking: the heights are lofty, picturesque, well covered with wood, and a great part of them planted with vines, disposed in the neatest order, and carefully cultivated; the summit of the pass is, by barometrical measurement, 1584 feet above the Mediterranean, and the mountain above it reaches 5337 feet. *Antab*, 65 miles N. by E., near the source of the Koikh, is a large town, with 20,000 inhabitants, in a rich and fruitful district. *Menbij* or *Bambuch*, 56 miles E. by N., where the walls still standing attest the ancient greatness of *Mabog* or *Hierapolis* (*Holytown*), sacred to the worship of the Syrian goddess Astarte, called in Scripture the Queen of Heaven. The goddess was represented by a monstrous image, half woman, half fish, and had a magnificent temple, served by 300 priests, and filled with rich offerings, which were plundered by Crassus, the co-triumvir of Cæsar and Pompey. *Shoar*, a town on the Orontes, on the road from Aleppo to Latakia, which was destroyed by the earthquake of 1822.

TRIPOLI, lat. 34° 26', long. 35° 52', called by the Turks *Tarabolus*, is built on the declivity of a hill, about a league, or half an hour's journey, from the sea shore, near the mouth of the river Kadisha. It is one of the neatest towns in Syria, the houses being all well built of stone, and neatly fitted up within; it is surrounded by luxuriant gardens, which produce abundance of oranges and lemons. The population amounts to about 15,000; among whom are several Europeans merchants, and consuls for France, England, and Austria. The principal article of export is the soap produced on the neighbouring mountains, of which it formerly exported 800 quintals every year, at about £80 the quintal: but its commerce has been lately on the decline. The next article of export is sponges, which are procured on the sea shore, the best being found at some depth in the sea: soap is exported to Tarsous for Anatolia and the Greek islands, as well as the alkali for making it, which is procured in the eastern deserts; the khan of the soapmakers is a large well-built edifice. The marina or port forms a little town by itself. Tripoli was formerly the seat of a Pasha, whose command extended from the river Ibrahaim to Latakia and eastward to the mountains.

In the eyalet of Tripoli are: *Batrun*, 15 miles S. of Tripoli, a small town of 300 or 400 houses, with a harbour for boats or small vessels. *Belmont*, 2 hours S. of Tripoli, a convent on a very high rocky mountain, of difficult ascent, which overlooks the sea. *Kanobin*, 14 miles S. E., a convent, the residence of the patriarch of the Maronites, may be considered the capital of that tribe. *Tortosa*, 30 miles N., once a very strong city, still exhibits the remains of two walls half a mile in circumference, but is now a miserable little town. Nearly opposite is the island *Ruad*, the *Arvad* of the Scriptures, the *Aradus* of the Greeks and Romans, once occupied by a Phœnician city, with houses of 5 or 6 storeys, where commerce and liberty had collected an immense population. It is now a naked rock. Only a few masses of strong walls, and numerous cisterns cut in the rocks, attest its former existence. *Jebileh* (*Gabala*) on the coast, 35 miles N. of Tortosa, is remarkable only for its antiquities, its tombs cut in the rocks, and its mosque of Sultan Ibrahim, which was demolished by the earthquake of 1822. *Jebail* or *Gebail*, 20 miles S. by W. of Tripoli, is the ancient *Byblos*, the chief seat of the worship of Adonis, whose beauty and tragical history occupy an important place in classic mythology. About a mile from the town flows the river *Ibrahim*, the ancient *Adonis*, the periodical reddening of whose waters, as if commemorative of the shed blood of Adonis, gave occasion to a famous Phœnician festival. Near Gebail is a fine sponge fishery. *Masiat* or *Masyad*, 40 miles N. E., a small town, the principal place of the Ansarians.

ACRE, or AKKA, or ST. JOHN D'ACRE (*Ptolemais*), lat. 32° 54', long. 35° 8', the capital of an eyalet, was a place of great importance in the time of the Crusades, and sustained many sieges alternately from the Saracens and Christians. It is memorable in modern history for the gallantry with which it was defended in 1799 against Buonaparte, who, after spending 61 days before it, was obliged to retreat. It was afterwards strongly fortified by Jezzar Pasha, which enabled it to endure a siege of seven months from the Egyptian army in the winter of 1831-2. Its fortifications were subsequently repaired and improved: but on 3d November 1840 the town was reduced to a heap of ruins by a three hours' bombardment from the British fleet, acting as the allies of the Sultan, and the fortress evacuated by the Egyptians. It stands at the north-east side of a fine bay, near the mouth of the river *Naamany* (*Belus*). The harbour of Acre is the best on this coast. Acre is the principal mart for the cotton of Syria, and the principal commercial nations of Europe have consuls here.

Mount Carmel, 8 or 9 miles S.W., forming the south-west side of the bay of Acre, terminates in a rocky promontory about 2000 feet high, and contains a number of grottoes once occupied by the cells and chapels of the austere order of monks called Carmelites. A very few still remain, who lead a recluse life, and are venerated even by the Mahometans, who supply their wants. The mountain bears the traces of ancient aqueducts, and of plantations of vines and olives, and on the top is a monastery built originally by the empress Helena, and recently restored in a very substantial and elegant style, chiefly at the expense of the late king of France, Charles X. At the foot of the hill, on the southern shore of the bay of Acre, is *Caipha*, a walled town, with about 3000 inhabitants. *Kaisariyah* (Greek, *Kaisareia*, Latin, *Cæsarea*), 20 miles S.S.W. of Acre, founded by Herod the Great in honour of Augustus Cæsar, and one of the finest and most magnificent cities of the East, so celebrated in the first age of Christianity, and so important during the Crusades, has now scarcely a single inhabitant; but the preservation of its walls, its harbour, and its monuments, says Count Forbin, inspires an indefinable surprise. *Nazra* (*Nazareth*), 20 miles S. E. of Acre, a mean and wretched village or town of 3000 inhabitants, contains an extensive building, the Latin convent; and the church of the Annunciation is the finest in Palestine after that of Bethlehem and the church of the Holy Sepulchre at Jerusalem. Another church contains several grottoes now converted into chapels, where popular belief places the kitchen, the bedchamber, and other parts of the house of the Virgin Mary; and not far from this, tradition shows the place where the angel Gabriel appeared to Mary, Joseph's work-shop, and the school to which our Lord went to be taught with other boys. Near Nazareth is *Cana*, a pretty little town of about 300 inhabitants, and *Mount Tabor*, the traditionary scene of the Transfiguration, where within a grotto have been built three altars in memory of the three tabernacles which Peter proposed to build. Once a-year, on the day of the Transfiguration, the Latin fathers celebrate mass here. Tabor is a conical hill, nearly detached from those around it; its form is singularly regular; the summit is flat, and commands a most magnificent view. In the same neighbourhood are the reputed scenes of several other miracles, to which the monks go in procession every year to chant the gospel on the day of their commemoration. *Tabarieh* (*Tiberias*), 30 miles E.S.E., a town with about 1000 inhabitants on the south-west shore of the Sea of Galilee, was nearly destroyed by an earthquake in January 1837. It was one of the four holy cities of the Jewish Talmud, and the residence for 350 years after the destruction of Jerusalem of the principal Jewish doctors, who founded there a school of great celebrity. *Safed* or *Safiad* or *Szafiad*, 27 miles E. by N. of Acre, a small, but well built and flourishing town, of about 600 houses, was swallowed up by the earthquake of January 1837. It was one of the four holy cities of the Jews, from which they sent forth missionaries to seek out their poor brethren; it contained a college and a printing press; and very near it was Jacob's house, consisting of magnificent tombs cut in the rock, which the Turks consider as the ancient

abode of the patriarch, and the citadel, which appeared to be one of the most ancient structures in Palestine; its walls were of extraordinary thickness and strength, and are often mentioned in the wars of the crusades. *Banias*, a village of about 150 houses, supposed to be built on the site of the ancient Dan; near which one of the branches of the Jordan issues from a cavern under a precipice. *Sûr* or *Tyre*, 28 miles N. by E. of Acre, the queen of the sea at the dawn of profane history, the cradle of commerce, and the chief city of Phœnicia, contained in the latter half of the 18th century only about a dozen of wretched huts, which sheltered a few fishermen. It afterwards began to recover, and now forms a considerable town, is well built, and contains several mosques, churches, and bazaars. The original Tyre stood on the mainland, but that having been taken and destroyed by Nebuchadnezzar, king of Babylon, the Tyrians built a new city on a small island off the coast, where they were again besieged by Alexander the Great, who joined the island to the continent by an immense mound, which now forms an isthmus. *Saide* (*Sidon*), the mother city of Tyre, 25 miles farther north, is still a considerable town, though somewhat decayed.

Beyrout or *Beirout* 65 miles N.N.E. from Acre, and 48 miles S.S.W. of Tripoli, one of the ancient cities of Phœnicia (*Berytus*), is situate in a lovely plain, with fine scenery all round. It is the port of Damascus and central Syria, and has more commercial activity than any other Syrian port. Many merchants reside in Beyrout, besides the consuls and agents of the various European powers. The town and neighbourhood have been of late greatly improved. A new lazaretto has been built by Ibrahim Pasha; and valuable productive mines of coal and iron have been found in the neighbourhood, within a few miles of the town. The white houses of the town, sloping up from the sea, are encompassed by vineyards and mulberry gardens, and the numerous villas of its merchants. That singular plant, the prickly pear, is very abundant, and often composes in part the hedges of the paths and gardens, where it is an effectual guard against forbidden feet. *Antoura*, 10 miles E. of Beyrout, is a beautiful and celebrated monastery; and three hours north of it is *Larissa*, a charming monastery, built in the Italian style, in a very elevated situation; not far from which is *Bezommar*, the finest and richest convent of Kesrouan, built upon a high mountain. *Zahlé*, 22 miles E. of Beyrout, a small town, is rapidly increasing, and is one of the places where the coal and iron have been found. *Deir-el-Kamar*, 13 miles S.E., the chief town of the Druses, consists of a large village, with 15,000 or 18,000 inhabitants, and a large *serai* or palace, which has no pretensions to elegance. *Nahar-el-Kelb* (*Dog River*), which reaches the sea about 12 miles north of Beyrout, is the ancient *Lycus*, which, according to Strabo, was navigable, though very rapid. The mountains, which are here very high and steep, come down to the sea, leaving only the road between them and the bay. In the neighbourhood, the sides of the rocks are in many places covered with Greek and Latin inscriptions, and with symbolical figures, whose meaning cannot be deciphered. *Baalbec*, at the head or north end of the valley Bekaa, near the source of the Leitani, 50 miles E.N.E. of Beyrout, formerly a considerable town, is now a mere village with 200 inhabitants. It occupies the site of *Hel opolis* (Sun-town), and contains several splendid remains, the principal of which is that of the temple of Baal, or the Sun-god, a beautiful building, with a Corinthian peristyle, built in the reign of Antoninus Pius, on the site of a more ancient fabric, fragments of which are still visible. North of Baalbec is the highest part of Lebanon, and on one of the roads from Baalbec to Tripoli are the ancient *cedars of Lebanon*, which the people of the country believe to be the remains of the identical forest which furnished the timber for Solomon's temple. Only seven of the old trees remain, but there are many hundreds of young trees growing up to supply their places. An ascent of three hours from the cedars brings the traveller to the snow-capt top of Lebanon, from which there is a splendid view of the mountain regions, of the plains at their base, and the not far distant Mediterranean. Before reaching this point, however, vegetation has expired, with the exception of a few stunted cypresses, which lose their spiral form, and, throwing out their branches sideways, have the appearance of small oaks. Every year, on Transfiguration day, the Maronites, the Greeks, and the Armenians, celebrate a mass at the foot of one of the ancient cedars, on a homely altar of stone. The nearest village to the cedars is *Bshirrai*, or *Bisharra*, 18 or 20 miles S.E. of Tripoli.

DAMASCUS, (EL SHAM of the Arabs), lat. 33° 29′, long. 36° 34′, situate in a beautiful plain, on the east side of Eastern Lebanon, watered by numerous streams which flow from the mountains eastward into the desert, where their surplus water forms a lake or marsh, called the *Bahr-el-margi*, Lake of the meadows. The plain is so extensive, that the hills which bound it to the north and south can merely be discerned from the opposite sides. Towards the north-west the mountain *Ashlun* bounds it in the distance, and on the south-east it extends to the *Jibbel-Haouran*. The city stands on the west side of the plain, not more than two miles from the place where the river *Barrada* issues from a cleft in the mountains, is studded with mosques and minarets, and is encompassed with gardens, extending in common estimation not less than 30 miles round, which gives it the appearance of a noble city in a vast wood. The gardens are planted with fruit trees of all kinds, and are kept fresh and verdant by the waters of the Barrada, which is distributed by canals and streamlets. The city is built of brick, and its streets are narrow and gloomy, the inhabitants reserving their magnificence for their interior courts and palaces. Several of the streets have rivulets running through them, which furnish plentifully the great eastern luxury of water. The principal building is the great mosque, which was formerly a Christian church, and now possesses so peculiarly sacred a character, that Franks are rarely permitted to enter it. This cathedral is one of the finest that the zeal of the early Christians produced; the architecture, which is Corinthian, is very superior in beauty and variety to that of any other mosque in Ottoman Asia. Next to it in architectural importance is the grand khan, a large and splendid building, with a very lofty roof supported by granite pillars, and surmounted by a large dome in the centre. The inhabitants of Damascus, amounting to about 100,000, have a bad reputation in the east, where *Sham Shoumi*, "the wicked Damascan," has even passed into a proverb. Formerly they were exceedingly fanatical, but since they fell under the Egyptian yoke, they have learned to be more liberal; European merchants have settled among them, and a British consul has hoisted his national flag in this holy city. Damascus has long been the most flourishing city in Syria, a distinction which it owed to the excellent character of several successive pashas, through whose exertions the whole of the territory assumed an improved and cultivated appearance. It has lost the manufacture of sword blades, for which it was famous in the middle ages; but it still has considerable manufactures of silk and cotton; and the fruits of the neighbouring plain, dried and prepared into sweetmeats, are sent to every part of Turkey. Damascus is a place of the highest antiquity, and is the point of union for the caravans of pilgrims from the north and the east of Asia, who travel towards the Holy Land of Arabia under the guardianship of its pasha. On this account it has received the name of "the Gate of the Kaaba;" but, what is of more importance, the resort of pilgrims produces a great trade, the pilgrims being careful, and indeed being expressly allowed by the Koran, to combine traffic with the more pious object of their journey. Ophthalmia and intermittent fevers are very prevalent; the former disease is attributed to the extensive irrigation, and the latter to the exhalations of the Bahr-el-margi, which, in summer, becomes a pestilential swamp. It is 140 miles N.E. by N. of Jerusalem; 180 S. by W. of Aleppo, and 60 miles E. by S. of Beyrout. *Salahieh*, a considerable village north-west of the city, contains numerous villas and gardens, and is the summer retreat of the wealthy Damascans. About a day's journey to the north-east, at *Malool*, is a number of curious grottoes, inhabited by Syrian Christians.

To the south of Damascus, and east of the Jordan, are: *Bozrah*, the ancient *Bezer* or *Bozrah*, 63 miles S., celebrated for its vineyards, but now inhabited only by about fifteen families. It is, ac-

vertheless, described by Burckhardt as the largest town in the Hauouran, including its ruins. *Jerash* (*Gerasa*), 40 miles S. by W., on a small stream, in a valley on the south-west side of Mount Gilead, is quite deserted, but the traces of its ancient walls remain, inclosing three splendid temples, two amphitheatres, porticoes, baths, and hundreds of columns, which vie even with those of Palmyra.

JERUSALEM EL KHODDS of the Arabs', lat. 31° 48', long. 35° 14', stands on part of four small hills, nearly surrounded by deep ravines, and is enclosed with Gothic embattled walls, about two miles and a half in circumference. The houses are heavy square masses, very low, without chimneys or windows, with terrace roofs or domes on the top, and presenting the appearance of prisons or tombs. The streets are narrow, dusty, and unpaved. The population has been variously estimated at from 20,000 to 30,000. The manufactures consist chiefly of objects accounted sacred; as shells of mother-of-pearl, considered as badges of pilgrimage, crosses and beads made of the stones of dates, of hardwood, or of black fetid limestone from the Dead Sea. These holy toys are purchased in large quantities by pilgrims and travellers. The principal support of the city is derived from the numerous pilgrims who resort to it from all parts of the east, and even from Spain, to visit the holy places. The principal and most conspicuous edifice is the mosque of Omar, built on the site of Solomon's Temple, and inferior in holiness only to the Beitullah 'House of God' at Mecca. It is an octagon, standing in the middle of an oblong square area, paved with white marble. The walls are externally covered with painted tiles, adorned with arabesques and verses from the Koran in gold letters, and altogether, it is one of the finest buildings in the Mohammedan world. It stands on the east side of the city, overlooking the deep valley of Jehoshaphat. The *Church of the Holy Sepulchre*, the grand object of attraction to the Christian pilgrims, was built originally by Helena, the mother of Constantine the Great, on a site which was supposed to include the scene of the greatest events of the history of our religion, the crucifixion, the entombment, and the resurrection of our Saviour. It contained also, till recently, the tombs of Godfrey and Baldwin, the first Latin kings of Jerusalem, which, however, have now disappeared; and a rent is shewn in the natural rock, supposed to have been produced by the earthquake which happened at the crucifixion. In October 1808, the ancient church was destroyed by fire; and in its stead the present building was erected, at an expense of upwards of £200,000, by the Greeks and Armenians, whose clergy have, in consequence, usurped the principal charge of the holy places, which was formerly possessed by the Latins. Of the thousands of Christian pilgrims who annually visit Jerusalem during Lent, almost the whole are of the Greek, Armenian, and other oriental churches, with scarcely a Catholic among them. Baron Geramb states, that at the period of his pilgrimage, in 1832, there were only himself and three other Catholics among 4000 pilgrims. There are three convents, belonging respectively to the Latins, the Greeks, and the Armenians, where travellers and pilgrims are hospitably entertained. The Mount of Olives overlooks the city on the east side, on the summit of which is a mosque, built on the site of a church erected by St. Helena, and occupying the very spot from which Christ ascended. In a kind of chapel, in the centre, is to be seen the print left in the rock by the left foot of our Saviour.—(See CEYLON.) The temperature at Jerusalem is exceedingly changeable; it has happened, that in the morning the heat has been suffocating, while at night snow has fallen. The city stands about 2750 feet above the level of the sea in the midst of a hilly country which is little better than a desert.

Bethlehem, 7 miles S.W. by S. of Jerusalem, the place where our Saviour was born, is still a large village, with 3-00 inhabitants, and contains a fine church, built over the site of the place of the nativity, and visited of course by numbers of pilgrims. *El-Khalil* (*Hebron*), 20 miles S. by W., in a country less arid than that around Jerusalem, has a population of 4000 or 5000 Turks and Jews. It is a pretty cheerful-looking town, on the slope of a hill, surrounded with vineyards and olive grounds. The magnificent church built by the empress Helena on the supposed site of Abraham's tomb, has been converted into a mosque, entrance to which is allowed only to Mussulmans. *Santa Saba*, 8 or 9 miles S.E. of Jerusalem, a monastery remarkable for its situation on a height, which rises precipitously several hundred feet from the deep valley of the brook Kedron. Beside it are numerous grottoes, which are said to have been inhabited by more than 10,000 monks at the epoch when St. Saba introduced the monastic life into Palestine. In continual danger from the wild Arabs, the convent appears like a fortress, with immensely strong and lofty towers. *Jericho*, 14 miles N.E., is represented by the modern *Rayah*, a miserable village of about 50 huts, or by some ruins in its vicinity, in a hot and dirty circular plain. *Nablous*, 30 miles N. of Jerusalem, one of the most beautiful and flourishing towns in the Holy Land, stands in a bold and fertile valley, surrounded by hills and embosomed in groves and gardens. The inhabitants, about 10,000, are employed in making soap and other articles for the neighbouring country. Nablous seems to be the metropolis of a very rich and extensive district, abounding with all the necessaries of life; it occupies the site of the ancient *Shechem*, which became the capital of the Samaritans after the destruction of Samaria by Shalmanaser. Its modern name is a corruption of the Greek *Neapolis*, New town. In its neighbourhood is the tomb of Joseph and the well of Jacob. *Sebasta*, 37 miles N. by W. of Jerusalem, the ancient *Samaria*, which was rebuilt by Herod the Great, and named *Sebast*, in honour of his imperial patron, Sebastos Kaisar (Augustus Caesar), and adorned with a temple of Sebastos, and other magnificent works. Its situation is extremely beautiful and naturally strong, on a fine large insulated hill, compassed all round by a broad deep valley, which again is surrounded by four hills, and cultivated in terraces to the top, sown with grain, and planted with fig trees and olive-trees. The hill of Samaria likewise rises in terraces to a height equal to any of those around it. The present village is small and poor; but on the hill in different places are remains of the ancient buildings. *Jaffa* (*Jaffa* or *Yaffa*), 40 miles N.W., formerly *Joppa*, one of the most ancient sea-ports in the world, its history stretching far back into the twilight of the early ages, is situate in a fine plain on the shore of the Mediterranean, and owes its continued celebrity and importance to its being the port of Jerusalem. As a station for vessels it is one of the worst on the coast. The present town stands on a promontory jutting into the sea, rising about 150 feet above its level, and offering on all sides picturesque and varied prospects. The interior of the town has all the appearance of a poor village. The streets are very narrow, uneven, and dirty; the inhabitants are estimated at between 4000 and 5000, of whom the greater part are Turks and Arabs; the Christians being only about 600, and consisting of Roman Catholics, Greeks, Maronites, and Armenians. The Latins, Greeks, and Armenians, have each a small convent for the reception of pilgrims. *Ramlah*, 35 miles N.W., on the road from Jerusalem to Jaffa, supposed to be the ancient *Arimathea*, is a pleasant town, situate in a fertile plain, with a population of 5000, who are principally engaged in agriculture. *Scalona*, 50 miles W. by S., an inconsiderable town, representing the ancient *Askelon* or *Ascalon*, a city of the Philistines. Askelon was of great note among the ancients for a temple of Derketo or Astarte, the Ashtaroth of scripture, who was here worshipped in the form of a mermaid, and is said to have been the mother of Semiramis. *Gaza*, 56 miles S.W., is a little town with 4000 or 5000 inhabitants.

§ *Cities, Towns, and Remarkable Places, in Algezira or Mesopotamia.*

DIYARBEKR or DIARBEKR, lat. 37° 56', long. 39° 52', the ancient *Amida*, is situate on the right bank of the Tigris, with intervening gardens between the river and the town. The town in its prosperity contained 40,000 families or houses, and numberless looms in constant work; it enjoyed an active trade with Baghdad in Indian, and with Aleppo in European produce, and was one of the most flourishing and wealthy cities of Asia. The plain was cultivated in every part, and covered with villages

and within three miles of the gates were several villages, each containing from 400 to 500 houses and more than one Christian church. But since the commencement of the present century, all this prosperity was destroyed by the Kurds, who plundered the caravans, and kept the city in a state of siege. The assailants were repressed by Reshid Pasha in 1837, and the communication re-opened; but since his defeat at Nezib, by the Egyptians, in 1839, the Kurds are said to have again broken loose. The climate, though excessively hot in summer, cannot be considered unhealthy, and in winter the temperature is delightful. The Tigris is not used as a channel of communication so high up, but rafts of timber are sometimes floated down from the mountains above the town.

About 36 miles north-west of Diyarbekr, is *Arghaná*, situate under a lofty peak, surmounted by a large Armenian convent, which overlooks a vast plain. It contains about 600 families, but appears in a very dilapidated state. Ten miles N. by W. is the copper mine of Arghana (*Arghaná-Maden*), around which are collected 743 families, of which 270 are Greek, 173 Armenian, and 300 Turkish, the first and the last being all engaged in directing or working the mines, the Armenians are tradesmen or artisans. From the mine to the town the road lies over steep, difficult, and barren mountains. In this neighbourhood, also, the sources of the Tigris are only 10 miles distant from the waters which flow to the Murad. In the district of Diyarbekr, 24 hours' distant, is *Sert*, believed by D'Anville and Kinnear to represent the ancient *Tigranocerta*; but according to M. Saint Martin, Diyarbekr itself is the Tigranocerta, where Tigranes, king of Armenia, was defeated by Lucullus, 67 years B.C.

In the valley of Diyarbekr, or the upper Tigris, there are no other places of any importance. The watershed between the Euphrates and the Tigris, in this neighbourhood, is the *Karajeh-dagh*, which extends in a direction parallel to the Tigris, at no great distance from the river. Between these mountains and the Euphrates itself, lies the pashalic of Orfa, which contains *Orfah*, the ancient *Edessa*, 40 miles east from the Euphrates, on the banks of the little river *Daisan*, which, after joining the *Giallab*, falls into a small lake about 25 miles below the town. Orfah is built on parts of two hills, and in the valley between them, and is surrounded by a wall three or four miles in circuit. The streets are narrow but paved, and not dirty, the bazaars numerous and well supplied, the khans also numerous, and some few caravansaries excellent. The number of mosques with minarets, seen from without, is fifteen; but the one which is held in the highest reverence and esteem, is that of *Ibrahim-el-Khalil* (Abraham the friend), which contains a tank or pool teeming with fish, which are preserved in honour of the patriarch Abraham, this town being the supposed *Ur of the Chaldees*. The manufactures of the town are confined chiefly to articles of the first necessity, principally coarse woollen and cotton cloths. The population is estimated by Mr. Buckingham at 50,000, among whom are about 2000 Christians and 500 Jews, the rest being Mahometans. *Racca*, 85 miles S. by E. of Orfah, also gives name to the same pashalic, and stands on the northern or left bank of the Euphrates, where it receives the waters of the small river *Beles*, or *Belish*, or *Belejish*. Racca is the Greek *Nicephorium*, and was once the favourite residence of the Khalif Haroun-al-Raschid, the ruins of whose palace may still be seen. It is now a very insignificant place, containing only about 30 houses. *Haran*, the place of Abraham's sojourn, before he went into Canaan, and famous in latter times, under the name of *Charræ*, for the defeat of the Triumvir Crassus by the Parthians. At *Jaour-Khouri*, 12 miles east of Orfah, is an immense number of artificial caves regularly arranged, presenting the remains of a subterraneous city. *Nisibin* (*Nisibis*), 120 miles E. of Orfah, and nearly the same distance N.W. of Mosul, was formerly a strong Roman fortress, and the frontier city between the Romans and the Parthians; but only the foundations of its walls remain, the interior being filled with stones and rubbish, and containing a hamlet of some thirty houses. *Dara*, 30 miles W. by S. of Nisibin, is another fortress, now in ruins, whose foundations may be traced more than two miles. *Merdin* or *Mardin*, 60 miles S.E. by S. of Diyarbekr, is the old Roman town of *Mardis*, the walls of which are still in tolerable repair. It consists of about 3000 houses, looking down from its heights of calcareous rocks on the plains below. It used to be reached by a stair more than a mile in length, cut in the rock, at the top of which is the gate, but the stair is now converted into a good road. The site of the town is so elevated, that the Turks say the inhabitants never see a bird flying over their heads.

Along the course of the Euphrates: *Bir*, on the east bank of the river, situate on a steep acclivity, contains between 1800 and 2000 houses, and is 3½ days' journey from Aleppo by caravan, lat. 36° 59′, long. 38° 7′. The stream is here very wide, and so rapid, that often the ferry boats can only cross it in an oblique direction. The inhabitants are Turks, who also extend about 5 or 6 miles down the river, and are described as a peaceable people. The Arab tribes commence about 14 hours below Bir, where there are some ruins called *Bilhah*, on the left bank. About 8 hours below Bir, on the right bank, are the ruins of *Salamia*. *Giabar* is a town of about 1000 houses and tents, 35 hours below Bir, on the left bank, near which there is an abundant supply of bitumen. *El-Der*, supposed to be the ancient *Thapsacus*, on the right bank, contains about 1500 houses. *Karkasia* (*Kirkesion* of the Greeks, *Circesium* of the Latins, *Carchemish* of the Hebrews), at the mouth of the Khabour. *Annah*, 170 miles below Racca, on the right bank, consists of one long, narrow, winding street, running along the narrow space between the river and the high grounds. The town contains two mosques, and about 1800 houses. *Hit*, 33° 43′ N. lat., 42° 27′, E. long., contains about 1500 houses, built round a long hill, which rises parallel to the right bank of the river. The houses are generally one or two storeys high, and flat-roofed; the streets are narrow, dirty, and steep. In the neighbourhood, for miles both above and below, there are numerous springs and streams of salt water and bitumen. *Felujiah*, 140 miles below Hit, is a castle on the left bank, with a floating bridge. At *Musseib*, 70 miles farther down, is also a bridge of boats 160 yards long. *Hillah*, a large well-built town of 10,000 inhabitants, 440 miles below Annah, and 460 from the Persian gulf. About two-thirds of the town are on the right bank, the rest on the left, with a bridge of boats between them, 450 feet long, the depth of water being 18 feet at the lowest season. The bazaars are good, and well supplied with meat, fish, rice, and even luxuries; the city is regularly governed, in general quiet, peaceable, and well disposed towards strangers and Franks. It is surrounded with a good wall, and the governor's house is also fortified. Below Hillah are the towns of *Dewaniyeh*, *Lemlun*, and *Semawah*, the last of which is celebrated for its cotton cloths, which are much esteemed throughout the East.

Hillah is situate within the precincts of *Babylon*, and built with bricks dug from its ruins. A few shapeless mounds are all that now remain of *the glory of the Chaldees' excellency*; the majority of which lie on the left, or east bank of the Euphrates, within five miles north of Hillah; but the most remarkable of all the ruins is on the west side of the river, five miles south of Hillah. This is an oblong hill surmounted by a tower, the circumference of its base measuring exactly 722 yards, and its height to the bottom of the tower 190 feet. The tower itself is a solid mass of the finest kiln-burnt brick-masonry, 35 feet in height, making the total height of the pile 225 feet. Two distinct stages of building are discernible along the sides of the hill; the tower forms apparently part of a third, above which there may have been others, decreasing gradually in their external dimensions so as to give the entire building a pyramidal form. The whole summit and sides are furrowed into deep hollows and channels, strewed with broken bricks, stamped with three, four, six, and seven lines of writing; stones, glass, tiles, large cakes of bitumen, and petrified and vitrified substances. Around it are several mounds and ruins; it is called the *Birs Nimrood*, and is believed by many to be the identical tower of Babel, afterwards converted into the temple of Bel, and destroyed by Xerxes, and which Alexander the Great attempted to restore. But Mr. Ainsworth supposes it to represent the *Borsippa* or *Birsitta* of the Greek and Latin geographers; while Mr. Rich, Major Rennel, and others, suppose the

tower of Babel and temple of Bel to be the ruin now called the Mujelibah, on the east bank of the river, ten miles from the Birs Nimrood.

At some distance west of the Euphrates, in the neighbourhood of Hillah, are situate three places of great historic and religious fame, watered by canals from the river. *Cufa, Kufa*, or *Kufa*, 2½ miles S. of Hillah, from which the letters of the Arabic alphabet have got the name of Cufic, was enlarged, if not built by Omar, who made it the residence of the Khalifs; but after the building of Backdad, it fell into decay. At present there remains little more than the mosque where the Khalif Ali was murdered, a plain building held in peculiar veneration. Ali's burial-place "was concealed from the tyrants of the house of Ommiah, but in the fourth age of the *hegirah*, a tomb, a temple, a city, arose near the ruins of Cufa. Many thousands of the Shiite repose in holy ground at the feet of the vicar of God; and the desert is vivified by the numerous visits of the Persians, who esteem their devotion not less meritorious than the pilgrimage of Mecca."—*Gibbon*, c. l. The city of *Meshed-Ali*, 5 or 6 miles W. from Cufa, is of the size and form of the modern Jerusalem. The tomb of Ali is within a handsome mosque in the centre of the city. All the tyrants of Persia down to Nadir Shah enriched it, says Gibbon, with the spoils of the people. The dome is of copper, with a bright and massy gilding, which glitters in the sun at the distance of many miles. *Meshed-Hussein*, about 30 miles N.W. of Hillah, is built on the spot where Hussein, the eldest son of Ali, and grandson of Mahomet, was killed by the emissaries of the Khalif Yezid, A.D. 680, in the plain of *Kerbela*. The town is larger and more populous than that of Meshid-Ali, and is principally supported by the influx of Persian pilgrims, who come here to worship at the shrine of the martyred Hussein: and whose bodies are brought in great numbers to be buried in so holy a spot. Meshid-Hussein was plundered of all its treasures by the Wahabees; and the reliefs of Meshid-Ali were carried off by the Pasha of Bagdad, to save them from the same fate but were never returned. Below these places, the last town on the Euphrates is *Sok-el-Sheikh* (Lord's market), 70 miles above Korrah, on the south bank of the river, which contains about 20,000 inhabitants, most of whom live in huts without the walls which enclose only a few brick houses. It was built above a century ago by the sheikh of the Montefage Arabs; is the great resort of Bedwins from all parts of the desert; and contains several wealthy merchants, who carry on a great trade.—*Ainsworth*, *Heathcot*, I. *Pell*.

Descending the Tigris from the valley of Diyarbekr, the first place of importance is *Mosul*, a large, ancient, gloomy-looking town in a state of visible decay. It stands on the west bank of the river in lat. 36° 20', long. 43° 6', and contains about 35,000 inhabitants, with the remains of some fine buildings. It carries on some trade, has some unimportant manufactures, and gives name to the well-known article *muslin (mousseline*, cloth of Noul). Exactly opposite, on the east side of the Tigris is the village of *Nunia*, occupying a part of the site of the ancient *Nineveh*; the only remains are mounds of earth, like those of Babylon, which are nearly a mile in circumference, but neither so high nor so perfect. About a day's ride north of Mosul, is the monastery of *Rabban-Hormuzd*, belonging to the Chaldaean Christians, and the residence of their metropolitan; and about a mile nearer the city is the village of *Al Kosh*, the reputed birth-place of the Prophet Nahum, and containing his tomb. *Erbil* or *Arbela* (*Arbil*), 25 miles E. of Mosul, gives its name to the last great battle fought by Alexander the Great with Darius King of Persia. The battle, however, was not fought here, but at *Gaugamela*, nearly midway between Erbil and Mosul. The inhabitants are Kurds and Turks. Erbil would once evidently a very large town, but is now in great decay. It is built on a round flat-topped hill, about 70 feet high, surrounded by a wall enclosing about 1000 houses; and there are about 500 more at the foot of the hill. *Abou Kapri* Golden bridge), 26 miles S. of Erbil, is a small town on an island in the Little Zab river, which is crossed here by two bridges of brick-work; and 24 miles farther south is *Kerkuk* (*Kirkuk, Kirkook*), a large town of 15,000 or 20,000 inhabitants, built partly on a hill like that of Erbil, and partly on the plain below. About 80 miles east of Kerkuk, is *Sulemania* or *Sulemaniya*, or *Suleimaneh*, the principal town of Turkish Kurdistan, situate in a sort of ravine, and containing about 20,000 Moslems, 130 of Jews, 9 of Chaldaean Christians, and 5 of Armenians; 6 khans, 5 baths, and 15 mosques. In winter the cold is sometimes intense, especially when strong easterly winds prevail; in summer, the east wind is hot and relaxing, blowing with prodigious violence sometimes several days in succession. *Kahaf*, at the mouth of the great Zab. *Nimrud*, at the mouth of the little Zab. *Tekrit*, a ruined fort near the mouth of the Tenk. *Deir, Samara, Karghoun*, a resort of pilgrims, and *Baghdad*.

Baghdad stands on the Tigris in N. lat. 33° 20', and E. long. 44° 24'. It is a large, but decayed city, surrounded by an ancient embattled brick wall, about 7 miles in circumference. The city is built entirely of brick, and contains no buildings of either elegance or importance. The river part in stands on the left bank of the river, which is crossed by a bridge of boats, 670 feet long. The desert comes up to the very walls. Baghdad is the capital of an eyalet, which includes all the country from Mosul to Bussorah; it was founded by the Kaliph Mansoor-ibn-Dewanik, in the 13th year of the Hejirah, or A.D. 706, and continued to be the residence of his successors till A.D. 1258, when it was taken, and the Kalifate terminated, by Holagu, the son of Jengis Khan. It came finally into the possession of the Turks, in 1638; and was recently recovered by the Sultan from the control of an almost independent pasha. Three miles north of the city is the mosque of *Camaret*, or *Kazimeyn*, built over the remains of the eleventh of the twelve Imams (see p. 121), and forming one of the handsomest structures in Mesopotamia; and, just without the city walls, on a sloping eminence surrounded by an extensive cemetery, is the tomb of Zobeide, the well-known wife of the Caliph Haroun-al-Raschid. The climate of Baghdad is salubrious, but, in the strictest sense of the word, excessive; the summer's heat reaching 120°, and sometimes even 140° Fahrenheit; and the winter's cold being relieved very low by the icy breezes from the neighbouring mountains. The cold season continues from the middle of December to the middle of February, when the warm weather begins, and gradually increases to the scorching heat of summer. From April till October the inhabitants spend the day in their *serdabs*, or underground apartments, and the nights on the roofs of their houses.

About 20 miles below Baghdad are the ruins of two ancient cities, on the opposite banks of the Tigris. *Seleucia (Selukeia)*, built by Seleucus Nicator, king of Syria, once contained 600,000 souls, and engrossed all the commerce and the wealth of Babylon; but time, violence, and the inundations of the river, have levelled everything. Bricks, tiles, and pottery of every colour, stones, glass, shells, compose what now remains of the once magnificent city. On the opposite, or eastern, bank of the river, are the ruins of *Ctesiphon*, built by the Parthians, within three miles of Seleucia, in order to depopulate and impoverish it. It contains one magnificent monument in a perfect state of preservation; but without an emblem to throw any light upon its history; and with no proof or character to be traced on any brick or wall. This stupendous fragment called *Tauk-Kesra*, is part of the terrace-built bricks, and measures 300 feet along the front or eastern face. It is divided by a high semicircular arch (*tauk*) of 86 feet span, which rises to the height of 103 feet, and is supported by walls 16 feet thick. All round are fragments of walls and masses of brickwork, and vast substructures encumbered with heaps of earth. On account of the vicinity of these two cities, the Arabs have given them the common name of *Al Madain (the two cities.)* Ctesiphon was taken and sacked by the Arabs in A.D. 637, and the plunder obtained was immense. This event was followed by its desertion and gradual decay, and the building of Baghdad finally reduced both of these cities to insignificance.

Kermanshah, Kerrind, Kermah, Carmah, the *Apamea* of the syrian Greeks, stands on the point of land formed by the confluence of the two great rivers. It is a warm and opulent place; but extensive

ruins attest its former importance. On the west bank of the Shat-el-Arab, 48 miles below Kornah, and 86 from the sea, stands Bussrah (*Bussŏrah*, *Basra*, *Basrah*, *Bozra*, *Balsŏra*, *Bassŏrah*, *Busrah*), a large commercial city. The position of the British factory, which is nearly in the centre of the town, has been determined to be in lat. 30° 29′ 30″, long. 47° 34′ 15″. The town is of an irregular oblong square form, surrounded by brick walls 8 or 9 miles in circumference, forming an effectual defence against the Arabs; but of the enclosed space not more than a fourth is occupied by houses, the rest being partly filled by ruins, or partly laid out in corn fields, rice grounds, date groves, and gardens. The walls and most of the houses are built of sun-dried bricks. The population has varied, at different times, from 500,000 to 50,000, of whom about one-half are Arabs, one-fourth Persians, and the other fourth a mixture of Turks, Armenians, Indians, Jews, Catholic Christians, and a few Kurds and Europeans. The situation is so highly favourable for trade, that in spite of every obstacle occasioned by a bad government, and an unsafe passage by land or water, it continues to enjoy a commerce sufficient to enrich many by its profits, and to furnish the means of subsistence to its large population. The ruins of the more ancient *Balsora* are at the distance of 8 miles from the modern city. The country immediately surrounding the city is a desert, with a horizon as level as the sea, and is covered with water for six months in the year. The climate is excessively hot from April till October, but the heat seldom rises above 110° Fahrenheit. On the east bank of the Shat-el-Arab, and on the north side of the Hassar canal, below Bussrah, is *Mohammérah* or *Mohamra*, a small place, where the steam-vessels occasionally stop.

ARABIA.

ASTRONOMICAL POSITION.—Between 12° and 36° N. lat., and 32° and 60° E. long.

BOUNDARIES.—*South-western*:—The Red Sea. *South-eastern and Eastern*:—The Arabian Sea. *North-eastern*:—The Persian Gulf and the river Euphrates. *North-western*:—Syria and Palestine, where, however, the boundaries are not precisely defined.

DIMENSIONS.—From the Isthmus of Suez, in the north-west, to Cape Ras-al-Had in the south-east, Arabia measures 1650 miles; from Suez to the Straits of Bab-el-Mandeb, 1300; from Bab-el-Mandeb to Ras-al-Had, 1250; from Bab-el-Mandeb to Racca, on the Euphrates, 1940; and from Gaza, on the Mediterranean, to the mouth of the Shat-el-Arab, 840. The superficial area is computed at about 834,400 square English miles.

Beled-el-Arab (Arab land), and *Jezirat-el-Arab* (Arab island or peninsula) are the usual native names of the country. The Persians and Turks call it *Arabistan*. The singular word *Arab* is used as a collective noun, to designate the people; but its etymology and meaning are uncertain.

GENERAL ASPECT.—Arabia is a large peninsula, having the greater part of its boundaries washed by the sea and the Euphrates, and occupies the south-western corner of Asia. It appears to be an immense pile of naked mountains and table-lands, encircled by a belt of flat, dry, sandy ground, along the sea coasts.

The north-western portions are mountainous; the triangular peninsula formed by the fork of the Red Sea is very rugged. The ridge of Anti-Libanus, or at least a continuation of it, after skirting the Dead Sea and the Ghor, runs along the coast parallel to the Red Sea, at a distance of from 30 to 80 miles, and sometimes approaches closely to the shore. It increases in elevation as it extends southwards, and appears to be continued in a line parallel to the shore of the Indian Ocean as far as Oman. These mountains diverge into the interior in ridges, which increase in elevation as they recede from the sea; in clear weather they are visible for 60 or 70 miles, and the distant peaks have a rugged pointed outline. Between their bases and the shore extends a lowland border of varying width, called by the Arabs the *tehamah*, which is generally desert and barren, but is cultivated in a few spots. The country to the east and the north of the mountains is higher than the low country along the coast, by so much as two thirds of the height of the mountains, and appears to form an immense table-land or series of elevated deserts, sloping generally towards the Persian Gulf and the Euphrates. No part of Arabia contains rivers or large streams, in the proper sense of the word; though the coast lands are intersected by numerous ravines, called *wadys*, which contain torrents during the rainy season. The dryness of the atmosphere is so great, that it sometimes does not rain for several years in succession. It is only, therefore, those lands which are situate at the foot of hills, and can be watered artificially, that are susceptible of cultivation; and without the help of the wady-torrents, which are intercepted by dams, collected in ponds, and turned from their course upon the land, scarcely any crops could be raised. The peninsula, however, contains many well-watered spots, and wells are interspersed throughout the deserts in numerous oases.

CLIMATE.—Arabia partakes of the climate of northern Africa. The mountains of Yemen are moistened by regular showers from the middle of June till the end of September; but even then the sky is seldom overcast for 24 hours together, and during the rest of the year not a cloud is to be seen. In Oman the rainy season begins in November, and continues till February; but along the south coast it begins in February, and lasts till the middle of April. The air is everywhere generally dry, and always hot; the average temperature of the year is reckoned at 85° Fahrenheit; but during summer, particularly in the low country along the Red Sea, the heat is intense, the thermometer at Mocha rising to 98°. In the hill country of Saana, north-east of Mocha, frost is sometimes, though rarely, felt; and falls of snow take place in the interior, which, however, never lies long. The nature of the winds differs according to the tract they have passed over, so that the same wind is in different places moist or dry. The winds which blow from the deserts are naturally of the latter kind; but it is only in the northern part of the peninsula, in the deserts between the Euphrates and Syria and Mecca, that the much-dreaded *Simoom* or *Samiel* is felt; and even that blows only during the intense summer heats. The Arabs are said to perceive its approach by its sulphureous odour, and by an unusual redness in the direction from which it comes. The only means of escaping from one of these poisonous blasts is to lie flat on the ground till it has passed over; and even the animals instinctively bow their heads, and bury their noses in the ground. The effects of the simoom on those who face it are instant suffocation, and the immediate putrefaction of the body, which is observed to be greatly swollen. In the driest tracts, near the sea, the dews are singularly copious; but the natives nevertheless sleep in the open air; and Niebuhr says that he never slept more soundly than where he found his bed all wet with dew in the morning. At night the stars shine forth with a brilliancy unknown in other regions. In the desert the cold of the night is in proportion to the heat of the day; fevers, notwithstanding, appear to be unknown; and the Bedwin who sleeps in the sand receives additional vigour and vivacity from the purity of the air which he breathes in his slumbers.

GULFS, BAYS, STRAITS.—The *Arabian Gulf* or *Red Sea* is a great inlet of the Indian Ocean, extending in a north-westerly direction between Arabia and Africa, through 18° of latitude, or from 12° 30′ to 30° 10′ N., a distance of 1,400 miles, with a breadth varying from 200 to 120, where undivided. Its northern portion is divided into two smaller gulfs, those of *Suez* and *Akaba*, which are very considerably narrower than the main sea. The Gulf of Suez extends about 200 miles in length, with a breadth varying from 10 miles to 40; the gulf of Akaba is about 100 miles long, but only 7½ wide at its entrance, and has the appearance of a narrow deep ravine, along which the hills rise in some places perpendicularly at the distance of 200 feet from the water. It is exceedingly stormy and dangerous

The Red Sea is full of coral reefs; and with the exception of occasional gaps, through which there are navigable channels, a continued line of these runs parallel to the shore along the whole Arabian side of the gulf. The average width, however, of the clear sea is 100 miles, and the depth almost unfathomable; and within this clear space it may be navigated at all seasons, without impediment from the reefs; only one of which, that of the *Dædalus*, is found within the whole extent. The monsoons, which blow periodically in the Indian Ocean, do not extend to the Red Sea; the wind, however, blows with equal violence from opposite quarters at the two extremities, leaving a considerable space which is subject to light breezes and calms. North-westerly winds prevail throughout the year, in the northern part of the sea; but, during June, July, and August, they attain their greatest strength, occasionally blowing home through the Straits of Bab-el-mandel, to the very limits of the south-west monsoon, and driving the water before them to such an extent, that reefs which are usually covered appear three or four feet above the surface. The duration, however, of such gales, rarely exceeds three or four days, and is usually succeeded by light breezes. In the southern portion southerly winds prevail for nine months of the year; in October, November, and December, they not unfrequently blow home to Suez, also raising the water perceptibly in that direction; but on ordinary occasions, their violence is not perceptible for more than 150 miles above Mokha. The temperature of the atmosphere, compared with that of the Persian gulf, is moderate. The north-west winds are cool and refreshing; but those from the south are damp, sultry, and unwholesome. During the prevalence of the latter in September and October, the humidity of the atmosphere is very great in the warmest days, and the heavy dew at night is particularly disagreeable. In the upper portion of the sea, during the prevalence of northerly breezes, the atmosphere is of uncommon purity, and every object can be perceived the moment it rises above the horizon. In the daytime a cloudless sky throws its deep blue tinge over the sea, which is more clear and pellucid than the tideless Mediterranean, except when the surface is agitated by the tempests which so frequently sweep over it, and raise its waters into snowy-crested waves. The nights are equally pure and clear, and though the coast of Hedjaz is said to be unhealthy, it is not found to be so at sea. The Red Sea communicates with the ocean by the Straits called *Bab-el-mandeb* (Gate of tears), which measure, between the opposite shores, 14½ geographical, or nearly 17 English statute miles across; they are divided by the island of Perim into two portions, of which the eastern is little more than 2 miles wide, and the western, 13. The soundings in the smaller strait vary from 8 to 14 fathoms; but in the middle of the other no bottom can be found with 120 fathoms. This larger strait is, however, divided by the *Jezirat-us-Sibah* or *the Brothers*, a cluster of rocky islets, extending 6 miles east and west, 10 miles south of the most southerly point of Perim. The strait is formed on the Arabian side by *Ras Bab-el-mandeb*, a prominent cape, visible from a ship's deck on a clear day at the distance of 35 miles; its highest peak, *Jebel Manhali*, rises 860 feet, and stands in lat. 12° 41′ 10″, N., long 43° 32′ 14″ E. On the African shore *Ras Sejan*, a gloomy-looking peak 340 feet high, projects northward from the coast, with which it is connected by a swampy piece of lowland 700 yards wide. (*Journal R. Geog. Soc. Lond.* IX. 127.)

Beyond the Strait is the *Gulf of Arabia*, more commonly called the *Gulf of Aden* or the *Gulf of Bab-el-mandel*, which extends east and west nearly 600 miles, with an almost uniform breadth of about 200. On the south coast of Arabia is the large open bay of *Curia-muria* or *Kooriya-mooriya*, with good soundings throughout. The *Gulf of Oman*, formerly called the *Gulf of Ormus*, extends 320 miles from S.E. to N.W., between Arabia and Persia, with a breadth varying from 200 miles at its eastern extremity, to 50 or 60 where its meets the *Persian Gulf*. The latter is a large gulf which penetrates 600 miles into the continent in a north-westerly direction from the Strait of Ormus, with a breadth varying from 230 miles to 130. Along the Arabian shore a great pearl bank extends from *Sharja*, 47 miles S.W. by W. of Ras-el-Khaimah, to *Biddulph's Group*, 400 miles N.N.W. up the gulf, with a breadth of 150 miles. The bottom consists of shelly sand and broken coral, and the depth of water varies from 5 fathoms to 15. The right of fishing for pearls is common to all; the fishery continues from June to September; during the rest of the year the weather is too cold. During the season, every person who can procure a boat, or a share in one, is employed. The boats are of various sizes and forms, averaging from 10 to 50 tons; Bahrein is computed to furnish of all sizes 3500; the Persian coast, 100; and the coast between Bahrein and the entrance of the gulf, 700. The annual value of the pearls obtained is estimated at £100,000 sterling; and the number of people employed is about 30,000. The heat of the atmosphere in the Persian Gulf is not surpassed by that of any other place in the world; the nights being short, neither land nor sea has time to cool; even the heat of the sun when on the horizon is sufficiently great to be disagreeable; the sailors say it rises red hot. From sunrise till about an hour before noon, when the sea-breeze sets in, the heat is almost intolerable.—(*Wellsted.*) The Persian Gulf receives at its northern extremity the waters of the great rivers Euphrates, Tigris, Jerahi, and others.

CAPES.—*Ras Mohammed*, a low promontory, forms the southern extremity of the triangular peninsula of Mount Sinai. *Ras Bab-el-mandeb*, the south-western point of Arabia. *Ras-al-had* (Flat Cape), a sandy point at the south-eastern extremity of Arabia. *Ras Muscndon*, an insulated rocky point at the entrance of the Persian Gulf, is separatad from the mainland by a very deep channel not more than 400 yards wide. *Ras Reccan*, the most northern point of a peninsula which projects about 100 miles into the Persian Gulf, on its south side.

ISLANDS.—In the Red Sea are: *Graa* or *Jezirat Pharoun*, named also by the Arabs *Kalat-el-dier*, is a small islet at the head or northern extremity of the Gulf of Akaba, consisting of two rounded hillocks joined by a flat isthmus, the whole being encompassed by a massive wall, with square towers at the angles. The island was noted in the wars of the crusaders.—(*Wellsted, Laborne.*) *Tehrum* or *Tiran*, a hilly island with a high peak, is destitute of water, and inhabited only by a few fishermen. It was anciently sacred to Isis, and is one of a group which lies opposite the mouth of the Gulf of Akaba. *Jebel Teir*, a pyramidal islet, 6 miles in circumference, is 1300 feet high, and inhabited by a few fishermen. N. lat. 15½°. *Jebel Zigger* (the isle of prayer), sterile and uninhabited rocks of volcanic formation. *Sabaquien Islands*, fourteen barren rocks, pyramidal and volcanic, to the south of Jebel Teir. *Sughair* and *Harnish*, two large islands in a group called the *Arrow Islands*, 14° N. lat. *Perim* or *Meyun*, a small rocky island which divides the strait of Bab-el-mandeb. *Camaran* or *Kamaran*, a large island near the coast, south of Loheia, which is used as a depot for coals to supply the steam-vessels. *Abdul-Kudir* or *Palinurus Shoal*, a dangerous patch, discovered by the H.E.I.C.'s ship Palinurus, in 1835, 8½ miles off shore, 14° 54′ 50″ N. lat., 50° 45′ 20″ E. long. E. by N. of Makulla.

Bahrein, *Baharein*, or *Aval*, a large island in the middle of a bay on the southern shore of the Persian Gulf, measures 27½ miles long, and 10 broad; the middle of its breadth is occupied by a range of hills, but its shores are very low, and surrounded with shoals, most of which are dry at low water. It is very fertile, and covered with plantations of date trees; it has also numerous springs of excellent water in the interior, but none near enough the harbour to be available for shipping, which are supplied from the bottom of the sea, 18 feet deep, where there is a spring of good fresh water. The chief town, named *Manama*, is a large and populous place at the northern end of the island, in 26° 14′ N. lat., 50° 36′ E. long., with about 40,000 inhabitants. The houses are well-built, and the town altogether is more respectable than any other in the Persian Gulf. The bazaar is well supplied with fine cattle, sheep, poultry, fish, and vegetables; an extensive trade is carried on with all the tribes along the

coast, in which upwards of 140 vessels are employed. But the principal source of its prosperity is the pearl fishery. The harbour is formed on the east side by the island of *Arad*, which is very low, and is nearly divided by the sea at high water, though the tide rises only seven feet. It contains the town of *Maharag*, about a mile east of Manama, but not nearly so populous. On the west side of Bahrein, is another small island, named *Jelel Hussein*, which is low and uninhabited. The group is surrounded by shoals and flats, one of which, named *Teignmouth Shoal*, extends 15 miles to the northward, with a breadth of 14 miles, and is in many parts dry at low water. The bay which contains these islands, extends 70 miles inland, between Ras Reccan and Ras Tanhora, but is so completely filled with shoals as to be quite unnavigable for ships of burden.

MINERALS, VEGETABLE PRODUCTIONS, AND ANIMALS.—According to Niebuhr, Arabia contains no mines of gold or silver, though the latter metal is found in small quantities among the lead of Oman. Iron mines exist in the north of Yemen. Rock salt is wrought near Loheia, and several other places; the beds of the Red Sea and the Persian Gulf abound with coral, and on the southern shore of the latter is the great pearl bank of Bahrein. The country is rich in indigenous trees, as the Indian fig tree, the date tree, which produces the staple article of food to the desert tribes; the cocoa palm, the fan palm, and other sorts of palms and fig trees; the corneil tree, the plantain or banana, the almond, the apricot, the pear, the apple, the quince, the orange, the acacia, which produces gum-arabic, the mangoustan, the papaya, the sensitive plant and other mimosas, the balsam tree, and the tamarind. There is, however, in the country, little timber fit for building, the wood being mostly of a light porous texture. Among the shrubs may be mentioned the coffee-plant, the indigo shrub, the castor-oil plant, the senna, aloe, styrax, sesamum, cotton, sugar-cane, betel, nutmeg, all sorts of melons and pumpkins, the *wars*, which yields a yellow dye, the *fouw*, which supplies a red dye, and a great variety of leguminous plants, pot-herbs, and officinal herbs. Among the odoriferous plants are lavender, marjoram, the white lily, the globe amaranth, the sea daffodil, various kinds of pinks, and other plants. Wheat, turkey-corn, and dhourra, abound in the plains of Yemen and other fertile districts; also barley, with which the Arabs feed their horses, and beans, which serve as food for their asses. Manna, answering precisely to the description given by Moses of the food of the Israelites, is produced abundantly from a little thorny shrub, in all the deserts. Arabia is distinguished for her breed of horses, the character of which is, that they are spirited, active, and of the most generous temper. Perhaps, it has been said, the genuine Arabian steed is the most compact piece of powerful and efficient mechanism in the brute creation; but the horses are generally of small size, and in no way remarkable for beauty. The Arabs pay the utmost attention to the genealogy and education of this faithful friend, which indeed is brought up as one of the family; the colts live in the tents among the children, and are treated with a familiarity and tenderness which produce gentleness and attachment. They are accustomed, says Gibbon, only to walk and to gallop; their sensations are not blunted by the incessant abuse of the spur and the whip; their powers are reserved for the moments of flight and pursuit; but no sooner do they feel the touch of the hand or the stirrup, than they dart away with the swiftness of the wind; and, if their friend be dismounted in the rapid career, they instantly stop till he has recovered his seat. There are two distinct breeds of horses: the one called *kadish* (of unknown descent), is in no higher estimation than the common horses of Europe, and is employed to carry loads, or for draught; the other breed, called *kohelli* or *kohlani* (of ancient and noble pedigree), is reserved for riding only. The best horses are bred in the Syrian deserts; they are valued more for their attachment and their amazing speed, than for their beauty. And yet the horses of Abdallah, the chief of the Wahabees, which were captured by the Turks, along with their master, and could not have been purchased at any price, are said to have had eyes and bones like those of the gazelle, the latter indeed delicate, but firm as steel. Nothing can be compared to the beauty and the gracefulness of all their motions, and none of the Turkish horses at all approach them in agility and swiftness. Horses, however, are not very numerous; the comparative scarcity of vegetable substances for their food is an insurmountable obstacle to the extensive breeding and rearing of this animal; and in some places there are many encampments without a single horse. The tribes richest in horses are those on the borders of Syria and Mesopotamia; while, on the contrary, the tribes in the southern parts of the peninsula have very few. Like their masters, the Arab horses live all the year in the open air. Next to the horse in importance is the camel, the faithful slave of the Arabs, which serves them as a beast of burden across their deserts, while its milk supplies them with the most nourishing part of their food, its hair with coverings for their tents, and its flesh with a dainty morsel on their holidays. The camels of Arabia are of the one-humped species; those of them that were trained for riding were denominated by the Greeks, from whom we have borrowed the term, dromedaries (racers), some of which are exceedingly swift; the modern dromedaries seem to be a peculiar variety of the species, generally of a lighter form than the beast of burden. The other animals found in Arabia are asses, some of which are large, and so spirited, that it has become a proverb to say of a person of great vivacity that he is as brisk as an ass. Oxen and cows with a hump, rock goats, gazelles, sheep with broad thick tails, hyenas, panthers, ounces, jackals, wolves, foxes, wild boars, hares, jerboas, and monkeys. Among the birds are eagles, falcons, sparrow-hawks, vultures, ostriches, lapwings, thrushes, pheasants, guinea-fowl, pigeons, partridges, larks, quails, plovers, and storks. Domestic poultry are very plentiful in all the fertile districts. Pelicans and other sea fowls are numerous on the coasts, which all abound with fish. There are also various kinds of serpents, lizards, and ants; and the formidable locusts are produced in myriads in the deserts. These last the Arabs dry, and roast or boil them for food; and Niebuhr states that in his time they were strung on threads, and offered for sale in the markets of all the Arab towns, from Bab-el-mandeb to Bus-rah. The practice is still continued; the mukin or red species is the fattest, and, when fried and sprinkled with salt, is considered a wholesome and nutritious food.

PEOPLE.—The Arabs are of the Caucasian, or white race of mankind, and speak various dialects of the Semitic language, which are all classed under the general name of Arabic. Their language is celebrated for its beauty and extraordinary copiousness. The people are Mahometans of the Soonee sect, excepting perhaps a few remaining Wahabees; and are all divided into the three classes of Bedwins,* husbandmen, and citizens. The modes of life of the two latter classes are not essentially different from those of people of the same classes in other countries; it is principally the Bedwins that exhibit the peculiarities of the Arab character. The stationary Arabs are somewhat above the average stature; they are robust and well formed; their skin is sun-burnt and brown, but elastic; their face is oval and copper coloured; their forehead high and broad; their eyebrows black and bushy; the eyes black, deep-seated, and quick; the nose straight, and of medium size; the mouth well defined; the teeth well set, beautiful, and white as ivory; the ear beautifully formed, and of the normal size, slightly curved forwards. In the women, the graceful outline of the limbs is especially admirable; and also the regular proportions of the hands and feet, and the elegance of their

* This word is usually spelled *Bedouins*; but as that is the French form, we have preferred the English *Bedwin*, which is nearly the same in sound, though different in spelling. The term is a corruption of the Arabic *badui*, which means an inhabitant of the desert, and is derived from the noun *badw*, an open country, a desert.

attitudes, steps, &c. The Bedwins are generally divided into tribes, which are scattered upon the confines of the cultivated regions, and along the edges or on the islands of the deserts; they live under tents, which they transport from place to place. They have generally a very strong resemblance to the settled Arabs; but their eyes are more sparkling, their features less distinct, and their stature somewhat inferior. They are also more agile; and, though slightly built, they are very strong; have lively imaginations; are haughty and independent in character; and are suspicious, dissembling, and restless, but brave and intrepid. They most religiously observe the rights of hospitality; and are especially remarkable for their profound address, and for their great intelligence. They are regarded as excellent horsemen; and they boast, not without reason, of their skill in the use of the lance and the javelin. They are also very skilful as tradesmen and artizans. The manners and customs of both classes are, however, in most respects very nearly the same. They rear sheep, camels, and horses; all speak dialects of the same language, and profess the same religion, Islam. Their mode of living is nearly the same; their food consists principally of milk, eggs, and vegetables; they eat but seldom, and consume little flesh; and in general they are very sober and temperate in drinking; and easily support all kinds of privation. The men all shave the head and allow the beard to grow; the women allow the hair to grow, and often colour it and their eyebrows with paint more or less of a deep brown, which strengthens the hair and imparts to it a beautiful black hue. They also dye with a liquor of a golden yellow colour, procured from the henna plant, the edges of the feet and hands, reaching to the points of the toes and fingers. These parts, and also the faces of the youth of the higher classes, are protected from the disfiguring effects of the small pox by means of gold leaf, which is applied at the invasion of the malady. (*Remarks on the Physical Constitution of the Arabians. By M. Larrey. Edin. New Phil. Journal* XXV. 318.) The life of a Bedwin is one continued round of idleness or amusement. When no pastime calls him abroad, he loiters in his tent, smokes his pipe, or stretches himself under the shade of a tree. He has no relish for domestic pleasures, and seldom converses with his wife and children; he values nothing so much as his horse, which he makes use of in hunting and plundering expeditions, to which the race have been addicted in all ages. The Bedwins are divided into numerous tribes, which have constant feuds with each other; and, even when they are at peace with their neighbours, they cannot rest at home, but make incursions upon distant tribes, and upon all the more civilized people who possess anything to tempt their cupidity. They are, in short, the children of nature, and exhibit a strange combination of virtues and vices. They are certainly now very much improved from their ancient condition, such as it is described in Antar, and which is very well exhibited in the speech of the Arab ambassadors sent to Yezdegird, the last Sassanian king of Persia, to require his submission to their prophet. "Their food was green lizards; they buried their infant daughters alive; nay, some of them feasted on dead carcasses and drank blood; while others slew their relations, and thought themselves great and valiant, when by such an act they became possessed of more property; they were clothed with hair garments, knew not good from evil, and made no distinction between what is lawful and what is unlawful." From this state they were raised by the religion of Mahomet; and whatever improvement their manners and customs have undergone must in fairness be ascribed to the new impulse given to their minds by that fanaticism wherewith he inspired them; to the union which he and his successors established among them, by giving them a common religion; and to the continued influence of that religion, which is pure in comparison with the idolatry by which the whole country was polluted before his time. The Arabs have been distinguished in all ages for their national independence; they have never formed part of any of the great empires; their country has never been overrun by any of those migratory hordes of Scythians, Turks, and Tartars, who have at different periods invaded and overspread all the other southern countries of Asia, overturning the existing governments, and founding new dynasties. This independence is easily accounted for; the Arabian deserts cannot easily be crossed by large bodies of men, and they contain nothing to tempt an invader. All that Arabia possesses to allure the cupidity of conquerors is to be found only in Yemen, and this province, accordingly, has been conquered and possessed by foreigners, who made their approach by the Red Sea. It is only the desert, therefore, that has maintained the much-vaunted independence of Arabia; and there everything contributes to preserve the natives from subjection. The Arabs are likewise famed for their hospitality to strangers; their generosity has also been much praised, as well as their fidelity; but they are, in fact, a nation of robbers; and late travellers, who have studied their character, declare that all the tribes, with very rare exceptions, regulate their fidelity only by their interests. They are all addicted to war, bloodshed, and cruelty, and never forget or forgive an injury. The houses in Arab towns, even when built of stone, are entirely destitute of taste; the men's apartments are in front, those of the women behind. Even the Bedwin divides his tent into two apartments by a curtain, behind which the women are concealed. In respect of personal cleanliness, they are said to observe the precepts of their religion with the most rigorous exactness. Their dress is loose, long, and flowing, wrapt round them and girded with a sash; some, however, go almost naked in hot weather, others wear drawers and slippers, but no stockings. In some parts the women wear large veils, with rings, bracelets, and necklaces, have their nails stained red, their feet and hands of a yellowish brown with an herb called *henna*, their eye-lashes darkened with antimony, and use every art to make the eyebrows large and black.

Some of the Arabs boast of their descent from Ishmael the son of Abraham; they are not, however, Ishmaelites. According to their own traditions they are sprung from two stocks, *Kahtan* or *Joktan*, the son of Heber, of the family of Shem, and *Adnan*, the lineal descendant of Ishmael. The posterity of the former they call pure Arabs, that of the latter, mixed Arabs. The Kahtanians settled in the east and south of the peninsula, while the Ishmaelites seem to have taken possession of the north-west, along the borders of Egypt, Palestine, and Syria. Their early history is very obscure: it was only after the time of Mahomet that they acquired what may be called an historical character; for, under his successors in the civil and ecclesiastical sovereignty which he founded, the Arabs burst from their deserts like a torrent, and made themselves masters of Syria, Assyria, Persia, Egypt, North Africa, and Spain. Their sovereigns, who took the title of caliph or khalif, transferred the seat of government to Damascus, and Kufa, and latterly to Baghdad on the Tigris; and the Arabs, who followed their chief into the cities and fertile countries subject to his dominion, became a very polished people, and carried the pursuits of literature and philosophy to a high degree of excellence, while Europe was buried in the darkness of the middle ages. As the caliphate declined, the natives of the peninsula relapsed into their former state of wild independence, in which they continue at the present day.

GOVERNMENT AND PRODUCTIVE INDUSTRY. — The nature of the country keeps the Arabs divided into petty tribes, and nowhere admits of large bodies being consolidated into powerful states, and thereby acquiring a supremacy over the whole nation, and founding such a monarchical despotism as has always prevailed in the more fertile and populous countries of Asia. The Arab governments are accordingly of the simplest kind, and their princes have very limited powers. The prevailing principle of their government is patriarchal, where the hereditary chief of the tribe is the real or reputed descendant of their common ancestor. The chiefs, who are called Sheikhs, and the more powerful of them, Emirs, lead the tribe to war, administer justice, and decree peace and war, but seldom without the advice of the elders of the tribe. The Sheikhs, however, though the princes of in-

dependent communities, are in no respect to be compared with the European kings; for their whole mode of life is distinguished by the utmost simplicity, and they live on the most familiar terms with all their subjects. From the principle inherent in the nature of man to abuse the power with which he is invested, some of these sheikhs occasionally conduct themselves very despotically; but in such cases their impatient subjects make no scruple to depose them, and elect others in their stead, a practice which operates as a salutary check upon their despotic inclinations. The governments of the desert tribes are all of this description; but, among the settled inhabitants of the cultivated districts, very despotic princes are to be found, those of the north-west, and along the coasts of the Red Sea, have been subjected to the vigorous and despotic rule of the Pasha of Egypt and his deputies; and the Arabs in Mesopotamia and Syria also acknowledge the sovereignty of the Sultan and his pashas, but pay very little obedience to their orders when they attempt to command. There is scarcely any such thing as manufacturing industry, excepting only the commonest articles and fabrics for home consumption. But in agriculture the settled Arabs are very industrious, particularly in turning to account the scanty streams of water. In Yemen, the contrivances for this purpose are elaborate and extensive. Terraces are formed, and dams to retain the water, which is also raised from wells to irrigate the fields. In harvest the crop is pulled up by the roots, and the hay is cut down with a sickle. The commerce of the country, though much less than it was before the discovery of the passage to India by the Cape of Good Hope, is still somewhat considerable, and is carried on chiefly by the caravans which yearly arrive at Mecca from all parts of the Mahometan world. The articles of necessary use are furnished by India, those of luxury by Europe, and military arms by Persia and Ottoman Asia. The principal exports are coffee, the most important of all; pearls, dried dates, skins, horses, senna leaves, indigo, gums of various kinds, the produce of Arabia; besides benzoin, incense, and myrrh, which are brought from Africa, though they pass in commerce for the productions of Arabia. The principal articles of import, besides the three already mentioned, are stuffs, sugar, and other produce of India, steel, iron, cannons, lead, tin, cochineal, cloth, false pearls, arms, and many other productions of European industry and skill.

The well-known division of Arabia, made by the Greek and Roman geographers, was into three parts: *Petræa*,* *Felix* (Greek *Eudaimon*, *Happy*), and *Deserta* (*Desert*). Petræa comprised the region between Judæa and the Red Sea, and was so called from its chief town Petra, the capital of the Nabatheans. The Happy, or fortunate Arabia, comprised the south-western regions, and appears to have been so called on account of its producing, or being supposed to produce the so much coveted drugs and spices of the East. The Desert Arabia comprised all the central, eastern, and northern parts of the peninsula. But these distinctions were never known to the Arabs themselves; nor are the native writers agreed as to the proper divisions of their country; in fact, as Arabia never formed one kingdom, the division into provinces is unknown, and the boundaries of the possessions of tribes being always fluctuating, and never at any time well defined, they cannot be assumed as civil divisions. Geographers are accordingly very much at a loss to know how to divide Arabia. No two of them are agreed as to the number or the names of the provinces; but as it appears that the Arabs do attach certain names to certain ill-defined portions of their country, we shall consider it as so divided, according to the best information we can obtain. The divisions are, 1. HEDJAZ, comprising the Petræan Arabia, and all the east coast of the Red Sea to the frontiers of Yemen. It thus includes the *Beled-l-Haram*, or Holy Land of Arabia. 2. YEMEN, comprising the south-west parts of the peninsula, including *Tehama*, or the low country on the Red Sea, and *Hadramaut*; or in other words, the whole of the low country along the Red Sea and the ocean, to the south of the 15th or 20th parallels of latitude. It comprises the Imamat of *Sanaa* or Yemen proper; the state of *Aboo-Arish*, between Mecca and Yemen; the countries of *Asheir* or *Hashid-wel-Bekil*, between Sanaa and Nedjed, inhabited by several warlike tribes, who form a kind of confederation, and furnish mercenary soldiers; the country of *Aden*, at the south-west extremity of the peninsula; and *Hadramaut*, which extends along the ocean to the east of Sanaa. 3. OMAN comprises the eastern angle of the peninsula, but its inland districts are very little known. 4. LACHSA or HESSE, extends to the north-west of Oman, along the south coast of the Persian Gulf, nearly as far as the Euphrates, and is divided into several small states; the population on the coast live principally by fishing and piracy. It includes also *Bahrein*, a group of islands in a bay of the Persian Gulf, celebrated as the chief seat of the pearl fishery. 5. THE BADIA or BAN-ARAB, the interior of Arabia, comprises two principal divisions: *Nejed*, which includes all the inland deserts, from Yemen and Oman, in the south, to the head of the Persian Gulf and the Red Sea; and the *Syrian desert*, which extends from the Euphrates to the borders of Syria and Palestine.

§ *Cities, Towns, and Remarkable Places.*

MECCA (Mekka or Bekka), N. lat. 21° 30', E. long. 40° 2', is situate in the Holy Land of Arabia, in a barren valley, surrounded by mountains, two days' journey from Jiddah on the Red Sea. It is celebrated as the birth-place of Mahomet, and the cradle of the Mussulman traditions. The Arabs believe that it was at Mecca that Adam and Eve, after their fall, obtained pardon of God. It was here, also, that Ishmael and his mother took refuge, after being driven from Abraham's house by the jealousy of Sarah, and founded the illustrious tribe of the Koreish, from which Mahomet was sprung. Abraham, they also allege, visited Ishmael several times at Mecca, and built the Kaaba, which has been ever since the object of religious veneration. Mecca may be styled a handsome town; its streets are generally broader than those of eastern cities; the houses are lofty, and built of stone; and the numerous windows which face the streets give them a lively and European aspect. The city is open on every side. No trees or gardens cheer the eye; and except four or five large houses belonging to the sheriff, two medreses or colleges, and the great mosque, with some buildings and schools attached to it, Mecca has no public buildings to boast of. Neither khans, nor palaces, nor mosques, which adorn other towns of the East, are here to be seen. The streets are unpaved, filled with dust in the dry season, and with mud during the rains. There are few cisterns for collecting rain, and the well-water is brackish; the best water is brought by a stone conduit from the vicinity of Arafat, six or seven hours distant. But Mecca possesses the *Beitullah* (house of God), the grand centre of the Mahometan world, which forms an oblong square, nearly in the middle of the town, 250 paces long, by 200 broad, and surrounded by a covered colonnade. The centre is occupied by the *Kaaba* or holy house, an oblong massive structure of rough stone, 18 paces in length, 14 in breadth, and from 35 to 40 feet in height, and entirely rebuilt, as it now stands, in A.D. 1627, after it had been nearly reduced to ruins by a torrent. At the north-east corner is a black stone, which appears to be a piece of lava, or black basalt, fixed in the wall, and is devoutly kissed by every pilgrim. The four sides of the Kaaba are covered with a black silk cloth which hangs down, and leaves the roof bare. This

* A vulgar error was long prevalent with respect to this word, which was supposed to be the common Greek word *petraia* (stony), and the province was accordingly supposed to have been so called on account of its very rugged, rocky, or stony nature. But in this respect it is not more stony than many other parts of the peninsula, and, historically considered, there is no reason to doubt the correct derivation of the word to be from *Petra*, the proper name of the city.

curtain or veil, called *kesoua*, is renewed annually at the time of the hadje, being brought from Cairo, where it is wrought at the expense of the Ottoman Sultan. Within the square is also the well *Zemzem*, and several other holy spots. The Meccawys are an idle and dissolute race, who, with great professions of sanctity, openly set at defiance all the moral precepts of their religion. Many of them even neglect its very forms, and, like the Bedwins, never pray at all, thinking it quite sufficient to ensure salvation that they have been born at Mecca. Their principal support is derived from the pilgrims, to whom they let their houses, and whom they supply with necessaries. Their number at one time amounted to so many as 100,000; but, after the invasion of the Wahabees, it was reduced to about 18,000. It is probably now very considerably increased. Mahomet having enjoined upon his followers that they should visit Mecca at least once in their lives, a great concourse of pilgrims takes place every year in this holy city, and, notwithstanding the decrease of religious zeal, and the increased expense of the journey, so many as 120,000 attended the hadje or festival in November 1831. —(*Lieut. Wellsted, Journal R. Geog. Soc. Lond.*, VI. 89.) After the downfall of the Caliphate, Mecca became an independent state under its own sovereign called Sheriff, but it is now a dependency of Turkey. In the neighbourhood are several holy places, which are visited by the pilgrims; as *Mount Arafat*, six hours' journey on foot east *the valley of Mina*, and the *mountain of Hira*, which contains the cave to which Mahomet was accustomed to retire for meditation on heavenly things, and where he reported that the angel Gabriel appeared to him for the first time. *Jiddah*, the port of Mecca, 55 miles west on the Red Sea, 21° 28′ 30″ N. lat., is a well-built town, on a slope which rises gradually from the sea, surrounded with a wall 3000 paces in circuit, but in the midst of a desert; there being within the town no gardens or vegetation of any kind, excepting a few date-trees near one of the mosques; and, even on the outside of the town, the whole country is a barren desert, covered on the sea-shore with a saline earth, and higher up with sand. The people are almost exclusively foreigners, and are engaged in commerce. Their number has been variously estimated at from 5000 to 40,000. The streets are airy, the houses lofty, and well built of coral. About 70 miles east of Mecca is *Taif* or *Taief*, a small town in the midst of a sandy plain, surrounded by hills, which is supplied with water from two copious wells, and celebrated all over Arabia for its beautiful gardens.

MEDINA, about 250 miles N. by W. of Mecca, situate in a low plain close to the mountains which run parallel with the Red Sea, is a small town surrounded by a good wall, which has always made it be considered as the principal fortress of the Hedjaz. It was formerly called *Yathreb*, and received its present name of *Medinat-al-nebi* (prophet's-town), from the circumstance of its having become the residence of Mahomet after his flight from Mecca, and of his burial. Without the town are extensive suburbs. The great object of attraction is the mosque which contains the tomb of Mahomet; it is smaller than the beitullah of Mecca, but built on a similar plan, forming an open square, surrounded with colonnades, and having a small building in the centre. Near the south-east corner stands the famous tombs, wherein are deposited the remains of Mahomet, and the first two caliphs, Abubekr and Omar. In the neighbourhood of the city are *Mount Ohud*, where the prophet suffered a bloody defeat from the Meccawys; and the *wells of Yeder*, where he gained his first victory over them. *Yambo*, a small town on the Red Sea, with a capacious harbour, the best on the coast, is considered the port of Medina, from which it is distant about 100 miles S.W. It is situate on a low sandy spot, which is utterly destitute of vegetation. The population is very fluctuating, but is estimated by Lieutenant Wellstead at 2000. No ships resort to the harbour, and its trade is carried on by boats. Lat. 24° 3′ 35″ N.

In that portion of the Hedjaz which corresponds with the ancient Arabia Petræa, are several places of remarkable interest. *Petra*, the ancient capital of the Nabatheans, is now deserted, but its site still exhibits many splendid remains of the architectural taste and the wealth of its inhabitants. It is situate in a small valley, called *Wady Mousa*, surrounded with precipices, about 64 miles from the head of the Gulf of Akaba. A little to the north-west is *Mount Hor*, where Aaron was buried, and where there is now a mosque containing his tomb. Mount *Sinai* and Mount *Horeb*, or *Jebel Katerin*, and *Jebel Mousa*, are situate in the southern part of the triangular peninsula formed by the forks or branches of the Red Sea, in a gloomy wilderness, consisting of long ranges of rugged rocks, intersected by deep valleys, at the bottoms of which are found the only traces of verdure. Sinai or *Jebel Katerin* is ascended by a very steep route, which formerly consisted of about 15,000 steps, said to have been made by the Empress Helena. At the foot of the mountain is the convent of St. Katherine, fortified like a castle, and inhabited by about thirty Greek monks, which contains also a very ancient church, and a mosque as old as the first century of the Hejrah. *Jebel Mousa*, the mountain supposed to be the *Horeb* of Moses, stands a little to the westward of Sinai, but is neither so high nor so ruged. The view from the top of Sinai exhibits "a perfect sea of desolation." The elevation exceeds 8000 feet above the level of the sea; but the only place from which it is visible from seaward is at a point on the west shore of the Gulf of Akaba, about 18 miles N. of Ras Mahommed. It is doubtful, however, whether or not these mountains be the Sinai and Horeb of Moses: there being another hill in the neighbourhood, which, in the opinion of some travellers, better accords with the history; and the honour is also ascribed to *Jebel Serbal*, a mountain considerably to the north-west. On the west coast of the peninsula is the small seaport town of *Tor;* about eight miles from which, on the sea shore, is the *Jebel Narcono* or *Sounding Mountain*. A solid slope of the finest sand extends from the base to the top of the mountain, a height of 600 feet, at an angle of about 40° with the horizon, and is encircled by a ridge of sandstone rocks rising to a pointed pinnacle, and presenting little surface adapted for forming an echo. When sand is rolled down it produces a sound commencing in a strain like the first faint notes of an Eolian harp, or of the fingers wetted and drawn over glass, and increasing in loudness as it descends, till at the bottom it becomes almost equal to thunder. *Akaba*, a Turkish castle at the head of the gulf to which it gives its name, is supposed to be near the site of the ancient *Eloth* and *Ezion-geber*, from which the fleets of Solomon sailed to Ophir. It communicates directly with the Dead Sea by the long narrow valley *El Arabah*, which was for some time supposed to have been traversed by the river Jordan before the catastrophe of Sodom and Gomorrah; but is now found to be so much higher than the valley of the Jordan as to render that supposition impossible. Wady Araba joins Wady Ghor about 12 miles south of the Dead Sea, forming there a long narrow valley or ravine 250 to 300 yards wide, which is filled with tamarisks. It widens as it extends southward; and from 30° 15′ N. lat. slopes to the Red Sea, forming what is properly called the *Akaba* or ascent. To the north-east of Petra are *Karek* or *Caruck*, and *Shobek* or *Montreal*, places distinguished in the wars of the crusades; Karek is still a considerable town of 550 families. Between Akaba and Suez is the desert *El Tyh*, or, as the Arabs call it, *Tyh-beni-Israel*, the desert of the Israelites, a desolate tract covered with black stones, which Burckhardt describes as the most dreary and barren wilderness he had ever seen.

In Yemen: Saana, the capital of the Imamat of Saana, one of the most powerful states of Arabia, stands in the middle of a beautiful valley 4000 feet above the level of the sea, and is a well-built town, surrounded with brick walls and towers. It is supposed to contain 40,000 inhabitants, who carry on a great trade, chiefly in coffee, and some of its merchants are reputed to be very wealthy. It is the seat of a dynasty of Imams, which dates from the year 1626, when the Turks were expelled from Yemen. The Imam has two large palaces, with extensive gardens walled round and fortified. The city also contains 20 mosques, many of which are splendid, with richly gilt domes. There are three other towns in the valley, *Bedak*, *Wady-Dhar*, and *Jeraf*, containing altogether about 30,000 inhabitants;

lat. 15° 21′ N., long. 44° 21′ E. *Mocha* or *Mokha*, 160 miles S.W. of Sanaa, a decayed town with 900 houses, on the flat sandy shore of the Red Sea, with an open roadstead, was formerly the principal sea-port of Yemen, and the place from which the coffee was exported. *Zebid*, 60 miles N. of Mocha, is a small gloomy city with 7000 inhabitants, and a garrison of 700 men. *Beit-el-fakih*, 93 miles N. of Mocha, a large unwalled town of 8000 inhabitants, is the frontier town of the Egyptian or Turkish government, and has a citadel of some strength. It is the emporium of all the coffee from the interior, and is reckoned the hottest town in the Tehamah. *Aden*, on the coast of the Indian Ocean, east from Bab-el-Mandeb, was once a great emporium of commerce, and has an excellent harbour; but its trade has been lost, and the town has been reduced to a heap of ruins; it contains a population of about 600 Jews, Banians, Arabs, and Somaulies. It is built on a small flat, probably the bottom of a crater, surrounded by precipitous rocks, on the east side of a peninsula formed by two fine bays, in the one of which, opposite the town, is the fortified island of *Sirah*, which commands the approach. The peninsula consists chiefly of a mass of volcanic rocks, of the most rugged and fantastic forms, extending five miles east and west and three broad, and having as its most southern point, *Ras Sanailah* or *Cape Aden*, in lat. 12° 45′ 10″ N., long. 45° 9′ E. The highest part of the peninsula is *Jebl Shamshan*, a rocky promontory of limestone, rising 1776 feet above the level of the sea. The peninsula bears a strong resemblance to the rock of Gibraltar, and could easily be rendered as impregnable; but its rocky masses are higher and more peaked in their outline. It is connected with the mainland by a neck of flat sandy ground only a few feet high. But both the peninsula and the mainland present the most desolate aspect; not a tree or a shrub is to be seen; and the heat is intolerable. On 5th June 1839, at six in the evening, the thermometer stood at 100° in a stone house; the place, however, is healthy. Aden has been taken possession of by the British Indian Government; the population is already increasing, and the town promises to become again as great a seat of trade as it was in the 13th century, when it contained 30,000 inhabitants. The neighbouring country abounds with honey and wax of the finest quality. *Makullah* or *Mukullah*, 300 miles E. of Aden, in 14° 31′ N lat. and 49° 13′ E. long., a sea-port town on a low projecting point under the face of a precipitous hill, is the principal trading place on the south coast of Arabia, and has a population of 4000 to 5000. Many of the houses are lofty and substantial. *Sihun*, the capital of Hadramaut is situate 160 miles distant from Makullah. *Loheia*, a town on the Red Sea, is situate in a poor country, with a shallow harbour and bad water; but exports a good deal of coffee. *Hodeida*, a town of considerable size on a sandy bay of the Red Sea, where ships are well protected. The neighbouring country is flat and sandy, and chiefly produces dates; but from the mountains, which are visible from the coast, at the distance of two days' journey, grapes, coffee, limes, and other vegetable productions are brought to the market. *Gomfodah* or *Comfodah*, is a port on the Red Sea. *Dafar* or *Zafar*, a town of Hadramaut, on the ocean, in the district of Shih-hir or Seger.

In Oman: Muskat, *Maskat*, or *Muscat*, a large town, is situate at the extremity of a small cove, in lat. 23° 38′ N., long. 58° 42′ E., in the gorge of an extensive pass, which widens as it advances into the interior. The town presents a fine appearance from the sea, but consists of narrow crowded streets filthy bazaars, and wretched huts, intermingled with low and paltry houses. The palace, however, of the Imam, the governor's house, and some others, are good and substantial. Muskat is important not only as the emporium of a very considerable trade with Arabia, Persia, and India, but also as the principal sea-port of Oman. Its imports are chiefly cloth and corn. The customs are fixed at 5 per cent. on all imported goods; but no duties of any kind are levied on exports, which consist chiefly of dates, madder, sharks' fins for China, and salted and dried fish. The returns are made principally in bullion and coffee. The population of Muskat and the adjoining town of Matarrah, which is a very large collection of huts about two miles distant, is estimated at 60,000, and consists of a mixed race of Arabs, Persians, Indians, Syrians, Kurds, Affghans, Beloochees, and others, who have been attracted by the equity of the government. They are chiefly engaged in commercial and maritime pursuits; the principal body of the merchants consist of Banians, who almost exclusively monopolize the pearl trade of the Persian Gulf. The common language is Hindoostanee, or lingua franca. The trade employs 14 ships and brigs, and 500 bungalows and battiles, from 60 to 400 tons; the coasting trade nearly 1200 more, from 8 to 40 or 50 tons. Muskat is the capital of a state, whose sultan, usually but erroneously styled the Imam of Muskat, claims the sovereignty of all the coast of Africa from Cape Delgado to Cape Guardafui; of the southern coast of Arabia from Aden to Ras-al-had, and thence northward as far as Bussrah; and of all the coasts and islands in the Persian Gulf, and the oceanic coasts of Persia as far as Sinde. His yearly revenue amounts to about 700,000 Spanish dollars. His only permanent military force is a small body of men accoutred like the Indian sepoys; but he can in three days collect from southern Oman 10,000 men, and can soon increase it to 30,000 by the accession of the neighbouring Bedwins. His flag now even crosses the Atlantic, and his traders have visited the ports of the United States. Muskat is considered the hottest town on the globe, being encircled by naked rocks, the sun's rays become concentred as into a focus, and the heat is at certain seasons almost intolerable; the thermometer ranges in January and February about 50°, but in July and August generally from 90° to 115°, and has even been observed at 122° in the shade; the Arabs emphatically call it *El-jehannum*, Hell. Very generally, however, this extreme heat is moderated, during the day, by cool and refreshing sea breezes. *Sohar*, a town of 9000 inhabitants, 140 miles W.N.W. of Muskat, carries on a considerable trade with Persia and India. There are several other large towns on the coast of Oman; but, with the exception of *Rostak*, which is large and well-built, there are none of any importance in the interior.

In Lachsa, the principal places are: *Ras-al-Khyma* or *Khaima* (Tent Cape), not far to the west of Ras Mussendon, a flourishing town, the residence of the sheikh of the Joasmee pirates, and the station of their fleet, which consisted at one time of 63 large vessels, and 800 barques, manned by 19,000 men. All their ships, building yards, and forts, were destroyed by the British forces from India in 1809, and a second time in 1819, but the town is again as flourishing as ever. Its harbour is the best on the coast. *El-Khatif*, a fortified town situate on a bay, with about 6000 inhabitants, is the most commercial place in this part of Arabia. *Ennf*, the chief town of the country of Lachsa, with about 15,000 inhabitants, consists of a fort, surrounded by an open village, fields, and plantations of date trees. *Grain* or *Koueit*, at the north-west corner of the Persian Gulf, is a town of 10,000 inhabitants, who live by fishing and trade.

In Nedjed the only place worth mentioning is *Derreyeh* or *Deraiah*, the capital of the ephemeral empire of the Wahabees, situate at the entrance of a deep and narrow valley, which is enclosed by arid mountains. It contained 28 mosques, 30 colleges, and 2500 houses; but in 1819 it was quite deserted, and we have no information of its present condition.

PERSIA.

This name is applied by European geographers to the wide region which extends from the basin of the Euphrates and Tigris, eastward to the Indus; and from the Indian Ocean, northward to the borders of Turkestan and the Caspian Sea. The name Persia, however, is quite unknown to the natives; and, whatever may have been the case in former times, this country does not now form one kingdom, but is divided politically into three regions, namely, *the Kingdom of Iran* or *Persia proper*; *Affghanistan* or *the Kingdom of Cabul*; and *Beloochistan* or *Belúchistan.*

THE KINGDOM OF IRAN

Is situate between 25° 40′ and 39° 40′ N. lat., and 44° and 62° E. long.; and is bounded on the east by Affghanistan and Beloochistan: on the west, by the mountains of Kurdistan, the river of the Arabs, and the Persian Gulf; on the north, by Russia, the Caspian Sea, and the Turkman desert; and on the south by the Persian Gulf and the Indian Ocean. Its greatest length, from north-west to south-east, or from Ararat to beyond Cape Jask, is about 1250 miles and its greatest breadth, from south-west to north-east, or from Russrah to beyond Meshid in Khorassan, about 870. The superficial area is about 500,000 square English miles. The southern and south-western portions form a narrow tract of level, dry, and arid country, without rivers, lying along the shores of the Persian Gulf. The appearance of this tract is everywhere the same, a succession of sandy plains; in viewing which the eye is occasionally relieved by plantations of date trees and patches of cultivation which are found near the wells and fresh water rivulets which are thinly scattered over the barren country. It is called the *Dushtistan* or *Gurmsir, i. e.* warm region. The heat during four months in the year is scarcely supportable even by the natives, and the atmosphere is so unwholesome that strangers who fall sick seldom recover. Along the shores of the Caspian Sea there is a corresponding narrow tract, but of a different character; for though the climate is very warm, and the heat in summer scorching, yet the winters are mild and the atmosphere is always excessively moist. To the human species this is a most insalubrious region; but, under the joint influence of heat and moisture, the vegetation is most luxuriant. The sugar-cane is cultivated with success in the low countries of Ghilan and Mazanderan, while the slopes of the mountains are covered with forests of acacias, lindens, oaks, and chestnuts, and their summits with the cedar, the cypress, and various other pines. Between these two narrow lowland belts lies an extensive table-land, generally of the great height of between 2500 and 3500 feet above the level of the ocean; though at Koom it is so low as 2046 feet; and in some other places even lower. It is, generally speaking, an immense, dry, salt plain, traversed by ranges of mountains, either isolated, or connected with the frontier chains, and includes many long valleys, which are, in fact, the only cultivated and populated parts of the country. This table-land is formed on the north by the great chain of mountains which connects the Himalayas with the Caucasus; a very high limestone ridge, rising abruptly from the shores of the Caspian, where it bears the name of *Elburz*, and the deserts of Turkestan, but declining more gently towards the inland country. The western and southern boundaries are formed by the mountains of Kurdistan, Louristan, and Bukhtiari, which extend south and south-east from Armenia to the Indian Ocean, consisting of from three to seven parallel ridges, separated by long narrow valleys, and forming so many terraces rising above each other, between the Gurmsir and the Sirhood, or cool country, in the interior. From both chains arise a multitude of ramifications which cover the country like a network, stretching in all directions, and heaped upon each other as if thrown together at random; but few of them rise more than 1000 feet above their base. There are but few passes leading through these natural walls of Upper Iran, into the low countries on the south-west and the north. Those which have acquired the greatest celebrity are: the *Median Pass*, which, beginning near Baghdad, passes through the Median gates (*Pylæ Mediæ* of the ancients), by Kermanshah, Bes tún, and Kungavar to Hamadan. 2. The pass called *Katul-i-dukhter* leading from Bushire to Shiraz; where the ascent is made by means of a road, most skilfully constructed, buttressed, levelled, and parapetted, so as not to alarm even the most timid, and broad enough to admit of several mules abreast. The summit is believed to be 6000 feet above the level of the sea, where there is a plain, green as an emerald in summer. Nothing, it is said, can be more striking than the change from the Gurmsir to the fine climate and rich soil of these elevated plains. Above Shiraz the road now bearing the name of *Dezht-i-Arjan* passes through winding mountain tracks and narrow ravines till it reach the plain of Merdusht, which contains the ruins of Persepolis. The summit of this pass is not less than 7200 feet above the level of the sea. From Persepolis the road proceeds over a third range of mountains, reaching the height of 6660 feet, to the valley of Ispahan, which is itself 4140 feet above the level of the sea. From this level the mountain passes farther north, near Kohrúd, rise nearly 2000 feet higher. A third great road begins at Gambrún or Benderabassi, and leads northward to Kerman over the Gebel Abad, but we are not aware that the elevation of its valleys and passes has been ascertained. Of the ancient Caspian and Hyrcanian gates (*Pylæ Caspiæ* and *Pylæ Hyrcaniæ*), leading through the mountains to Mazanderan, the former, supposed to be the one that leads past Kishlac, rises to 4572 feet; and the other, by Shahrúd into the province of Astrabad, to 3414 feet. The summits of the mountain range through which they extend, do not rise above 7000 feet, except only the peak of Demavend, which reaches 14,600.

The great plains of the table-land are all to be found in the eastern part of Iran. Westward, the table-land narrows to nearly half the breadth, but increases in elevation, rising into mountain masses which become higher and higher, till in the provinces of Azerbijan and Kurdistan, it is replaced by enormous mountains, and the high valleys which are found among their ranges. But the principal feature of this region is the great extent of its deserts, or sandy and salt plains, which form no inconsiderable portion of that long series of deserts already mentioned as extending across Africa and Asia. But, besides the characters common to them all, the deserts of Iran exhibit some peculiarities. The principal desert is the *Kuveer* or *Great Salt desert*, which extends, with a very irregular outline, over a great part of the provinces of Irak and Khorassan. In some places its surface is dry, in others it is a crackling crust of earth covered with efflorescent salt. Elsewhere it is marshy, the melting of the snow occasioning an accumulation of water in the lower parts, which in summer is evaporated, and leaves a quantity of salt in the form of cakes upon a bed of mud. In other places again, sand predominates, either in the shape of heavy plains, or wave-like hillocks, easily drifted by the wind,

and at times so light and movable as to be dangerous to travellers, who are not unfrequently buried under its heaps. There are also the deserts of Kerman, and Makran; and even the low country along the Gulf is little better than a desert.

The low shores of the Caspian Sea are exposed to oppressive heats in summer; but the winter is mild, and excessive humidity at all times pervades the atmosphere. Like tropical countries they have a rainy and a dry season: the heavy gales commence in September from the north and north-east, by which the clouds are driven against the mountains, and the rain in consequence descends in torrents, accompanied by terrific thunder storms. In the plains the rain continues till the middle of January, but among the mountains, it is converted into snow in November. The spring from March till May, is the most pleasant and healthy season. In summer, though rain is less frequent, the atmosphere contains much moisture, and the plains are almost constantly covered with vapour and fogs, which occasion fevers and other dangerous diseases. In the central table-lands excessively hot and dry summers are succeeded by rigorously cold winters. From March till May high winds generally prevail, with frequent hail-storms. From May till September the air is serene, scarcely a cloud is to be seen; dews are unknown; but refreshing breezes prevail during the night. From September till November high winds again prevail: the atmosphere however, still remains extremely dry: in winter snow storms are frequent, but thunder and lightning are very rare. This general character, however, of the climate is subject to local modifications. The mountainous regions of Kurdistan and Azerbijan derive from their great elevation and their forests a greater degree of humidity, and enjoy a more equal temperature, although the winters are sometimes extremely severe. Fars also, especially the valley of Shiraz, is exempt from great extremes of heat and cold, the thermometer in summer seldom rising higher than 90°, or sinking at night below 62°. In descending towards the shores of the Persian Gulf, the climate and the face of nature undergo a complete change. From the mouths of the Indus to those of the Euphrates, the narrow tract of low land which lies between the mountains and the sea bears a greater resemblance in soil and climate to Arabia than to the uplands of Persia. The country is almost an entire desert, and the summer's heat is insupportable; but the heat and dryness of the climate are the very circumstances which make it suitable for the growth of the date tree, which is almost its only vegetable product.

The table-land is entirely destitute of trees, and is chiefly covered, where there is any vegetation at all, with plants which require a saline soil. The soil is generally a hard clay, quite unproductive without irrigation, but wherever water can be obtained, the vegetation is most luxuriant. Wheat is the chief produce; barley, millet, and oats are also grown, and in Mazanderan, rice is cultivated with great care. The gardens of Iran are highly celebrated, and few countries surpass it in the variety and flavour of its fruits. It is believed to be the native country of the fig, pomegranate, mulberry, almond, peach, and apricot: it also produces oranges and lemons of great size, melons, quinces, and grapes; hemp, tobacco, opium, assafœtida, rhubarb, manna, saffron, cotton, turpentine, mastic, various kinds of gums, and galls-nuts. The most remarkable vegetable production is the plant from which assafœtida is obtained. Poppies, which produce opium, are cultivated all over the table-land, and in many places saffron is also raised. The silk worm is extensively reared, and the annual produce of silk has been estimated at 2,500 bales of 216 lbs. each.

The animals are, horses of different breeds, some of which are considered the finest and the handsomest in the East; camels of both the Bactrian and the Arabian species, and a mule breed, produced between them, which is considered preferable to the pure breeds in respect of strength, docility, and patience; horses, asses-mules, asses, wild asses, and buffaloes. Numerous flocks of goats and sheep form the wealth of the nomadic tribes, while antelopes, hares, zebras, foxes, and deer of various kinds afford amusement to the sportsman. Boars, bears, lions, and the smaller kinds of tigers lurk in the forests and the mountains, and hyænas and jackals infest the southern provinces. There are also tame and wild fowl of the same kinds as in Europe, with plenty of pigeons and partridges, eagles, vultures, and falcons.

Iran is not rich in mineral products. Salt is too abundant: the ground is everywhere impregnated with it. Copper is found in Mazanderan and Kerman; iron and silver in Azerbijan; sulphur and nitre in Mount Demavend; turquoise in Khorassan; and naphtha and bitumen in Irak. Medicinal springs of various kinds are numerous; and near Maraga, in the valley of lake Urmiah, there is a spring whose petrifying quality is so remarkable, that it produces a beautiful transparent stone, called Tabriz marble, which admits of being cut into large slabs, which take a good polish and form a principal ornament in the buildings throughout the country.

People.—The Iranee are divided into two great classes, the fixed and the erratic, the latter being called *Eliauts* or *Ilyats*. The former, called *Nishéree* by the rural tribes, are a mixed race of Turks, Tartars, Arabians, Armenians, and Georgians engrafted on the stock of the ancient Persians, and their general language is a mixture of Arabic with the ancient dialect of Fars. They are generally called *Tajiks* or *Tanjiks*; and by that name only are their colonies in Afghanistan and Turkestan distinguished from the other inhabitants. They are a fine race of people; they are not tall, but it is rare to see any of them diminutive or deformed, and they are in general strong and active. Their complexion varies from a dark olive to a fairness nearly approaching the northern European. They are quick of apprehension, vivacious, and naturally polite, sociable and cheerful, but prodigal and rapacious. The higher classes are kind and indulgent masters, and the lower ranks, so far as respects the active performance of their duty, and the prompt execution of orders, are equally good servants. But there is a great difference and variety of character among the inhabitants of different cities and provinces: some being as remarkable for their courage as others are for their cowardice. The highest class, from whom the ministers of state are usually selected, are called *mirzas* (secretaries or men of business), who are often highly accomplished, but versed in deceit, and not very remarkable for strict morality. They rarely indulge in martial or athletic pursuits, nor do they assume much state. They do not wear sword-, and are distinguishable by a culmdaum, or inkstand, stuck in their girdle instead of a dagger. The merchants are numerous, an often wealthy; the shopkeepers and tradesmen are distinguished for cunning and insincerity, but are versatile, humble, and persevering. The clergy, in Iran, are the expounders of the law, are a very numerous, wealthy, and powerful body; the higher ranks of whom are usually men of learning, of mild temper, and retired habits, and are very careful to preserve the respect which they enjoy, by cherishing the popular impression of their piety and humility; but nothing can be worse than the character of the lower classes of the clergy: their hypocrisy, profligacy, and want of principle, are the subjects of stories, epigrams, and endless proverbs. They are bigoted and intolerant, and are often accused of indulging the worst passions. To say, a man has the air of a mollah, is to assert that he cherishes sentiments of the most inveterate hostility. The cultivators of the soil appear, in general, to be in easy circumstances. Their houses are comfortable and neat, and are well supplied with the necessaries of life.

The character of the Eliauts or Ilyats is very different from that of the other class: they are generally sincere, hospitable, and brave; but rude, violent, and rapacious. Their origin is various; those that are indigenous are found principally in the hilly countries of the south and west; the others are chiefly Turks and Arabs. Many of them have become inhabitants of towns and villages, and the class is therefore divided into *Shehr-nishin* (dwellers in towns), and *Sahra-nishin* (dwellers in fields). A few only adhere to their former mode of life, live during the whole year in tents, in winter keeping to the plains, and in summer seeking the pasturage of the mountains. These look upon the Shehr-

nishin as degenerate. The principal or most distinguished tribes are:—The *Kajar*, to which the present royal family belongs, who occupy the country around Astrabad and Teheran, with branches in Casvin and Erivan. The *Afshars*, of Turcoman origin, are found in the greatest numbers at Abiverd, in Khorassan, the birth-place of Nadir Shah, the most distinguished member of their tribe, and at Kelat, his favourite stronghold. The *Laks*, a very large tribe of ancient Persian origin, and renowned as thieves, are much dispersed, but their principal seats are about Casvin, and in Fars and Mazanderan. The *Feili* are the most numerous tribe, and the most formidable, from their being all collected in one region, the western side of the mountains of Louristan, and the adjoining parts of Khuzistan; they number 100,000 houses. The *Eukhtiari*, a mountain tribe of 100,000 houses, inhabit the high lands of Louristan, and are a brave and hardy race. On the eastern frontier are two large tribes of *Arabs* and *Kurds*, who were transplanted thither by Shah Ismail, in the sixteenth century; the former have increased to 6000 tents, and the latter to 50,000 houses, and are formidable from their numbers and bravery, and their predatory habits. The *Aimaks* or *Eimauks*, a large Affghan tribe in Khorassan; the *Baluch*, in Southern Persia; the *Khodabendehlu*, near Teheran, of Persian origin; the *Shekagi*, a Turkish tribe, in Azerbijan; the *Memaceani* pride themselves on their antiquity, and preserve their original wildness and independence, by keeping almost constantly in the fastnesses of Fars, where they are celebrated as robbers. Most of the tribes, however, are so much dispersed, that they have lost that union which alone could render them formidable. Such of them as have become inhabitants of towns are subject to the laws and regulations of the community to which they have attached themselves. The Saha-nishins, though taxed in various ways, and made to contribute to the military service of the state, are comparatively less molested by the government than the other subjects. Their wealth consists principally in cattle and sheep. They breed camels and horses for sale and their sheep yield milk, which is made into *roughan* (liquid butter) and sold. Their peculiar privileges consist in liberty to range over districts from which none can dispossess them. They ascend in summer to cool regions called *yailak*, where they find pasture; in winter, they return to the lower and warmer districts, which they call *kishlak*. These regions are assigned by the government to each tribe; and whenever the appointed limits are encroached upon by other tribes, violent strife and battles ensue. The government is generally very jealous of the migrations of the tribes; and prevents them from moving from one province to another without the king's permission; but in troublous times, if they be strong enough to encounter opposition, they frequently pass from their old haunts to better localities. The existence of these migratory tribes being advantageous to the government, they are little oppressed: they are taxed at certain established rates on each head of cattle, and are called upon to serve in the king's armies. They are not compelled to labour on public works, like other subjects; and their taxes are levied by their chiefs, who transmit them to the government. In their small communities they are governed by *Reis-sefid* or elders. Their chiefs are the only hereditary nobility of Persia.—(*Some account of the Iliyats, or Wandering Tribes of Persia, by James Morier, Esq. Journal R. Geog. Soc. Lond.* VII. 230.)

Speaking generally of the Persians, says Sir John Malcolm, we may describe them as a handsome, active, and robust race of men; of lively imagination, quick apprehension, and agreeable and prepossessing manners. As a nation they may be termed brave; but their vices are still more prominent than their virtues. There being no such thing as a census in Persia, the amount of its population can only be conjectured. The fixed inhabitants are estimated by Mr. Fraser at 7,000,000; the Iliyats, by their own account, amount to nearly half a million of houses or families, or 2,500,000 individuals.

RELIGION.—The Tajiks, Ghelakis (inhabitants of Ghilan), Lours, and Baluchees, are Islamites of the Shiah, or heterodox sect; the Turkish and Arab tribes, and the greater part of the Kurds, are Soonies. Jews are met with in all the great towns; Armenians and Nestorians are also to be found, and a few Sabeans, or star-worshippers. It has been conjectured that there are between 200,000 and 300,000 professed Suffees, or free-thinkers. The clergy consist of various orders. The highest are Mushtiheds, of whom there are seldom more than three or four. Next in rank is the Sheikh-ul-Islam, or Ruler of the Faith, who is the supreme judge of the written law, in which capacity he enjoys a salary from the government. In every mosque of consequence, and at every considerable shrine, there are at least three clergyman; the mütwulle, who manages the temporalities; the Muezzin, who summons the people to prayers; and the Mollah, who conducts the ceremonies. If the establishment is rich, there are several mollahs, from whom is selected a polish-numaz (fugleman), who recites the prayers, and goes through the motions and genuflexions, to guide the congregation. The mollahs also preach occasionally a sort of sermons on texts from the Koran. Besides these, there are in every city, and connected with all seminaries of learning, a crowd of moilahs, who, like the French abbés of old, live by their wits, and have little of the priestly character but the name. The character of the class, as already mentioned, is generally very indifferent. The only remains of the ancient fire-worshippers, or followers of Zoroaster, called Guebres or Infidels by the Moslems, reside chiefly at Yezd, Kerman, Shiraz, Isjahan, and Kashan; but they are very few in number, there being only about 2300 families in the whole of Persia.

EDUCATION and LEARNING.—The Persians received their arts and sciences originally from the Arabs. The Ptolemaic system of astronomy was implicitly accepted as true, and still continues to prevail. During the reigns of the Sufavey princes the mollahs had acquired great power and independence. Mahomet has made no positive provision for the ministers of his religion, and has denounced priestcraft in very strong and decided language. Nevertheless, during the long reigns of the house of Sefi, and even earlier, the endowments of land and other property which had been made to the colleges, mosques, and other religious institutions, had become so large in the hands of the mollahs, that they possessed above a third of the whole revenues of the kingdom, and were therefore, as a body, powerful and formidable. During the ravages which followed the Affghan invasion and the extinction of the Sufaveys, their estates suffered considerably and fell into decay, and Nadir Shah seized the opportunity of proposing that if they would relinquish all claims to their territorial possession he would in return allow them a fixed income out of the government treasury as pensions. Thus the literary institutions were deprived of all their estates; the colleges and public buildings which had been ruined during the revolution were never restored; and those which had withstood the political storm soon fell, from want of repair, to utter ruin. After the establishment of the present dynasty, a severe struggle took place between the regal power and the influence of the mollahs, who possessed at that time great authority over the minds of the people. The agreement made with Nadir Shah had served his purpose of rendering the mollahs completely dependent on him; but when the country again became involved in anarchy, the stipulated pensions were gradually diminished, till at length the mollahs were obliged to seek some other means of subsistence. They consequently allied themselves more closely than ever with the people, on whom their sole dependence rested, and by their own religious zeal, and by appealing to the superstitions of the populace, and constantly rousing their prejudices or their fears, they succeeded in obtaining the most complete ascendancy over their minds, and thereby acquired so formidable a power, that they have ever since set at defiance the authority of the kings, who are compelled to court their friendship and solicit their blessing. Futtey Aly Shah, during his reign, increased their pensions, and restored the college lands as far as possible. Several colleges were built at Teheran, one by himself, and others by his nobles and relations. From the beginning of the present century Persian literature has been decidedly on the advance. A spirit of intellectual refinement is beginning to influence society, and

a general thirst for knowledge prevails among the Persians of the present generation. With the exception of some of the lowest peasantry and actual paupers, there is now scarcely a mechanic or labourer who does not send his children, especially the boys, to school; but the system of instruction is so bad, that the pupils, after four or five years' attendance, are unable to read or write. The children are first taught the Arabic alphabet, and are then required to read the Koran in its original language; and until they can do so fluently (without, however, being made to understand a word), no attempt is made to teach them their own language. From this point, however, the system is tolerably good; those whose parents can afford to keep them longer at school, and those who are intended for the university, now make a rapid progress, and on the average, become in three years respectable scholars; after which, and not till then, Arabic is taught grammatically, and then for the first time a young man begins to comprehend the meaning of the Koran. The absurdity and the mischievous effects of this system are daily becoming more and more obvious. Another event, which must necessarily have important consequences on literature, is the introduction and establishment of the printing press. The first was established at Tabriz about 25 years ago; six years later another on a larger scale was set up at Teheran; and a third has since been established at Ispahan. The books which have been printed hitherto are chiefly elementary schoolbooks, and works on theology and law. Even the girls are now much better instructed than formerly, and a father does not fear, in defiance of the Imams, to allow his daughter to learn to write, an accomplishment which those leaders of the faithful have strictly prohibited. They would indeed have forbidden women to open a book, but for the clear and unequivocal directions of the prophet himself, who exhorts all his followers, without distinction of sex or caste, to acquire knowledge, and particularly to study the Koran. The good effects of the education of women are becoming more apparent every year; the greater number of them will not now consent as formerly to be married to men whom they have not seen, and hold it no breach of filial duty to refuse obedience on such occasions.

Ispahan contains the largest and most important university. There is one also at Shiraz, and a third at Meshid. In all of these the Arabic language and literature, and the Mahometan laws and theology, are studied; but each seminary is celebrated for some particular branch or branches of learning. Accordingly Meshid is considered as the seat of natural philosophy, but in truth very little is taught there. In mathematics the students scarcely ever go beyond the elements of Euclid and the Almagest. The Ptolemaic system of astronomy is also studied to a limited extent, and the belief in astrology is as strong as ever; this keeps the credulous in the constant practice of algebra, which they understand tolerably well. Of geography they literally know nothing. Ispahan is the great school for metaphysics and philosophy, and the students cultivate these sciences with logic and usool (general principles of law) to singular perfection. The city contains about 30 inhabited colleges, some of them very large and flourishing, and the number of masters and students in and out of college may amount to 6000 or 7000. At Shiraz there is a curious mixture both of men and studies. There are to be found the high orthodox theologians, the Akbarees, who consider every branch of literature, excepting *hkuk* and *padith* (law and traditions) as useless, and hold that whoever wastes his life in any other pursuit incurs the denunciations of the holy Imams, already recorded against such infidels. There, too, are the *Hakeem-Uoodies*, or religious philosophers, who, although they consider the study of the law to be the most important, yet, according to the clear declaration of the prophet himself, that "the knowledge of anything is better than being ignorant of it," do not think it wrong to study the usool and metaphysics. Again, there are the *Soofies*, who are divided into two great branches, the *Soofy-Motasherria*, or orthodox Soofies, who admit (rather reluctantly) the mission of the prophet, but not directly from above: their belief is that he was himself a Sooly, inspired by the divine spirit to guide the vulgar and organise society; but they do not consider themselves bound to obey his precepts as they stand in the Koran, some of which they explain metaphorically, and act accordingly; not believing, for instance, that an occasional glass of Shiraz wine, or food which is not injurious to the health, can hurt any one. The others are termed *Soofy-Mollacks*, or abstract philosophers, who look upon the Koran as a fine specimen of Arabic composition, but do not entertain any particular reverence for its author. The Soofies are upon the whole the most rational and intelligent of the Persian literati; they do not hesitate to study any subject, nor to discuss any point, whether intellectual or moral, with any rational being, whether infidel or Moslem. There are, and have always been, more sound and learned men among the Soofies, than among any orthodox class of the educated men in Persia; and however misrepresented and calumniated by their enemies, the superstitious Moslem, their morality is in general beyond question.

Besides these three principal universities there is another which furnishes the Persian colleges and societies with many highly orthodox mollahs, at Kerbelah, where there is a seminary for the study of law and philosophy, chiefly attended by Arabs and Persians. The arch-Mojtahed of all Persia generally resides there as head of the university, and thence sends his resolas or mandates to all parts of the kingdom, together with numerous disciples, whose high Mahometanism and khoshkydamagh (dryness of the brains, as the Soofies term it), baffle all description. But Soofieism is gaining ground in Persia, and those khoshk-damaghs are not so much feared, nor are the Soofies so much abused and persecuted as formerly. The greater part of the literary men of Shiraz are Soofies, who scarcely disguise their principles, and yet are rarely molested or interfered with by the orthodox. A Soofie doctor may now sit in his divan-khanah (outer room), with his pupils around him, without fear of being assailed by the mollah-mob, persecuted by the fakihs, or bastinadoed to death, as he probably would have been 25 years ago. The courses of study at the colleges comprise Arabic and Persian literature, logic, metaphysics, moral philosophy, theology, law, usool, and tafseer (commentaries on the koran), all of which they study thoroughly. Their knowledge of mathematics is very limited; with natural philosophy they are in general but imperfectly acquainted; of geography and geology they know little; in fact they are rather a literary than a scientific people. Poetry has been in all ages, and is still, a favourite pursuit, and there is scarcely a species of composition which the Persian poets have not cultivated with success. During the reigns of the Sufavey princes Persian literature began to flourish. They spared no pains to improve the country; gave every encouragement to literature and science; and built and nobly endowed colleges in almost every city. The nobles followed their example. No sooner was a college built by the sovereign, than others were commenced by his servants, and endowed with lands or money, amply sufficient to render the students, who never pay for their education in any college, and the teachers comfortable and independent. Under Abbas the Great Ispahan became a seat of learning, and Shiraz resumed its ancient fame. The greater number of colleges were established at Ispahan, and an immense congregation of professors and students were collected there from all parts of Persia, and formed a large and brilliant university. The system of instruction, the modes of study, and the habits of the students, are excellent. Every college has a superior, who, with assistants, presides over its discipline, and manages its property, if it have any. There are no formal degrees conferred, except on the immediate ministers of religion, nor any professorship founded. The lectures are all public, and open to any person who may choose to attend them. Any man may act as a professor and give lectures, but the number of his pupils will of course depend upon his ability. There is no emolument attached to a professorship, nor do the scholars pay for instruction; public fame and honour are the only rewards.—(*History of Persian Literature by Mirza Ibrahim, of Haileybury College; published in Athenæum* 1837.)

GOVERNMENT.—The government is an unmitigated military despotism, the country and the people being considered the property of the king, whose word is law. The nomadic tribes, however, are ruled immediately by their khans, whose authority is sometimes very limited. The civil and criminal laws are founded on the precepts of the Koran, and are administered by the Sheik-ul-Islam and his deputies, in the sherrah courts. There is also the *Urf*, or customary law, administered by secular magistrates, of whom the king is the chief; but the respective powers and privileges of these two branches of judicature have always been matter of dispute. It is scarcely necessary to add, that in Persia, as in every other oriental country, justice is sold to the highest bidder. The governors, indeed, civil, military, and ecclesiastical, from the highest to the lowest, seem never to have entertained the idea that the administration of justice, and the preservation of the public peace, are their highest, and, in truth, their only legitimate functions. They appear rather to look upon their subjects as things made for no better purpose than to be cheated, abused, robbed, and murdered, for their amusement, and for the gratification of their appetites and passions.

The public revenues which reach the royal treasury are said by Mr. Fraser not greatly to exceed a million and a half sterling; out of which are paid the expenses of the royal family; the salaries of officers not provided for in the expenditure of the local government; and the maintenance of *gholams*, or household troops. But the greater part of the public revenues are levied and expended by the provincial governors, who form a sort of petty kings, uncontrolled in their administration, though appointed by, and amenable to, the Shahan-shahee, king of kings, when he has power to enforce his commands.

The army is principally composed of irregular troops, supplied by the nomadic tribes, and officered by their chiefs. During the reign of the late king the European discipline and tactics were introduced to a considerable extent, but without much success; though, it must be admitted, that the regular troops, and the artillery in particular, have been very serviceable in reducing the rebel chieftains of Khorassan, who had nearly become independent. Against the regular troops the rebels could not keep the field, and their fortlets have been easily demolished by the artillery. The amount of force which the kingdom can raise, there is no means of determining, though the late king is said, in various ways, when he took the field, to have made up a numerical force of 100,000 fighting men, besides double or treble the number of camp-followers. The Persians are naturally qualified to make good soldiers; they are able-bodied, and capable of enduring fatigue and long marches with little food; and they acquire military discipline more readily than Europeans; but their military organization is defective to the last degree. Besides these regular and irregular troops, the king has a class of military favourites, called *gholams* or slaves, who are Georgian or Circassian captives, intermingled with the sons of the first nobles of Iran. The situation is one of honour as well as of contingent emolument, and is eagerly sought after even by the highest ranks. This body amounts to about 3000 or 4000, who are chiefly distributed about the king's residence, and attend him in camp. They are well mounted, and armed with matchlocks or muskets, swords, and sometimes pistols, and generally carry a shield on their shoulders. Their pay varies according to their standing and estimation. They are commonly employed as messengers on confidential business, and the more experienced of them are often entrusted with affairs of high importance, in which they contrive to amass large sums by extortion. Their name is a terror to the country, and the arrival of a *gholam-e-shahee*, or king's slave, is sufficient to throw a whole district into alarm.

PRODUCTIVE INDUSTRY AND COMMERCE.—The great mass of the fixed inhabitants are engaged in agriculture and manufactures; the nomadic tribes are herdsmen and shepherds. All the Jews, and many Armenians and Arabs are engaged in commerce. Agriculture is followed in many places with much activity and intelligence, in spite of the obstacles arising from the salt impregnature of the soil, the want of rivers, the obstruction of the aqueducts, bad roads, civil and foreign wars, and the oppressions of every kind to which the people are subject from a tyrannical and rapacious government. The Iranee have a natural talent for the mechanical arts, some of which they have carried to great perfection. They excel particularly in making sabres, in copper and brass work, perfumery, dressing of leather, pottery, silk plain and brocaded, carpets, felts, painted cloths, and shawls. Their commerce is principally carried on by land, their maritime trade being all in the hands of the English, Arabs, and Russians. Their principal port on the Persian Gulf is Bushire; and on the Caspian, Enzillee and Balfrush. The land trade is carried on by caravans, with Turkestan, Turkey, and across Turkestan and Affghanistan, with Russia, India, and China. The principal commercial towns are Tabriz, Kermanshah, Hamadan, Cashan, Ispahan, Shiraz, Balfrush, Mushed, and Nishapore. The principal articles of exportation are pearls, silk, horses, camels, goat-skins, camel-skins, lamb-skins, sal-ammoniac, naphtha, amber, turquoises, copper, sulphur, rice, madder, gall-nuts, saffron, raisins, dates, pistachios, opium, almonds, salep, cotton, tobacco, silk-stuffs, cotton-stuffs, shawls, cloths, carpets, felts, leather, rosewater, asafœtida, hennah, copper and steel articles, pipe-heads, &c. The importations are principally indigo, cochineal, coffee, sugar, rhubarb, drugs, furs, tin, lead, iron, porcelain, tea, diamonds, rubies, and other precious stones, ivory, eunuchs, fine cloths, and all other kinds of European merchandise. There are no roads in Persia but such as have been made by the constant passage of baggage, cattle, and travellers.

DIVISIONS.—For administrative purposes, Iran is divided into large provinces, governed by *beghlerbeghs* or great lords, who have under them *kakim* or governors of districts, and *darogas* or governors of towns; but the limits of these provinces are frequently varying, and do not always comprise the territories of the nomadic tribes. Geographers, therefore, continue to retain the ancient divisions of the country, namely, *Kurdistan*, *Azerbijan*, *Ghilan*, *Mazanderan*, *Astrabad*, *Khorassan*, *Irak-ajemi*, *Khuzistan*, *Furs*, *Laristan*, *Kerman*, and *Seistan*. These we shall now describe separately in their order.

PERSIAN KURDISTAN OR ARDELAN, situate to the north-west of Irak, and to the south of Azerbijan, measuring about 160 miles in length, by 100 in breadth, is composed of a series of hills and table-lands, intersected by narrow valleys, where the villages are built in situations to protect them from the weather. The soil is good, and would yield abundance of wheat and barley; but the Kurds content themselves with raising what is necessary for their own subsistence. Tobacco is cultivated in small quantity; and the forests of oak supply abundance of timber and gall nuts. The country is inhabited by various tribes of Kurds, but the principal chief, who claims at least the nominal supremacy under the king of Persia, is the Walli of Ardelan, who resides at *Senna*, a romantic and flourishing place, in a deep secluded valley, which is filled with orchards.

AZERBIJAN, adjoining the north-western frontier, is one of the most fertile and most productive provinces, but is high, rugged, and cold. It extends in length 275 miles from N.W. to S.E., and 240 in breadth from S.W. to N.E. Nearly the whole of it consists of a succession of lofty mountains separated by deep valleys, which are partially cultivated, and open into fertile plains. In the very centre the mountain of Sahend raises its enormous mass, like a truncated cone, to the height of 9000 feet. To the east of Tabriz, and near Ardebil, Savellan rises to 12,000 or 13,000 feet, with every appearance of having once been a volcano, though no crater is now visible, it being probably covered with the snow. To the east the province is bounded by the mountains of Talish or Massula, which separate it from Ghilan; and on the west by the high range which extends southward from Mount Macis, and divides Azerbijan from Turkish Kurdistan and Armenia. The western portion of the province contains the large lake of Shahee or Urumiah, which is generally about 83 miles long, and 17

where broadest; its greatest depth is generally 45 feet; but it is subject to great variations both in depth and extent at different times. The water is so salt that no fish can live in it, though the smaller classes of zoophytes are found in considerable quantity, and is so buoyant that a man can scarcely stand in a depth of three feet; and will actually float on the surface. In shoals, which are not agitated by the wind, the water forms almost a paste of salt. The lake contains 36 islands, and a large peninsula on the east side, formed of a mass of rock 4 miles in circumference, containing 12 villages, and sometimes entirely surrounded with water. (*Monteith, Journal R. Geog. Soc. Lond.* III. 54.) Several large streams of bitter brackish water flow into it from the north, and it probably contains numerous subaqueous saline springs. The lake is bordered on its west side by the rich alluvial plain of *Selmas*, which extends westward to the mountain border of Turkey, and is thickly studded with villages. In the north-east there is another fertile plain, named *Chuvul-Mugan*, which contains excellent pasturage, but is infested by a dangerous kind of snakes. Azerbijan forms the north-western portion of the great table-land, and has a general elevation of 4500 feet. The climate is healthy and temperate, though the summer heat is considerable; during winter the atmosphere is generally very clear, but the cold is intense, and is the more severely felt, in consequence of the want of fuel, the only article of which is dried cow-dung mixed with straw. During several months in winter, the country is generally covered with snow; but, nevertheless, in the plain round Lake Urumiah, the winters seem not to differ much from those of northern Italy. The principal town is TABRIZ (or *Tebreez, Tauris, i. e.* fever dispelling), a prosperous commercial town, with a large but very fluctuating population. It stands about 4500 or 5000 feet above the level of the sea, in a dry and stony plain, bordered on three sides by bare mountains of the most fantastic forms, while on the fourth side the plain extends without interruption to Lake Urumiah, which is 30 miles distant. The city is about four miles in circuit, and is surrounded by a brick wall; and the citadel, a high and massy structure of brickwork, is visible from a distance rising above the broad screen of gardens which mask the approach to the city, and which, being cultivated with great care, yield every kind of fruit in the utmost perfection and abundance. The winter cold at Tabriz is severe, and snow sometimes lies for six months without intermission. *Dehman* is a modern town of about 15,000 inhabitants, near the north-west corner of Lake Urumiah. *Ardebil*, 85 miles E. of Tabriz, is an insignificant town, which in 1837 presented the appearance of a mass of ruins, but is remarkable as the original family seat of the Sophi or Suffavean dynasty of kings, who ruled Persia during the 16th and 17th centuries, and for a fort constructed on European principles. *Maragha*, an ancient town with 15,000 inhabitants, is noted as having been the residence of Hulagu Khan, who conquered Persia in the 13th century, and is supposed to have been buried there. It contained, likewise, the observatory of the celebrated astronomer Nazir-ud-deen; and near it are some singular caves, with altars not unlike the Lingam of India. *Urmi* (corrupted to *Rhumi, Ur miah*, or *Oormiah*), the birth-place of Zoroaster, the founder of the ancient Magian religion, is now a well-fortified town of 20,000 inhabitants, 60 miles S.E. of Tabriz, and 12 miles W. from the edge of the lake. *Khoi*, one of the finest towns in Persia, has 30,000 inhabitants, 80 miles W.N.W. of Tabriz. *Selmas*, N.W. from the lake, with sulphureous water. *Miana* or *Meeanah*, 94 miles S.E. by E. of Tabriz, a small dirty town of 2500 inhabitants, at the passage of the Sufeed-rud, on the road to Teheran, noted for a species of bug, the bite of which is said to be fatal. Near the south-eastern border of the province is a remarkable place named *Takht-e-Suleymun*. Solomon's throne, which is supposed by Major Rawlinson to be the *Ecbatana* of Dejoces, described by Herodotus, and particularly with the indestructible luxuriance, and perfectly inexhaustible. Above the narrow plain rise the mountains in two ridges, the first clothed with forest, as those in the plain below, and thrown forward at those points which in some places reach the coast. Beyond, this range, which is traversed in all directions by the wildest and most romantic glens, the peaks and rocky masses of the Elburz are seen rising in naked grandeur, and spotted with snow even in September, their elevation being from 6000 to 9000 feet. The coast line with a ridge of sand-hills, from 2000 to 3000 feet high and 200 feet broad, behind which lies a morass of stagnant water, in many places forming large inland lakes, whose banks are overgrown with alders of enormous size, plane trees, cypresses, poplars, and other trees adapted to a moist soil; and, in the rainy season, the country is so flooded as to exhibit the spectacle of a boundless forest in a swamp. It is, indeed, impossible to imagine a more luxuriant vegetation than that of Mazanderan. Exposed alternately to heavy rains and a powerful sun, the rich soil throws out in profuse abundance every form of vegetable life. The vivifying breeze from the Caspian is sometimes thick like a Scottish mist, and is in consequence called the *bad-e-kheir*, or evil wind. The Mazanderanee are a fine hardy race, of a deeper color complexion than the inhabitants of the northern parts of the table-land of Iran, and distinct from them in manners and language. The language of Ghilan is a dialect of the Persian, and is that of the Talish, a small province which borders and forms a continuation of Ghilan on the north. The principal places in Ghilan are, *Resht, Enzelee, Tonun*, and *Lengeran*. *Resht*, the capital, is a busy trading town; but its population (10,000 or 8000) was recently reduced by cholera and other calamities, to 15,000 or 20,000. *Enzelee* or *Enzelli*, its shipping port, 12 miles distant, is a town of from 300 to 400 houses, at the east end of a sandy spit, with an excellent harbour, a good bazaar, and a population chiefly Russian. The spit, which is 15 miles long, and in some places only 150 yards wide, is divided from a similar tongue of land, called Kazeran, by a strait 500 yards wide, but only five feet deep; and inside the water is usually so much as to be fit for drinking; about 70 streams flow into the lagoon. *Lehejan*, another considerable town in Ghilan, with 12,000 inhabitants, 35 miles E. by S. of Resht. *Sari*, the capital of Mazanderan, is a large town surrounded by a mud wall two miles in circuit, with 10,000 inhabitants. *Amol*, 40 miles west of Sari, on the river Heraz, 12 miles from the Caspian, has a bridge of 12 arches over the river, and the ruins of a mausoleum erected by Shah Abbas the Great to his maternal ancestor Meer Buzurg, king of Sari and Amol, in 1575. *Feiruzkoh* or *Lafoorkoh*, once a flourishing commercial town between Amol and Sari, on the river Bawul, at the mouth of which is its port of *Mushedi-Sir*. The population, in 1822, was estimated at 30,000; but before 1831, it was reduced by cholera and loss of trade to about 3000. *Astrabad*, the capital of the small province of the same name, has a circumference of three miles, and had once a population of 40,000. *Asheraf*, 60 miles west of Astrabad, was the favourite residence of Shah Abbas the Great.

KHORASSAN or KHORASAN, is a large province of very fluctuating and uncertain limits, forming the north-eastern portion of Iran. The mountain range of Elburz, after passing to the south of the Caspian Sea, here spreads out into a great width, in some places extending to 200 miles, and is di-

vided into ridges with intervening valleys which communicate with each other by defiles or passes, and form an extensive aggregate of districts, many of which are well cultivated and populous. Towards the northern desert this mountain region presents a considerable declivity, called *Ataḳ* or *Damán*, *i. e.* the skirt; but towards the deserts of the interior it declines less abruptly. Speaking generally, Khora-san, formerly one of the richest provinces of Iran, is now almost a wilderness, thickly strewed with the ruins of large towns, and other vestiges of former prosperity. For many years it was in a state of anarchy, and divided among petty chiefs, who by turns conciliated or defied the king of kings. It has been again reduced to obedience; but, under so mischievous a system of government as now exists in Persia, it seems to have little chance of recovering its former prosperity. MUSHED (MESCHED or MEKSCHID), the capital, is celebrated for, and owed its prosperity to, the tomb of Reza, one of the twelve Imams, descendants of Ali (see *antè*, p. 124), which is contained in a most splendid mosque. Besides the remains of the Imam lie those also of the celebrated Caliph Haroun-al-Raschid, who died at *Tús* or *Toos*, a city now in ruins, a few miles to the north-west. Mushed is, in consequence, the resort of great numbers of pilgrims, and had, not many years ago, a population of about 100,000; but, when visited by Mr. Fraser in 1834, it was nearly depopulated; the few remaining inhabitants were reduced to poverty; thousands of beggars at the point of starvation annoyed the traveller; and even the mosque itself, shorn of its glories, was falling to ruin. *Kabúchan*, 100 miles N.W. of Mushed, is a large town of 15,000 inhabitants, and is the seat of the most powerful of the Kurdish chiefs of Khorassan. *Nishapúr*, 90 miles E. by S. of Mushed, once a large city, now contains only 5000 inhabitants. *Kelat* or *Kúlat-Nadiri*, the stronghold of Nadir Shah, is a valley 50 or 60 miles long, by 12 or 15 wide, surrounded by mountains so steep, that a little help from art has rendered them quite impassable, the rocks being scarped into the form of a huge wall. A stream runs through the valley, and its entrance and outlet, the only points of access, are fortified by walls and towers which are deemed impregnable. The valley contains a number of villages, and 2000 families. *Mero* or *Meru-Shah-Jehan*, once a famous city of Khorassan, is now a mass of ruins, beyond the present limits of the kingdom. *Turshiz*, *Tubbus*, *Serukhs*, and *Tabas*, are all large towns, with some trade, to the south and south-east of Mushed. *Herat*, 200 miles S.E. by E. of Mushed, is a large city, with a population of about 45,000, is well fortified, and about three quarters of a mile square, or three miles in circuit. It is divided into four quarters, by four long bazaars, covered with arched brickwork, which meet in a small domed square in the centre of the city. The city contains altogether about 4000 houses, 1200 shops, 17 caravanserais, 20 baths, numerous mosques, and fine public reservoirs of water. It is, however, one of the dirtiest cities in the world. The necessaries of life are plentiful and cheap; and the water and the bread of Herat are proverbial for their excellence. The climate is said to be salubrious, though the heat is excessive for two months of the year, and though in winter there is much snow. Herat is the emporium of the trade between Persia and India. For many years it belonged to the late kingdom of Cabul; but, since the downfall of that kingdom, it has been possessed by a branch of the Dúrannee royal family, as an independent sovereignty. It is still, however, claimed by the king of Persia as a part of Khorassan; but he was recently foiled in an attempt to make himself master of it. The town is situate in a beautiful and extensive plain, or long valley, watered by the *Hurrarúd*, which runs northward to the desert, where its termination is unknown.

IRAK-AJEMI or PERSIAN IRAK, is the largest and one of the most valuable provinces of the kingdom. It forms part of the great table-land; and is almost everywhere intersected with valleys of indefinite length, but seldom exceeding 10 or 15 miles in width. The hills which border them are barren, and stretch almost invariably west and east, gradually sinking into the desert, or extending into Kerman and Khorassan. The valleys are nearly destitute of water, except after the melting of the snow, and only a small part of them is cultivated. The north-western part of the province forms an elevated plain, varied with gradual ascents and descents, and furrowed by deep valleys in which the rivers flow. ISPAHAN or ISFAHAN (the SPAHAWN of old travellers), the capital of Iran under the Sophi kings, and at that time a very large and splendid city with nearly a million of inhabitants, is now deserted by the court, and a great part of it is in ruins. It stands in a plain 4140 feet above the level of the sea, upon the banks of the Zeinde-rúd, which is crossed by three fine bridges, and is surrounded by a mud wall 24 miles in circuit. Nothing can exceed the fertility and beauty of the neighbouring valley, and the first view of the city is still very imposing. A nearer view however dispels the illusion; though much still remains of wealth, if not of splendour. Ispahan has still a considerable trade, and a population of about 150,000. On the south side of the river are the two suburbs of *Isfahanuk* or *Little Ispahan*, and *Julfa*; the latter named after a town of Armenia, whose inhabitants were transported hither by Shah Abbas the Great. TEHERAN or TEHRAN, the modern capital of Iran, and during forty years the residence of the late king Futtey-Ali, 220 miles N. of Ispahan, is four miles in circuit, and fortified with a mud wall, towers, and a wide and deep ditch. Its only important edifice is the ark, a fortified palace or citadel. The population varies with the season from about 10,000 to 60,000. Teheran stands in a gravelly plain 3786 feet above the level of the sea, which is bordered by a high range of mountains. A gazette was commenced at Teheran in 1837, under the auspices of the Shah. About 40 miles E.N.E. of Teheran, is *Demawend* or *Demawund*, an enormous volcanic peak, rising 14,300 feet above the level of the sea. About 10 or 12 miles S.E. of Teheran are the extensive but almost obliterated remains of *Rhe* or *Rhages*, the contemporary of Nineveh and Ecbatana, the capital of the Parthian kings, and the birthplace of the great caliph Haroun-al-Raschid. *Casbin*, (*Cazvin*, *Kazvin* or *Casveen*), 96 miles W.N.W. of Teheran, one of the largest and most commercial cities of Iran, is situate in a large plain or valley, 20 miles in breadth, which affords good pasturage, contains numerous villages, and is in some parts well cultivated. The town is approached through a vast extent of vineyards and orchards inclosed by high walls. The grapes of Casbin are considered the best in Iran; and its pistachio nuts are also abundant and highly esteemed. The town is inclosed by a mud wall with towers, and is said to exceed Teheran in size, though it is not so populous. It contains whole streets lying in ruins, and has no building of any note. Population about 40,000. *Sultaniah*, 60 miles W.N.W. from Casbin, is a mere village amidst the ruins of a great city. In summer, the late king and his court, accompanied by a great part of the inhabitants of Teheran, used to encamp on this plain of Sultaniah to avoid the heat of the plain of Teheran. About 70 miles E. of Teheran, on one of the mountains of the Elburz, is the fortress of *Firúz-kúh*, which is considered impregnable, and is of great importance as commanding the most accessible pass leading to Mazanderan. *Zenjan*, 90 miles W.N.W. of Casbin, is a considerable town with 8000 inhabitants, at the junction of the roads which lead from Teheran and Hamadan to Tabriz. *Hamadan*, supposed by some to be the ancient *Ecbatana*, 270 miles N.W. by N. of Ispahan, and 198 W. by S. of Teheran, stands at the base of Mount *Elvend* or *Elwund*, the ancient *Orontes*, and is merely a collection of clay-built houses, with 50,000 inhabitants. The sides of the hill abound with antiquities; but the only buildings which are entire are the tomb of the celebrated physician Avicenna, and the supposititious tomb of Esther and Mordecai. Hamadan is the centre of a considerable trade; has extensive and well furnished bazaars; and a very active and bustling population. *Kungaur* or *Kenghevar* (*Concobar*), a small town 20 miles W. by S. of Hamadan, contains the ruins of a splendid temple of a goddess, corresponding to the Greek Artemis and the Roman Diana. In the same direction, at the distance of 52 miles, is *Kermanshah*, a thriving city with 35,000 inhabitants, adorned with many handsome public buildings. It is noted for the manufacture of car-

pets; and the vicinity is celebrated for the production of wheat and superior mules. About 90 miles W. of Kermanshah, is *Kasr-i-Sherin*, a village, containing the remains of two magnificent palaces built by Khosroo-Parviz, one of the Sassanian kings, as a retreat for himself and his beloved wife Sherin. It is 11½ miles N.E. of Bagh'dad. At *Bestun*, 21 miles E. of Kermanshah, are the remains of a large piece of sculpture on the face of a rock, supposed to represent Semiramis and her guards, but so much defaced that scarcely any outline can be traced; the figure and also an inscription of nearly 1000 lines of arrow-headed letters, exhibiting the religious vows of Darius the son of Hystaspes after his return from the destruction of Babylon, on the revolt of its governor. *Koom* or *Kum*, a large but ruinous town, the abode of a fanatical, ignorant, and bigoted people, is rich only in shrines and priests, and contains more domes and minarets than inhabited houses. It is situate 175 miles W. by N. of Ispahan. As a place of pilgrimage it ranks next to Kerbelah and Mushed; the principal object of attraction being the tomb of Fatima, the sister of the Imam Reza. From the holiness of its saints and priests, Koom has acquired the title of *Dar-al-Mursheda* (the abode of the pious). *Kashan*, 105 miles N. by W. of Ispahan, a neat, populous, and busy town, situate in a well-cultivated and fruitful country, is famous for its manufactures of silk and cotton stuffs, brocades, carpets, and copper-wares. *Yezd*, 250 miles E. of Ispahan, situate in a dry but well cultivated and fruitful oasis, nearly encircled with mountains, and connected with the fertile tracts eastward of Ispahan, by a series of small oases or islands in the desert, is one of the most prosperous commercial and manufacturing cities of Iran. It is a great mart for the interchange of commodities, between eastern and western Persia; and its own manufactures of silk and other stuffs, felts, sugar-candy, and sweetmeats, enjoy great repute, and command a ready sale. Population about 50,000, amongst whom are more than 3000 families of Guebres, followers of the religion of Zoroaster, an industrious and patient race, who are busily occupied in trade and agriculture. The south-western part of Irak is a mountainous region named Louristan, inhabited by nomadic and pastoral tribes, part of whom are now classed under the general name of Bukhtiari. It contains the towns of *Kermanhad*, *Hissar*, *Burujird*, and *Saharend*.

KHUZISTAN, the ancient SUSIANA, lies along the eastern or left bank of the Tigris and Shat-el-Arab, at the head of the Persian Gulf. A large proportion of the province is little better than a forsaken waste; and the southern part of it is a desert arid country called *Chab*, which is possessed by an independent Arab tribe. The mountainous portion, however, to the north and east, contains several fertile valleys of great extent, but only partially cultivated. *Shuster*, the capital, is a well-built town, with stone houses, but narrow and dirty streets, and contained about 15,000 inhabitants before it was nearly depopulated by the plague in 1832. *Dizful*, between Shuster and Sus, is now considered the principal town of the province, and may contain about 20,000 inhabitants.—(*Jour. R. Geog. Soc.* IX. 671.) At *Sus* or *Shus*, 90 miles N.E. by N. of Kornah, and 37 W. by S. of Shuster, are the ruins of a great city six or seven miles in circumference, which present the appearance of irregular mounds of bricks and broken pottery. Sus contains also a modern building called the tomb of Daniel. *Susan*, on the Kuran, 160 miles N.E. by E. of Kornah, and 50 E. of Sus, also contains the ruins of a great city, and the tomb of Daniel, called Dan-yali-Akbar, or the Great Daniel, to distinguish it from the structure at Sus. Major Rawlinson is of opinion that Susan and not Sus is the Shusan of Scripture, though probably both places represent the *Susa* of the Greeks at different epochs.—(*Jour. R. Geog. Soc. Lond.* IX. 85, &c.) *Ahwaz*, on the banks of the Kuran, 50 miles S. by W. of Shuster, is a small, mean, and solitary town of about 1000 inhabitants, in the midst of a mass of ruins, the remains of what was a large city in the days of the Abbaside Caliphs. *Dorak*, on the banks of the Jerahi, a wretched collection of date-tree huts, surrounded by a mud wall, and containing about 6000 inhabitants, is the capital of the Chab district. *Hureeza* or *Hurreza*, on the Kerah or Kerkhah river, 85 miles S.W. of Shuster, is a considerable town, surrounded with a fortified wall, and contains a fort or castle. *Ram-Hormuz*, the ruins of an ancient city in a beautiful valley of the same name, 60 miles long by 6 or 8 broad, watered by the Jerahi, 100 miles S.E. by E. of Shuster.

FARS or FOUSISTAN, the original PERSIA, lies on the north-eastern side of the gulf, and extends towards Irak and Kerman. The northern and north-western portions of the province are rich in soil, and covered with wood and verdure, but contain scarcely a human inhabitant. The eastern portions are sandy and arid. The northern section, bordering on Irak, consists principally of rocky mountains, which enclose long narrow valleys, many of which afford excellent pasture to the herds and flocks of the wandering tribes who possess it, and even yield grain where the means of irrigation exist. The plain, which extends along the northern side of the mountain ous region, has a soil strongly impregnated with salt, and contains the great lake or Bakhtegan, with several of smaller dimensions. It would form a portion of the great desert, were it not separated from it by a series of ridges, extending east and west, between 29° and 30° N. lat., and enclosed to the north and south by two low ridges of rocky hills. This narrow tract, called the *Nemamaur*, produces some grain, and is particularly rich in fruit, some kinds of which reach great perfection. *Shiraz*, the capital, is situate in a plain 4284 feet above the level of the sea, on the *Rokna'ad*, a small stream, which empties itself into a salt lake. It has never at any time been remarkable for its splendour or fine buildings, but is renowned for its vines. Shiraz contains the tombs of Sadi, the moral philosopher, and Hafiz, the lyric poet, the Anacreon of Persia, whose works contain the most glowing allusions to the pleasures of Shiraz; but all is now changed. It had been for a long time rapidly falling to decay, and its ruin was completed by an earthquake in 1824. The town is about six miles in circumference, but great part of its area is covered with ruins. The houses are generally small, and the streets narrow and dirty. The ground has been raised, and the climate changed for the worse. The population is much reduced from its former numbers. Lat. 29° 37', long. 52° 41'; 220 miles S. by E. of Ispahan. *Kauzroun* or *Kazerun*, 50 miles W. from Shiraz, is a town of some importance, in a fine and well-watered valley, 2772 feet above the level of the sea; but its walls enclose more ruins than houses, and its population is only about 3000 or 4000. *Abu-Shehr* or *Bushire*, on the gulf, the principal sea-port of Persia, in lat. 28° 58', long. 50° 52', 120 miles W. by S. from Shiraz; population about 10,000. The harbour and roads are capable of containing any number of small native vessels and boats; but neither in the inner harbour, where vessels under 18 feet water may lie, nor in the outer roads, is there sufficient depth for vessels to anchor at a convenient distance from the shore, nor sufficient shelter to protect them against the prevailing winds. The town is built at the end of a sandy peninsula, and, from the anchorage, has rather an imposing appearance; but is really a mean and dirty place. The water near the town is brackish, but sufficiently wholesome. Ruins of *Shapur*, 7 miles N. of Kanseroun, once the capital of Persia, in a well-watered plain. Plain of *Merdusht*, 35 miles N.E. from Shiraz, contains the ruins of *Persepolis* or *Istakhar*, the principal part of which is called *Chilminar*, or the 40 pillars; also *Takht-Jemsheed*, *i.e.* the throne of Jemsheed. A few miles distant are remarkable excavated hills called *Nakshi-Roustan* and *Nakshi-Rejid*, which are supposed to be tombs of Sassanian kings. *Murghab*, 40 miles N.N.E. from Istakhar, contains numerous ancient remains, apparently coeval with those of Persepolis, and among them a building, generally considered to be the tomb of Cyrus, but called by the natives the Mosque of Solomon's Mother. It is in perfect preservation, but the body of the great conqueror of Asia is gone. The ruins which surround it are supposed to be those of *Pasargadæ*. *Darabghird*, a town with 15,000 inhabitants, 135 miles E. by S. from Shiraz; *Saza* or *Tesa*, 75 miles E. by S.; *Firozabad* or *Feruzabad* 60 miles S.; *Yezdikhast*, a considerable town on the borders of Irak, 140 miles N. by W. *Congoon*, on the coast,

east of Cape Verdistan, is said to contain 6000 inhabitants, who are subjects of the Imam of Muskat and carry on a considerable trade. *Beehaban*, 130 miles W.N.W. of Shiraz, is a large town 3 miles in circumference, and said to contain 10,000 inhabitants.

LARISTAN is a small province on the northern side of the gulf near its mouth. The lower part of it is an arid desert, with a surface diversified by rocky mountains and valleys of sand and salt; but the northern region contains a number of fine valleys, which produce dates and other fruits, and also grain. *Lar*, the capital, is a town of 12,000 inhabitants, with a castle situate on a hill, and contains the finest bazaar in Persia. *Asmloo, Nabend, Shewar, Nackiloo, Jezsar, Cheroo*, &c. are all towns on the coast of the Persian Gulf. *Furem*, and *Forg* are inland.

KERMAN lies to the east of Fars and Laristan, having the Persian Gulf on the south, and the great deserts on the north. It is exceedingly mountainous and barren, is destitute of rivers, and but for a few springs in the hills, and the subterraneous aqueducts, the inhabitants could not exist. Water is collected with extraordinary pains, and, after all, is not more than sufficient to irrigate a very trifling portion of the soil; although snow lies on the mountain tops during the greater part of the year. In the desert part of the province, the ground is so impregnated with salt, that sometimes not a blade of grass is to be found in a stretch of 90 miles, and not a drop of water. In the whole tract there is but one green spot, where the town of *Khubbees* was built, lat. 31° 40′, long. 58°14′, for the purpose of facilitating the trade between the northern and the southern provinces. But the town has gone to decay, and its inhabitants have become robbers. KERMAN, the capital, lat. 29° 51′, long. 56° 13′, 220 miles E. from Shiraz, 340 miles S.E. by E from Ispahan, stands in the centre of a large well-cultivated plain, and has a population of 30,000. The wool of Kerman is celebrated for its fineness, and its manufactures of shawls, felts, and matchlocks, are in request all over Iran. *Gambron, Gombroon*, or *Bender-Abasi*, on the shore of the Persian Gulf, once a flourishing commercial town, is now a collection of huts, inhabited by 3000 or 4000 Arabs. *Krook, Nuheemabad, Regan, Jumalee, Bumm, Teheroot*, all to the south-east of Kerman, in the district of *Nurmanshir*, the most fertile part of the province, a tract or series of oases, extending east and west 90 miles by 30, where the soil, consisting of a rich black mould, and watered by mountain streams, yields an abundant produce. *Rayun*, 40 miles S.E., *Killaheirtga* 70, and *Shuhri Bababeg*, the ruins of a once splendid town, in the midst of a profusion of the most prolific fruit gardens, 105 miles W. from Kerman.

SEISTAN, in the middle of the eastern border of the kingdom, is a small province, and consists of a desert of sand and rocks, through which the river *Helmund* or *Hermund*, from Affghanistan, flows into the sea or lake of *Durrah* or *Zurrah*. This lake is about 60 miles in length by 35 in breadth, and covers an area of about 1100 square miles. The water is slightly brackish, but abounds with fish and wild fowl. In the dry season it is shallow, and overgrown with reeds. In the middle of it is a fortified island named *Koh-i-zur*, where the chiefs of Seistan used to take refuge when their country was invaded. The province is now in the possession of independent wandering tribes, whose chiefs live in fortified villages on the banks of the Hermund, and are frequently engaged in plundering expeditions.

ISLANDS.—*Kharak*, in the Persian Gulf, 45 miles N.W. of Bushire, in 29° 14′ 45″ N. lat., and 50° 19′ 19″ E. long., is five miles long and two broad, with excellent water, and contains an old Dutch fort, and a good harbour. The soil is light and productive; millet, onions, cucumbers, grapes, melons, and figs, grow in great abundance. About a third part of it is cultivated. The island was recently taken possession of by a British force from Bombay. *Kishme, Kishm*, or *Jism*, called also by the Arabs *Jezirah-Tawilah* or *Jezirah Diraz* (*i. e.* long island), is situate at the entrance of the Persian Gulf, the 56° E. long. running nearly across the middle of it. It is 54 miles long, by 20 at its greatest breadth, and is separated from the mainland of Persia by *Clarence Strait*, which is three miles wide at its narrowest part, but expands to 13, and is studded with islets. The south side of the island is occupied throughout by a range of hills; the north side consists of arid plains and deep ravines. The greater part of the surface is sterile, and has in some places a crust of salt. The northern portion, however, is somewhat fertile and populous; the total population about 5000, are employed in fishing, cultivating the soil, and making cloth. They reside chiefly in villages and hamlets scattered along the coast. The only towns are *Kishme*, with 2000 inhabitants; *Laft*, and *Basidoh* or *Easidore*. The last named town is situate at the west end of the island, in lat. 26° 59′ N., and 55° 22′ E. long; and recently was the naval station of the Bombay squadron in the gulf, and the residence of its commodore. *Ormus* or *Hormus*, eastward from Kishme, near the north shore, under a lofty mountain called *Jebel Shamal* (Mount North), whose summit is clad with snow even in spring. Ormus is 12 miles in circuit, nearly circular, and its appearance from seaward is broken and rugged. The surface is destitute of soil, and the conical shape and isolated positions of the numerous small hills which cover it, give it a highly volcanic aspect. The harbour on the north-east side is secure and convenient; the fort is situate on a projecting point of land, separated from the main body of the island by a moat, and is still in good condition. There are no fresh-water springs in the island. The rugged hills which line the eastern shore, are covered at one part, to a considerable distance from their bases, with a crust of salt, in some places clear as ice, and in others partially covered with a thin layer of dusky red-coloured earth, tinged with oxide of iron, with which the whole surface of the island is deeply impregnated. Ormus once contained a splendid and populous city, one of the principal commercial settlements of the Portuguese, during the period of their dominion in the Indian Ocean; but the city has entirely disappeared. The island is now in possession of the Imam of Muskat, who farms it from the king of Persia, and keeps in the fort a small garrison. Population in 1827, when the island was surveyed, about 300, whose only employments were collecting salt, and fishing. *Anjar*, on the south side, and *Larek*, on the east side of Kishme, are small, sterile, volcanic-looking islands, the latter inhabited only by a few fishermen. The *Great* and the *Little Tomb (Tunb)*, two uninhabited islands, 24 miles S. of Basidoh; the former well stocked with antelopes. Along the coast northward are the islands of *Pelior, Keish, Inderabia, Busheab*, and *Kenn*.

RIVERS.—The rivers of Iran are few and unimportant. The *Kizilozan* rises in Azerbijan, and flows through Ghilan into the south-west corner of the Caspian Sea; in the lower part of its course it takes also the name of *Suffeid rûd*, or the White river. In Azerbijan it flows in so very deep a channel that its waters cannot be used for the purposes of irrigation, and it enters Ghilan by a deep gorge, which separates the Elburz from the mountains of Massula. This is the famous *Pass of Rûdbar*, about 30 miles long, through which the river dashes with incredible velocity. The *Tedjen*, in Khorassan, near Mushed, flows north-eastward into the desert, where it is lost. The *Zeinde* waters the valley of Ispahan, and flows through that city to the south-east, where it terminates in the desert. The *Kûr* or *Bundemir*, in Fars, runs into Lake Bakhtegan. The *Kuran* and *Jerahi* fall into the Persian Gulf. The *Haweza* or *Kerah* or *Karasu*, is an affluent of the Shat-el-Arab. The *Diala*, in Kurdistan, is an affluent of the Tigris. The *Gourgon* and the *Attruck*, both flow into the south-eastern corner of the Caspian Sea, to the north of Astrabad. The *Murg-ab* rises from the Paropamisan mountains to the north-eastward of Herat, and flows to the north-west, where it is lost, like so many others, in the Turcoman desert. The *Shiur-rûd*, in Kerman, flows into the Persian Gulf, opposite the island of Kishme. The names of Persian rivers sometimes terminate with the syllable *rood* or *rûd*, which signifies river.

CAPES.—*Verdistan*, in the Persian Gulf; *Bombarak* and *Gask*, on the coast of the Gulf of Oman.

AFFGHANISTAN.

The north-eastern portion of Persia, is bounded on the north by the ridges of the Himalayas and Hindoo-koh, and the Paropamisan mountains; on the south by Beloochistan; on the east by the river Indus; and on the west by Khorassan and Seistan; measures from west to east about 630 miles, and from north to south, 450; and contains an area of 240,000 square English miles.

Affghanistan is a congeries of high valleys and table-lands, which are separated by lofty mountains. The Hindoo-koh and Himalayas, which bound it on the north, appear, in some places, to form four distinct ranges, the most northerly of which is always covered with snow, though not of equal elevation throughout. In some places the range is surmounted by peaks of great height and size, which do not taper gradually to a point, but rise at once from their bases with amazing boldness and grandeur. The height of one of these peaks was ascertained by Lieutenant Macartney, in 1809, to be 20,493 feet. Koh-i-baba, a remarkable ridge with three peaks, in longitude 68° E., rises to 18,000 feet; it was crossed on the east side by Lieutenant Burnes, in 1832, by the pass of *Ooma*, the summit of which is 11,000 feet high; the pass of *Hajeeguk* is 12,400 feet; and beyond these lies the pass of *Kaloo*, which is 1000 feet higher. The secondary ranges decrease in elevation according to their distance from the main trunk; the tops of the highest are bare; but their sides and the whole of the lower ranges are well wooded. The minor ranges are covered with snow for several months in the year; their tops have few trees; but their sides are covered with forests of pine, oak, and wild olive. Lower down are many valleys, watered by clear streams, whose banks afford a profusion of European fruits and flowers, which grow wild, in the utmost variety, perfection, and abundance. The hills bear many pretty sorts of fern and similar plants, with several elegant shrubs; and even the rocks are rendered beautiful by the rich verdure of the mosses which cover them. This region is called the *Kohistan* or hill country. All the valleys of the range open ultimately into the great valley of the Cabul river, which extends east and west about 200 miles, and carries their waters to the Indus. The Hindoo-koh may be said to terminate westward with the Koh-i-baba, beyond which the range declines in elevation, and is lost in the Paropamisan or Ghor mountains, which extend about 350 miles east and west, with a breadth of 200, the whole space being a congeries of mountains of difficult access, and little frequented. They are so much lower than the Hindoo-koh, that no continuous line of perpetual snow can be traced among them. On the south side of the Cabul valley, to the west of Peshawer, the *Suffeid-koh* or White Hill, called also *Spenghur*, rises to the height of 14,000 feet above the level of the sea; and is only separated by the river from the projecting offsets of the Hindoo-koh. To the south of this mountain, a range extends through several degrees of latitude, forming the eastern limit of a mountainous country which reaches to the desert of Seistan; and the western limit of the basin of the Indus, to which it descends with a rapid slope, terminating in an arid plain, called the *Damin* or Skirt. The elevation of the range is considerable, but the Suffeid-koh is the only peak which retains snow throughout the year. In lat. 31° 39′ it forms the lofty mountain of *Cussay Ghur*, of which the Tukht-i-Suleiman (Solomon's throne) is the highest peak, which rises 11,000 feet above the level of the sea. Snow lies upon it for three months, and on the neighbouring mountains for two. To the westward are two smaller parallel ranges, both lower than the most easterly or principal range, the last of which, however, is intersected by valleys which open a passage to the Indus for the waters which rise between it and the second range. The latter thus forms the watershed between the Indus and the rivers which flow westward to the desert of Seistan, and throws out several branches in that direction, which form the high valleys of Pisheen, &c. The Sulieman or eastern range is described as being composed of a hard black stone; the next, of a red stone equally hard; and the third or most westerly, of a friable grey sandstone. Their summits are all bare; the sides of the highest range are covered with pines; those of the second with olives and other trees; but the lowest is quite bare, except in the hollows, which are overspread with thickets of brushwood. Westward from these mountains, the country gradually becomes more and more bare and sterile, till at last it terminates in the deserts of Seistan and Khorassan.

In the lower portions of the eastern valleys the summer heat is sometimes as great as in the hottest parts of India; but it does not continue so long, and is compensated by a much colder winter. In the western districts of the country, where the land is higher, the heat is less excessive. In the north, the temperature is various, as might be expected from the differences of elevation and from other circumstances. The low parts are hot, the middle temperate, and the high cold; but speaking generally, the average heat of the year does not reach that of India, nor is the cold so great as that of England. The north-eastern portion of Affghanistan participates in the Indian monsoons or rainy season; but they are here greatly modified, and very different from that incessant and drenching rain which prevails in the southern provinces of Hindostan. These periodical rains diminish to the westward, and in the valley of Peshawer the monsoon only appears in some clouds and showers; in the valley of Cabul it does not extend beyond Lughman; but in the southern mountains, called Coond, it forms the principal rain of the year; while, in the southern regions, it is felt as far west as the western boundary of Mekran. There are other rains or snows that fall about Christmas, which, in the greater part of the country, are of more value to husbandry. The monsoon rains are indeed less important than those of spring, which are said to come from the west. Candahar has a hot climate; no snow falls; and the little ice which forms at night on the edges of the streams melts before mid-day. To the north and east, as the country rises, the cold increases, and the communication between Cabul and Candahar is often interrupted by the snow. At Ghuznee the cold is sometimes excessive; and there are traditions of that city having been twice destroyed by falls of snow, in which all the inhabitants were buried. The prevailing winds are from the west.

Gold does not seem to be found in Affghanistan, except in the streams which flow from the Hindoo-koh. Silver is found in small quantities in the country of the Kafirs; and whole cliffs of lapis-lazuli overhang the river of Kashkar, to the north of the Euzofzye country. There are also lead, antimony, iron, sulphur, rock-salt, and alum, and indications of copper. Saltpetre is made everywhere from the soil. Silver, copper, iron, lead, antimony, lapis-lazuli, and asbestos are found in the mountains around Cabul, and the sand of the Kirman river is washed for gold. The most common trees on the mountains are pine, oak, cedar, and a sort of gigantic cypress; also walnuts, wild olives, wild grapes, and barberries; in the plains are found, the mulberry, the tamarisk, the willow, the plane, and the poplar; in gardens are roses, jessamines, poppies, narcissuses, hyacinths, tuberoses, stock, and other English kinds of flowers, and many of them are found wild. Lions are very rare, if found at all; tigers are found in most of the countries to the east of the Sulelman range, and these, with leopards, are to be met with in most of the woody parts of Affghanistan. Wolves, hyenas, jackals, foxes, and hares are common everywhere; bears are found in all the woody mountains; wild boars are rare; and the wild ass appears to be confined to the Dūranee country, Gurmseer, and the sandy country to the south of Candahar. Elks, and many kinds of deer are found in all the mountains; but antelopes are rare, and are confined to the plains. The wild sheep and wild goat are common in the eastern hills, which contain also porcupines, hedge-hogs, and monkeys, mungooses, ferrets, and wild dogs. The principal domestic animals are horses, ponies, asses, mules, camels, buffaloes, and humped beeves. The great

stock of the pastoral tribes consists of sheep of the broad-tailed species. The greyhounds are excellent, and are bred in great numbers among the pastoral tribes, who are very fond of hunting; pointers also are not uncommon. There are also cats, particularly a long-haired species called *Burak*, which are exported in great numbers, and everywhere called Persian cats, though they are not numerous in that country, and are never exported from it. Of birds, there are eagles, hawks, falcons, herons, cranes, storks, wild ducks, geese, swans, partridges, quails, pigeons, doves, crows, sparrows, cuckoos, magpies, and many other species. The snakes are chiefly innocent; the scorpions of Peshawer are well known for their size and venom, yet their bite is seldom or never fatal. There are no crocodiles; turtles and tortoises are common. Great flights of locusts are not of frequent occurrence. Bees are common, and musquitoes, which are less troublesome than in India.

The origin of the Affghans, and of the name by which they are designated, is uncertain. It is only through the Persian that the name is known to the people themselves, and it is probably of modern introduction. The name they themselves give to their nation is *Pushtun*, in the plural *Pushtanneh*, whence probably the name of *Patan*, by which they are known in India. They consider themselves to be descended from Affghan the son of Irmia or Berkia, a son of Saul, king of Israel. They call themselves accordingly *Beni-Israel*, though they consider the term *Yahudee* (Jew) as one of reproach. According to the native tradition they were transplanted by Nebuchadnezzar, after the overthrow of the temple, to Ghoré, a town near Bamean, and lived as Jews till the first century of the hejrah, when Khaleed converted them to Islam. The Affghans have all the appearance of Jews, and many believe them to be really the descendants of the captive ten tribes of Israel, but the matter is at the best very uncertain. They are divided into a number of tribes, which possess each a distinct territory, and continue in a great measure unmixed. Each tribe has branched into several divisions, and in the more scattered tribes, these branches have separated, and are each governed by its own independent chief; they retain, however, the common name, and an idea of a community of blood and interests. This operation of subdividing is repeated so often, that the last offshoot sometimes contains but a few families, with a chief who is subordinate to the leader of the division in which it is comprehended. Each branch has its common ancestor. The chief of a tribe bears the title of khan, and is generally elected by the people, who pay some attention to primogeniture, but more to age, experience, and character. The chief of a subdivision is always elected by the people from the oldest family which it contains, except in the lowest subdivision, where the superiority is often natural, as when an old man is the head of 10 or 12 families, formed by his sons, nephews, and grandchildren. The internal government of the tribes is conducted by the khans, and assemblies of the heads of divisions called jirgas. The khan presides in the principal jirga, which is composed of the chiefs of the great branches of the tribes. Each of these presides in the jirga of his own division, which is formed in a similar manner of the chiefs of the subdivisions, who again hold their jirgas. This system of government is, however, so often deranged by circumstances, that it is seldom found in full operation; and must therefore be considered rather as the model upon which all the governments of the tribes are formed, than a correct description of any one of them. The members of the tribes are naturally attached to the tribe and its members, but their attachment is rather to the community than to the khan; and though, in the opinion which they entertain of their khan, the idea of a magistrate set up for the public good is certainly mixed with that of a patriarchal and natural superior, yet the former impression will always be found to be the strongest. Accordingly, the power of life and death is rarely possessed by a khan, and it is but seldom that his personal interests would lead a tribe to take any step inconsistent with its own honour or advantage. An assemblage of many such commonwealths composes the Affghan nation. Each tribe has its own territory; and they may be arranged geographically in the following order:—Eastern tribes,—the *Euzofzyees*, *Otmankhail*, *Turcolanees*, *Kyberees*, the *tribes of the plain of Peshawer*, and those of *Bungush* and *Khuttuk*, all classed under the general name of *Berdúráni*, inhabit the north-eastern part of the country between the Himalayas, the Indus, the Salt range, and the Sulieman range. The tribes of *Esaukhail*, *Sheotooks*, *Bunnúses*, *Dower* and *Khústees*, are found in the neighbourhood of the Salt range. The *Dawhitkail*, *Meankhail*, *Babúrs*, *Stureani*, and *Gundepúr* occupy Damán. Central tribes:—*Jangees*, *Toorees*, *Jadrans*, *Vizerees*, *Minheils*, *Munakhail*, *Zimurrees*, *Sheranees*, *Spintereens*. Western tribes:—I. The *Dúrani* or *Dooraunees* possess a tract of country of about 400 miles in length by 120 or 140 in breadth, extending from Herat to the south-east of Candahar, where it appears to be bounded by the range of mountains called Kojeh-Amran, which is so high as to be covered with snow for three months in the year. To the south of Kojeh-Amran is *Pisheen*, a sort of valley or table-land, 80 miles from N.E. to S.W., its greatest breadth being about 40 miles, which is inhabited by the *Tora-Tereans*, who are closely connected with the Dooraunees both by descent and friendship. Their principal employment is agriculture, but a great proportion of them is occupied between Candahar and upper Sinde, in the business of carriers. II. The *Ghiljees* extend from the south-east of Candahar to the Kohistan or hill country, north of Cabul, and eastward to the heights of Jellabad and the range of Suleiman, occupying a tract of about 350 miles in length by 150 in breadth. To the south of the Ghiljees are the *Cauters or Kuukers*, whose country forms a square of about 100 miles, extending westward from the Suleiman range, and separated from Beloochistan by the pass of Bolan. They are divided into at least 10 clans, without any chief of the whole tribe. All the tribes above mentioned possess a country of their own, but the *Nassers* live in scattered parties, wandering in summer in the western deserts of Affghanistan, and proceeding in winter, in a collected body of 30,000, with their herds and flocks, into the warm region of Damán.

After the death of Nadir Shah, in 1747, one of his principal officers, Ahmed Abdallee, a Dúrani, fought his way to Candahar, where he established a kingdom, which subsequently included all Affghanistan and Beloochistan, extending westward from the Punjab and the Indian desert, to the deserts of Khorassan and Kerman, and northward from the Indian Ocean to the river Oxus. He was succeeded by his son Timúr Shah, and the latter successively by his two sons Shah Zeman and Shujah-ul-mulk, the latter of whom was the king who received the British embassy at Peshawer in 1809. Sujah was subsequently deposed, and expelled from the country by the brothers of his hereditary vizier Futtey-khan, of the Barukziya family, who continued to rule over Affghanistan till 1840, when the kingdom was recovered for Shah Shujah by the British forces from India, and virtually annexed to the British dominions. The king cannot be left alone to contend with so turbulent and independent a people as the Affghan tribes, and, according to present appearances, nothing less than the continued effectual aid of his foreign allies, will suffice to keep his family on the throne.

The northern parts of Affghanistan, including the hill country of the Paropamisan range, nearly all the way from Cabul to Herat, are occupied by the *Hazarehs* or *Huzaras*, a simple people, who differ much from the Affghans. In physiognomy they more resemble the Chinese, and have square faces and small eyes. They are of Mongol or Tartar descent, and one of their tribes is now called the Tartar-Huzaras. The Huzaras were subjects of the kingdom of Cabul, but latterly they have been almost quite independent, owing their independence and their safety to the natural strength of their country. They are mostly a pastoral people, partly Soonies and partly Shiahs. They derive their name from the Persian word *hazar*, a thousand, from being divided into innumerable tribes. Their subsistence depends chiefly on the produce of their flocks.

§ *Cities and Towns.*

CABUL or KABUL or CAROOL, is situate in a plain at the bottom of a kind of funnel formed by a high and irregular hill of gneiss which rises 1000 feet above it, and bends round it from south-east to north-west. The city is surrounded by a lofty wall with towers and curtains and a broad ditch; and, with the exception of a suburb, stands all on the right bank of the river, which is rapid and clear, but only 30 or 40 yards wide, and is crossed by four bridges. The houses are built of sun-dried bricks and wood, but few of them are more than two stories high. The great bazaar (*Chareháut* or *chowcháut*), is an elegant arcade nearly 600 feet long and 30 broad, and divided into four equal parts. There are few such bazaars in the East, and wonder is excited by the silks, cloths, and goods arrayed along its sides, and at the quantity of dried fruits, grapes, pears, apples, quinces, melons, &c., piled up in endless profusion. Each trade has its separate bazaar. A white jelly strained from snow, called *falooh*, and blanched rhubarb, called *rhiwarch*, are great favourites with the people; and the town is famous for its cubebs or cooked meats. The population amounts to 60,000. Tajiks, Affghans, Persians, Cashmerians, Hindoos, Turks, Beloochees, Arabs, Jews, Armenians, Siaposhkaffirs, and Kybarees; who all seem to converse in Persian as their mother tongue; but the Pushtoo or Aughan language is spoken in the neighbouring villages. At the foot of the eastern ridge is the *Bálá-hissar*, a fortified palace, surrounded by an old brick wall: and on the eminence above it is the upper *Bálá-hissar* or citadel, which overlooks the whole plain. The city stands about 6500 feet above the level of the sea; but the climate is genial. At noon in summer the sun is much hotter than in England, the thermometer generally standing at 94° or 95°; the evenings, however, are cool, and during the night the cold is excessive. The snow lies for five months in winter, several feet deep; and the prevailing winds are from the north. Cabul is celebrated for its fruit; its gardens afford a great variety of both fruits and flowers; and the people make a species of wine not unlike Madeira. The people are passionately fond of sauntering in the gardens; and in the centre of one of these, about a mile from the city, is the tomb of the chivalrous and philosophic Sultan Baber, the founder of the Mogul empire in India. His grave is marked by two erect slabs of white marble; and in front of it is a small but chaste mosque of simple and pleasing architecture. Near it are interred the remains of his wives and children. The gardens of *Lálaf*, in the valley of Kohdamun-mountain skirt, 25 miles N. of Cabul, are famous throughout Affghanistan. At the head of the valley, on its eastern side, the face of the hill, at one particular spot, is covered with fine sand, called *Reg-Rowan*, or the moving sand, which ascends about 200 yards up the hill, with an acclivity of 45°, and produces sounds when disturbed.

CANDAHAR or KANDAHAR, the western capital of Affghanistan, is situate in an extensive plain, bounded on the north and west by picturesque mountains, and watered by the river Urghand-ab. The city is of a square form, 3000 feet in circumference; is surrounded by a sun-dried mud wall 33 feet high, with towers and loop-holed battlements; and contains a citadel consisting of an inner enclosure 200 yards square, in the northern face. Streets lined with houses of sun-dried brick, start from each of the four principal gates, and meet in the centre of the city under the vast dome of a circular bazaar, called the Chuhar-soo, or four ways; all of which are filled with shops, and crowded with people from morning till night. The streets, however, are excessively filthy, and mendicity is to be seen in its most loathsome and repulsive forms. The mosques are neither numerous nor splendid. The finest building in the city is the mausoleum of Ahmed Shah Abdallee, the founder of the Pooraunee dynasty; an octagonal structure surmounted by a lofty dome. Candahar is the centre of a great trade between India and Persia; its population amounts to 60,000, of whom the greater part are Affghans. It is supposed to be one of the *Alexandrias* founded by Alexander the Great; but the present city is comparatively modern; the ruins of the older city are situate about three miles to the westward, at the foot of a range of mountains which bounds the plain in that direction. The climate is subject to great extremes; the thermometer, which sinks at night to 32°, ranges above 100° during the day, and in June and July the city is often visited by the fatal simoom from the western deserts.

GHUZNEE or GHIZNE, the capital of a powerful kingdom in the 12th century, is now completely in ruins; but there is a new town built at the foot of a long narrow ridge of gypsum, which rises a few hundred feet above the plain, and forms an irregular pentagon, with sides varying from 200 to 400 yards in length. The fortifications consist of a high rampart built on a scarped mound about 50 feet high, which, flanked by numerous towers, and surrounded by a fausse-braye and a deep wet ditch. About half a mile N. of the Cabul gate is the tomb of the iconoclast conqueror of Hindostan, Sultan Mahmoud of Ghuznee, in the midst of a vast enclosure of gardens and orchards. It consists of a low and plain marble sarcophagus, in a low-roofed building; at the head of the tomb is still preserved the mace with which he demolished the idol Somnath; and the cedar-wood gates of the building are those which he carried off from Somnath's temple, in Gujrat, seven centuries ago. Not far from the tomb are two very elegant and graceful minarets of brick work about 140 or 150 feet high, but considerably damaged.

PESHAWER is a large town situate in a rich and extensive plain, watered by the river of Cabul, and extending westward from the Indus. The town is upwards of 5 miles in circuit, but the environs exhibit little else than a vast space covered with ruins and tombs. The gardens which stretch from the south to the west of the city present the appearance of a forest of orchards, where the plum, the fig-tree, the pear, the mulberry, the pomegranate, and the quince are cultivated. Peshawer has the appearance of a very ordinary Hindoo town, but contains about 105,000 inhabitants, consisting of Affghans, Cashmerians, and Hindoos. Peshawer, as well as the neighbouring territory between the Indus and the mountains, which form the western border of its valley, are at present in possession of the Seikhs, who have built a substantial fort on the site of the Bala-hissar, or royal palace of Peshawer. *Jehangeerah*, 6 miles W. of Peshawer, is an insignificant place, in a healthy situation, containing 500 or 600 houses, and surrounded by a square wall. The *Kyber Pass*, between Peshawer and Jellalabad, extends about 30 miles in length, partly lined with precipices, and is completely commanded by the wild Affghan tribe of Kyberees, who either rob travellers, or make them pay for a safe passage. At *Kohat*, 24 miles S. of Peshawer, a paltry-looking town with 2,000 inhabitants, the Seikhs have erected a fort on the top of a scarped rock. Near it are naphtha springs which yield five gallons a-day, and sulphur mines. Descending the Indus from Peshawer are several important places on the right or Affghan side, as: *Kalabagh*, a town romantically situate in a gorge of the great salt range, the hottest place between Attock and the sea. It has an alum work, which employs about 300 people, and produces daily about 122 maunds. *Dera-Ismael-khan* is a new town well laid out, with straight and wide streets, in a country abounding with both the necessaries and the luxuries of life; 32° N. lat. The old town was swept away by the river in 1829. *Dera-Ghazee-khan* stands on the alluvial plain of the Indus, four miles from the river, 30° N. lat., and is surrounded by date groves, from the produce of which the Seikh government draws a considerable revenue. The town is admirably situate for trade. *Mittun* or *Mittunkote*, on the right bank of the Indus, near the junction of the Punjnud, is a town of 1500 houses. *Quetta* or *Kwetta*, a town of mud houses, surrounded by a mud wall, at the head of a fine valley, in the country of the Caukers, 170 miles S. by E. of Candahar. To the south-east of Kwetta, extends the *Pass of Bolan*, leading through the Kurklekkee hills, into Cutch-Gundava, with a steep descent, and of the most formidable description. Like the sea-beach, it is formed of loose pebbly stones and sand, and

runs in sharp angles from 150 to 200 yards in length, and gradually decreasing in width till it narrows to 20 or 30 feet, with perpendicular rocks rising like walls on each side.

Bameean (*Baumeean*), 60 miles W.N.W. of Cabul, is a singular place, situate in a valley to the north of the Hindoo-koh, on an affluent of the Oxus, and is celebrated for its colossal idols and innumerable excavations, which are found in all parts of the valley for about eight miles, and still form the houses of the greater part of its inhabitants. Altogether, they form an immense city, but none of them have any pretensions to architectural ornament. Bamean appears to be a place of very high antiquity. The gigantic idols, for which it is so famous, consist of two human figures, the one named Silsal, the other Shahmana, both of which are cut out in high relief on the face of a hill; the larger of the two is 120 feet high, and stands in a nich of 70 feet radius; the other is about half the size. Both are much mutilated, and their origin is quite unknown. The dominions of Cabul extend to the *Pass of Akrobat*, 15 miles N. of Bameen, leading through a wide belt of mountains, which are much lower than those to the south, and are free from snow when the others are covered. In the valley of Bameean are the remains of *Ghulghuleh*, a town destroyed by Zengis Khan, A.D. 1220. *Furrah*, 260 miles W. of Candahar, and 140 S. of Herat, is a town of 1000 houses, near the river to which it gives its name (Furrah-rûd), built under a single hill in the middle of the valley.—(*Conolly.*)

The principal river of Affghanistan is the Indus, which forms its eastern border. The others are:—the *Aboo-Seen*, which joins the Indus at Cabulgram; a river without a distinctive name, which joins the Indus at Attock, and conveys the collected waters of the valley of Cabul. Its principal affluents are, the *Kama*, *Kumeh*, or *Kuner*, which drains the hill country of Chitral, between the Hindoo-koh and the Himalayas; the *Lundye*, *Punjcora*, and *Goorband*. The *Helmund*, *Heermund*, or *Etymander*, which rises at Fazindaz, in the mountains of Pagman, near the Oona pass, and flows south-west and west into the Lake of Zurrah, after a course of 400 miles. Its immediate banks, and the country within half a mile or a mile of them, are everywhere fertile, and in most places well cultivated. Its principal affluents are, the *Urghandab*, *Khashrûd*, *Turnuk*, *Urghessun*, *Shorundam*, and *Duree*. The *Furra-rûd*, or river of Furrah, runs into the Lake of Zurrah, after a course of 200 miles. The *Lorah*, in Pisheen and Shorabûk, is lost in the desert, after a course of 200 miles. The *Gomul* drains the high valleys above the Suleiman range, through which it forces a passage; but its water is completely absorbed by irrigation, in the Damân, before it reaches the Indus. The only lake in the country is the *Ab-i-Standeh* (*i.e.* the Still-water), about 60 miles S.E. from Ghiznee; about three or four miles in diameter in dry weather, and about twice as much after floods. Its water is salt; and it abounds in ducks and every sort of wild fowl.

BELOOCHISTAN,

The remaining division of Persia, lies between Affghanistan on the north, and the Indian Ocean on the south, extending along the latter almost 600 miles, from Cape Jask to Ras Monsé, and comprising altogether an area of about 150,000 square English miles. The greater part of the country is mountainous, and especially its east and west divisions, which consist of two elevated table-lands. A large portion of it is entirely desert, being a continuation of the deserts of Kerman; and the sea-coast is covered by flat barren sands, which are destitute of water, and produce no other vegetation than date trees. The geology is almost totally unknown; gold, silver, iron, lead, copper, tin, sulphur, alum, nitre, rock-salt, sulphur, and naphtha, are found in different places. The climate is healthy, except in the maritime region of Mekran, where there are four seasons, two wet, one cold, and one hot; in the hill countries to the north there are also four seasons, corresponding with those of Europe. The principal vegetable productions are, the zizyphus jujuba, the timber of which resembles teak, palms, the tamarind, neem, peepul, maryo, walnut, and sycamore; and fruits of almost all the kinds known in Europe. Mekran is famous for its dates, Kelat, for almonds; and melons are produced of so large a size that a man is scarcely able to lift one. Lions and tigers are rare, but both are found on the eastern border; hyenas, wolves, and jackals, are found over the whole country; there are also wild dogs, which hunt in packs; leopards, wild cats, foxes, wild asses, antelopes, elks, red and moose deer, hares, mungooses, and mountain goats. Eagles, kites, and magpies, are found near Kelat; also water-fowl of various kinds, as herons, flamingos, bustards, patridges, lapwings, snipes, &c. Fish abound on the coast, where they form the principal food of both man and beast. Tortoises are common; but vermin and venomous reptiles are not so abundant as in India. The number of cattle is considerable; the sheep are of the fat-tailed kind; the cattle are chiefly of the black breed or buffaloes. The horses of Kelat and Cutch are large, strong, and bony, but vicious; but those of Mekran and Lus are small and spirited. Greyhounds and shepherd's dogs, of a ferocious kind, are both much valued; fowls and pigeons are the only domesticated birds. Except in Cutch-Gundava, which is fertile, well cultivated, and said to be capable of producing a sufficient supply of grain for the whole of Beloochistan, not a hundredth part of the country is cultivated. All the kinds of grain, however, which are known in India, are grown; also cotton, madder, and indigo, pulse and vegetables.

The people are almost equally divided into two distinct nations, the *Beloochees*, who are found in the west, and the *Brahoes*, who occupy the east. The former are desirous of being considered descendants of the Arabs, but do not resemble them in physical conformation, and are believed by Col. Pottinger to have been originally Seljukees. They are almost entirely a rude, nomadic, and pastoral people, living in tents, and moving from place to place with their herds and flocks. Their language is a corrupt dialect of the Persian. They are divided into three great tribes, the *Nahrooees*, the *Rinds*, and the *Murghsees* or *Murrees*, with numberless subdivisions. The Brahoes inhabit chiefly the district of Kelat, the Hala or Brahooick mountains, and their borders; the Rinds and Murghsees occupy the country of Cutch-Gundava; the latter are also scattered over Sinde. The Brahoes are inferior in personal appearance to the Beloochees; their habits are still more unsettled, but they are not so predatory, avaricious, revengeful, and cruel. The government of Kelat, when the British army marched into Affghanistan, comprised the provinces of Jhorawan, Sarawan, Mukran or Mekran, Lus, Cutch-Gundava, Hurrund-Dazel, Mustoong, and Shal. Shal, Mustoong, and Cutch-Gundava, have now been made over by the British Government to the King of Cabul. A people called Gewahrs, probably of Gheber descent, are found in different places, who speak pure Persian; Hindoos are tolerated, and monopolise most of the trade of the eastern provinces. The government was nominally under the khan of Kelat, but was really in the hands of the chiefs of the tribes. During the advance of the British army the Beloochees offered every opposition, by a continual series of predatory attacks; Kelat their capital has been in consequence taken possession of by the British troops; but, while we write, the Beloochees are said to be still in arms, and will probably not be soon subdued, as they can always have recourse to their deserts, or mountain fastnesses, where the regular warfare, for which disciplined troops are most available, cannot easily be carried on.

Cutch-Gundava, the best cultivated, and the most fertile part of the country, is properly within the limits of India, lying below the mountains which form the western border of the basin of the Indus, on the north-west frontier of Sinde. It consists chiefly of a plain, bounded by sandy deserts on the

north, south, and east, but watered by a number of streams which communicate with each oth canals. The face of the country is thus covered by water courses and streams, about four feet and as many deep, all having their sources in the Kala mountains. Two of these are entitl the name of rivers, namely, the *Nuree* and the *Kauhee*, which both flow from the mountains are lost, or entirely absorbed, before they reach the Indus. The soil is rich and exceedingly pr tive; the climate is oppressively hot in summer, when the country is occasionally visited by th tilential hot winds from the desert; and then becomes a white arid plain, presenting a cracked face like the dry bed of a marsh. In March 1839, the thermometer, in the tents of the British cers, stood at 111°. In the rainy season the low level parts of the province are converted i swamp of salt marshes. In winter the climate is mild, and the inhabitants of the western m tains and table-lands then resort to Cutch. The majority of the people are Jûts, but there ar a few Hindoos, who are engaged in trade. Villages are extremely numerous. The chief town *Gundava*, the capital, once a rich though mud-built city; but it was sacked and completel stroyed in October 1840, by the marauding Beloochees. *Dauder* and *Baugh* are also large tow mud houses, on the road from Shikarpore in Sinde to the Bolan pass. Dauder contained abou inhabitants, but has suffered the same fate as Gundava.

INDIA.

ASTRONOMICAL POSITION. — Between 7° and 35° N. latitude; and 67° and 97° East longitude.

DIMENSIONS. — The greatest length from north to south, or from the Himalayas in Cashmere to Cape Comorin, is 1870 miles; and the greatest breadth, from the Hala mountains in Sinde to the eastern extremity of Assam, nearly along the 27° N. lat. is about 1800 miles. The superficial area comprises about 1,250,000 square English miles, with a sea-coast line of 3622 miles.

BOUNDARIES.—The natural boundaries of India are remarkably well defined. The whole of the northern frontier is formed by the gigantic range of the Himalayas; and the southern, or more properly the south-eastern and the south-western boundaries are fixed by the Indian Ocean, into which the country extends with a wedge-like point. The eastern boundary is less regular. Commencing at the head of the valley of Assam, it may be drawn along the mountains which form the southern watershed of that valley, and then, turning to the south, it divides Arracan from Birmah, and terminates at Cape Negrais. The western, or north-western boundary is formed in like manner by the transverse range of mountains which commences at Ras Monzé, or Muaree, and extends northward to the Suffeid-koh, which again is separated only by the narrow bed of the Cabul river from the offsets of the Himalayas and Hindoo-koh. The Indus, however, has been usually considered the north-western boundary of Hindûstan; the sacred limit beyond which the Hindoos are forbidden to pass; and, in fact, the right bank of the river, and some portions even of the left, as in Sinde and above Attock, are inhabited by Beloochees and Affghans. The mountains beyond it may nevertheless be assumed as the natural geographical boundary of the region of India; for the narrow intervening strip of country has all the characteristic qualities of the Indian soil and climate; while the country on the other side of the mountains becomes at once a portion of the table-land of Iran or Eastern Persia. Nor could the free navigation of the Indus be preserved, were not both banks under the entire control of the same ruling power.

NAME.—The origin of the name of India is uncertain; it was formed by the ancient Greeks from the name of the river Indus or Sinde, which in their days was the eastern boundary of the Persian empire. Among the Brahminical Hindoos it bore anciently the general name of *Djambu-dwipa*, Island of the Djambu; and *Bharata-khanda*, the land of Bharata. The Hindoos divided it into, 1. *Ouditshya-desa*, North country; 2. *Madhya-desa*, Middle country; and 3. *Dackshina-desa*, South country. The first and the second divisions, corresponding with the modern Hindûstan, they considered as their true fatherland; beyond them every place was regarded as impure, an imputation which extended even to India itself to the south of the Vindhya mountains. In the ancient books of Zoroaster, India is called *Ferakh-khand;* and *Hindûstan*, the modern name of Northern India, or the region between the Himalayas and the Nerbuddah, is likewise Persian, being derived from the words *Hindoo*, black, and *St'han*, country, *i. e.* the country of the blacks; but it has for ages been adopted by the natives of all religions. Colonel Tod, however, says, that *Indu* is a name of Buddha, and that the appellation of the *Indû* or *Hindû* race is derived from the word *Induvansa*, one of the names of the descendants of Buddha, or the moon-race of India. — (*As. Jour. December* 1840, p. 234.) That portion of India, to the south of the Vindhya mountains, or the river Nerbuddah, has been generally called the *Deccan* or South Country; but the extension of this name, as well as of Hindûstan, is now considerably restricted.

GENERAL ASPECT. — The Himalayas extend along the whole of the northern and north-eastern frontier of India, with a continuous series of snowy peaks. From the crest of the passes through this chain, for 30, 40, or 50 miles southwards, the whole space is covered by immense snowcapt peaks, which are separated only by narrow intervening valleys. Another space of 30 or 40 miles is occupied by a very elevated region, consisting of mountains so lofty, as to have their summits covered with snow in winter, but embracing between their ridges high and narrow valleys, which are watered by mountain streams, and are generally inhabited and cultivated. The vegetable productions of this region are of the most remarkable stateliness, variety, and

beauty. Except at the summits of the mountains the trees are very large; and everywhere, and at all seasons, the ground is covered with the most beautiful flowers, which partly resemble those of India, but approach still more nearly to those of Europe. Along the south side again of this second region, is a lower belt of about 20 or 30 miles in breadth, covered with small hills which rise gradually towards the north, and are intersected by valleys, watered by numerous streams which have their sources among the loftier mountains, with which these hills gradually unite. The lower parts of this belt, with a portion of the adjacent plains, are the grand seat of the Salforests. In some places, particularly between the Jumnah and the Ganges, where the Sevalik hills form a belt, which rises from 1000 to 4500 feet, these low hills are separated from the mountains by fine valleys of considerable width, like the English *dales* or the Scottish *straths*; while, among the hills themselves, are many narrower valleys, resembling the *glens* of Scotland. Between this last or lowest ridge of hills, and the plains of Hindûstan, is a strip of country called *Tarai*, *Tarae*, *Turiyani*, or *Ketonee*, varying at different places from 3 to 20, or even 50 miles in breadth, and containing a few scattered small hills, and much poor high land overgrown with trees and shrubs, which are the haunt of elephants, tigers, black bears, hares, foxes, jackals, wild hogs, antelopes, and monkeys. It contains also much rich soil; but the whole district is so marshy and pestilential, that even the natives of the neighbouring country tremble to approach it; and, from April to October, the monkeys themselves, as well as the tigers and other wild denizens, and even the birds, are said to abandon this "belt of death." In Rohilcund the terai is separated from the plains by a low range of hills, crossed by numerous passes, some of which are practicable for wheel-carriages. The remainder is wholly open to the plains.

To the south of these mountainous and hilly regions, extend the great plains of Hindûstan, which are watered by the Indus, the Ganges, the Brahmapûtra, and their numerous affluents, and fall with a very gradual slope to the shores of the ocean, on the eastern and western sides of the peninsular part of India. Between the basin of the Sinde or Indus, which has been called *Sindetic India*, and the basin of the Ganges, or *Gangetic India*, is a ridge, or a series of ridges of hills, called *Aravulli*, which extend south-west and north-east more than 300 miles, with a breadth varying from about 6 to 60 miles, and a general elevation of 3600 feet. The Aravulli rise abruptly from the western desert, but fall gradually towards the east. Their general geological character is of primitive formation, and the summits of the diverging ranges west of Ajmere are quite dazzling, not with snow like the Himalayas, but with enormous masses of vitreous rose-coloured quartz. To the north of Komulmair, 25° N. lat., two of their divergent ridges form a continuous table-land, from 6 to 20 miles in width, as far as Ajmere, where it breaks up from the tabular form, and sends off numerous branches of low rocky hills through Jeypoor and Alwar, which reach the Jumnah in the vicinity of Delhi. From the south-western extremity of the Aravulli, several subordinate ranges of hills diverge to the north-east, and form a table-land, or series of high valleys at their angles, which slope towards the Jumnah. Further south, the *Vindhya Mountains* extend east and west, for about 350 miles, being separated from the Aravulli range by the valley of the river Mhye, and terminate eastward in a hilly region, which covers a large portion of Central India, and sends out branches as far as the Ganges at Chunar, Mirzapore, and Rajmahal, and even to the ocean at Balasore. The Vindhya mountains are scarcely so high as the Aravulli; but they rise very abruptly to their full elevation from the valley of the Nerbuddah, and form on their northern side the table-land of Malwah, which is about 2000 feet above the level of the sea, and slopes gently northwards; in which direction the Chumbul and other rivers carry the most of its waters to the Ganges, while a portion of them is conveyed by the Mhye to the Gulf of Cambay. Along the south side of the Vindhya mountains the long narrow valley of the river Nerbuddah extends in the same direction, beyond which is another nearly parallel ridge called the *Sautpoora Mountains*. To the south of these is the valley of the river Taptee, beyond which rises the *Chandore* and *Gawilghúr ranges*, forming the northern mountain border of the table-land of the Deccan.

The southern part of India forms a large triangular promontory or peninsula, projecting into the Indian Ocean, about 900 miles farther than the coasts of the Gangetic and Sindetic plains. Along the western coast of this peninsula, a range of lofty mountains, called the *Ghauts*, extends from near the mouth of the Taptee river to the valley of Coimbatoor, where they terminate with the *Nilgherries*, or *Blue Mountains*, which are the highest in the peninsula. The Ghauts rise very abruptly at the distance of about 30 or 40 miles from the coast, but form on their eastern side a table-

land, about 2000 feet above the level of the sea, which is rather undulating than flat, and is covered with numerous smaller ranges of hills, which slope eastward to the Bay of Bengal, towards which the country falls by terraces, and sends its waters. The northern part of the chain is less elevated than the southern, and seldom exceeds 3000 feet; between 17° and 18° N. the Mahabaleshwar hills form a table-land of about 4500 feet high; between 10° and 15° N. there are peaks of granite 5000 or 6000 feet high; in Coorg, *Podicandamale* rises to the height of 5682, and in no part of the country is there a summit lower than 5000 feet; farther south the Nilgherries reach the elevation of 8960. On the eastern coast of the peninsula a similar chain, named the *Eastern Ghauts*, extends along the borders of the Lower Carnatic and the Northern Circars, but at a greater distance from the sea than the Western Ghauts; it is not lofty, is less continuous, and is crossed by all the rivers which flow from the interior table-land. At their southern extremity the Eastern are connected with the Western Ghauts, and in the angle formed by the two chains, the table-land of Mysore, and that of the Balaghaut or Upper Carnatic, rise to the great elevation of 3000 feet above the level of the sea; the table-land of the Nilgherries reaches 7000 feet, and from these the country declines rapidly towards Coimbatoor. Northwards, the Eastern Ghauts terminate in an unexplored country, where their diverging ranges seem to cover a wide extent of surface. The highest part of the chain is about the latitude of Madras, where it rises to 3000 feet. To the south of the Nilgherries, which form, as it were, the terminating nucleus of both ranges, the valley of the river Paniany forms a gap of 16 miles wide; and beyond it, to the south, rises a group of mountains clothed with stupendous forests, and intersected by lovely valleys, which extends southwards nearly 200 miles, and may be considered as a continuation of the Ghauts. Within 30 miles of Cape Comorin this groupe terminates abruptly in a bluff granite peak, about 2000 feet high, from the base of which a low range of similar rocks extends southwards to the sea. Between the Western Ghauts and the sea, there is but a narrow strip of land, and the precipitous sides of the mountains which rise above it, are generally covered with forests of the tallest trees, and with impenetrable jungle. The lowland along the east coast is very considerably different, being a broad though unequal belt of country, many parts of which consist of alluvial plains formed by the deposits of the numerous rivers which flow from the table-land of the interior. In the sea these deposits are so distributed as to form a shelving bank, upwards of 100 miles in breadth along the coasts of the peninsula, which slopes so regularly that the number of fathoms of water is a sure indication of the distance from land.

But the most remarkable region is the Great Desert, which may be said to extend from the eastern base of the Hala mountains to the western base of the Aravulli, a distance of 350 miles; and from the Runn of Cutch northward to the Suttlej, upwards of 450 miles; comprising an area of 150,000 square miles, or about an eighth part of the surface of India. This desert is traversed in its western portion by the Indus, and in its eastern, by the Loonee; but, except along the banks of these rivers, and within the reach of artificial irrigation, it admits of cultivation only in a few places, and immediately after the rains. Between the Indus and the Loonee and the Aravulli mountains, the desert forms a continuous succession of sandhills, for a space of 450 miles in length, with a breadth varying from 50 to upwards of 100, intersected by valleys where scanty crops of grain are raised after the monsoon. The sand is a dust of the finest quality; the hills are covered with stunted shrubs and different kinds of vegetation till within a few months of the rainy season, when, in consequence of the herbage being burnt up, the sand is blown violently about by the wind, and the region is rendered almost uninhabitable. The surface has no covering of turf, nor any closely contiguous roots; but there are various kinds of plants, whose berries, leaves, or fruit are fit for food. Travelling through such a tract is difficult and disagreeable; camels and horses are the only animals which can cross it; hill and valley alternate, as if the surface had been troubled like the sea in a tempest, and left stationary in the midst of its fury. Wells, however, are scattered through the desert, and are generally found in the valleys, often in the bed of a tank, or in the hollows where the rain-water collects. They consist of small round holes, about a foot and a half in diameter, which are dug sometimes to the depth of forty or fifty fathoms, and lined with branches of trees. The rains which fall are slight and irregular, and are speedily absorbed by the thirsty sand. That portion of the desert which is destitute of wells is called *rohree;* and it would not be difficult to convert the whole region into a useless waste, by filling up the few which exist. This is not unfrequently done by some Rajpoot chief or other desperado, who, flying to the desert, fills up the wells to strengthen his position, and betakes himself to rapine and bloodshed. So far as it

has been hitherto examined, the desert lies upon a sandstone formation. Many large portions of it present the features of real solitude and desolation; but there are also numerous oases, where herdsmen pasture their flocks. In the direct line from Bhooj to Kairpûr water is abundant; and the country is traversed by low sandstone hills, which are thickly wooded. The desert is called by the natives *Thull*, *Thur*, or *Dhat*; but in the Hindoo geography it is called *Maroosthulli*, or the Region of Death. The people found in it are Bheels, and wandering tribes of Soda and other Rajpoots, Khosas, and Sindees; the first two tribes are the only permanent settlers, the others being attracted to it only after the rains, for the sake of the abundant pasture which it then produces. Of the whole surface of India it is reckoned that one third is covered by jungle or waste.

GULFS, BAYS, and STRAITS.—The *Gulf of Cutch*, between Cutch and Gujrat. The *Gulf of Cambay*, between Gujrat and the peninsula of Kattiwar. With the exception of the Bhagwa sands on the east side, between the Nerbuddah and the Tuptee rivers, the lower part of the gulf is clear of shoals, with irregular soundings of from 8 to 30 fathoms; but the upper part is filled with extensive shoals and sandbanks, intersected by deep channels, which are frequently shifting, particularly during the rains. The tides are extremely rapid, and their rise and fall very great. The whole coast is low, is overflowed for some distance inland at high spring-tides, and is intersected by numerous small creeks and inlets. The bore of the tide sets into the gulf like an upright wall of water, with a head of 4, 5, or 6 feet, each succeeding wave always decreasing, till the whole gulf is reduced to the level of the sea without. *Bombay* is an indentation of the coast of Concan, formed by the islands of Bombay and Salsette on the west, and contains several wooded islands. The *Gulf of Manaar*, which separates the southern Carnatic from Ceylon, is too shallow for large vessels, but has a sufficient depth for sloops and the craft of the country, which, by passing this way, avoid making the circuit of Ceylon. The gulf is closed to the north by a ridge of sandbanks, stretching 30 miles across, between the islands of Manaar and Ramiseram, the formation of which is very remarkable, being only about a quarter of a mile in breadth, and consisting entirely of sand, partly above and partly below water, which has been collected apparently by the surf and the currents, and is, so far as can be ascertained, unsupported by rock. On each side, at the distance of two and a half or three miles, the sea is six fathoms deep, and quite free of obstruction. There are three principal channels across it, which are passable by dhonies and fishing boats in fine weather; but the passage being difficult and dangerous, is not commonly used. The whole distance between Ceylon and the continent is 62 miles; but the only channels safely passable even by small vessels are one of one mile in breadth, between Manaar and Ceylon, and another of only about fifty yards wide, on the west side of Ramiseram. The latter is called *Paumbaun passage*; and for several years attempts have been made by the Madras government to deepen it, so as to make it passable for the larger vessels of the country. They have so far succeeded as to form a channel for vessels of 60 tons; and it is expected that a depth of 12 or 14 feet will be ultimately reached. The ridge itself is called by Europeans *Adam's bridge*; and is said by the Hindoos to have served as a bridge for their demigod Rama, when he invaded Ceylon. The channel to the northward is called *Palk's Straits*, from a Dutch commander who is said to have once passed through the bridge with a fleet. *False Bay* and *Balasore Roads*, between Point Palmyras and the Hoogly river. The whole of the east coast of India is destitute of harbours, and large ships are obliged to cast anchor at the distance of several miles from the shore, which slopes very gradually seaward.

CAPES.—*Jugput Point*, the western point, and *Diu Head*, the southern point, of the peninsula of Kattiwar, in Gujrat. *Boria*, a remarkably high bluff headland, on the coast of Concan, lat. 17° 20' N. *Ramas* or *Ramas*, a bluff headland, in lat. 15° 40' N., which projects so far from the line of coast as to form a bay on each side. *Maundilly* or *Mount Dilly*, lat. 12° 1' N., a hill separated from the coast of Malabar by salt-water creeks, and forming a bold and remarkable promontory. The bay on the south side runs three miles inland, with six fathoms water, and a fine bottom. A project is under the consideration of government to convert it into a harbour, by means of a breakwater. *Comorin*, the most southern point of India: the land at its extremity is low and flat, covered with trees, and not visible from a ship's deck for more than four or five leagues; but about half a mile inland is the mountain of Komari, 4000 feet high, quite smooth, and verdant to the very top. *Point Calimere*, the south-eastern point of the delta of the Cauvery. The *Dolphin's Nose*, at Vizagapatam, on the coast of the northern Circars, a lofty and steep promontory, rising abruptly to the height of 1600 feet above the level of the sea, which washes its base. *Point Palmyras*, the most easterly projection of the province of Cuttack. The *Sandheads*, the extremities of the sand-banks which which lie between Point *Palmyras* and the mouth of the Hoogly river.

RIVERS.—The INDUS is formed in Balti, or Little Thibet, by the union of two streams, the *Shayuk* and the *Sinh-kha-bab*, or river which rises from the lion's mouth. The latter is so called in reference to the Thibetan tradition, borrowed perhaps from the Hindoos, of the origin of four great rivers from the mouths of as many animals; as, the Indus from the lion's mouth; the Ganges from that of the peacock; the Sutlej from the elephant's; and the Sanpoo from that of the horse. The *Sinh-kha-bab* rises in the Kan-re, Kangri, or Kantesi mountains, the Kailasa or Cailas of the Hindoos, which skirt on the north the sacred lakes Manasarowara and Rawan-rhad, in the Chinese province of Chanthan. Flowing in a north-westerly direction, it receives at Tashigong a river from the valley of Gartopé, and pursues its course through Ladakh and Balti, receiving in its progress a number of large streams from both sides, the principal of which are the *Zanskar* or *Lingter*, to the westward of Leh, and the united stream of the rivers of *Pushk-yum*, *Kartse*, *Dras*, and *Shingo*, which drain the valleys to the north-east of Cashmere. The *Shayuk* has its sources in the mountains of Karakorum, between 77° and 78° E. long., and about 35° 40'-N lat.; it flows first for several days' journey to the south, and then turning almost at a right angle to the north-west, continues in that direction till, at Kiris, 20 miles E of Iskardo, it meets the Sinh-kha-bab. From Kiris the united stream flows westward for about 100 miles, receiving in its progress the rivers of *Shigar*, *Nagar*, *Hunz*, *Gilgit*, *Yasin*, *Hasora*, and other streams, and then turns to the south, breaking through the Himalayas in 74° E. long. From this it flows south-west among high mountains, where it receives the *Abu-seen*, and thence onward to Torbela, 40 miles above Attok, E.N.E., where it enters the valley of Chuch, spreading out and forming innumerable islands as far down as its confluence with the Lundye or River of Cabul, where it again enters a hilly country, and becomes so confined, that at Attok it is only 286 yards across, but very deep and rapid, with a current exceeding six miles an hour. Even when the river is lowest, the stream at the meeting of the Indus and the Lundye, and during its course through the rocks, is full of waves and eddies, and produces a sound like that of the sea; but, when it is swelled by the melting of the snow in summer, it forms a tremendous whirlpool, the roaring of which can be heard at a great distance, and which often swallows up boats, or dashes them against the rocks. The Indus itself is unnavigable above the confin-

ence, but the Lundye is navigable till within 50 miles of Cabul, from which point boats may drop down to the sea, a distance of 1200 miles, but not without danger; for, besides the obstructions already mentioned, the Indus, only 200 yards above the fort of Attok, gushes over a rapid with amazing fury, but afterwards passes on in a tranquil stream. At Nilab, 10 miles below Attok, the river enters again among hills, and continues to wind through them to Karabagh or Calabagh, 33° 7′ 30″ N. lat. The banks of the river throughout this distance are formed of hills which rise immediately from its waters in bold bluffs, or weather-worn slopes, at some places presenting mural precipices, at others rugged and broken, and casting dark shadows across the narrow river. Compressed by narrow banks, which are several hundred feet high, the sullen stream, when not obstructed, glides smoothly onward with a current of nine miles an hour, where its depth and velocity are greatest. From May till September the upward voyage through this gorge may be pronounced impracticable; but the downward voyage may be performed at all seasons, though not without risk, when the river is full. Below Karabagh it enters the rich valley of the Esau-khails in four great branches, and, except at Bukkur, where it crosses a low limestone range, is not again interrupted by hills till it reach the ocean, to which it flows first south and then south south-west, dividing into numerous streams, fertilizing a wide extent of country, and ultimately forming a delta, which presents a face of 125 miles to the sea. The inconstancy of the river in flowing through the delta is proverbial; its channels and branches are continually changing, new courses being formed, and old ones filled up, almost every season. The tide flows and ebbs with great violence, particularly near the sea, and ascends the river about 75 miles, overflowing the lower banks to a great extent. The course of the Indus is occasionally swept by terrific blasts, which, while they last, prostrate everything before them; but fortunately they give timely warning of their approach, and long before the storm bursts the careful tracker has moored his boat in some secure haven.

The principal affluent of the Indus on the right is the *Lundye* already mentioned, which is also named the *Cabul River*. Indeed, the river which joins the Indus from the westward above Attok has no distinctive name; it is formed by the streams which flow from the Himalayas, the Hindoo-koh, and the Suffeid-koh, into the valley which lies between them, the Lundye and the River of Cabul being perhaps the principal channels. But there is an affluent larger than any of the others, named the *Kama* or *Kameh* or *Kunar*, which forms the great drain of the elevated hill countries of Chitral and Kafferistan, situate between the Himalayas and the north-east prolongation of the Hindoo-koh, and has its remote sources near those of the Oxus. On the left the Indus receives also one great river, the *Chenab* or *Punjnud*, near Mithun-kote, 28° 54′ N. lat. This affluent is composed of five celebrated streams, the *Vedut*, or river of *Jelum*, *Jhylum* or *Jylum* (ancient *Hydaspes*), which drains the valleys of Cashmere and Garets; the *Chenab* (*Accines*); the *Ravee* (*Hydraotes*); the *Ghara* or *Beas* (*Hyphasis*); and the *Suttlej*, *Suttledge*, or *Sutudra* (*Hesudrus* or *Zaradrus*.) The first four have their sources on the south side of the Himalayas; but the Suttlej flows from the lake Rhawan-rhad, on the north side of the same chain, and its most remote source is said to be at a place named Chomik-Tongdol, where a small stream issues from the ground, and runs into Goorgoo lake, about 19,000 feet above the level of the sea, and 2000 feet higher than lake Manasarowara in Undes. It flows first in a south-westerly direction, till, on the borders of Kunawar, it is joined by the *Losar* or *River of Piti*, which drains the southern district of Ladakh, when it turns to the south, and enters India through a very deep valley between 77° and 79° E. long. At several places above Loodiana the Suttlej is fordable, but in general is so rapid as to be scarcely passable; below Loodiana there are no fords, and the river is said to be very deep. These are all very large navigable rivers, but being studded with shifting sandbanks, they are not equally navigable at all seasons, nor for all kinds of vessels; indeed the navigation of them can be considered practicable only by the boats of the country, which are flat-bottomed, and draw little water. Steam vessels could ply if built in the same manner, but no vessel with a keel could be safely navigated on them all. There is, says Lieutenant Wood, no known river discharging even half the quantity of water which is not superior for navigable purposes to this far-famed stream, the Indus. Till recently, the navigation, such as it is, was completely obstructed by political influences; these have been now removed by the extension of the British dominion to the Indus, and steam-boats ascend that stream, the Chenab, and the Suttlej, to Ferozepore and Loodiana. A survey has been made of the level between the Suttlej and the Jumnah, and the ground has been found favourable for a canal between Kurnaul and Loodiana, which would complete a circuit of nearly 3000 miles of inland navigation, from the Arabian Sea to the Bay of Bengal.

The GANGES, which is reckoned the principal river of India, is formed by the union of two branches, the *Bhagirathy*, which is regarded as the true Ganges, and the *Alakananda*; the former rises from a bed of snow above Gangoutri, at the height of 13,800 feet above the level of the sea, 79° E. long.; the latter rises above Badrinath, 79° 20′ E. long., and after having received the waters of the *Doulee*, *Pindur*, and other streams, unites with the Bhagirathy at Deo-prayaga. The Bhagirathy, or true Ganges, is considered peculiarly sacred, and is even worshipped as a goddess under the name of Gunga; the water of the river is reckoned capable of washing away all sin; and multitudes of pilgrims come from all parts of India to bathe in the stream, or have its water poured over them. It is peculiarly sacred at the confluences of five of its tributaries, four of which unite with the principal channel among the hills above Hundwar, and the fifth, which is the Jumnah, at Allahabad. The united stream, or Ganges, then flows on to Hurdwar, where it leaves the mountains, and enters the plains of Hindûstan, with a clear, beautiful, and rather shallow stream, having already fallen 12,000 feet below the level of Gangoutri. The river then flows with a winding course in a general direction south-east by east, receiving in its progress all the streams which descend the southern slopes of the Himalayas through 15° of longitude, and those collected from Central India by the Jumnah, the Saone, and others. From Hurdwar to Allahabad the Ganges is generally from one mile to 1¼ wide; farther down it becomes more winding, and its bed expands till it reaches its extreme width of three miles. Above Allahabad it is fordable in some places, but the navigation is never interrupted. At the distance of 500 miles from the sea the channel is 30 feet deep when the river it at the lowest; and this depth continues to the sea, where the sudden expansion of the stream deprives it of the force necessary to sweep away the bars of sand and mud which are thrown across it by the strong southerly winds, so that the principal branch cannot be entered by large vessels. About 200 miles from the sea, or 300 by the course of the river, commences the Delta of the Ganges. The two most westerly branches, named the *Cossimbazar* and the *Jellinghy rivers*, unite and form the *Hoogly river*, which passes Calcutta, and is the only branch commonly navigated by sea-going vessels. It is moreover considered by the Hindoos to be the Bhagirathy or true Ganges, and therefore held sacred. For the greater part of its course, from Calcutta to the sand-heads, the banks of the Hoogly are the most desolate that can well be imagined; and the navigation is rather intricate, owing to the frequent changes of the sand. From Jellinghy the main stream flows south-east, and throws off numerous branches, which form a labyrinth of rivers and creeks, inclosing a multitude of low islands covered with jungle, and named the *Sunderbunds*, which give an extent of 200 miles to the base, or sea-coast of the delta. In the dry season the mean rate of motion of the stream is less than three miles an hour; but in the rainy season the current runs five or six miles, and in some places even seven or eight. The Ganges and its branches form the great highways of Bengal and the upper provinces, along which all bulky commodities are transported, and it is said that so many as 300,000 boatmen are employed in this traffic.

The most important affluent of the Ganges is the *Yamuna* or *Jumnah*, which joins it at Allahabad,

after a course of 780 miles. It rises at Jumnotri, a little to the west of Gangoutri, 10,849 feet above t level of the sea, and flows southward, nearly parallel with the Ganges, at the distance of from 50 to miles. It is fordable in several places above Agra, before the beginning of October, and may be co sidered passable at any place above its junction with the Chumbul. Its affluents on the right ar the *Hansootee*, *Bungunga*, *Chumbul*, *Kohari* and *Ashin*, *Sinde*, *Jetara*, *Cane*, *Betwey*; the *Hind* on the left. The *Chumbul* has a course of 440 miles, rising near Maundoo in Malwah, and falli into the Jumnah 20 miles below Etawah. Its principal affluents are the *Sippra*, *Chota-Sind*, *Kal Sind*, *Newuj*, *Parbuttee*, on the right; the *Bunas* (termed *Kowarri* or the virgin), on the left. B tween the Jumnah and the Sutlej are several small streams, which are very important in a militia point of view. The *Khugor* or *Gagur*, and some others fall into the *Sursooty*, the termination of whi was long a problem; it is lost in the desert to the east of Bhutnere; but the Hindoos believe that proceeds under ground to join the Jumnah and the Ganges at the great prayaga of Allahabad.

The other principal affluents of the Ganges on the right, are: the *Tonse*, the *Sone* or *Soane*, t *Burra-nur*, and the *Dummooda*; on the left, the *Ramgunga*, *Gomutee*, *Tonse*, *Sarjoo* or *Gogra*, *Gu duck*, *Pogmutty*, *Coosy* or *Kosah*, *Mahananda* and *Purnubhah*, *Attri* or *Teesta*; all very large river

The BRAHMAPUTRA or BURRAMPOOTER, is supposed to have its origin in a lofty mountain ran somewhere near the 29° N. lat., and 97° 30' E. long. It flows westward through Assam till it rea the borders of Bengal, where it turns south, and reaches the sea, after a course of 1000 miles. In t higher part of its course it is also named *Lohit*, and, near its mouth, *Megna*. Its affluents are t *Dibong*, *Dihong*, *Dikho*, *Deesung*, *Boree-dehing*, *Noa-dehing*, *Debanoo*, all in Upper Assam; t *Bonsa*, *Champamutty*, *Gaddada*, *Tuveesha*, and *Manshi*, from Boutan; the *Teesta*, *Atri*, *Lubaee*, a others, between it and the Ganges. The only tributary of any importance is the *Dihong*, which joi the principal stream in 27° 45' N. lat., and 95° 25' E. long. It comes from the north, and its volu of water being about three times that of the Brahmapûtra, it is supposed to derive them from the Sa poo of Thibet; but the difficult state of its channel, which is full of rocks and rapids, and the impos bility of travelling on its banks have hitherto prevented a survey by European officers, for more th a few miles up the stream. The late mission to Bhotan (1838) were told by intelligent natives th the San-poo is the Brahmapûtra of Assam, and that, just before turning to the south, it receives river from the eastward from China. The Brahmapûtra is the largest river of India. It has a cour of 400 miles through Bengal, during the last 60 of which, before its confluence with the Ganges, i width is regularly about four or five miles; and but for the freshness of its waters, it might pass f an arm of the sea. Upwards it ceases to be navigable, except for canoes, at Soonapoor, about 20 mil E. of Sudiya, in Upper Assam.

The LOONY, LOONI, or LOONEE, has its sources in the sacred lakes of Poshkur and Ajmere, with more remote arm from Purbutsur, in Rajpootana, and has a course of more than 300 miles S.W through Marwar into the Runn of Cutch. It is the only channel by which the rain which falls on th western slopes of the Aravulli finds its way to the sea; but it is rather a torrent than a river; i stream is constant only during the rainy season. It has, however, pools of water in its channel, an affords an ample supply from pits or wells dug in its sandy bed.

The SABERMUTTY and the MHYE or MAHI both flow into the head of the Gulf of Cambay; the fo mer from Rajpootana, the latter from Malwah; but they are both great water courses rather tha rivers, their streams being almost dried up within three or four months after the rains.

The NERBUDDAH, NARBADA, NERBADDAH, NERMADDA, or NIRMADA, rises near Omercuntuc, i Gundwana, 2463 feet above the level of the sea, close to the source of the Soane. It flows at first alon a table-land; has a great fall near Mundlah; and then turning nearly due west, between the paralle ranges of the Vindhya and Sautpoora mountains, falls into the Gulf of Cambay. It has a course o 750 miles, with fewer windings than most Indian rivers; but it is obstructed by rocks, shallows, an cataracts. At Husseinabad the bed of the river is 900 yards wide, but much broken, and has thirtee fords within 14 miles of that town; but at Mandatta, 130 miles further down, it is not more than 1 yards wide, being confined between barren rocks, and very deep. The valley, for 300 miles abov Hindia, is only from 15 to 20 miles wide, the river keeping near the Malwah side; forests of dee jungle extend on both sides, and rise to the tops of the hills.

The TUPTEE or TAPTY rises near Beltoul, among the Injardy hills, and flows west with a ver winding course of about 503 miles into the Gulf of Cambay, below Surat. Its principal affluents ar the *Pourna* and the *Guirna*.

The CARAWOTTY rises in the table-land of the Deccan, to the east of Goa, and, after a windin course, falls into the sea on the west coast, between Carwar and Shedasheveghur. In leaving th upper country it forms a tremendous cataract several hundred feet high.

The CAUVERY rises in the hill country of Coorg near the coast of Malabar, 4000 feet above the level o the sea, passes through Mysore, Coimbatoor, and the Carnatic, and after a winding course of 45 miles falls into the sea below Tanjore by six principal mouths, which form a spacious delta. Ab Trichinopoly the Cauvery divides into two branches, which form the island of Seringham. About miles east these branches again approach, but the northern one is 20 feet below the level of the othe and they are prevented from uniting by a great *bund* or dam, which serves the southern branc through Tanjore in numberless channels, while the northern branch flows onward to the sea under th name of *Coleroon*. Its principal affluents are the *Henarutty*, the *Shimsha*, and the *Arraruttу* in Mysore and the *Noyel* from Coimbatoor. It is navigable only for small boats. Near the island of Sivana Samudra, 35 miles E.S.E. of Seringapatam, the river forms two cataracts of extraordinary grandeu named *Gungana-chuki* and *Burra-chuki*, the one 460 feet, and the other 350 feet high. The volume o water in the rainy season is very great, especially in the larger fall, where it rolls in one sheet over precipitous ledge of rock, with a fearful and stunning sound. These falls have been made easil accessible by roads and bridges, constructed by a public-spirited individual named Ram-Samy Mode liar, to whom the Rajah of Mysore gave a grant of the island, and by whom the jungle has bee cleared, and the land brought into cultivation. The source of the Cauvery is a place of devotion to th pious; and the spring is fabled to have been once a nymph of exquisite beauty. At its confluenc with the Kuniky, in Coorg, are three temples dedicated to the Hindoo triad.

The PENNAR rises in Mysore, which flows first N., then E. by S. into the Bay of Bengal, belo Vellore; the *Palar*, in the Carnatic, which passes Vellore and Arcot, and falls into the sea to the soutl of Sadras; the *Punnair*, which rises in Mysore, and falls into the sea at Cuddalore; the *Vellaur* passe Attoor, and enters the sea at Porto Novo, at the mouth of the Coleroon.

The KRISHNA or KISTNAH rises from the western Ghauts in the table-land of Mahabaleshwar, onl 80 miles from the west coast, and 4500 feet above the level of the sea, and flows S.E. into the Bay o Bengal, after a course of 650 miles. Its principal affluents are: the *Tungabudra*, formed by th *Tonga* and the *Budra*, *Wurda*, *Hugra*, and *Vedarutty*; the *Warna*; the *Gunga*; the *Gulpurba* the *Mulpurba*; the *Dhon*, a salt-water river from Bejapore; the *Beema* or *Bima*, which has a cours of 400 miles before it joins the Kistnah, receiving in its progress the *Moota-moola*, *Neera*, *Mann*, *Vai Goor*, *Kokuree*, *Seana*, and *Buree*; the *Dindee*; the *Pedda Wag*; and the *Musy*, which passes Hy drabad.

The GODAVERY rises in the western Ghauts, near the fort of Trimbuck, about 70 miles N.E. o Bombay, and flows S.E. into the Bay of Bengal, after a course of 850 miles. It enters the sea by tw principal branches, and several smaller streams, which form good tide harbours for ships of moderat

burden. Its principal affluents are: the *Para*; the *Sindhana*; the *Manhat*; the *Manjera*; the *Deedna*; the *Ghurk-Poorna*; the *Pranheeta*, formed by the *Whurda* and its affluent the *Pain-Gunga*, and the *Wyne-Gunga*, with its affluents, the *Khahan*, *Heeree*, *Atora*, and *Choolbund*; and the *Solair*.

The MAHANUDDY rises near Conkeir in Berar, and enters the Bay of Bengal near Cuttack by many mouths. The BERVORAH, formed by the *Brahminy* and the *Soank*, enters the Bay of Bengal under the name of MYPURRA, on the north side of Point Palmyras. The DOMRAH, formed by the *Byturny*, *Cogle*, *Salundy*, and others, also falls into the Bay of Bengal, a few miles farther north. The *Subemerka* or *Subunreeka*, rises in the district of Chuta-nagpoor, in Bahar, and falls into the Bay of Bengal, between Balasore and Injellee. It has a great fall at Hûrûrû-ghaut, near Kishenpore and Dounda in Chuta-nagpoor.

LAKES and MORASSES.—The *Runn* of *Cutch* is one of the most singular features of India. It is situate between the peninsulas of Kattiwar and Cutch on the south, and the Thur or Great Desert on the north; being about 190 miles in length, and 90 at its greatest breadth, and containing about 6500 square miles. In the dry season it forms a desert plain interspersed with diminutive shallow lakes, long ridges of barren sand, patches of verdant pasturage, a few fields susceptible of cultivation, and extensive sheets of salt crust spread over the insiduous surface, which is full of dangerous quicksands; but, during the monsoons it is covered with water, which flows into it from the Gulf of Cutch and the Loony river, and forms a dirty saline solution, which reaches up to the camels' girths in many places along the tract where it is crossed, between Bhooj and Buliari; the travellers finding rest, and their camels pasture in a little island named *Khari-cabu*. After the retiring of the waters again, myriads of dead prawns, mullets, and other fish are found strewed over the surface. The ground, when uncovered with water, is nowhere fenny or swampy, but is dry and sandy; and the limits of the Runn are as strongly marked as those between a gravel walk and the verdant lawn which it skirts. The traveller steps at once from a soil teeming with vegetation upon the bare and sterile ground. At some seasons the mirage is very prevalent in the Runn. On the banks, and in the small islands of the Runn, the wild ass, a handsome animal, but of untameable fierceness, exists in great numbers; apes, porcupines, and vast flocks of large birds share with him the possession of this dreary and desolate region. The lakes of India are few and of small dimensions. The *Chilka lake*, on the coast of Orissa, between Cuttack and the Northern Circars, is a shallow expanse, 35 miles long by 8 in breadth, separated from the sea only by a belt of sand. *Colair lake*, in the Northern Circars, is chiefly formed by the overflowing of the rivers Kistnah and Godavery, between which it lies. It is about 47 miles in length by 14 in breadth; from the beginning of July till the end of September it is covered with water, except about 60 or 70 small islands in which the inhabitants remain; during the rest of the year it is dry and passable, and in some parts highly cultivated. *Pulicat lake*, on the coast of Carnatic, north of Madras, is about 33 miles long, and 11 broad, contains several islands, and communicates with the sea by very narrow channels. *Sumber* or *Sambur lake*, in Rajpootana, 20 miles long, and 1½ broad. After its bed is filled with the rains, the water becomes strongly impregnated with salt, which, when the waters retire, is found crystallized in large masses under a layer of mud. It supplies with that article a considerable portion of Upper India. *Deedwannah* and *Sirr*, two other small salt lakes, also in Rajpootana. *Lunar lake*, 40 miles from Saulna, in the Neermal hills, is a vast crater 500 feet deep, and 4 or 5 miles round the edge; its water is green and bitter, supersaturated with alkaline carbonate, and containing silex in solution, with a portion of iron. The mud is black, and abounds with sulphuretted hydrogen; the water, nevertheless, is clear and without smell.

GEOLOGY AND MINERAL PRODUCTIONS.—The geological arrangement of the rocks is everywhere very simple, and a great uniformity prevails throughout the whole country from Cape Comorin to the Ganges; the same formation extending in many instances uninterruptedly for several hundred miles in one direction. Primitive formations, in which granite seems to bear the principal proportion, stretch, with few interruptions, from Cape Comorin to beyond Nagpoor and Ellichpoor, occupying a great part of the Carnatic, Malabar, and Mysore, nearly the whole of the Nizam's territory, and a large portion of Berar. They are also met with in many places still further north, in Malwah, Bundelcund, the Aravulli mountains, and the neighbourhood of Delhi, and occupy altogether about three-fourths of central and peninsular India. Primitive rocks form also the main body or nucleus of the Himalayas, and some of the highest peaks seem to be composed of granite. The flanks of the sub-Himalayas are covered with beds of concretionary sandstone, conglomerate, and loam. Between the Jumnah and the Ganges, these hills, there named the *Sevalik* or *Sewalick*, rise from 1000 to 4500 feet; and in their deposits are found immense quantities of the fossil teeth and bones of the elephant, mastodon, hippopotamus, rhinoceros, elk, ox, horse, deer, of several carnivorous animals, crocodiles, gavials, and freshwater turtles, with fluviatile shells, and remains of fishes. The remains of extinct species of the monkey and the camel have also been found. The great plains of Gangetic and Sindetic India are almost entirely composed of alluvial deposits, which are in many places, as in Bengal, several hundred feet thick. A great sandstone formation, commencing at the Rajmahal hills on the Ganges, stretches westward across the basin of the Saone, and through Bundelcund to the banks of the Nerbuddah, and appears again at Neemuch and Baug. In both of these districts, and in Malwah, it is frequently covered with a thin crust of grey argillaceous limestone, nearly destitute of organic remains, the general absence of which in the secondary rocks of India is remarkable. The Thur or Great Desert, to the west of the Aravulli mountains, also lies, as already mentioned, on a great bed of standstone. Tertiary rocks are found at the base of the first rise of the primitive rocks of the Himalayas, in the north-east of Bengal, where the Brahmapûtra issues from them at the passes of the Garrow hills. Various animal remains have been found among them; and nummulite limestone prevails at Sylhet. Enormous beds of trap rock or basalt have been traced all over Malwah, southward to Nagpoor, and the western confines of Hydrabad, thence to

the sea near Bankote, and northward to the Gulf of Cambay, covering an area of more than 200,000 square miles, and contributing very materially by their disintegration to the amazing fertility of that part of India.

Coal occurs extensively in the grits bounding the southern slope of the Himalayas, and in other places. The sites at present known are at Burdwan in Bengal, where the coal district extends for sixty miles along the bed of the river Damooda; at Rajmahal, Palamoo, Ridgeghur; the Towa river, Hoshungabad, Jubbulpoor, Sohagepoor, Chanda, and Mardanala, in the Nerbuddah districts; on the Mahanuddy in Cuttack; at Chirrapoongee in Sylhet; Assam; and at Sandoway and Kyook-Phyoo in Arracan. Fossil seeds carbonized have been found in Travancore; and lignite, in Kumaon, Moradabad, Cutch, and Peshawer. Coal has been traced from Burdwan to the westward across the valley of Palamow, and by Sohagepoor to Jubbulpoor, and the neighbourhood of Sak, and the Towa river, a distance of 420 miles. It is found nearly in the same latitude in Cutch, and eastward to the extremity of Assam, forming a great belt, which stretches from 69° to 93° E. long., and between 20° and 25° N. lat.; Chanda, on the Wurda river, Cuttack and Arracan being its southern boundary, while the vale of Callinger, the river Teesta, at the base of the Sikim mountains, and Upper Assam, form its northern limits. This valuable mineral has also been found at Hurdwar and Attok. In 1837, an extensive bed of fine quality was discovered in a range of low barren hills a few miles from Chunar. Several quarries of fine marble were likewise found in the same vicinity. *Fossil salt* occurs in large quantity in the salt range of hills which crosses the bed of the Indus, extending from the Suffeid-koh to the Jhylum; salt is also produced abundantly by evaporation in the Samber and other lakes of Rajpootana, and in the Sunderbunds on the coast of Bengal; and throughout Rajpootana a saline efflorescence covers the surface, occupying the dried beds of marshes and rivulets, and in appearance exactly resembling hoar frost. The inhabitants call it *reh*, and use it for making soap, an impure sulphate of soda, and other compounds. It consists principally of carbonate of soda, with associated sulphate of soda, and chloride of sodium, and is consequently a natron. *Iron* is found in the Carnatic, and is wrought with great skill, and to a considerable extent at Porto-novo and Nagore. *Gold* and *silver* have been found in Mysore; and particles of gold occur in the beds and at the mouths of the rivers of Southern Malabar. *Tin* and *copper* have also been found. *Diamond* mines are wrought in the district of Punah in Bundelcund, in a matrix formed of conglomerate, with quartzose pebbles; also at Heera Khoond, eight miles east of Sumbulpoor; and diamonds were formerly found also in the Neela-mulla mountains, between the Kistnah and Pennair rivers, in the extinct kingdom of Golconda. Rubies, chrysolites, garnets, amethysts, catseyes, and many kinds of carnelian, jasper, and agate, rock crystal, rock salt, and beautiful felspars are likewise found in many places. *Talc* is found in great abundance in the Mahabaleshwar hills, where it is used instead of glass, being cheaper and more durable.

The soil varies with the geological character of the country. In the deltas of the rivers it consists of a rich alluvium; and in the countries overlaid by the great trap formation, a stiff clay and tenacious surface, which is highly fertile when irrigated, prevails. But for more particular information on this subject, we refer to our subsequent topographical description of the states and provinces of this interesting country.

CLIMATE.—As a great part of India is situate to the south of the Tropic of Cancer, the climate of the low countries is tropical, and the year is divided into two seasons — the wet and the dry. Owing, however, to the great and abrupt elevation of portions of its surface, this country exhibits varieties of climate corresponding in temperature to those which are met with through every degree of latitude from the equator to the poles; so that, while the plains are burnt up by intolerable heat, some of the mountains which overlook them are clothed with everlasting snow. Between these extremes the climate is delightful; and the most favoured regions of southern Europe are rivalled at least, if not surpassed, in amenity and luxuriant productiveness, by the newly explored hill countries of India. The highest degree of temperature is found in the Thur, and other sandy districts near the level of the sea, as in the Northern Circars and the Lower Carnatic, where the climate is the hottest in India. Frost is never felt in the Deccan, nor in the countries to the south of it, except on the summits of the Nilgherries; but the temperature at Hydrabad is sometimes only 6° or 8° above the freezing point. In the table-land of Malwah, or Central India, the temperature is not only mild, but the range of the thermometer is unusually small, seldom falling below 72° in the night and morning, or rising above 76° or 77° at noon. After the close of the rainy season the mornings become cooler,

but the cold weather does not commence till December; when it continues during the whole of January and part of February. During the hot season which succeeds, the parching winds from the north and west, which prevail in most parts of Hindûstan to an intense degree, are in Malwah comparatively mild and of short duration. The thermometer, however, during the day rises sometimes to 98°; while the nights are invariably cool and refreshing. In the low countries, to the north and north-east, the climate is scarcely less hot than in the Carnatic. In the Thur, the thermometer has been seen to reach 112°; and even in the plains of Delhi, 5° north of the tropic, and 800 feet above the level of the sea, the ground is parched in summer, and the heat becomes intolerable to Europeans. Yet there, owing to the great radiation from the sandy surface, the cold of winter is sometimes 3° or 4° below the freezing point, and the tanks are entirely frozen over. In Upper India, the climate is generally dry, but is subject to considerable changes of temperature. During three months of the year, the hot winds blow like hurricanes from a furnace; but in the cool season the precautions against cold which are common in Europe are far from being unpleasant. Bengal is free from the great alternations of heat and cold to which the upper provinces are exposed; the climate is moist and humid; the hot winds are unknown, and during the cold weather no inconvenience is suffered; but the heat and the moisture together render the temperature very oppressive during the greater part of the year. The climate of India, even in the north-western provinces, does not permit the use of woollen clothes for more than five months in the year, and sometimes not so long. The spring, or dry season, throughout Gangetic India, lasts about four months, the heat gradually increasing till in May and June the thermometer rises to 100°, and frequently to 108° and 110°. The heat is occasionally modified by terrific thunder-storms, termed northwesters, which purify the atmosphere, refresh the soil, and give new life to the vegetation. Milder showers also occur, and partially refresh the air. In the north-western provinces a parching wind often blows from the west during the day in the hot season, which is succeeded at night by a cool breeze from the opposite quarter, and sometimes for a considerable time by easterly gales. The cold season, which follows the rains, continues from November till the middle of February, and during all that period the atmosphere is clear, and the thermometer ranges from 65° to 84°. In the Carnatic it ranges from 100° to 106°; and the cold season is of very short duration. In the low country of the Arcot district, during the hot season, the thermometer rises to 100° in a tent, and to 120° in the sun. At Madras, the average heat is less than at Calcutta, the mean temperature being about 80°. In January, when the temperature is lowest, the thermometer ranges about 75°, and seldom rises above 91° in July. At Coimbatoor, among the hills, the temperature in the cold season varies from 31° to 59°; in summer, it rises to 64°, 65°, or even sometimes 75°. Near Bangalore, it seldom rises above 82°, or falls below 56°. The hottest months on the west coast are April and May. At Cochin, the greatest rise of the thermometer in April is to 105°. At Bombay, it ranges during the year from 64° to 98°; at Surat, from 59° to 96°.

The most remarkable peculiarity of the Indian climate is the periodical changes of the wind, which blows alternately for nearly half the year in opposite directions. These are termed the monsoons, and blow from the south-west and the north-east; but it is in the southern or peninsular part of India that their effects are more particularly felt. On the Malabar coast the south-west monsoon commences about the middle of April, and continues till August or September, when it gradually loses its violence, and is succeeded by light variable winds. Towards the end of October, the north-east monsoon begins on this coast, and continues till April. On the eastern coast the south-west monsoon begins in the latter part of March, or beginning of April, but is not regular or strong till June, land and sea breezes being not uncommon in March, April, and May. Even during the three following months, when this monsoon is very steady, a land breeze often blows from shore for twenty-four or forty-eight hours. In September the south-west monsoon declines, and the north-eastern commences about the middle of October; from which time till the beginning of December navigation is rendered extremely dangerous, and a tremendous surf is thrown on the coast. During the prevalence of the south-west monsoon, the coast of Malabar is deluged with rain, in consequence of the clouds which it brings with it being intercepted by the lofty range of the western Ghauts, which protect, in a great degree, both the table-land of the Deccan and the Carnatic from its influence. The rains which fall in Mysore are not more than sufficient to preserve the verdure, and in the Mahratta country there is seldom heavy rain for any long continuance, particularly at the commencement of the season; and the country is in consequence but ill supplied

the natives), and otto or attar, of which only the weight of a rupee is produced from 200,000 bulbs. Along the coasts of the Bay of Bengal, the cocoa and areca nut palms flourish abundantly; of dyes, medicinal drugs, resins, gums, and oils, there are great varieties. Timber of all kinds is everywhere abundant; the forests are numerous and magnificent, and cover a large portion of the country. The maritime provinces produce teak, ebony, and many other species of trees; the interior produces the saul, sissor, bamboos, and sattans, with a great variety of plants which yield excellent materials for cordage. The northern and hill provinces yield at one season European grains, and at another those that are peculiar to the tropics. On the Himalayas, tropical trees entirely disappear at the height of 4000 or 5000 feet; the middle region, between 5000 and 9000, produces oaks, sycamores, elms, hornbeams, pines, barberries, roses, and honeysuckles, all of Indian species, but of European forms; and numerous saxifrages, crowfoots, geraniums, violets, gentians, primroses, and labiate plants. It is this belt also which produces the scarlet rhododendron; and, on its lower edge are found those camellias and tea-like plants which render it probable that the tea-plant itself might be cultivated in this part of India. The third and upper belt extends to an elevation unknown in any other part of the world. Trees of rhododendron and quercus lanata are first met with; to these succeed pines and various kinds of firs, some of which are splendid at the height of 11,000 or 11,500 feet; oaks in great variety; yews, birches, sycamores, and poplars, with roses, viburnums, and honeysuckles; above which follow patches of snow, with the Himalayan bamboo, creeping along the ground. To these succeed forests of quercus semicarpifolia; and the limits of vegetation are finally marked by a few starved yews and junipers, with primroses in the warmer situations, dwarf species of rhododendron, heather, and willow. The agriculture of this region is as singular as the vegetation; wheat is sometimes cultivated on the top of a mountain, and rice at its foot; maize, millet, and other small grains constitute the rain crop; capsicums, turmeric, and ginger, are grown as high as 4000 feet; wheat is cultivated as high as 10,000 feet, or even, according to Captain Webb, to the height of 12,000 feet. Cotton succeeds even at Kumaon. At Saharunpore, 30° N. lat., 77° 32′ E. long., 1000 miles from the sea, and 1000 feet above its level, the East India Company have established a botanic garden, where are collected in one place, and naturalized in the open air, the various fruit and other trees of very different countries, as those of India, China, Cabul, Europe, and America. But the most remarkable vegetable production of India is the banyan tree (*ficus Indica*) the branches of which send out shoots, which fall to the ground and fix themselves there, becoming in time large trunks, and forming a grove around the parent stem. A famous banyan tree has been often mentioned as growing on an island in the Nerbuddah; and one in Mysore is said to cover an area of 100 yards in diameter. — (*Boyle's Illustrations of the Botany of the Himalaya Mountains. Introduction.*)

ANIMALS.—India produces many of the most interesting forms of animal life. The elephant ranges wild in the deep forests and jungles of the eastern and southern provinces, and is domesticated throughout the peninsula, where it is still used to swell the gorgeous parade of the court, and to form the humblest of drudges. Wild elephants are particularly numerous in Assam, where they move about in large herds; and from 700 to 1000 are yearly exported from that province. Its huge rival, the rhinoceros, is also found in the thickest parts of the forests of Bengal, but has never been trained to any useful employment. The camel abounds in the sandy regions of the north-west, where it is used as the ordinary beast of burden. Deer, of many species and varieties, are found among the mountains and forests; also antelopes, wild boars, hyenas, jackals, foxes, hares, squirrels, porcupines, hedgehogs, and monkeys, the last being met with in great variety, and multiplied to a vast extent through the superstition of the Hindoos, who consider them as sacred animals. Bears abound in all the wooded mountains; wolves are also numerous in the northern provinces. The wild dogs of the Himalayas are remarkable animals, in form and colour like a fox, though larger; they hunt in packs, give tongue like dogs, have a very fine scent, and by force of numbers they are said at times to destroy the tiger. The buffalo, both wild and tame, is indigenous; one species, the *bos-arneé*, is noted for its great size and strength; the *yak*, or Tartar ox, is numerous among the Himalayas, where they browse in herds among ice and snow, and constitute, next to corn, the chief wealth of the inhabitants; there are also several species or varieties of beeves, the most common of which is the sacred humped species. The native horse of India is a small, ill-shaped, vicious poney; but fine horses in great numbers are imported from Arabia and Turkestan, and are bred in

the studs. The sandy deserts of Western India are the haunt of the wild ass, which roams in herds along the borders of the Runn of Cutch. In Southern India asses of several varieties are tamed for domestic purposes. The rat tribe abound; one species is of enormous size and very mischievous; some of the smaller species are also very destructive. The musk rat is only about the size of a mouse; and yet when it passes through a room it perfumes the whole atmosphere, and whatever it passes over become impregnated with the taste and the smell of musk. The goat of Cashmere has long been celebrated for its fine wool; and there are also other varieties of the goat. In the country of the shawl-goats some sheep's wool of very fine quality is also produced and no mutton is finer than that of the grain-fed sheep of the plains of India; but the native sheep are covered with hair instead of wool. Great attention has, however, of late, been paid to the introduction of improved breeds of sheep; the most decisive results have been obtained within the limits of the Bombay presidency, and, from the active measures taken to improve the fleeces, in the extensive pastoral country of the Deccan, the export trade in wool promises to be one of the most valuable and important for Bombay. But, of all the animals of India, those of the feline tribe are the most remarkable, as well for their beauty as for their size, strength, and fierceness. The lion is found chiefly in the northern provinces, near the borders of the plains, and in Kattiwar; but the tiger abounds in all the forests and jungles throughout the country, even up to the glaciers of the Himalayas, and is the grand object of pursuit with European sportsmen. Leopards, ounces, and panthers, of different varieties, are also numerous; one species of leopard, the chittah or cheetah, is employed for hunting wild deer. The ox and the cow are treated with great veneration and are even worshipped; and cow dung is used by the devotees to adorn their persons.

The birds of India are, in many cases, both splendid and curious. Those of the parrot tribe are the most remarkable for beauty, and for the variety of species. eagles are numerous among the Himalayas, also vultures, hawks, and falcons; many other birds are common, as herons, cranes, storks, flamingoes, pea-fowl, pheasants, geese, swans, partridges, quails, pigeons, gulls, plovers, wild ducks, and the common domestic fowls; the jungle-cock of India is believed to be the original parent of the common cocks and hens of Europe.

Reptiles are numerous; serpents swarm in the gardens, and even intrude into the houses; some are comparatively harmless, but of others the bite is speedily fatal. Water snakes are so particularly numerous along the coasts, that seamen used to ascertain their approach to land by the appearance of those animals. Alligators abound in the rivers and tanks, and particularly among the creeks of the Sunderbunds, along with a great variety of amphibious animals and fishes; the shark infests the mouths of the rivers, as well as the sea-coast, and grows to an enormous size. The best and most highly flavoured fish is the mango, which appears in the lower Ganges in June, and is reckoned a delicacy at the tables of Europeans, especially in the two months during which it is in roe. Mullet is plentiful in all the rivers; and there are also many other kinds of fish which we cannot attempt even to enumerate. The natives are dexterous fishers. Oysters, as well flavoured as those of Europe, but not so large, abound on the coast of Chittagong.

The insect tribes may be said to be innumerable. The heat and the moisture of the climate give incredible activity to swarms of noxious and troublesome insects; and to others of a more showy class, whose large wings surpass in brilliancy the most splendid colours of art. Musquitoes, moths, and ants of the most destructive kind, everywhere abound, to the intolerable annoyance of both Europeans and natives. The white ants destroy every sort of animal or vegetable substance, and the natives allege that they can even eat rupees. Clouds of locusts are also occasionally seen in the northern provinces. Among useful insects, is the silk-worm, the produce of which has long formed an article of commerce from India: the indigenous species are numerous; others have been introduced from China and Italy; and the greatest attention is now paid to the rearing and training of the worms, and to the preparation of the silk, the quantity and value of which are yearly increasing. Attempts have also been made to introduce the cochineal insect, but hitherto without the desired result; for, after a great deal of trouble and expense, the animals imported and multiplied over the country turned out to be of the wild species, and not of that which produces the finest dye. But the cactus on which they feed, will flourish in the most sterile parts of the country; and, as the experiment with the wild species was so successful, no doubt can be entertained of equal success with the *grana fina* cochineal, whenever it can be introduced.—*(Royle, Productive Resources of India.)*

PEOPLE. — Throughout the wide extent of India there is greater diversity of character and language, physiognomy, manners, customs, and occupations among the natives, than is to be found in the whole of Europe. The country contains at least thirty nations, speaking as many distinct languages, and all strangers to each other; and of each of these languages there are innumerable diversities of dialect. The inhabitants of India are in fact a very heterogeneous people; though they are generally considered as belonging to the Caucasian variety of the human race. In the form of the skull, the features of the face, and the proportions of the limbs, the Hindoos resemble Europeans more than the Persians and the Arabs; but their physical characteristics differ so much in different parts of the country, that no general picture would suit the various dissimilar races. Among the Rajpoots and northern mountaineers are often found men of gigantic stature and proportions; but, in general, the inhabitants of the plains are of shorter stature, and more slender form. They are, however, all of an agile graceful figure, and capable generally of enduring considerable fatigue. Few deformed persons are to be seen, but blindness is not uncommon. Their complexion varies from a dark olive, approaching black, to a light, transparent, beautiful brown, with still an olive tinge, like that of the natives of North Italy, or Provençe; nor does this variety of colour seem to depend entirely on climate. "Of the crowd," says Heber, "by whom we were surrounded, some were black as negroes, others merely copper-coloured, and others little darker than the Tunisines, whom I had seen at Liverpool. It is not merely the difference of exposure, since this variety of tint is visible in the fishermen, who are all equally naked. Nor does it depend on caste, since very high-caste Bramins are sometimes black, while Pariahs are comparatively fair. It seems therefore to be an accidental difference, like that of light and dark complexions in Europe, though, where so much of the body is exposed to sight, it becomes more striking here than in our own country." (*Journal*, I. 9.) Their face is oval; the forehead moderately large and high; the eyes and hair black; the eyebrows finely turned; and the nose and mouth have a European cast. The women, when not exposed to the weather, or stunted by hard work, are often very beautiful. Their forms are delicate and graceful; their limbs finely tapered and rounded; their features mild; their eyes dark and languishing; their hair fine and long; their complexions glowing; and their skins remarkably soft and polished.

The Brahminical Hindoos appear to have been divided, at some remote era, into four *tchadi* or *castes*, each of which had its peculiar privileges, duties, and laws. These were, 1. The *Brahmins*, priests; 2. The *Kshatryas* or *Khetris*, soldiers; 3. The *Vaisyas*, *Vice*, or *Bice*, merchants and husbandmen; 4. The *Sudras*, artisans, labourers, and servants. A notion has long been prevalent among Europeans, that the Hindoos are a race unsusceptible of improvement, in consequence of every trade and profession being confined to a particular caste, and each caste being placed within certain impassable limits or walls of separation. But this opinion is now ascertained to be very incorrect. If the fourfold division of castes ever existed entire in India, it certainly does not exist now, so far as occupations are concerned. Even before the time of their legislator Menu, more than 3000 years ago, an intermixture of the castes had taken place, and the mixed race thence arising were divided into a great number of new tribes or castes, to which, speaking generally, no employments are forbidden; and the subdivisions of these classes have further multiplied distinctions to an endless variety. "It appears, indeed," says Mr. Colebrooke, "that almost every occupation, though regularly it be the profession of a particular class, is open to most other classes; and that the limitations, far from being rigorous, do in fact reserve only the peculiar profession of the Brahmin, which consists in teaching the Vedas, and officiating at religious ceremonies." (*Asiatic Researches*, Vol. V. *As. Ann. Reg.* 1800.) We have thus the highest authority for rejecting entirely the doctrine that the whole Hindoo community is divided into four castes, whose peculiar prerogatives are kept inviolate by impassable walls of separation; and, instead of this, we find everywhere in the present day, a heterogeneous mass of people of all professions, without a single example in any particular state, or kingdom, or portion of the community, of that fourfold division of castes which has been so confidently insisted on. "I have myself," says Mr. Rickards, "seen carpenters of five or six different castes, and as many different bricklayers, employed on the same building. The same diversity may be observed among the craftsmen in dockyards, and all other great works; and those who have resided for any time in the principal commercial cities of India, must be sensible that every increasing demand for labour, in all its different branches and varieties of old and new arts, has been speedily and effectually supplied, in spite of the tremendous institution of castes; which we are

taught to believe, forms so impassable an obstacle to the advancement of Indian industry." (*India*, I. 32.) In short, the only one of the four castes which still preserves anything like a distinct existence is that of the Brahmins; but even of these, in Bengal alone, Mr. Colebrooke enumerates 168 subdivisions or families, with important distinctions among them. Even their sacred functions have been encroached upon; for the priests throughout India are not all Brahmins, nor are all the Brahmins, priests. According to the Abbe Dubois, the pontiffs and all the clergy of the sect of Siva, in Southern India, are Sudras; but the greater part of the high priests of Vishnu are Brahmins. Many of them engage in the employments of the lower castes; they are found professing almost every trade and calling, and even act as cooks in the kitchens of the despised but wealthy Sudras. Brahmins form a considerable proportion of the British Indian army; they are also usually the political and financial functionaries of the native princes; some of them engage in commerce; some are employed in the appropriate duties of their caste, in religious services at several of the temples, and in literary pursuits; but great numbers of them live by begging, it being one of their highest privileges to live by the industry of the lower classes. Whatever be their occupation they are generally an artful set of impostors. Till recently, the number of them who were respectable for knowledge was very small, while the great majority were devoted to ambition, intrigue, and sensuality; their character being disgraced by a degree of avarice, meanness, and cruelty, which inspired a stranger with no feeling towards them but one of contempt. The charity to which they give so high a place in the list of duties and virtues, has no human beings but Brahmins for its objects. Towards the other castes they cherish no feelings of humanity; but, on the contrary, claim everything from them, while they would give them nothing in return. The Brahmins, indeed, appear to have been originally foreigners in India. They have a tradition that the primitive seat of their ancestors was to the north of the Himalayas; and there we still find the most sacred of all the Hindû places of pilgrimage, the *Manas-sarowar* (lake of intellect), and the river *Brahmapûtra* (son of Brahma). Tradition relates that the descent of the Brahmins into India took place by the chasm through which the Ganges flows, and which is called the *Gomukhi* (cow's mouth, or more properly, water spring). This accounts for the very holy character which is ascribed to that great river.

The rest of the Hindoo community is composed of innumerable mixed tribes, not one of which can prove itself to be genuine Kshatrya, Vaisya, or Sudra. It is certain that the professions peculiar to these castes are everywhere usurped and practised by the mixed classes; and all the castes, except that of the Brahmins, are thoroughly intermixed. A real Kshatrya prince or soldier is not to be found; that caste has indeed long since disappeared, and the Brahmins allege that it was entirely extirpated by Parasu-Rama, the sixth avatar of Vishnu. All classes and castes now exercise the profession of arms; and Brahmins, Vaisyas, Sudras, and mixed castes, perform the functions, and hold the rank of princes and rulers, which, by the laws of Menu, belong exclusively to the Kshatryas. The Nairs, for instance, who are the hereditary soldiers and rulers of Malabar, and the warlike Mahrattas, who so long domineered over Hindûstan and the Deccan, are only Sudras. In like manner all the varieties of castes follow the allotted professions of the Vaisya and the Sudra, and practise, without distinction, every branch of agriculture, commerce, handicraft, and menial service. But, though the grand fourfold division certainly no longer exists; and, though people are at liberty to practise what profession or trade they please, without legal restraint, yet they are, nevertheless, so far divided into castes, as to follow very generally and exclusively the profession of their fathers, and do not readily engage in any other, unless from necessity or great temptation. So much does this feeling prevail, that the members of different professions may almost be considered as forming so many distinct hereditary castes; but, instead of *four* only, there are *many hundreds* of such castes, often distinguished by very trivial and even ridiculous customs and practices. "In the neighbourhood of Pûna," says Mr. Elphinstone, "where they are probably not particularly numerous, there are about 150 different castes."—(*Hist. of India.*) Nor do persons of different professions or castes readily associate with each other; they are always under the superstitious dread of coming in contact with something that will pollute them; and, as they thus live much estranged, the various classes come at last, through inveterate usage, not only to lose all mutual sympathy, but to consider each other almost as beings of different races or species, having no common sympathies, feelings, rights, or privileges. These feelings, however, have been of late years considerably modified, through the prevalence of European education and intercourse; and there are unequivocal

signs that caste will ere long fall into disuse, if not into contempt, among the educated classes. It is even alleged, that, were the matter enquired into, there would scarcely be found a single Hindoo family in the whole of Bengal whose caste has not been already forfeited by a violation of its laws; though, by mutual forbearance and connivance, they give each other credit for still possessing it, and though the higher orders still sometimes shew an insolent reverence for its rules. Still, of all these various classes or castes, the greater number are considered as more or less *pure*, and consequently entitled to a certain degree of respect and attention; but, beneath the lowest of the pure castes, there is a very numerous race of outcasts, amounting, it is said, to not less than one-fifth of the whole Hindoo population, to whom the higher classes deny the rights of humanity. These are generally called in the Carnatic *pariahs*, in some places *chandalas*; and, whatever may have been their origin, they exist now in the lowest and most deplorable condition. A person of pure caste is contaminated by entering a pariah's house, or eating food prepared by him; some even consider themselves polluted by the touch of a pariah. In the towns these outcasts are confined to separate quarters, and are employed in the meanest and most disgusting occupations. It is on this latter account that Europeans are ranked with pariahs by the *pure* Hindoos; for, like them, they perform indiscriminately all kinds of work, however impure; and eat, with equal indifference, all kinds of food, even that of the sacred cow. Yet even these degraded beings have, among themselves, distinctions of purity, which they observe as rigidly as the purest Brahmins. In Malabar there is a variety of outcasts called *poliars*, who are not allowed even to approach any of the higher castes. If a poliar wish to speak to any of these, he must stand at a prescribed distance, and call aloud; and when a violation of this rule occurs, the person polluted must purify himself by bathing and by reading the sacred books. Nor are even these the lowest; there is in the same province a still more degraded race, called *niadis*, who wander in small companies, and, when they see a passenger, set up a howl to warn him not to approach too near. Slavery, also, both prædial and domestic, prevails extensively throughout India; there is no law defining the extent of a master's power over his slaves; and the prohibition of importing them by sea, from other countries, has long increased their price, without putting a stop to the traffic. The slaves are generally kept in a very wretched state; and, in some places, as Travancore, the *Merramukhul*, or children of slavery, are so degraded, as to be connected in name with everything that is most revolting, shunned as if infected with the plague, spreading alarm and indignation among the higher classes by their presence, and even defiling towns and markets by their approach. The number of slaves throughout India is estimated at 10,000,000.

For a long time it was generally believed in Europe that the Brahminical Hindoos abstained entirely from animal food; but, like the doctrine of castes, this has been found to be a most erroneous notion, for they are scarcely less carnivorous than Europeans, and even the purest Brahmins are allowed to eat mutton and venison. Any person, not excepting even a Brahmin, eats readily the flesh of whatever animal has been offered in sacrifice; while, among all the lower castes, mutton, pork, venison, fish, everything, in short, but beef and fowls, are consumed as readily as in Europe. And though intoxicating liquors are prohibited by their religious codes, the prohibition is very generally disregarded by persons of all ranks, both Hindoo and Moslem. Many of them are very fond of liquor, and drunkenness is a common vice of their chiefs. Opium is also used to a great extent; among all classes *bang*, a preparation of hemp, is as common as their rice; and the most respectable Hindoos are seldom an hour without having a large piece of betel and chunam in their mouths. "On the whole," says Captain Ogle *(As. Jour. October* 1840*)*, "though the Indian, from the nature of his climate and constitution, can never become a drunken brawler, yet I should unscrupulously average the use of intoxicating drugs amongst all classes of society to be ten times greater than among the population of Great Britain." The poor, whose means will not allow them to procure animal food, consume rice, dhall, and other cheap grains, seasoned with salt, spices, and, if possible, a little fish. On the whole, however, the Hindoos are generally considered by other writers to be an abstemious and very temperate race. The character, indeed, of the Hindoos varies in different parts of the country, as much as the characters of the nations of Europe differ from each other. The Bengalees are weak in body and timid in mind, and are, in general, marked by the accompaniments of timidity, which are fraud and servility; and they seem to deteriorate in respect of bodily strength and mental capacity, as they approach the coast. The Hindûstanees of the upper provinces, above Benares, and particularly the Rajpoots, are a race of men, speaking generally,

not more distinguished for their lofty stature, which rather exceeds that of Europeans, and their robust frame of body, than for some of the finest mental qualities. They are brave, generous, and humane; and their veracity is as remarkable as their courage. The greater proportion of the Bengal army is composed of these Hindûstanees; and it is remarked that there are few corporal punishments in that army, the slightest reproach being felt as the greatest punishment. Such is the character given of the soldiers by Sir John Malcolm; and the character of those who follow civil pursuits is much the same as that of the soldiers, allowance being made for their different habits of life. The Hindoo on the coast of Coromandel is a weaker man than the Rajpoot; but even here there are among them many classes who are highly respectable. On the other side of India, the Mahrattas are much superior to the Bengalees, and even to those of the Carnatic.

Besides the Hindoos who profess the Brahminical faith, there are in India multitudes of people and numerous tribes, differing from each other in origin, religion, and habits of life; of these, as well as of the more noted of the Hindoo classes and races, we shall now endeavour to enumerate the principal.

Armenians, who, being expelled from their original country, and scattered over all the regions of south-western Asia, are also to be found in the principal cities and towns of India, following their usual employments of merchants and tradesmen.

Banians or *Banyans* is the name given to Hindoo merchants, as well in India itself as in the places where they are settled for the purposes of trade, along the coasts of the Indian Ocean. They do not form a distinct caste; but, like the members of other professions, are divided from their brethren by strong hereditary prejudices. They are generally mild and well-conducted, and many of them have very extensive mercantile connections throughout the cities of the East. Most, if not all, the Banians are Jains, and are distinguished for that tenderness for animal life which is the peculiar characteristic of the sect.

Batties or *Bhatties*, a predatory tribe in the desert, between Rajpootana and the Indus, remarkable for carrying on their depredations on foot, and still more for the length and rapidity of their incursions; but they have been latterly reduced to order.

Bhils or *Bheels* are an interesting race, considered by some as the remnant of the aboriginal people who were driven to the hills by the Brahminical Hindoos. They are found in the hilly parts of Gujrat and Malwah, and among the hills along the Nerbuddah and the Tuptee. Their habitations are of the rudest kind, and they are in other respects barbarians; but they have been nevertheless considered by some of those best acquainted with them to be generally a better, a nobler, and a more manly race than their Hindoo conquerors. Attempts have been made to wean them from their wild and lawless life, but hitherto without much success. There are among them a great many varieties, some being more civilized than others, among whom human sacrifices still prevail to a great extent. Some of them are even said to be cannibals, and to consider it a part of their religious duties to devour occasionally a member of their own family. They do not burn their dead according to the custom of the Hindoos, but bury them in the ground. They are very expert marksmen with the bow, which in their hands is a formidable weapon. They seldom or never commit aggressions upon the Europeans in their vicinity; and have never been known to abuse the confidence placed in their honour by young officers who sometimes go among them, for a few days' sport in their wild haunts; but they are not so scrupulous with the native servants who are sent among them on any duty.

Boamas, a sort of separatists from the Newars in Nepaul, who are supposed to amount to about 5000. They observe many of the customs of the Bhooteas.

Bohrahs, a singular sect of Mahometans, supposed to be of Arab descent, whose molla or high priest resides at Bohraunpoor, form a very large society, spread over the whole of the Deccan, and carry on an extensive trade. They call their sect Ismaeeliah, and derive their origin from one of the followers of the prophet, who flourished in the age immediately succeeding that of Mahomet.

Bhooteas, *Bhutiahs*, or *Booteas*, a people of Tartar descent, who possess Bootan, and are found along the hills as far as Kumaon. They are rather an undersized race, more remarkable for tension of sinew than for weight of limb; their features are purely Tartar; their persons are extremely filthy; they are, however, a very quiet industrious people. They shave their heads, and observe many idolatrous rites and customs.

Bringaries or *Brinjarahs*, and *Loodanahs*, are a sort of travelling merchants, who have no permanent residence, but live in tents, and trade generally in grain, with which they travel from province to province, or follow the route of armies, who in their fiercest contests consider these useful attendants as neutrals. They preserve a marked independence and separation from other races; and their dress and usages are peculiar.

Budhuks, a numerous fraternity of hereditary thieves, who inhabit the almost impenetrable forests which gird the northern border of Oude, and the banks of the river Chumbul. They have no fixed abodes, but live in temporary huts, and shift their residence with a rapidity scarcely credible. They do not willingly allow Mahometans to join them; but they have few Hindoo prejudices, feeding upon every kind of animal, and drinking spirits in large quantities. They speak a peculiar language. Like the Thugs, they are very superstitious, and pay great attention to omens. A great many robberies have been traced to them, and Government is now employed in putting them down.

Cherons, a race of Hindoos who employ themselves as carriers of heavy goods, such as grain, in which they also deal; they possess large droves of cattle for carriage. They are likewise sometimes engaged to protect travellers in the wild parts of the country, and take an oath to die by their own hands in the event of those who are under their protection being plundered. The superstitious thieves of India are always overawed by this threat of the Cherons, whom they hold in great veneration.

Coolies or *Kholies*, a manly and bold-looking, but very ferocious and troublesome people, who are found in Gujrat, among the wilds and jungles of the province. They used to be formidable for their robberies; but seem now, like their neighbours, to give promise of more peaceful conduct under their powerful masters.

Cossyahs, or *Kussyahs* or *Khasyas*, are found in the Khasya hills to the eastward of Bengal, and are a dark and scanty race, but strong and well-formed, and of greater stature than most mountaineers. Their character is peaceable and honest. Their women have handsome features, but are sun-burnt and toil-worn; and their ears and noses are deformed by heavy metal rings, which they wear as ornaments. The Cossyahs are very industrious.

Dawodpûtras, a tribe of Mahometans from the district of Shikarpore, who crossed the Indus in the reign of Aurungzebe, and wrested from the Sindees the lands which they now possess. Their whole number does not exceed 50,000; they are a fair and handsome race, and are subjects of Bhawul-Khan.

Dhenwars, the husbandmen and fishers of the western districts of the kingdom of Nepaul.

Garrows, a barbarous people who live among the hills to the eastward of Bengal. They are strong, well-shaped men, hardy, and able to undergo much toil, of a surly look, flat caffre-like noses, small eyes, generally blue or brown, wrinkled foreheads, overhanging eyebrows, large mouth, thick lips, round and short face. Their colour is brown, of different shades. They are of a mild disposition, honest, and faithful to their promise. They are more agricultural and industrious than the Kossiyahs, whom they resemble in warlike character, and excel, if possible, in muscular developement and bodily strength, though not their equals in external appearance and dignity of carriage. They go almost naked, and lead a very savage life. A Garrow's greatest treasure is as many human skulls as his house can contain; his greatest cordial, a pint of brandy; and his greatest dainty a pudding made by feeding a young dog with as much rice as he can contain, and then roasting him alive till the rice is cooked, when the entire mass is served up for eating. Their country is extremely fatal to Europeans. A branch of the same people, called *Hajirs*, who reside at the foot of the hills, are more civilized, and in religious matters partake more of Hindoo notions.

Gipseys, known in India by the name of *Bazighurs* (players or actors), are divided into seven castes, have all become Mahometans, and are found principally in the upper provinces of Hindûstan. They are pretty numerous, and are identically the same people as those found in Europe.

Goands, *Goonds*, *Khunds*, a savage people who occupy the wildest parts of Gundwana, to which they have given their name, between the northern Circars and the Bengal provinces. They bear a striking resemblance to the African negroes; and are in the lowest condition of savage life; their appearance is generally wretched, though some of their leaders are fine-looking men. They are blood-thirsty, cruel, and revengeful, and offer human sacrifices. Their country is mountainous, rising 2000 or 3000 feet above the level of the sea. The Goonds are a perfectly distinct race from the people of the plains, and speak an entirely different language. They are armed with bows, arrows, and battle-axes. Those who live in Goomsur have been recently reduced to subjection by the British Government.

Ghorkhas or *Goorkhas* are the dominant people of Nepaul, but are also found in the hill countries to the westward, which were recently subject to the Nepaul sovereigns. They appear to be descended from the Hindoos of the plains, who took refuge in the hills from the Mahometan invaders, but have been intermingled in blood with the Tartar and Chinese races, who seem to have been the original inhabitants of those regions. They are a hardy, brave, active, and enterprising people. In the British Indian military service there are several regiments or battalions of Goorkhas, who make excellent soldiers.

Gurungs, a pastoral tribe in Nepaul, who shift their abodes between the mountains and the valleys, with summer and winter. They adhere to the Lama priesthood and the Buddhist faith. They cultivate their lands with the hoe, are diligent miners and traders, and employ their numerous flocks in conveying their goods to market.—*(See Nepaul.)*

Jarejahs are the ruling class in Cutch, and are all more or less connected with the family of the Rao, from whom they hold their lands by military tenure. There are about 250 chiefs, who are termed the *Bhyaud* or brotherhood, and form the Rao's hereditary advisers. They are a singularly fine race of people, naturally robust, and peculiarly warlike in dress and bearing; but in their habits dissipated, proud, and cruel. They procure their wives from the Soodahs, a people who live in the Thur, and put their own female children to death, usually by means of opium applied to the mother's breast, or by drowning them in milk. They have numerous retainers called *Grasias*. The western part of Kattiwar is also possessed by Jarejahs, who migrated from Cutch 800 years ago.

Jariyahs, a numerous tribe, who inhabit the lower hilly region between the Kali river and the valley of Nepaul. They are now almost all converted to Hinduism.—*(See Nepaul.)*

Jats or *Jauts* are a numerous and turbulent race, who occupy great part of the north-west provinces. They appear to have migrated originally from Turkestan, and still retain the nomadic and warlike habits of the people of that region. Colonel Tod considers the peasantry of north-west India, as well as the Seikhs, to be chiefly composed of this people. The Jauts of Bhurtpore, who are descended from a low Sudra caste, but have assumed the title of Kshetri, or warrior, are distinct from the Jauts of the Punjab.

Jews are found in considerable numbers in Western India; many of whom are enrolled in the ranks of the Bombay army, and form good soldiers. There are two races or colonies of Jews at Cochin, distinguished as the white and the black. According to the missionary Wolff, those are called black Jews who became Jews of their own accord in Malabar, and these who are dispersed in the country, of black and half-black colour. They have neither priests nor levites, nor families nor relations in foreign parts. Their complexion is like that of the Hindoos. They consider themselves as slaves to the white Jews; they pay them a yearly tribute, and also a small sum for the privilege of circumcising their children, and for being allowed during the time of prayer to wear the frontlets. They do not sit in presence of the white Jews, nor eat with them; they are, however, richer, more industrious, and more moral than the white Jews.—*(Miss. Journal*, I. 478.) The Jews of Bombay are of a higher degree of respectability than in any other part of India; they call themselves Beni-Israel, and there is some reason to believe them descendants of the ten tribes, rather than of the later Jews.

Katkaris or *Katodis*, a people in the northern Concan, who live as outcasts near villages, and are held in great abhorrence by the country people, and particularly by the Brahmins. They derive their name from the occupation on which they are principally dependent for support, the manufacture of the *kat* or terra japonica from the khair tree or acacia catechu.

Katties inhabit Kattiwar, the peninsular part of Gujrat, and are reckoned one of the royal races of India. They are a half-civilized people, whose principal occupation formerly was robbery and piracy; but, now that their occupation is gone, their villages and forts are falling to decay, their country is covered with ruins, their power is broken, and their chiefs are in poverty.

Kookies or *Lunctas*, in the hills north-east of Chittagong, are regarded as the wildest of all the tribes on the eastern frontier.

Mahrattas, a numerous and powerful race, who originally occupied the north-western part of the Deccan. They rose to distinction in the 17th century, under their rajah Sivagee, and, during the 18th, were possessed of a great part of Northern and Central India. Their power was first broken by Ahmed Abdallee, king of Cabul, from whom they sustained a terrible defeat at Paniput in 1761; and they have now completely yielded to the British ascendancy. Their principal remaining chiefs are the Rajah of Sattarah, who is the descendant of Sivagee, the Maharajah Scindiah, Holkar, the Guicowar, and the Rajahs of Kolapoor and Sawuntwarree. The Mahrattas are generally of a diminutive stature, ill formed, and of a mean rapacious disposition. They are of low caste, and divided into three principal tribes, the Koonbees, the Dungar, and the Goalah, or the farmer, the shepherd, and the cowherd. There are certainly minute shades of difference among them, but no distinction of caste, for the genuine Mahrattas are all Sudras; and there are local circumstances which may prevent one family from intermarrying with another; but still every Mahratta can eat with his neighbour, unless he should have become an outcast, an event of no unusual occurrence. The Brahmins who live among them differ in their customs from their neighbours, with whom they will neither associate nor intermarry. The Mahratta language is widely spread, extending from Beder over the whole country to the north-west of Canara, and of a line, which, passing considerably to the eastward of Dowlatabad, takes an irregular sweep till it touches the Tuptee river, and follows the course of that river to the sea.

Mairs inhabit that part of the Aravulli mountains in Rajpootana called *Mairwarra*, or the region of hills, between Komulmair and Ajmere. They are a branch of the Mainas, one of the original tribes of India, and have lived for ages by robbery, being at constant war with their Rajpoot neighbours. They have yielded, however, to the British power, and give fair promise of becoming a civilised and industrious people.

Mararas inhabit a stripe of land on the coast from Cape Comorin to the north of Ramnad, their principal town. They are a people of considerable antiquity; and there appears some reason to conclude that they are the descendants of the rude tribes who inhabited the peninsula before the Hindoos colonized it, and introduced Brahminism, which they seem to have effected under the command of their celebrated hero or demigod, Rama. The Maravas have also been spread at different times, and in various proportions, through the Tanjore, Madura, and Tinnevelly provinces.

Mechis inhabit the forest portion of the Teral, from the Brahmapútra to the Konkinia in Upper Assam, a space 250 miles in length by 12 or 15 in breadth. They live entirely in the forest, without towns or permanent villages, and are remarkably healthy, notwithstanding the malaria, which is so deadly to strangers. They are Sivaites, but have no priests or temples, nor distinctions of castes, and no prejudices against strangers. They are industrious and honest.

Moplas or *Moplays* or *Mapellahs*, are the Moslem inhabitants of Malabar, and are a wealthy, intelligent, and enterprising race of people. They enjoy the greater part of the traffic throughout Malabar, and are exceedingly jealous of the interference of any other class in their occupation.

Moslems or *Mahometans* of India, are of various races, partly emigrants from the countries to the west and north, as Moguls, Tartars, Turks, Persians, and Affghans, and partly converted Hindoos. Those of foreign origin are considered as generally superior to the Hindoos; they have greater elevation of sentiment, greater energy of purpose, and dignity of character; they are more luxurious and dissipated, but decidedly more warlike, manly, and cultivated as a people. They are, however, very bigoted and fanatical, but harmonize, notwithstanding, very well with the Hindoos, who even assist in celebrating some of the Moslem festivals; and it is very remarkable that all the butcher meat consumed by the Hindoos is prepared, as far as regards the slaughter and cutting up of the animal, by Moslem butchers only. The Moslems are spread over the greater part of India, but are most numerous in Hindústan, or the upper provinces; they are also congregated in great numbers at Hydrabad in the Deccan. Their number altogether is estimated at about 15,000,000; and they are said to cherish a deadly hatred to their European conquerors, and to be always looking for an opportunity to throw off their yoke. The principal Moslem princes are the family of the Great Mogul, or Emperor of Delhi; the king of Oude; the Nizam, or king of Hydrabad; the Nabob of Arcot; the Nabob of Bhopal; and Bhawul Khan.

Mughs are the indigenous people of Arracan, and the most numerous portion, amounting to six-tenths of its present population. They are a hardy but inoffensive race, of a short muscular stature, with a copper complexion, and round flat features. They are Buddhists in religion, and though in many respects far from civilized, yet in others they equal, or even surpass the most polished nations. There is rarely one of them to be met with who cannot read and write. Their priests appear to be entirely occupied in the education of the children, and in every village there are two or three who are so employed. The Mughs, in their manners, are perfectly free from the servile hypocrisy of their western neighbours, and equally superior to them in probity.—(*Journal R. Geog. Soc. Lond.* I. 177.)

Nairs are the aristocracy of Malabar, who are divided into eleven ranks; they were formerly the hereditary soldiers of the country, but now engage in handicrafts. Though they are considered to belong to the Sudra caste, they are, nevertheless, a very arrogant race. They do not marry; and their families are continued by the children of their sisters.

Nayaks or *Nayakadias*, a wild tribe who inhabit the Passia, Chúmpaneer, and Oudipoor Jungles, between the Mhye and the Nerbuddah, with a breadth of about 50 miles. They are found chiefly about the centre of that region, and are much scattered towards the extremities, where various tribes of Koolies and Bhils, and a mixed Hindoo population predominate. They are very barbarous, and objects of the greatest terror to their peaceable neighbours. They worship Wagheshwar, the lord of tigers, and Maha, a malevolent female deity.

Newars, a people who originally occupied the more fertile part of Nepaul proper, before the Goorkha conquest of that country. They are generally of the middle size, of great bodily strength, with broad shoulders and chest, very stout limbs, round and rather flat faces, and open and cheerful countenances, but with little or no resemblance to the Chinese. They are peaceable, industrious, and even ingenious; their occupations are principally agricultural; but they are, besides, almost exclusively employed in the arts and manufactures of the country. The greater part of them are Buddhists, and are much attached to their religion; but they do not acknowledge the lamas of Thibet, and have priests of their own. They live in towns or villages, in houses built of brick, cemented with clay, and covered with tiles; they live on buffaloes, sheep, goats, fowls, and ducks, and are immoderately attached to the use of spirituous liquors.

Oorians are the aboriginal natives of Orissa, which derives its name from them. They are a timid people, and the men are so feminine in appearance that it is difficult to distinguish them from the women, both sexes dressing alike. They are exceedingly dissolute and obscene, and more versed in low cunning, dissimulation, and subterfuge, than perhaps any other people of the East. They are, however, honest and industrious.

Parsees, a numerous colony of fire worshippers, who left Persia to avoid the persecution of the Moslem conquerors, and have settled in Gujrat and Bombay. Their total number is about 50,000, of whom 20,000 are found in Bombay; the remainder are to be found chiefly at Surat, Baroach and its neighbourhood, the Northern Concan, and Ahmedabad. The opulent among them are merchants, brokers, ship-owners, and extensive land-owners; the lower orders are shop-keepers and artizans, and are in great request by European families as domestic servants, for they are much less intolerant in their principles than either Moslems or Hindoos, will perform a greater variety of work, and are more agreeable as domestics. The Parsees are divided into two classes, clergy and laity (*mobed* and *behdeen*.) The clergy and their descendants are very numerous, and are distinguished from the laity by wearing white turbans; but, excepting those particularly selected for religious service, they follow, like the laity, all kinds of occupations. They have a few plain churches, where they assemble for prayer; these are crowded daily by the clergy, but the laity attend only on certain days. They neither bury nor burn their dead, but place the bodies in open buildings, where they leave them to be consumed by the elements or the birds. The greater part of the wealth of Bombay is in the hands of Parsee merchants, who are a hospitable people, liberal but not extravagant in their expenditure. Their houses are often furnished in the European style, and they have adopted from their rulers many customs and habits still unthought of by the Moslems and Hindoos. Their women, though not jealously excluded from all society, are rather closely kept. Their charities are munificent; they relieve the poor and distressed of all classes, and maintain their own poor in so liberal a manner, that a Parsee beggar is nowhere to be seen or heard of. Their sacred books are written in the Zend and Pehlari languages, the genuineness of which is unanimously opposed by English authorities, who consider them inventions of the Parsee priests; while, on the contrary, the continental European scholars are equally unanimous in vindicating their authenticity.

Patans are people of Affghan descent, who inhabit different parts of Hindústan, and are the prin-

cipal people of Bhopal. Their name is believed to be a derivation or corruption of *Pushtoo*, the native name of the people whom the Persians call Affghans.

Pucharries are the inhabitants of the Rajmahal hills, and the hill country between Boglipoor and Burdwan, in the north-west of Bengal. They are quite distinct from the Hindoos in features, language, civilization, and religion; they have no castes, care nothing for the Hindoo gods, and are even said to have no idols. They are middle-sized, rather little men, but very well made, with remarkably broad chests, long arms, and well-formed legs, broad faces, small eyes, and turned-up noses; in other words, they are a short, thick-set, sturdy race, with the African nose and lip. They are an idle and dirty people, not fond of hard work, but orderly and loyal, and they hate and despise lying so much, that in the courts of law the evidence of a Pucharrie is always trusted more than that of half-a-dozen Hindoos.

Rajpoots (sons of kings), the noblest of the Hindoo races, are the dominant people of North-western India, which from them is named Rajpootana, Rajwarra, or Rajahstan. They are a tall, vigorous, and athletic race, with rude habits, and are devoted to war and robbery. They form the best soldiers of the Bengal army, though not quite so orderly and obedient to discipline as their comrades of the Brahminical and other castes. Their chiefs boast of a long line of ancestry, and are considered as of more illustrious birth and of higher rank than any other Hindoo princes. A sort of feudal system is established among them; the subordinate chiefs holding their lands on condition of military service. The Rajpoots pretend to be the lineal descendants of the lost Kshatraya, or royal and military caste; but the Brahmins deny it, and allege that they are sprung from the Vaisya caste on the paternal side, and from one of the mixed castes on the maternal. Yet the Rajpoots are, even more than the Brahmins, the representatives of Hinduism. In them are seen all the qualities of the Hindoo race unmixed, and displayed in the strongest light. They exhibit the genuine form of a Hindoo community, consisting of the most discordant materials, and combining the most extraordinary contrasts; unconquerable adherence to native opinions and usages, with servile submission to any foreign yoke; an unbelieving priesthood, ready to suffer martyrdom for the most petty observance of their professed faith; a superstition which inspires the resolution to inflict or to suffer the most atrocious barbarities, without cultivating any benevolent sentiment, or enforcing any social duty.—(*Sir J. Mackintosh; Memoirs*, I.) The poorest Rajpoot of the present day, says Colonel Tod, retains all the pride of ancestry, often his sole inheritance; he scorns to hold the plough, or to use his lance except on horseback. The Rajpoots are divided into thirty-six royal races all descended from the sun and moon, or the Surya and Induvansa races; and to each family or tribe is attached a bard, who is acquainted with all their peculiar privileges and customs, religious tenets, and ancient history. The great families use armorial bearings; and, in memory of their reputed ancestors, many of them wear round their necks badges of gilt metal, with the images of the sun and moon on horseback. They are extremely attached to their chiefs, to whom they yield a sort of feudal obedience. They hold their lands at low rents, on condition of military service, each village or township furnishing its contingent of horsemen on the shortest notice. Family feuds are frequent, and last for centuries. Hence murders, burnings, poisonings, mingle in their domestic annals with traits of generosity and romantic valour; and the modern Rajpoots differ little in their manners and prejudices from their ancestors.—(*Annals of Rajahsthan*, I. 3.) The Rajpoot states were first brought within the pale of the British ascendancy in 1817; but their turbulent disposition, and their impatience under the yoke of what they consider ignominious treaties, have kept them in a state of continual anarchy and revolt. Their extravagant dissensions, and endless disaffection, have at last made the British Government subject them to an active political superintendence; but no measures have yet been taken to institute among them regular forms of government; and, although they have been taught to acknowledge the British supremacy, and to feel their own weakness, they have hitherto been permitted to indulge in all the excesses of internal discord, and futile animosity. Yet, amidst all their social disorganization, lie concealed the elements of national worth and greatness, with qualities which may be wrought into the elements of future prosperity. The opening of the Indus, and the consequent extension of trade, accompanied by the gradual progress of knowledge, will be of importance in purifying the noxious atmosphere of Rajpoot feelings and politics.

Ramoossies, a predatory tribe in the neighbourhood of Poonah and Sattarah, have great faith in destiny, and live in little or no fear of law or punishment. They are worshippers of the *lingam*. Oomiah, one of their principal, most adventurous, and most successful chiefs, was tried at Poonah, and hanged in 1832.

Rohillas, a numerous people of Affghan descent, who possess the country east of Delhi, but are now wholly subject to the British Government. They are also called *Patans*, and are professors of Islam. They are a tall, handsome race, and, compared with the southern Hindoos, are of fair complexion; they are a clever and animated people, but devoid of principle, false, and ferocious. Crimes, both of fraud and violence, are very numerous, and perjury is almost universal. Rohilcund is infested with a crowd of lazy profligate *suwarrs*, or gentlemen, who, though not possessed of a rupee, conceive it to be derogatory to their gentility and to their Patan blood, to apply themselves to honest industry. They prefer living on the tradesmen and farmers, or existing as hangers-on to the few noble and wealthy families that yet remain in the province. The Rohillas were originally a band of Patans or Affghans, who came into Hindóstan about the year 1720, in quest of military service, and soon after made themselves masters of the district which bears their name, and where they rose to considerable power and influence. But their combined forces were completely defeated by the British at the battle of Cutterah or Kuttrah in 1774, an event which terminated the Rohilla sway; and nearly the whole of Rohilcund was ceded by the Nabob of Oude to the British government in 1801.

Sikhs or *Sikhs*, a religious community which, after the downfal of the Mogul empire, rose to great political power, and now possess the whole of the Punjab, and some adjacent territories.—(See *antè*, p. 126.) Their fatherland is the Doab or peninsula between the Ravee and the Suttlej; but few are to be found 30 miles below Lahore. There are none westward of the Jhylum; and even to the eastward of Lahore, where they are most numerous, they do not form one-third of the population. They are a robust and athletic race, with sinewy limbs, and tall stature. The genuine Kalsa or Singh knows no occupation but agriculture and war. They are, however, very tolerant; they have no prejudices of caste, nor are they averse to fermented liquors; but hold tobacco in abhorrence.

Shekhawutties, a tribe of predatory Rajpoots, living in the desert north of Jyepoor, have been recently reduced to order by the British Government, after a great deal of trouble and harassing petty warfare.

Soodahs, a rude people of noble, or perhaps Rajpoot lineage, who live in wandhs or grass huts in the Thur or great desert, in a state of peculiar privation and misery. They are by profession shepherds, but frequently commit forays on their neighbours. They find, however, their principal source of wealth in the beauty of their daughters, for one of whom a rich Mahometan will sometimes pay 10,000 rupees (£1000); and they also furnish wives to the Jarejahs of Cutch.

Tudas, *Tudavers*, *Thudavers*, or *Todevies*, a small tribe who occupy the highest valleys of the Nilgherries. They are tall, athletic, with a bold bearing, and long black hair, Roman noses, and large full eyes; they live in patriarchal simplicity, raising no grain, nor rearing any domestic animal but the cat. Their wealth consists in herds of buffaloes; their principal occupation is to tend and milk their herds, and prepare the milk for use or exchange; and the little commerce they carry on is in

butter, which they exchange for grain. They dwell in families, in small clusters of huts, migrating from place to place, according to the convenience of pasturage. They are strangers to war, and have no weapons of attack or defence, yet their demeanour is hardy and fearless; they are strictly honest, and, without fastening their doors day or night, live in perfect safety. They are ignorant of the mythology, language, learning, and manners of the Hindoos; their temples are dark hovels, in which a little shining stone is the only object of worship. They are certainly an idle race, but are not apathetic. They have no civil or political government, but yet are quite orderly. They are highly respected by the other people of the hills, who, though richer, more numerous, and more civilized, look upon the Tudas as a superior class, appeal to them in their disputes, and pay them tribute; their whole number is said to be less than a thousand.

Thugs or *Phansygars*, a singular class of professional murderers, do not form a distinct tribe or sect, but rather a confederacy, consisting of both Moslems and Hindoos. They have been found chiefly in Central India, on both sides of the Nerbuddah; but used to spread themselves over the country in all directions for the purpose of plundering travellers and others who came within their reach; always murdering them by strangling them with a noose, and carefully avoiding bloodshed. They were devout worshippers of the goddess Bhovani (Kali), and were directed in all their proceedings by omens, which they believed to be sent by her for their guidance. They generally travelled in parties, and consisted of people of all sects, the Moslems amongst them assuming Fatima, the daughter of their prophet, to be the same person as the Hindoo Kali. A few years ago the Thugs attracted the particular attention of the British Government, who are now employed in putting them down, and in endeavouring to extirpate so mischievous a brotherhood. Many most appalling atrocities have been brought to light; many hundreds of the gang have been hanged, transported, or imprisoned; yet the survivors, such is the force of superstition, ascribe their misfortunes, not to their crimes against humanity, but to some neglect of their duties towards their patron Kali, who, they think, has in consequence abandoned them.

Waghers, a predatory tribe of Rajpoot descent in Kattiwar, near Okamundel.

Waralis, a wild tribe who inhabit the jungles and forests of the Northern Concan, and speak the Mahratta language; their principal object of worship is Waghia (the lord of tigers), a shapeless stone, smeared with red lead and ghi, but they have no priests.

The *Europeans* in India consist chiefly of natives of the British islands, French, Danes, and Portuguese, with their descendants. The British are completely the ruling class, perform all the functions of supreme government over the greater part of the country, and fill all places of power and profit, in the presidencies into which the British territory is divided. They are exclusively the officers of the British Indian army, and the greater number of them, either in a civil or a military capacity, are the servants of the East India Company, or in their employment. The independent settlers are very few; and the total number of Europeans, including the Queen's regiments, throughout India, is believed not to exceed 40,000, of which number so few as one-eighth are not in the employment of Government. Since the renewal, however, of the Company's charter in 1833, the right of independent settlement is so much less fettered than it was previously, that it is probable the number of European immigrants will rapidly increase.

The *East-Indians*, called also *Anglo-Indians*, *Indo-Britons*, *Eurasians*, or *Half-castes*, are the offspring of European fathers by native mothers. No proper census has ever been taken of their number, but it appears to be very considerable, and to be always increasing. They are found chiefly in the capitals of the three presidencies, and in the neighbourhood of the principal civil and military stations. They are in general tolerably well educated; and the whole of the class speak English as well as the vernacular tongue of their native province. They almost monopolize the situations of clerks and accountants in the Government offices, as well as in those of public servants and private merchants. The ladies of the class, though feelingly conscious of the distinction between them and genuine Europeans, yet look upon the young men of their own colour as beneath them. In the seminaries and asylums of Calcutta, there are generally upwards of 500 half-caste girls, illegitimate daughters by native mothers of the higher ranks, who receive a genteel education.

The *French* and the *Danes* are found of course at the small settlements belonging to their respective governments; but their number is relatively small. The descendants of the *Portuguese*, once masters of the coasts of India, are believed to amount to 600,000, who are all Roman Catholics. Most of them occupy only the lower places in the community, and have sadly degenerated from their renowned forefathers; they have now no tie which unites them with Portugal, of which, indeed, they are altogether ignorant. Their condition and state of civilization are nearly the same with those of the aboriginal natives among whom they live, and are frequently much lower. They are, indeed, very ignorant, and are sunk into a state of idolatry and superstition not far removed from heathenism; but their being nominally Christians, and their steadiness in adhering to their faith, preserve them as a distinct class. "In most parts of India no reproach is more cutting than to be called a Portuguese; for the name is supposed to combine all that is most depraved in wickedness with all that is most despicable in weakness."—(*Major Bevan*, II. 88.)

The *Chinese* are fast establishing themselves in Calcutta, where their superior skill as artizans procures them ready and profitable employment. And besides those which we have enumerated, there are various other petty tribes, races, and distinctions of

class, in all parts of India, some of which are partially civilized, while others remain in the lowest stage of savage life. As no complete census has ever been taken, the total amount of the population of India is not known with any degree of certainty. Mr. Martin estimates it at 200,000,000, which is only 90 inhabitants to the square mile; and of that number much more than one-half are British subjects.

LANGUAGES. — The learned language of the Brahminical Hindoos is the *Sanscrit (sancta scriptura)*, in which most of their sacred books are written, and which, though no longer spoken, appears to be the parent of, or at least to be intimately connected with, many of the living tongues and dialects of India. It has also been found to have a remarkable affinity with the Greek, the Latin, and the Teutonic languages of Europe, which are now believed to have all sprung from one original tongue spoken in some central part of Western Asia, from which they diverged at a very remote period. The Sanscrit is written with 52 letters, for several of which there are no corresponding characters in the alphabets of Europe. It has also thousands of syllabic abbreviations. Harmonious and grave, with a just proportion of consonants and vowels, rich in terms, free and flowing in its pronunciation, possessing numerous conjugations, tenses, cases, and particles, this language may be compared to those which are considered the most perfect and most refined of the original tongues. The *Pracrit* is softened Sanscrit, and is spoken by the women in their classic dramas. In modern India there are at least thirty nations, who speak as many distinct languages. The principal of these are: the *Bengalee*, spoken in Bengal Proper by about 30,000,000 people; *Hindûstanee*, spoken in Hindûstan or the upper provinces, in a variety of dialects, by about 20,000,000; the *Maharatta* or *Mahrati*, in the western parts of the Deccan; the *Gurjara*, in Gujrat and the adjoining districts, including the old provinces of Khandeish and Malwah; the *Tamul*, in the country south of Madras; the *Telinga* or *Kalinga* or *Teloogoo* or *Tenugu*, spoken to the north of that city for about 500 miles along the coast, and 200 inland, by about 8,000,000 of people; pervading a semicircle of which Rajamundry may be considered the centre, while the radius extends to Madras. It has a peculiar alphabet. The *Carnataca*, spoken in the Balaghaut or Upper Carnatic, and also in some districts on the west coast; the *Cashmerian; Dogura; Ooch; Sinde; Cutch; Concanese; Punjabee; Bicanere; Marwaree; Nepalese*, &c. In short, it has happened in India, as in every other country where there is no popular literature, nor free and regular communication among its people, that every small community has a dialect of its own, which is intelligible only to its own members or their immediate neighbours; though these dialects may be, as they often are, merely modifications of the one original tongue spoken by the people from which the various communities and tribes of a province or a country may have sprung. For a long time the modern Persian was used by the British Indian Government as the language of their state papers and courts of justice; but that practice is now abolished, and Hindûstanee substituted for general purposes; for all ordinary local purposes, however, the vernacular language of the country is now the language of the courts of law and government. English, however, is everywhere making rapid progress. The spirit of change, or probably the desire of improvement, has seized upon the people; men of all classes have become desirous to learn English, as the only road to the treasures of knowledge which that language contains, and are ambitious to give their children an English education; so that the day is perhaps not far distant when we shall see our own speech spread over all India as the common language of literature, science, government, and religion.

EDUCATION. — Every village can boast of its schoolmaster, who forms as regular a constituent member of the community as the priest or the barber; and the school is open to all boys of pure caste. The ordinary routine of education generally commences in the fifth year, at which time the child is either taught by his father to write the alphabet, or is sent for that purpose to the village school. From the simple characters the pupil proceeds to the compound letters, to words, and to the figures of arithmetic. But the blessings of superior education are very partially diffused even among the Brahmins, most of whom are ignorant of their sacred professional language, the Sanscrit. Among the warlike tribes of the north, music forms a part of education, and one of their principal amusements, though it is indecorous to be considered a performer. Some of the higher classes have proceeded so far in their literary education as to possess an easy epistolary style; though most of the Rajpoots can only read, and sign their names; considerable intellectual energy, nevertheless, is sometimes exhibited among them. Though the gains of the schoolmasters are very small, yet they are generally respectable men. The sacred books

Krishna wrought on earth during his reign of a hundred years. Be this as it may, Krishna is now most extensively and enthusiastically worshipped by the Hindoos of Bengal, and the north-western provinces, where he is the great delight of the females. The Vaisnavas claim for their deity the title of Iswara or the Supreme Lord; but his claim to this honour is contested by the Saivas, who bestow on Siva the title of Buhbandiswara or Lord of the Universe; and frequent, and sometimes sanguinary conflicts take place between the rival sects in support of the pre-eminence of their respective gods. Siva is principally worshipped under the form of the *lingam*, which is nothing more than a smooth black stone, nearly in the form of a sugar-loaf, with a projection at the base resembling the mouth of a spoon. It is indeed an obscene representation, in one image, of the active and passive generative powers. The number of the worshippers of this symbol is beyond comparison greater than that of the other deities or their emblems. The bull *Nandi*, on which Siva rides, is also held in great reverence, and has many living representatives, called brahminy bulls, which infest the cities, and are fed by the people. Siva has besides many other names, the principal of which is that of *Maha-deo*, the Great God. *Kali* (Kawlee), the wife of Siva, known also by the names of Bhavani, Doorga, Ooma, Syilla, &c., is likewise held in very great veneration; but she is represented as ferocious and blood-thirsty, the terror alike of gods and men. She is, however, at the same time, the patron deity of poetry, of arms, and of arts; and is, in short, mythologically considered as merely the energy of Siva in his destructive character of *Kal* or Time. Kali is the name-mother of the city of Calcutta (*Kalighaut*), which has been built beside a *ghaut*, or flight of steps, leading from her temple to the sacred Ganges. But whatever be the object of worship, the Hindoos are all equally idolaters; their rites, ceremonies, and superstitions, are of the most grotesque irrational, and revolting kind; and the effects of the whole system upon their moral character, are thus summed up by Bishop Heber, from the results of his personal observation: — "Of all idolatries which I have ever read or heard of, the religion of the Hindoos really appears to me the worst," in respect of "the degrading notions which it gives of the deity, the endless round of its burdensome ceremonies, which occupy the time, and distract the thoughts, without either instructing or interesting its votaries; in the filthy acts of uncleanness and cruelty, not only permitted, but enjoined, and inseparably interwoven with those ceremonies; and in the total absence of any system of morals, or any single lesson which the people ever hear, to live virtuously, and to do good to each other. In general, all the sins which a Sudra is taught to fear, are, killing a cow, offending a Brahmin, or neglecting one of the many frivolous rites by which their deities are supposed to be conciliated. Accordingly, though the general sobriety of the Hindoos affords a very great facility to the maintenance of public order and decorum, I really never have met with a race of men whose standard of morality is so low, who feel so little shame in being detected in a falsehood, or so little interest in the sufferings of a neighbour not of their own caste or family; whose ordinary and familiar conversation is so licentious; or, in the wilder and more lawless districts, who shed blood with so little repugnance." With the Hindoos, every thing is mixed up with their religion; their sciences, their arts, are all revealed from Heaven. Their religion mixes itself with their legislation, determines their habits, fixes their customs, establishes their institutions, forms their national character; it guides their science, and controls every branch of intellectual pursuit. Undo, therefore, their religion, and you undo the whole system of Hinduism; overthrow their science, and their religion perishes along with it. In an essay read at the last examination of the General Assembly's school (22d January 1841), at Calcutta, by Mahendra, a Hindoo convert to Christianity, a rapid view is taken of the leading branches of Hindoo literature, science, philosophy, and theology, and it is shown in succession how sound knowledge must inevitably demolish the whole. Considering that there were hundreds of intelligent Hindoos present, and that they could patiently listen to such a demonstration from one of their own countrymen, we may well conclude, says Dr. Duff, that the spell and enchantment of Hinduism are fairly broken in the metropolis of British India.

The doctrines and precepts of the present religion of the Hindoos, are contained in Scriptures called the *Puranas*, of which there are eighteen, all alleged by their followers to be the works of Vyasa, the compiler of the Vedas; but they were in reality, according to Professor Wilson of Cambridge, composed by different authors, between the eighth and the sixteenth centuries of our era, though many parts of them are formed of materials of much more ancient date. The Puranas contain theogonies,

cosmogonies, philosophical speculations, instructions for religious ceremonies, genealogies, fragments of history, and innumerable legends relating to the actions of gods, heroes, and sages. Most of them are written for the purpose of supporting the doctrines of particular sects, and all are corrupted by sectarian fables; so that they do not form a consistent whole, and were never intended to be combined into one general system of belief. They are all, notwithstanding, received as incontrovertible authority; and as they are the sources from which the present Hindoo religion is drawn, it must necessarily be full of contradictions and anomalies. Colonel Kennedy, however, strenuously controverts this opinion of the learned professor, and maintains their genuine antiquity and unsectarian character. (*As. Journal*, 1840-41.) The doctrines of the more ancient religion are contained in the *Vedas*, which are incontestibly of great antiquity. Their primary doctrine is the Unity of God. "There is in truth," say repeated texts, "but one Deity, the Supreme Spirit, the Lord of the Universe, whose work is the Universe." Among the creatures formed by the Supreme Being are some superior to man, who should be adored, and from whom protection and favours may be obtained through prayer. The most frequently mentioned of these are the gods of the elements, the stars, and the planets; but other personified powers and virtues likewise appear. The three principal manifestations of the Divinity, Brahma, Vishnu, and Siva, with other personified attributes and energies, and most of the other gods of Hindoo mythology, are indeed mentioned, or at least indicated in the Vedas; but the worship of deified heroes forms no part of the system. Brahma, Vishnu, and Siva, are rarely named; they enjoy no pre-eminence, and are never mentioned as objects of special veneration; and Mr. Colbrooke could discover no passage in which their incarnations were suggested. There seem to have been no images and no visible types of the objects of worship. (*Elphinstone's History of India*, I.)

Buddhism (see p. 125) appears to have been at one time extensively prevalent in India; and Buddha is even claimed by the Brahmins as one of the avatars of Vishnu; but as Buddhism strikes at the root of the supremacy and pretensions of the Brahmins, it seems to have excited their violent animosity, and to have yielded at last to their unrelenting persecution. Buddhism is pre-eminently the religion of reason, while Brahminism depends entirely on tradition and authority. The Mughs of Arracan and the people of Bootan are the only Buddhists now on the continent of India; but Buddhism is still the national religion of Ceylon. The late Mr. Prinsep ascertained, in the course of his learned researches, that, at the period of Alexander's conquest (B. C. 332-320), India was under the government of Buddhist sovereigns, and that the earliest monarchs of the country are not associated with a Brahminical creed or dynasty; and Colonel Sykes (in a paper read before the Royal Asiatic Society, 30th June 1840), states, that he had arrived at the conclusion that Brahminism, such as it has been known in Europe, is of comparatively modern date; that it was introduced into India by a tribe foreign to the country, at least to India south of the Punjab; and that it did not reach the plenitude of its power till after the decline of Buddhism; that the Buddhism of Sakyamuni prevailed universally over India and Ceylon from the sixth till the seventh century, and was not entirely overthrown in India till the twelfth or fourteenth century; that the religion of the preceding Buddhas prevailed from a very remote period; that the followers of the mystic cross, "the doctors of reason," whose characteristic emblem was the Swastika, were Buddhists; that India was at that time divided into small monarchies, though occasionally consolidated under one prince; that there is no evidence of the dominion of princes of the Brahminical faith during the prevalence of Buddhism; that Brahminism, as it is taught by the Puranas, did not spring up till the decline of Buddhism; that the tribe of Brahmins were originally a secular, and not a religious community, and did not acquire political influence until about the period of the rise of the Rajpoot states, and the invasion of the Mahometans; and, that the division of castes was secular, and that similar divisions existed among the Buddhists. He then alludes likewise to the fact, that the oldest inscriptions found in India all relate to Buddhism or the fire worship, and are in a form of the Pali, and not in the Sanscrit language.

The *Jains* are a numerous sect in Central and Western India, and are also found in Mysore. They profess to believe in one God, possessing the attributes of wisdom, power, eternity, and intuition; but affirm that the government of the world is independent of him, that matter is eternal, and that the harmony of the visible world is dependent only on natural and organic laws, which must be everlasting. They pay little respect to the Hindoo gods, and hate the Brahmins; but have, nevertheless

many customs in common with them. They burn their dead, pay great reverence to their gurus or spiritual teachers, and believe that a life of solitary privation will entitle a devotee to be absorbed into the Supreme Being. They are divided into two classes, the Shrawuks and the Lunkas; the former of whom are worshippers of the images of twenty-four deified saints called Trithacaro; while the latter abhor idols, and are more strict than the Shrawuks in observing the laws against the destruction of animal life. The Jains have numerous temples in Kattiwar, Gujrat, and Rajpootana; the most splendid of which are on the sacred mounts, Aboo, Girnar, and Satrunga. One of their principal places of worship is also at Sravana-belgula, 36 miles N. by W. of Seringapatam. The Jaina religion is closely allied to Buddhism, and every circumstance connected with it demonstrates its early and extensive prevalence in Western and Central India. The chief merchants and men of property in those regions are still generally Jains. It appears also that a hard struggle had at an early period taken place between Brahminism and Jainism, in which the latter was finally crushed though not extirpated.

In Malabar and the Carnatic there are about 220,000 *Syrian Christians*, who are divided into three sects or denominations:—1. Those of the pure Syrian church, in Quilon and its neighbourhood; 2. The Syro-Roman Churches, who have adopted the Roman ritual, but still perform their worship in the Syrian language; and, 3. Those who have fully conformed to the church of Rome, and use the Latin liturgy. The Syrian churches remain quite distinct from the Latin; they are superintended by bishops, and a regular establishment of clergy, but they are very poor.

The Portuguese are all Roman Catholics, and the missionaries of that faith have succeeded in spreading it into several inland districts, among a few native converts. The Catholic hierarchy, who now enjoy the protection of the British Government, are four apostolic vicars stationed at Pondicherry, Verapoly, Bombay, and Agra; with a prefect of the Roman mission in Nepaul. There are also two archbishops and two bishops appointed by the Crown of Portugal, namely, the archbishop of Goa, who is metropolitan and primate of the East, and the archbishop of Cranganore. The bishops are those of Cochin and of St. Thomas at Madras. The latter sends a legate to Calcutta, who has under his superintendence fourteen priests and ten churches. Although, however, the forms and ceremonies of the Romish church approximate very closely to those of the Hindoo worship, and though the most profound religious ignorance is alike compatible with both, there have been few converts to Romanism.

The Europeans are, of course, all professors of Christianity, and most of the British are Protestants of the English or Scottish Church. Since 1813 there has been a Lord Bishop of Calcutta appointed by the Crown; and since the last arrangement with the East India Company in 1833, two other bishops have been appointed, one at Madras, and the other at Bombay. Under their charge are three archdeacons, one at each presidency, with a numerous body of chaplains at the civil and military stations throughout the country, all of whom are paid by Government. There are also two chaplains of the Church of Scotland at each of the presidencies, likewise appointed by Government, and paid out of the public revenues.

During the last forty years strenuous efforts have been made to convert the Hindoos to Christianity, but the labours of the missionaries for a long time gave little promise of success. The Baptist missionaries, who had established themselves at Serampore, zealously set to work to translate the Bible into all the languages of India, in the hope that by this silent method the gospel might find its way into every corner of the land. Their labours, however, have not hitherto accomplished much; nor have the missionaries of the Roman Catholic Church been more successful. Indeed the failure of the latter has been so signal, as to draw from one of their number, the Abbe Dubois, an expression of the utter hopelessness of success, and his belief that "these unhappy people (the Hindoos) are lying under an everlasting anathema." "The Hindoos," says Professor Wilson, "are an intelligent and inquisitive people, and not averse to controversy; but they will not contend in matters of speculation against authority. Their defence is reserve; and their obstinate adherence to their own opinions is proportioned to what they think an unfair method of refuting them.' Taught by experience, we may now venture to assert that those Christian sects only who are ready to give a reason for their faith, as well as for the authority which they claim for the Scriptures; and who combine the culture of the intellectual and moral faculties of the people with the preaching of the gospel, can hope for ultimate and complete success.

Besides the religious denominations already enumerated, there are professors of Islam or Mahometans, to the amount of about 15,000,000, who are spread over the

northern and central provinces; Armenian Christians in the great towns; and some Jews. The hill tribes, as the Bheels, Ramoossies, and Koolies, hold communion in religious matters with the Brahmins, only so far as concerns the civil institutions of marriage, naming of children, and such like. Several of the gods worshipped by the common people are unknown to the Hindoo mythology; and others are but incidentally connected with it. The Brahminical religion is exceedingly accommodating to other idolatrous systems; and, consequently, wherever the Brahmins find among other nations a god whom they deem worthy of reverence, they make him an avatar, or incarnation of one of their own deities who most resembles him in attributes. We must not, therefore, take it for granted, that every article of belief which, in more modern times, has attached itself to Hinduism, belongs to the ancient Brahminical creed. One of the most decided anti-brahminical forms of religion is that termed the worship of *Vetal*, in the more secluded parts of the Deccan, Concan, Canara, Gujrat, and Cutch; and which Dr. Wilson of Bombay considers to be not only repugnant to Brahminism, but of an earlier date in those parts of India. *Vetal*, however, is not the proper name of any individual god, but is merely a general term for a spirit or demon. Vetal, in the Deccan, has no image in the shape of any animal; he has no temple, but is worshipped in the open air, generally under the shade of a wide-spreading tree; the place is usually inclosed with a circle of stones; and the principal figure is a rough unhewn stone, of a pyramidal or triangular shape, placed on its base, and having one of its sides fronting the east. (*Jour. R. As. Soc.* V. 192, &c.)—There is also in the Deccan, a religious sect called Bauddha Vaishnavas or Vithal Bhaktas; they are found chiefly in the Mahratta country, but are also scattered over Gujrat, Central India, and the Carnatic, wherever Mahrattas have settled. Although the basis of their system is Brahminical, they may be considered as a kind of religious eclectics and reformers, borrowing doctrines from all sources, and appealing for support to reason rather than tradition. In their notions of deity, matter, and spirit, they appear to follow the Vedanta philosophy. In theory they admit of no distinction of castes, but in practice conform to the ordinary customs of the country.

The festivals celebrated by the Hindoos in honour of their gods are very numerous. Two of these, the one Mahometan and the other Hindoo, which are considered the principal solemnities, are common to the various sects, and take place annually. The European officers are expected by the natives to honour them with their presence; and all contribute towards the expense. The Mahometan festival is called the *Mohurrum;* which is strictly a fast of the most mournful kind; but is attended with such pomp, magnificence, and show, that it rather resembles a rejoicing. This is a dramatic representation of the deaths of Hossein and Hussein (see p. 124), and the marriage of the daughter of Hossein with her cousin. The latter event took place on the day of the battle of Kerbela; and on the seventh night of the Mohurrum the marriage is represented with great magnificence. The whole ceremony lasts ten days, and on that particularly devoted to the commemoration of the deaths of Hossein and Hussein, the Moslems wear mourning, clothing themselves in green garments. The Hindoo feast, which is called the *Dûrga-pûja*, or *Dûsserah*, or *Dûsrah*, also lasts ten days, and takes place in September or October. It is celebrated in honour of the great goddess Dûrga or Kali; and all mercantile, judicial, and government business of every description is suspended for eight days. To a person unacquainted with the religion it appears only a scene of confusion. Men present themselves dressed up in the form of animals, and perform numerous antics; dancing-girls and music also form a chief part of the amusements. The entertainments, however, are various: consisting of recitations, sham-fights, and expert swordsmanship, in which the wonderful activity of the men, their quickness of eye, and rapid movement of limbs, astonish Europeans, who are always the welcome and honoured guests of the wealthy natives on this occasion. A brilliant display of fireworks closes the evening's entertainment; after which refreshments of coffee, sweetmeats and fruit are presented to the visitors, before they retire. Sometimes the different castes countenance the festivals of each other, but more generally they are jealous of rivalry in splendour. The Brahmins are the principal performers in the dûsserah festival; they read portions of their sacred books, recite prayers and incantations, and perform a multitude of ceremonies. There is also a great festival, called the *Hooly*, celebrated in honour of Krishna, in the month Phulgoon (February, March), at the beginning of spring; the amusements of which consist in dancing, singing, and ludicrous exhibitions. It is observed by all classes throughout India, and may be termed the Saturnalia of the Hindoos; when all give way to licentious rioting and confusion.

India is infested by religious devotees, who prey on the community, and form a numerous class of sturdy beggars. They consist of both Hindoos and Mahometans; but the former are found in greater variety and excess. The *Sannyasis* are Brahmins who break off all ties, whether of affection or interest, which could bind them to society, make profession of mendicity, and subsist solely upon alms; and their initiation is accompanied by numerous ceremonies. They perform also numerous acts of penance and mortification; but, in general, these are mere amusements when compared with those which the *Iogis* or *Yogies*(another class of devotees) sometimes inflict upon themselves. The name *Iogi* properly signifies the followers of the Yoga or Pajantalah, a school of philosophers, who maintain the possibility of acquiring entire command over elementary matter by means of certain ascetic privations. But few, if any, of the Yogies are entitled to the dignified appellation of philosophers; most of them are only deluded fanatics; some keeping their hands closed till they are pierced through by the growth of the nails; others making vows to remain standing in a certain position for years, with their hands over their heads, till the arms become fixed and powerless. Some crawl like reptiles on the ground, or roll along in a ball like a hedgehog; others swing before a slow fire, or hang suspended for a time with their head downwards over the fiercest flames. In short, there is no limit to the varieties of torture which they practise. Another class are called *Gosaïns*, who all wear the distinguishing mark of Siva, a crescent on the forehead. Many of them, however, who have made a vow of celibacy, still follow secular professions, and distinguish themselves both in trade and in arms. The *Aghori* are a fraternity who infest almost every town in the upper provinces, and abound at all the holy places of the Jains. Their religious principles teach them to act in almost every respect contrary to the rules of caste, which they despise; and, going to the opposite extreme, they eat everything without scruple, even putrifying human carcasses, which those who respect caste will not even approach. The *Fakirs*, *Fakeers*, or *Fukeers*, are a Mahometan fraternity, who profess to devote themselves entirely to religious duties, and to visit the holy places. These classes together are believed to amount to several millions; wherever there is a fair, a festival, or a sacrifice, they collect, attracted by the prospect of gain, which they have the faculty of scenting from afar. They perambulate the streets in a state of almost perfect nudity, generally besmeared with ashes, and bedaubed with paint. Their principal mode of getting a livelihood, is either by compelling the people to contribute to their wants, by making a clamorous demand at their doors, or by selling roots, drugs, and charms. Many of them, it is said, do not scruple to engage in crime. Among the priests of India, there is one particular class, who, in respect of their authority and rank, bear a strong resemblance to the clergy and episcopal hierarchy of the Christian church; these are the *Gûrûs* or *Gooroos*, a sort of spiritual teachers. Each caste and sect has its particular gûrû; but they are not all invested with the same degree of authority; there are among them gradations of rank, and subordination is strictly preserved. The inferior clergy or gûrûs are very numerous, and derive their authority from the superior priests, who depose them at pleasure, and appoint others in their room. The high priests or superior gûrûs are comparatively few. At stated periods these high functionaries make the circuit of their dioceses, inquire into the conduct of the inferior gûrûs, and perform certain important rites at the temples. Such of them as make profession of superior sanctity greatly extend their pilgrimages, for the purpose of performing the *upaseyda* and other solemn ceremonies, at their colleges and in their sacred groves. The gûrûs are mostly either Brahmins or Sudras.

GOVERNMENT.—In the native states, the Government is a pure despotism in its most naked and most oppressive form; the people and the land are alike the property of the rajah, the nabob, the sultan, or the padishah. The greater part of his revenues consists of the land rents, and these, with rare exceptions, he wastes in riot and debauchery. The instances of a good and enlightened prince, using his power and privileges for the welfare of his subjects, are rare indeed; and India everywhere retains the traces of the tyranny, the misrule, the anarchy, the quarrels, and the bloodshed which have been the pastime of her people and their rulers, from the commencement of her national existence. To this state of things the British ascendancy has so far put an end, that none of the native princes can, with the hope of impunity, follow the example of their predecessors, in measures of open violence. But their states are still left to the misrule of men destitute of the necessary qualifications of governors; and it will require a long continuance of peaceful habits, a complete regeneration, indeed, of Indian society, to root out the vices so intimately interwoven with the national character, as well of the rulers as of the ruled.

The education of the native princes not only unfits them for government, but is often conducted on this very principle by those who have the direction of it. From infancy the future rulers are taught to consider themselves the favourites of Heaven, to whose use and convenience all other created beings are subservient. Possessing no feeling beyond an exaggerated idea of their own greatness and power; incapacitated by early excesses, habitual indolence, and gross ignorance, from forming an opinion on any serious subject, they sink into an early grave; and they advance in succession through the same process, each ending his worthless life in the same manner. The affairs of the kingdom or state are left to the management of adventurers, whose sole aim is to secure a large portion of plunder to themselves, before they are succeeded by others, destined to act in the same manner and on the same principle. In the native governments, however, there is hardly any greater source of evil than the female supremacy which has existed in the country—a system of female government uncongenial with Asiatic institutions, but which the British rulers have unfortunately managed everywhere to foster, instead of putting it down. A prince dies; his widow is allowed to adopt an heir; she adopts the youngest she can find, that her own reign may be as long as possible; and when the heir grows up she tries to dispose of him, that she may adopt another infant. In order to acquire the sceptre, these ladies have been suspected of destroying their husbands, and, in order to retain it, of disposing of their adopted children, or even of their sons. Secluded, as all women of rank are in India, they have no opportunity of learning the character or capacity of the men they entrust with the conduct of affairs; but they are generally found to consider such points as of little importance, and to select either their own paramours, or those of some favourite attendant, commonly making them paramours after they are chosen, if not before. Under such a system the people are governed by a set of miscreants whom they detest and despise, and who, knowing that they are detested and despised, set no bounds to their rapacity.

The superintendence, direction, and control of the whole civil and military government of the British territories and revennes in India, is vested in a Governor-General and Councillors, styled, "the Governor-General of India in Council." The Council is composed of four ordinary members, three of whom are chosen from the East India Company's servants; and, when there is a separate Commander-in-Chief, that officer is an extraordinary member, taking rank and precedence next after the Governor-General. The Governor-General in Council are empowered to *legislate* in every matter touching the government of India, and may assemble and meet in any place; but, when their meeting is held within the territory of Bombay or Madras, the Governor of that presidency is for the time an extraordinary member. The *Executive* Government of Bengal was intended to be vested in the Governor-General, and those three of his councillors who are Company's servants; but, by virtue of a new interpretation of the act of Parliament, the Government of Bengal has been transferred from the Governor-General in Council to the Governor-General himself, in his new capacity of Governor of Bengal. The Government of Agra is administered by a Lieutenant-Governor, or by the Governor-General himself, when he resides within its limits. In each of the other presidencies the Executive Government is likewise vested in a Governor and two Councillors; but these have no power to make laws or to grant money, and are subject in all respects to the orders of the Governor-General in Council, who in their turn are subject to the orders of the Court of Directors of the East India Company, acting under the superintendence of the Board of Control for the affairs of India, and ultimately responsible to the British Parliament. Misgovernment is thus guarded against with as much care and effect as the great distance between Britain and India will admit.

The capitals of the three presidencies are subject to the laws of England, and justice is administered within their limits by Supreme Courts, the judges of which are appointed by the Crown But, within the rest of the territory, justice is administered according to Hindoo or Mahometan law, by courts of various degrees of authority, under European and native judges, from whose decisions appeals lie to the *Sudder-Dewanny* and *Nizamutadawlet*, or supreme courts of civil and criminal law, attached to each presidency, and ultimately to the Queen in Council. A new digest or code of laws for these courts has recently been prepared and promulgated by Government.

For administrative purposes the whole of the settled territory is divided into shires or provinces, called *zillahs*, *circars*, or *collectorates*, each of which is placed under the charge of a government officer, and has its peculiar courts; but the newly acquired territories are generally entrusted for a time to commissioners, who are vested

with the whole powers of government, civil, military, and financial, subject of course to the orders of the Government of the presidency to which they belong. Under the former Mogul governments, a certain number of villages formed a *pergunnah;* a certain number of pergunnahs, comprehending a tract of country equal to a moderately-sized English county, formed a *chuckla;* of these a certain number formed a *circar;* and several circars formed a *soubah* or province, to each of which was assigned a *soubahdar* or governor, who exercised the whole functions of government, civil, military, and financial. Through the various changes of rulers which India has undergone, the Hindoos, in all the settled parts of the country, have uniformly been divided into small communities, or townships, where not only the public services, but also the handicrafts, with the exception of mere agricultural labour, have been performed by persons who hold them by hereditary succession, and who are paid by certain portions of land, or by fixed presents. The principal of these is the *potail* or headman, under whom are the officers and servants of police; an officer, whose business it is to be acquainted with all the local rights and boundaries, and to settle all disputes respecting land; the superintendent of watercourses; the brahmin; the astrologer; the schoolmaster; the village register; the smith; the carpenter; the poet; the barber; the musician; and the dancing girl; and in levying revenues or demanding services of any kind, it has always been found the most expedient method to apply to the heads of the village, and delegate to them the task of collecting and apportioning it. In some provinces, however, the collection of the revenues had been entrusted to certain officers, called *zemindars*, &c., who, acquiring by degrees an hereditary tenure of office, and being merely obliged to pay a certain fixed rent, came in time to be viewed as proprietors, burdened only with a land-tax, and as such they were dealt with by Lord Cornwallis in his settlement of the land-revenues of Bengal. Being entrusted at the same time, to a great extent, with the administration of justice and police, they became in a certain degree the feudal lords of the district. Under them were the immediate cultivators of the soil, the *ryots*, who, either by original right, or long established usage, retained their land, so long as the rent was paid, in undisturbed possession from father to son.

FINANCES. — The revenues of all Asiatic states are drawn principally from the land, the whole of which is regarded as the property of the sovereign. To this general rule the British Indian Government forms no exception; for the greater proportion of their territorial revenue consists of the land rents, collected in some provinces through the instrumentality of zemindars, whom, as we have stated, the Government have constituted hereditary proprietors of the land, though they were formerly only collectors; and in others, derived directly from the ryots or cultivators, by the officers of Government, according to permanent or temporary arrangements, as the case may be. The rest of the revenue consists of the profits of the monopoly of salt, opium, and tobacco; and of taxes on imported merchandise, stamps, licences, postages, and various other imposts. The average annual revenue for the ten years 1829–39, amounted to £15,930,000; and the average annual expenditure for the same period, including interest on debt, but exclusive of the charge of collection, amounted to £14,632,000. Of the finances of the native princes no account can be given.

ARMY and NAVY. — Each presidency has its separate army, commander-in-chief, staff, &c.; but the Commander-in-chief of the supreme Government possesses a general authority over all the presidencies. The total armed force in British India is about 194,000 men, which may be said to consist of three branches, namely, Queen's cavalry and infantry; the East India Company's European engineers, artillery, and infantry; and the Company's native artillery, cavalry, and infantry. The last branch has two sets of commissioned officers, the one European and the other native, the latter consisting of soubahdars, jemadars, and havildars, or captains, lieutenants, and ensigns, who, though holding nominally the same rank as the corresponding European officers, are nevertheless all subordinate to the lowest European commissioned officer. The total number of European troops in India, besides commissioned officers, is usually about 30,000, of whom two-thirds are Queen's regiments, the remainder consisting of persons enlisted in Britain directly for the East India Company's service. The native troops are composed of Hindoos and Moslems, &c. who are mixed in every regiment; they are usually called Seapoys, Sepoys, or Sipahees, and in discipline, cleanliness, sobriety, bravery, and fidelity, are not surpassed by any body of men. The native artillery make it a point of honour never to desert their guns, and wherever a British officer has been found to lead, it has rarely or never happened that the seapoys refused to follow. The native cavalry are excellent and

fearless riders, superior in that respect even to Europeans, and good swordsmen; they are exceedingly fond of their horses, and treat them with the greatest kindness. Of the whole army it may be said that no men are more alive to emulation; a medal is as highly prized by a seapoy as by a British soldier; and many instances of their heroism have been related which would do honour to Greek or Roman story. The Bengal army is considered to possess the men of the highest caste, most of them being Brahmins and Rajpoots; the Bombay seapoy is more a man of all work; and the Madrasites are perhaps the hardiest race; but all are extremely tenacious of their rights, and adhere punctiliously to the customs which their religion ordains.—(*Martin's Statistics, &c.* p. 325.) The prejudices, indeed, of the Bengal troops on many points are often difficult to be overcome, partly in consequence of the great number of Brahmins among them, and partly, because they consider themselves collectively as of a higher caste than the Madras seapoys, whose prejudices are comparatively trivial. The appearance of the Bengal sepoy is in general better than that of the Madras soldier; the Bengalee has generally greater height, though he does not usually possess muscle in proportion. The Madras seapoy is of shorter stature, but has more strength and power of enduring fatigue and privation. The troops of Bengal and Bombay lately gave a noble proof of devotion to their duties, by passing the forbidden limits of the Indus, in their way to Affghanistan, not only without a murmur, but with high spirit. In 1837, two orders of distinction were instituted, the first, styled "The Order of British India," is to be given to soubahdars and jemadars, for long and honourable service; and to consist of two classes. The first class is to consist of 100 soubahdars, with an allowance of two rupees a-day each, in addition to their regimental allowances, or retiring pensions; and the second class, of 100 officers, with an allowance of one rupee a-day each, in addition to their pay and pensions. Members of the first class receive the title of Surdar-bahadur (invincible commander); those of the second, Bahadur (invincible.) The other order, styled "The Order of Merit," is to furnish rewards for personal bravery, and to consist of three classes, with an appropriate badge, and additional pay and pensions, without distinction of rank.

Besides the regular British army, several of the native princes are obliged by treaty to maintain subsidiary troops, who in fact form a guard over the conduct of those who pay them; and, in the event of war, they are required to furnish contingents for service in the field. Formerly, the Indian troops were little better than an undisciplined rabble, called out for the special purposes of the war in which their ruler happened to be engaged: or consisted of mercenary soldiers, who sold their services to the highest bidder, and who changed from one employer to another, just as it suited their interest or caprice. Latterly, several of the princes have attempted to form and maintain regular armies, disciplined in the European manner; but, from imperfect training, the want of proper officers, or general mismanagement, these armies, when brought into collision with the British troops, have proved hardly more efficient than their undisciplined predecessors. But the fighting men form the smallest part of an Indian army; the attendants, servants, and camp followers are innumerable. Each of the British seapoys has his personal servants at all times; but, when the army takes the field, the number of attendants is prodigiously increased. When General Harris advanced against Seringapatam, in 1799, his army consisted of 35,000 soldiers and 120,000 attendants; and when the Marquis of Hastings, in 1817, commenced the Mahratta war, his fighting force amounted to 110,000 men, his camp followers, to half a million.

The navy of the British Indian empire was at one time very considerable, but is now much diminished; it consists only of a few vessels of war of the smaller classes, several armed steamers, and some surveying vessels. The navy is attached to the Bombay presidency; and measures are now in progress to convert it into an armed steam flotilla. At Calcutta, there is a marine establishment, which, though not of a warlike character, is nevertheless of the utmost importance. It is the pilot service, which consists of 12 strong, well fitted, and quick-sailing vessels, of 200 tons burden, several of which are always stationed off the mouths of the Ganges and the Hoogly, on the look-out for vessels coming up the bay, into each of which they place a European pilot, and a leadsman to steer the course to Calcutta. There are 120 Europeans employed in this service; the first rank being that of branch pilots, who are 12 in number, and receive each £70 a-month. The yearly cost of the pilot service, including pilots, men, vessels, lighthouses, buoys, and other necessary adjuncts, exceeds £150,000 a-year.

PRODUCTIVE INDUSTRY.—Agriculture throughout India is in the lowest condition; the implements used are of the rudest kind, and the cultivator follows the routine of

his forefathers, without ever dreaming of improvement. For the articles of produce, see *Vegetable Productions and Topography.*

The great fertility of the soil generally insures a sufficient supply of food; but so dependent is vegetation, in this hot climate, upon the supply of moisture, that an unusual continuance of dry weather sometimes occasions dreadful famines. Tanks or artificial ponds, and wells, are spread in countless numbers over every tract of cultivated country; and the former, being often of great extent, and maintained by strong dams, present an interesting proof of the power of human skill and industry in averting an evil so incident to the climate, and supplying to the thirsty soil that moisture of which it is deprived by the long droughts of a tropical region. Without these innumerable wells and reservoirs, which have been created by the labour of successive generations, great part of India would speedily become an uncultivated desert. European skill and capital are now, to a large extent, applied to the production of indigo and opium, principally in Bahar and Malwah; and tea is cultivated in Upper Assam, where it is already grown of good quality, and may be raised almost to any extent which the market may require. The cultivation of the indigo plant occupies above a million of acres, yielding an annual produce of the value of two or three millions sterling. Silk is the next important article: the average quantity of raw silk exported during each of the twelve years ending 1831, amounted to 1,334,883 lbs.; and in 1837, the value of silk exported exceeded £120,000. There are in India three species of mulberry-tree, and two kinds of silk worm; the silk districts, which are in Bengal, are all situated between the parallels of 22° and 26° N. and long. 86° and 90° E. Opium is produced in Malwah and Bahar; and in 1836 was exported, for the purpose of being smuggled into China, to the enormous extent of 26,018 chests, valued at 17,106,903 dollars. The working of mines is scarcely worth mentioning; diamonds are procured near Punnah, in Bundelcund; coal is wrought in the district of Burdwan, in Bengal, and in other places; and iron in the Carnatic, where excellent steel is manufactured at Porto-Novo. For many ages India was famous for the weaving of silk, cotton, and goats-wool, particularly for muslins and calicoes; but since the opening of the trade in 1813, the introduction of British manufactured goods has almost entirely ruined the Hindoo manufacturers, without supplying a substitute for their employment. In woollen textures, iron work, and earthenware, there are few nations more rude or less successful. Notwithstanding the vast demand in Europe for the staple productions of India, and the unlimited capability of the country to furnish them, the native products have hitherto been exported only to a comparatively small extent. The commerce, however, both in exports and imports, has increased immensely since the trade was opened in 1813. According to the last published parliamentary returns, the value of the imports into the presidency of Bengal in the year 1836–7 amounted to 40,429,076 Company's rupees; into Madras, 15,125,857; into Bombay, 47,245,571; total, 102,800,504 rupees, or £11,565,056 sterling. The value of the exports for the same year amounted, in Bengal, to 67,847,147; Madras, 27,854,757; Bombay, 59,905,978; total, 155,607,882 rupees, or £17,954,161 sterling. The maritime trade centres in Calcutta, Bombay, and Madras; but the people of Mandivee, in Cutch, likewise carry on a great trade; and from Curachee, in Sinde, caravans of camels convey large quantities of goods towards Cabul, Candahar, and other places to the north-west of India; bringing back in return the produce of these countries for exportation. Upwards of 1000 Arabian ships also arrive annually in India between the monsoons; by which an extensive commerce is maintained in a quiet imperceptible manner, through the means of obscure native agents, who freight the Arab boats; and thus many thousand tons of British manufactured goods are bought from our merchants, and find their way into the heart of the most remote and most barbarous countries. But besides the commerce with Europe, a considerable trade is carried on with the Persian Gulf and Arabia; and with China and the Asiatic Islands the trade is also great. A large quantity of wool is now exported from Bombay, the produce of the sheep pastured along the Indus and other districts beyond the British frontier. The first exports reported, were in 1833, when the amount was only 69,994 lbs.; in 1837 it had increased to 2,444,091 lbs. The general peace, also, and the increased safety of communication which now exists throughout all India in consequence of the British ascendancy, are fast producing their natural results, in a rapidly increasing internal commerce. Inland customs are also now abolished, and traders may carry their goods from one extremity of the country to the other, without being pillaged at every step, as formerly, by custom-house officers. For the encouragement of this trade, two banks have been established in Calcutta; one at Agra, which divided, in 1839, nine

per cent. of profits; and one at Bombay. The available capital of these banks is less than £2,000,000 sterling; they have little or no intercourse with England; and their business is chiefly confined to the limited population of the presidencies. The great mass of the people are dependent on the shroffs or money-lenders for pecuniary assistance, at the rate of two per cent. a-month, or on the Government for small advances to carry on their agricultural operations from seed time till harvest. The monetary circulation consists of the rupee, a silver coin of no more than two shillings value, with copper and shells. To remedy these inconveniencies, a great establishment, called the Bank of Asia, with branches in India, has lately been established in London.

Internal Communications.—The roads throughout India are generally mere tracks, scarcely suited for the transport of wheel-carriages; and the modes of travelling are of a nature which an European, accustomed to travelling in Britain, would hardly feel very comfortable. Such conveniencies as stage-coaches, public waggons, and boats, do not exist. There are not even any conveyances which can be hired from stage to stage, except in a very few parts of the country, where a traveller may for a short distance be supplied at certain intervals with ponies which go at the rate of three miles an hour, while he is obliged to hire porters to carry his baggage. The only attempt at travelling post is by going in a palkee (palankin), which is carried by bearers; and this is a mode of conveyance available only to the rich. A palkee holds but one person, and the charge is never less than one, sometimes two shillings a mile, a rate as high as posting in England. The traveller is obliged to give from two to five day's notice to the postmaster, according to the distance; and the average rate of travelling is about four miles an hour. In ordinary cases the traveller carries everything with him; if he is a rich man, accompanied by his family, his retinue resembles that of the patriarchs of old, including his flocks and herds, his camels, and his beasts of burden, his men-servants, and his maid-servants; he travels on his own horses, or on an elephant, while his tents, beds, cooking vessels, &c. are conveyed on camels or in carts. Some of his attendants accompany him on horseback, or on ponies; and the rest follow on foot at the rate of ten or twelve miles a-day. If he travel by water, he hires a comfortable boat for himself and his family, with as many more as he requires for his kitchen and baggage, and embarks with all his retinue. Individuals of less wealth convey their property in carts, and are content to sleep and eat under the shelter of trees, or of one of those magnificent groves of mango which are found at intervals of a few miles in many parts of the country. According to the rank or wealth of the individual his mode of travelling and the number of his attendants varies; some have only a pony to carry their baggage, while they walk on foot; and the poorest not only walk, but carry their own stores, consisting of a blanket or quilt for a bed, a pot of brass or copper tinned in which to boil their pulse or make a curry, a smaller vessel for drinking, and a round plate of sheet iron, on which, supported on two stones or lumps of earth, and with a few sticks or a little cow-dung for fuel, they bake their cakes of unleavened bread, which consist merely of flour and water, kneaded for a few minutes. Merchants, who have goods to dispatch, hire boats, or carts, camels, pack-horses, or bullocks to convey their wares to their destination; and the same conveyances and the same drivers proceed throughout the whole distance, though it may be 500 or 1000 miles. Large sums of treasure or jewellery, amounting sometimes to several thousand pounds, are constantly dispatched by the bankers of one town to their correspondents at the distance of several hundred miles, by the hands of common porters. These men, instead of going in large parties well armed, usually travel in small numbers, without arms; trusting for protection to the extreme poverty of their appearance. There are but few inns or serais; and the best of them consist but of a square of arches or arcades. Some of these, which were raised under the Mahometan princes, are beautiful specimens of architecture, with lofty gateways and battlements; but the greater part of them are rude and shapeless. Under the native princes, these buildings were numerous, and were kept in tolerable order; a regular establishment of guards and servants was maintained at them; and there were private doors and apartments furnished for women. But all have suffered more or less from the political disturbances of the country, and many of the most splendid have gone entirely to ruin. There are generally a few shops within the square; and, in places of considerable thoroughfare, a few people, of a class called Buttenras, who cook dinners for travellers. Where there are no serais, travellers sleep in the verandahs of houses, or in any open sheds they can find; but the climate of India is such as to render shelter unnecessary during nine months

in the year; and none but single travellers, or very small parties, care for serais or houses. All who are rich enough to carry tents with them, or those who travel in considerable numbers, usually prefer encamping under the shade of trees, at some distance from the dirty serais or villages; and when one party is so encamped under a shady grove, a single traveller, or even a party of several, will easily be induced to join them, and often ask permission to do so, for the sake of protection.

But several good roads have been recently formed or projected, particularly one from Calcutta to Cuttack; and a great road, which is to extend from Agra to Bombay, through Allyghur, Sasseram, and Jihree, crossing the Nerbuddah at Akberpore, a total distance of 750 miles, has been surveyed, and partly executed. There are no navigable canals or railways; but the Indus and the Ganges both afford a long course of inland navigation, which is traversed by steam-boats; and a canal has been projected to connect these rivers, proceeding across the country between the Jumnah and the Suttlej; and its tract has already been surveyed and found practicable. — See RIVERS— *Indus*, *Ganges*, &c.

DIVISIONS. — As India has never formed one empire, there is no general system of administrative divisions. By the Mahometan writers, the name *Hindústan* was understood to signify the country in immediate subjection to the sovereigns of Delhi which, in 1582, was divided into eleven *soubahs* or provinces, the names of which are still retained in our maps, though most of them have become entirely obsolete, and those which still remain, have materially changed the extent of their application. These were: — *Lahore*, *Moultan*, including *Sinde*, *Ajmere*, *Delhi*, *Agra*, *Allahabad*, *Bahar*, *Oude*, *Bengal*, *Malwah*, and *Gujrat*. A twelfth soubah was formed of *Cabul*, and the country to the west of the Indus; and several new divisions were afterwards added from the conquests in the Deccan, namely, *Berar*, *Khandeish*, *Aurungabad*, *Beejapore*, *Beder*, *Nandere*, *Hydrabad*, the *Carnatic*, *Gundwana*, and *Orissa*. Of all these, the only soubahs which now remain as geographical appellations are, *Bahar*, *Oude*, *Bengal*, *Orissa*, *Malwah*, *Gujrat*, *Khandeish*, and the *Carnatic*. Bengal is the great plain at the mouths of the Ganges and Brahmapûtra; *Bahar* is a smaller province to the north-west; *Oude* is the name of one of the existing political divisions; *Malwah*, or *Central India*, is the table-land, supported on the south by the Vindhya mountains; *Gujrat* is the country around the Gulf of Cambay; *Khandeish* is a province of the Bombay presidency, in the lower part of the Tuptee; the *Carnatic* is the south-eastern portion of the peninsula of India; *Orissa* extends along the coast, between the Carnatic and Bengal, with a breadth of about ninety miles inland, where it borders upon *Gundwana*, a large tract of country, with ill-defined limits, but understood, in its widest dimensions, to extend westward and northward to Ellichpoor, Bhopal, and Bundelcund.

India is now divided politically into a number of sovereign states, which may be arranged into four classes: — 1. Territories under the immediate government of the officers of the East India Company, which are divided into the three Presidencies of *Bengal*, *Madras*, and *Bombay*; 2. Subject States, left to the rule of the native princes, but under the protection and complete controul of the British Government; 3. States under British protection or alliance, but without interference in their internal governments. These do not in reality differ much from the Subject States, and we have therefore, in the subjoined table, united them in the same class; 4. Independent States. The names of all of these, with their dimensions and population, are stated in the following Table: —

I. BRITISH TERRITORY.

	Area in sq. miles.	*Population.*
Presidency of Fort-William, Bengal.		
1. Government of Bengal, Bahar, and Orissa, including Assam and Arracan,	181,684	40,550,000
2. Government of Agra, or the north-west Provinces,	170,210	17,021,000
Presidency of Fort St. George, Madras,	121,982	15,090,084
Presidency of Bombay,	62,542	6,940,277
	536,418	79,101,311

II. and III. SUBJECT AND PROTECTED STATES.

Nizam, or King of Hydrabad,	88,884	10,000,000
Rajah of Berar, or King of Nagpore,	56,723	3,000,000
Rajah of Sattarah, } Mahrattas,	7,943	794,300
Rajah of Kolapore, } Mahrattas,	3,184	318,400
Rajah of Sawuntwaree, } Mahrattas,	935	93,500
Rajah of Travancore,	4,574	457,400
Carry over,	698,661	90,764,911

			Area in sq. miles.	Population.
	Brought over,		688,651	90,764,911
Rajah of Cochin,			1,988	198,800
Rajah of Mysore (now annexed to Madras),			27,999	2,799,900
Rajah of Sikim,			4,400	440,000
Padishah, or King of Oude,			23,923	6,000,000
Rajah of Rewah, in Bundelcund,			10,310	1,031,000
Chiefs of Dhattea, Jhansi, and Terhi, in do.,			16,173	1,617,300
Rajah of Bhurtpore,			1,946	194,600
The Rajah of Dholpore, Baree, and Rajah-Kairah,			1,626	162,600
Nawub or Nabob of Bhopal, in Malwah,			6,772	677,200
Holkar's territory in Malwah,			4,245	424,500
The Rajahs of Dhar and Dewas, in Malwah,			1,466	146,600
The Guicowar, or King of Baroda,			24,950	2,495,000
The Ras of Cutch or Kach'h,			7,396	350,000
The Rajpoot and other Princes in Rajpootana and Malwah.				
Mewar or Oudipore,	11,784	1,178,400		
Jeypoor,	13,427	1,342,700		
Marwar or Joudpour,	34,132	1,706,100		
Kotah,	4,389	438,900		
Bhondi,	2,291	229,100		
Alwar,	3,235	323,500		
Bikaneer,	18,060	180,600		
Jeysulmere,	9,779	97,790		
Kishenghur,	724	72,400		
Banswarra,	1,440	144,000		
Pertaubghur,	1,457	145,700		
Dungarpoor,	2,005	200,500		
Keroli,	1,878	187,800		
Sirohi or Sirowy,	3,024	302,400		
Ameer Khan, lord of Tonk, Seronj, and Nimbheera,	1,633	163,300		
			109,456	6,718,190
Rajahs of Patiala, Keytal, Naba, Jeend, and others, between the Jumnah and the Suttlej,			16,602	500,000
Bhawul-Khan, Chief of the Daoudpûtras,			30,000	350,000
Ameers of Sinde,			60,000	200,000
IV. INDEPENDENT STATES.				
The Maharajah Scindia in Central India,			32,944	3,294,400
The Punjab, or Kingdom of Lahore,			160,000	4,000,000
The Kingdom of Nepâl or Nepaul,			36,000	2,000,000
Bootan, or the country of Deb-Rajah,			20,000	1,000,000
V. FOREIGN POSSESSIONS.				
French territory,			530	210,000
Danish territory,			93	35,000
Portuguese territory,			1,200	500,000
Total area and population of India,			1,298,452	130,905,000

A large portion of the British territory consists of the possessions of princes, who, though deprived of the government, still enjoy pensions paid out of the public revenues. The territories of some of these princes were ceded in return for military protection; others were forfeited by the chances of war; and those of a third class were taken from them, on account of their tyranny or incapacity. The princes of the first and the last classes, are formally installed on their thrones, and allowed to exercise sovereignty over the tenants of their private estates, and the members of their household; are exempted from the jurisdiction of the British courts of law, have their own civil and military functionaries, with all the ensigns of state, and a British envoy usually resident at their court. The following list contains their names and the amount of their stipends:—

	Stip. Rupees.
The Great Mogul, Emperor of Delhi, and Family,	1,500,000
Soubahdar of the Carnatic, or Nabob of Arcot,	1,165,400
Families of former Soubahdars,	900,000
Rajah of Tanjore,	1,183,500
Soubahdar of Bengal, Bahar, and Orissa,	1,600,000
Families of former Soubahdars,	900,000
Rajah of Benares,	143,000
Families of Hyder Ali, and Tippoo, Sultans of Mysore,	639,549
Rajahs of Malabar,	250,000
Peishwah of the Mahrattas, and Family,	2,150,000
Descendants of Himmut Bahadur,	60,000
Benaeek Rao, and Seeta Baee, Chiefs of Saugor,	250,000
Gowind, Rao of Calpie,	100,000
Nawab of Masulipatam,	50,000
Nawab of Surat,	162,675
Nawab of Furruckabad,	108,000

TOPOGRAPHY.—We shall now proceed to describe the different provinces of India, in the following order:—1. *Government of Bengal;* 2. *Government of Agra;* 3. *Presidency of Madras;* 4. *Presidency of Bombay;* 5. *Subject and Protected States;* 6. *Independent States;* 7. *Foreign Possessions;* and 8. *The Islands.*

§ 1. *Government of Bengal, Bahar, and Orissa.*

This is the original territory granted in dewanny or stewardship by the Emperor of Delhi to the East India Company in 1765. It is situate at the head of the Bay of Bengal, and consists chiefly of the alluvial plains formed and intersected by the Ganges and the Brahmapûtra, with their innumerable branches. The government extends 380 miles in breadth, N.S. in the meridian of Calcutta, and about

520 in length E. W. along the 25° N. lat., comprising an area of 217,000 square miles. *Bengal* is a very flat country, with scarcely a hill of any considerable elevation, and is so intersected by rivers, that even in the driest season there are few points which are 20 miles from a navigable stream. The lower portion of the country, adjoining the sea, is a dreary tract of islands called the *Sunderbunds*, formed by the branches of the Ganges, covered with jungle, and infested with tigers, alligators, and other wild animals. The ground of Bengal consists entirely of alluvial or travelled matter, which extends to a very great depth. A bore made at Fort-William in 1840 reached not less than 481 feet, without rock, which was not found even there, the lowest stratum which was reached consisted of fine sand, like that of the sea shore, largely mixed with shingle. The cultivable soil, however, is very thin, and is composed of saltish mud and sand; but it, nevertheless, produces abundantly all the necessaries, and many of the luxuries of life. Rice, the principal food of the natives, is grown in the low grounds; and wheat and barley in the higher districts. The most fertile and the best cultivated portion is the district of Burdwan, which has the appearance of a garden in the midst of a wilderness. Salt, tobacco, sugar, indigo, cotton, silk, and opium, are also produced, and the cultivation of the potatoe is rapidly extending. The climate is very damp; during half the year it rains incessantly, and during the other half the dews are heavy and penetrating. The rainy season lasts from June till October; the cold season from November till February, when the hot season begins, and continues till the middle of June. During the cold season the atmosphere is clear, sharp, and bracing; but the hot season, in the lower parts of the province, is nearly intolerable, even to a native. The rays of the sun seem to penetrate to the very vitals, while there is not a cloud in the sky to intercept them. When the monsoon is about to change, the very atmosphere feels as if it were thick, breathing becomes laborious, and all animated nature languishes, the oppressiveness of the night being almost as great as that of the day. In the north, however, where the country begins to rise, and where the land is cleared, the climate is said to be very fine. A narrow portion of Bengal extends to the south-east along the coast for 120 miles, forming the district of Chittagong, an unproductive hilly region, which is much resorted to by Europeans for sea air and bathing. *Bahar* lies north-west of Bengal, and contains about 55,000 square miles, of which nearly one-half is plain arable ground; about a seventh consists of a straggling hilly country, producing little; and the remainder, about a third, is a highland region of inconsiderable value. It is divided by the Ganges into two nearly equal portions. The climate is comparatively temperate; the heat and the moisture are less oppressive, and the cool season continues longer than in Bengal. The soil of the plains is generally fertile, unless where saltpetre exists in excess, and being well watered and cultivated, is very productive of the dryer grains, and of the luxuries required by the more active inhabitants of the north. Opium is the staple produce; and a great quantity of saltpetre is manufactured, principally in the divisions of Hajeepore and Sarun. The part of *Orissa* originally included in the Emperor's grant, is only a narrow tract stretching along the south-western frontier of Bengal.

The government of Bengal, Bahar, and Orissa is divided into four provinces and thirty districts or zillahs. CALCUTTA PROVINCE contains the *City of Calcutta, the suburbs, the 24 pergunnahs*, and the zillahs of *Hoogly, Nuddea, Jessore, Cuttack, Midnapore, Burdwan*, and *Jungle-mehauls*. The PROVINCE OF PATNA contains the districts of *Ramghur, Behar, Tirhoot, Sarun, Shahabad*, and *Patna*. The PROVINCE OF MOORSHEDABAD contains the districts of *Bhaugulpore, Purneah, Dinagepore, Rungpoor, Rajeshahye, Birbhoom*, and *Moorshedabad*. The PROVINCE OF DACCA contains the districts of *Mymenving, Sylhet, Tipperah, Chittagong, Backergunge, Dacca* and *Dacca-Jelalpore*. The cities and towns of Bengal have been arranged in the following table, which shows also their distances and bearings from Calcutta.

Azmerigunge,	220	N.E. by E.	Darra,	172	N.W. by N.

CALCUTTA, the capital of Bengal and of all India, is situate on the left bank of the Hoogly river, 100 miles from the sea, and 130 from the Sandheads, in 22° 33′ N. lat., and 88° 28′ E. long. The city and suburbs extend along the river more than six miles, but the breadth is various. The European residences are built in the Grecian style, generally detached, and are situated in the southern part of the city, which is called Chowringhee, or in the suburbs. The natives reside in the "Black Town," a congeries of narrow and dirty streets, most of which are lined with mud hovels, but contain also some large houses of the rich Baboos. Fort-William stands on the river side, separated from the city on the north and east by a wide esplanade, which also extends along the south side, where it forms the race-course. The fort is an irregular octagon, strongly fortified; it has cost the H. E. I. C. £200,000 sterling, and would require a garrison of from 10,000 to 15,000 to man the works. The interior is truly beautiful, consisting of large grass plots surrounded by shady trees, and intersected with gravel walks, with here and there piles of balls, bombs, and parks of artillery. The barracks are large enough for 20,000 men. For a quarter of a mile round the outside no tree or house is permitted, and ships pass so close that they may be hailed from the glacis; but the country being perfectly flat, and the ramparts rising only a few feet above it, the fort does not make a very imposing appearance; indeed its strength is scarcely perceptible. The only other building deserving of special notice is the palace of the Gover-

strewed in many places for miles with a thin sprinkling of limestone concretions; it extends from north of the Mahanuddy to Midnapore; it is finely cultivated, and has a most picturesque appearance. At Balasore a group of fine hills approach within 15 miles of the sea. The interior, however, is little known; the hilly region is said to extend for 200 miles in length, by 100 in breadth; the elevation of the highest hills seen from the Mogulbundy is estimated at 2000 feet, but their general elevation only from 300 to 1200. They consist chiefly of granite, resembling sandstone, and containing a variety of minerals and precious stones. The granite rocks are very hard and naked, presenting a bold and varied outline, with sharp peaks and abrupt craggy faces; they are in many parts curiously intersected with trap veins. The rivers in the lowlands are embanked with immense earthen mounds, sometimes 60 feet thick, and 20 high. *Cuttack*, the capital, which is situate on a branch of the Mahanuddy, 250 miles travelling distance from Calcutta, contains upwards of 6000 houses, and 40,000 inhabitants. *Balasore*, 150 miles N.E. of Cuttack, is a seaport town on the Booree-Bellaun river, which is not navigable for vessels of greater burden than 100 tons. Pilots for the Hooghly are procured in Balasore roads. *Pooree*, a small town on the coast, 45 miles S. of Cuttack, is considered the Montpellier of Bengal, the climate being somewhat dry, while a refreshing sea-breeze blows continually from March till July. It contains, or adjoins, the celebrated temple of *Juggernaut*, who is an incarnation of Vishnu; but he is accompanied by his brother and sister; and, besides these, all the idols particularly venerated by the Hindoos find a place within the precincts of the temple, so that all castes and sects may unite in celebrating the great yearly festival. The body of the temple consists of a pagoda 200 feet high, which forms a landmark at sea; and the various services are performed by about 3000 Brahmins and their attendants. The number of pilgrims who attend the yearly festival amounts to 8000 or 10,000. On this occasion the idols are placed on cars, to which long ropes are attached, and by these the people draw them forth, it being considered a meritorious service to assist in advancing the deities; and sometimes people throw themselves before the ponderous wheels, for the purpose of being crushed to death, and thereby obtaining an entrance into Paradise. The superintendence of the temple is vested in the rajah of Khoordah; and 50,000 rupees (£5000) are paid annually for its support, by the East India Company, out of the ordinary revenues of the province. The country round Pooree is considered holy to a great distance; but the most sacred portion is confined to a circuit of about eight miles. The country consists of low sand hills, covered by a thick but not lofty forest. About a mile from the sea vegetation suddenly ceases; the intervening space being a waste of deep and loose sand along the desolate shore. Pooree is situate on the edge of this desert; and the European cantonments stand on a high ridge, perfectly destitute of verdure, fronting the sea, and enjoying the benefit of its cooling breezes. The town is in consequence a desirable residence; and many persons, worn out with the heat of Bengal and Hindûstan, are delighted to loiter upon the healthful, though solitary, shores of Cuttack. Juggernaut is as sacred in the estimation of the Buddhists as of the Brahminical Hindoos, on account of its having contained for a period of eight centuries the *dalada*, or tooth of Buddha, which is now in Ceylon. The name Juggernaut, properly *Jhugat-nata* (lord of the universe), is an appellation which Gautama-Buddha himself assumed; for it is said that on the day he became Buddha, as well as when about to expire, he exclaimed, "O universe, I am thy Lord." Allahabad, Benares, Durjodum, Gaya, Saugor Island, and Juggernaut, are places of devout pilgrimage to the Buddhists of Thibet, but the last two are of pre-eminent sanctity, whilst Gaya, the birthplace of their legislator, is only of secondary rank. All castes are privileged to mix within the sacred limits of Juggernaut; they are said to be even blameless for eating together, which savours more of a Buddhist than of a Brahminical origin.—(*Forbes' Ceylon*, II. 217.) *Kannaruc*, or the *black pagoda*, on the coast, 15 miles E. of Pooree, has been one of the most splendid temples of which India can boast. It was a temple of the sun, of greater antiquity than that of Juggernaut; but has lost its sanctity, and is now deserted. The building is lofty, forming a landmark at sea, and is adorned with numberless sculptures of exquisite beauty, but generally of an indecent character. It stands in the midst of a wilderness of sand, partially overspread with jungle; and great part of the building is now in ruins.

Assam is situate in the valley of the Brahmapûtra, to the eastward of Bengal, is about 360 miles in length, and from 20 to 70 in breadth, and contains an area of 18,900 square miles. It extends from the river Monash to the foot of the Himalayas, close upon the western frontier of China; on the north it is bounded by a cold mountainous country, and on the east and south by a range of mountains which gradually decrease in elevation as they proceed westward, separating Assam from the basin of the Irrawady, and the rivers of Silhet and Cachar. The country is almost a perfect flat, studded with little conical green hills, which rise abruptly to the height of from 200 to 700 feet. It is intersected in every direction by the branches and affluents of the Brahmapûtra, which are almost everywhere navigable; it is always swampy, but in the dry season the ground is susceptible of cultivation, and produces abundant crops. Assam is rich in mineral treasures; nearly all the streams carry down particles of gold; the mountains contain precious stones, and silver; iron is found under the Naga hills, and elsewhere; and coal of good quality has been found to the east of Rangpur. The soil of the hills is composed of a rich red loam, with a sprinkling of particles of quartz or talc; and large masses of granite are scattered over them in whimsical confusion. It is well adapted for agricultural purposes, and for many hundred miles, might be converted into one continuous garden of silk, cotton, coffee, sugar, and tea. The last is an important article of produce; it grows wild in Upper Assam; is the identical tea tree of China, and only requires the same care in its culture and manipulation to rival or supersede the "fragrant weed" of the celestial empire. Coffee is also found in its wild state. Assam is beyond the influence of the moonsoons; the wind blows from east or north-east for nine months in the year, and seldom in any other direction for more than a few days in succession. In the rainy season, in July, the whole country is flooded like an inland sea, the river rising to an average height of 30 feet. Some centuries ago it was richly cultivated by an industrious and enterprising people; but now seven-eighths of the surface are covered with jungle, which emits febrile miasmata. The ruins of splendid temples have been discovered in the midst of wastes and forests; and large tanks, overgrown with brushwood, point out the sites of once populous cities. The ruling people of Assam, who were called Ahoms, and belonged to the Tai family, are supposed to have migrated from the borders of China, and to have conquered the country early in the thirteenth century. In the 17th century they were converted to Hinduism, and adopted the language of Bengal. The present representative of the powerful kings of Assam resides at Jorenath in tawdry splendour, his resources are limited to those of a zemindar, his nobility has been reduced to beggary, and his court presents the empty mockery of royalty. The central part of Assam, with a population of about 200,000, was left for some time under his immediate government, after the country was recovered from the Burmese in 1826; but it has been again resumed, and placed under the immediate charge of British officers. The most ancient capital was *Ghergong*, a city of great extent, built of brick or stone, a few miles above Rangpur; and about 10 miles from it is *Axoo*, the burial place of the kings, where their remains were deposited in a vault under a magnificent temple. During the splendour of the Assam princes *Gowhatti* was also a large city and fortress, but few vestiges of its grandeur now remain. It has however again, within a few years, grown up from a cluster of huts to a well-built and populous town. *Sudiyah*, in Upper Assam, was for sometime a British military station, but it has been abandoned, and the head-quarters of the army have been established at *Saikwah*, on the opposite bank of the Brahmapûtra, three miles below. *Goalpara*, in Lower Assam, is rapidly rising

in importance as a mart for the produce of the country. The Assamese are chiefly Hindoos, followers of Brahminism, and subject to an influential, intriguing, and vicious priesthood. There is also a large proportion of Moslems, who are held in great contempt. The population is besides composed of great numbers of people from the hill country, who intermarry with the Assamese. In Upper Assam, and among the hills, are various wild tribes, as Booteas, Akas, Duphlas, Kuppochors, Miris, Abors, Bor-abors, Mishmis, Kangtis, Bor-Kangtis, Singphos, Muttucks, Nagas, Munniporis, Cacharis, Kassyas, and Garrows. The kangtis, who are Buddhists, and live in Upper Assam, are the most civilized; but the most numerous and most formidable tribe are the *Singphos*, who are somewhat more than lawless, but nevertheless acknowledge the paramount authority of the British Government. The whole country has been hitherto in a state of abject barbarism; but, under its new masters it is rapidly improving; and promises to become one of the finest and richest provinces of the Indian empire.—(*Topography of Assam, by John McCosh, Calcutta*, 1837.)

ARACAN or RAKHAIN lies along the east side of the Bay of Bengal, between 17° 20′ and 21° 2′ N. lat.; extending 240 miles in length, with a breadth varying from 10 to 100, average 60; and containing about 16,540 square miles, of which only 1-24th part is cultivated. It is bounded on the east by a range of mountains, named *Yomadong* by the Aracanese, and *Anupectamien* by the Birmans, which stretches northwards from Cape Negrais to the Tipperah hills. Its mean height is 3000 feet, but in some places it reaches 5000. Not less than 22 passes are said to exist in the ridge, leading between Aracan and Ava, but only five are used for this purpose; the best is the pass of *Arac*, the summit of which is 4061 feet above the level of the sea. Towards the east side the mountains decline by a succession of terraces; but towards Aracan the descent is steep and abrupt. The northern part of the province consists of the large valley of Aracan Proper, which is divided from the Bay of Bengal by a range of heights, which scarcely rise to more than 700 feet, and generally assume a conical shape. Some of them are insulated; others are connected by narrow ridges; but all are scattered irregularly, and separated by ravines, valleys, and confined level spots, each occupied by a stream, a lake, or a marsh. The valley of Aracan varies in width from 10 miles or less to 40; but is so little above the level of the sea, that the tides overflow the flat borders of the rivers to a considerable extent, and leave them at ebb a noisome swamp. With the exception of this swampy ground, the soil consists of rocks crumbling on the surface, and covered by a thin layer of loose black earth, overspread with grass and jungle. In July, when the rains become abundant, the whole valley is inundated; and so numerous are the rivers which intersect it, that they form a complete labyrinth of water communication between the towns and villages during the greater part of the year. The principal river is the *Kaladyne* or *Hurdung*, which rises between Chittagong and Munipoor, and has a course of about 240 miles, terminating in a bay full of low islands of considerable size. The valley is extremely unhealthy; the heat, the inundations, and the general moisture, all contributing to this effect. Even in the dry season, November, December, and January, occasional, and sometimes heavy showers occur; in February, March, and April, they become more frequent; and still more so in May and June, when the periodical rains set in, and continue till November. Heavy dews and thick fogs prevail, even in the dry season, and great heat in the day-time; the thermometer rises in July to 86°, in August to 84, and is never under 77° in these months. The country is extremely fertile, and the soil fit for the cultivation of almost all kinds of tropical produce; but nothing except rice is cultivated to any extent. Indigo, cotton, tobacco, hemp, sesame, and mustard seed, are also raised; the sugar-cane grows very luxuriantly, and might be cultivated to a great extent; black pepper grows wild near Aeng, but is nowhere cultivated; fruit is plentiful, and of excellent quality. The pine-apples and the plantains are perhaps the finest in the world, and are produced in the greatest abundance. Mangoes, jack-fruit, sweet-limes, and cocoa nuts, are plentiful, but oranges are scarce. Onions, garlic, and turmeric, are the principal culinary vegetables; but bhangens, red pepper, cucumbers, water-melons, papeyas, and raktalus, are also abundant. No forest trees grow in the valley, nor on the hills along the shore; but large forests of teak abound in the mountains. Tigers and elephants are found in the upper part of the valley; there are also poultry of various kinds, buffaloes, silk worms, and bees. Fish are so plentiful, that they supply not only a principal part of the food of the people, but also, when dried, an article of export. The whole coast is intersected by rivers, creeks, and inlets of the sea, so as to form a series of peninsulas, isthmuses, and islands, some of the latter of which are large, particularly those of *Ramree* or *Cheduba*. Ramree is about 50 miles in length, mountainous and covered with jungle, and separated from the mainland by a narrow strait. Cheduba is only about 30 miles in length, but, further from the land, low, dry, and sandy, tolerably free from jungle, and healthy. *Akyab*, at the mouth of the Aracan river, is similar to Cheduba, but smaller. Between Akyab and Ramree is an extensive and numerous group of hilly islands, mostly uninhabited. *Broken Islands* are a group of high insulated hills to the north of Aracan; *Haricia Islands* and *Coal Island*, to the south-east of Ramree and Cheduba. Aracan was conquered from the Birmans in 1826, and is now under the charge of a commissioner, and divided into the four districts of *Akyab*, *Ramree*, *Sandoway*, and *Aeng*. In 1831 the population amounted only to 173,028, in 1839 it had increased to 216,051, chiefly by immigration from Chittagong and the neighbouring districts of Bengal. The nett revenue has reached 457,183 rupees (£46,000). *Aracan*, the capital, stands on a navigable river, 50 miles from the sea in a direct line; it was formerly very large, but its population has fallen to 3000, and is still diminishing. Its trade has passed to Akyab, at the mouth of the river, a place which has been selected on account of its advantageous position for health and trade, and is rapidly increasing. *Kyouk-Fyoo*, *Kyouk-Phyoo*, or *Kyouk-Fee*, white stone bay, at the northern end of Ramree, is large enough to accommodate the whole British navy. It is land-locked on three sides, east, west, and south, and is thus completely secured against the south-west monsoon; the anchorage has from 8 to 15 fathoms water throughout, the beach consists of fine hard sand, strewed with beautiful white pebbles, from which the harbour and one of the islands derive their names. The town of *Kyouk-Fyoo* contains 2000 inhabitants; *Ramree*, on the same island, 7000. The latter stands on a creek in a low situation, surrounded by hills, but bears a high character for salubrity.

To the southward of Assam and eastward of Bengal are situate several wild countries, named *Cachar* or *Kachar*, *Tiperah*, *Munipoor* or *Munipur*, *Kosah* or *Cossya* or *Kossyah*, *Gomasee*, and the *Garrows*, which form a sort of neutral territory, between Bengal and Birmah. *Munipur* contains an area of 7000 square miles; the central portion of which consists of a valley of rich alluvial soil, 36 miles by 18, 2500 feet above the level of the sea; the climate is favourable; and the fruits of both tropical and temperate climates are plentiful. It was formerly very populous and well cultivated, but is now overspread with jungle and marshy swamps. *Chundrapore* is the present capital; the ancient metropolis consists only of ruined temples, mounds, and ditches. It was conquered by the Birmese in 1771, and reconquered by the British in 1825, who restored the Rajah. The Munipoories are active soldiers and expert horsemen, and are very courageous. They profess to be Rajpoots, but they have broad Tartar features; the women are coarse and masculine. *Cachar* contains 4300 square miles; its capital is *Cospur*. The country is in great measure waste; and part of it is under British rule. The *Kossyah hills* extend from Silhet to Gowhatti, being an elevated region of 3500 square miles, which forms a sort of table-land, varying from 4000 to 6000 feet above the level of the sea. The inhabitants are ruled by a number of petty Rajahs, who form a sort of confederacy. *Gomasee* and the *Garrows* are a continuation of the same elevated region, extending westward to the great bend of the Brahmaputra. In the Kossiyah hills is *Cherra-poonjee* or *Churra-poonjee* or *Chura-poonjee*, a sanatarium, 30 miles N.N.W.

of Silhet, and 4000 feet above the level of the sea. *Tipperah* or *Tiperah* is situate to the north-east of Chittagong; some parts of it are rich and fertile, but the greater part of the country is wild, covered with jungle and forests, and abounding in wild elephants and other animals.

§ 2. *Government of Agra or the North-west Provinces.*

These provinces extend from the mouth of the Soane upwards, along the Ganges and the Jumnah, to the sources of these rivers, including the Doab or peninsula between them; the hill country of Kumaon, Hurriannee, Rohilcund, Bundelcund, ceded districts on the Nerbuddah, and the districts in Gundwana and Orissa, ceded by the Rajah of Berar in 1826. The outline of the provinces is extremely irregular, varying from about 50 miles in breadth to 500; and they comprise altogether about 170,210 square miles, divided thus:

	Sq. miles.
Government of Agra Proper, containing the districts of *Allahabad, Futtehpore, North Bundelcund, South Bundelcund, Benares, Ghazeepore, Gurruckpore, Juanpore, Azimghur, Mirzapore, Agra, Allyghur, Furruckabad, Bareilly, Shah-jehan-pore, Saharunpore, Meerut, Cawnpore, Etawah, Moradabad,* and *Bolundshuhur*, ...	66,510
Hill Countries of Kumaon, &c.	18,000
Ceded Districts on the Nerbuddah, ...	29,800
Districts ceded by the Rajah of Berar, in Gundwana, in 1826, ...	55,900
	170,210

In the lower districts of Agra, along the rivers, the country is flat, and, where well watered, is exuberantly fertile, particularly in the *Doab*, or peninsula between the Jumnah and the Ganges. As abundance of water is indispensable to fertility, the government have it in contemplation to cut a canal from the Ganges, near Hurdwar, through the length of the Doab, to the south of Coel and Mynpoorie. To the south-west the country rises considerably, and in Bundelcund or Bundelkhund, becomes a table-land diversified with hills, where were formerly numerous strongholds, whose ruins still crown the summits. This table-land contains the famous diamond mines of Punnah. To the north the country along the rivers still continues flat, as far as the Sub-Himalayas, where it is only 1000 feet above the level of the sea, though nearly 1000 miles distant from it in a straight line; but towards the west and north-west frontier, it becomes hilly and wooded. Westward of Delhi is the province of *Hurriannee*, which, in the flourishing times of the Mogul empire, was the appanage of the heir apparent, and is celebrated for the fine verdure, from which it derives its name, for the herds of cattle which are pastured on it, for its lions, and for the valour and independent spirit of its inhabitants. Eastward of Delhi, between the Jumnah and the hills on the north-east is the extensive territory of Rohilcund, which derives its name from the Rohillas.—(See PEOPLE.) The soil and climate of Rohilcund are very fine. The sugar, rice, and cotton raised there are the best in India; toddy and date palms are common, while the walnut, the apple, the pear, strawberries, and grapes, likewise thrive. *Kumaon*, *Gerhwal* or *Gurhwul*, and *Sirmoor*, are severally the names of a mountainous region, popularly called THE HILLS, extending from the Suttlej to the Kali, a distance of 250 miles east and west, and between the Sub-Himalayas and the crest of the main chain, to the north-east. The whole of this space is occupied by numerous ranges of mountains; and, when viewed from a commanding position, presents the appearance of a wide expanse of unconnected ravines, rather than a succession of regular chains. The valleys are lowest on the banks of the largest rivers, where, too, the greatest portion of level land is generally to be met with. These spots, however, never exceed, and seldom amount to, half a mile in breadth. The region contains the sources of the Ganges and the Jumnah, and of several of their tributaries, and no less than four of their five *prayagas* or holy junctions, the fifth and principal one being at Allahabad. The hill countries are blest with a delightful climate, the rigours of the winter being moderated by powerful solar radiation, while the summer heats are tempered by the snows of the Himalayas. Indeed during summer the vicinity of the frozen region causes a continual descending current of air which sets in daily, just as regularly as a sea breeze on a tropical shore, and with an equally invigorating freshness. At Saharunpore, the climate resembles that of the southern parts of Europe, the mean annual temperature being 73°. During more than half the year the Bhot districts of Kumaon are covered with snow, which begins to fall in September, and continues to accumulate till April. In open and level places, where the body of snow is in some parts 12 feet deep, it disappears early in June; but in the hollows it remains till the middle of July. During the five summer months the thermometer ranges at sunrise from 40° to 55°; at mid-day from 66° to 75° in the shade, and from 90° to 110 in the sun. During the cold season, on the contrary, owing to the great evaporation, the thermometer before sunrise is always lowest in the valleys, and the frost is more intense than on the hills of moderate elevation (below 7000 feet), while at noon the sun is more powerful. The extremes within 24 hours have been known to be 18° and 51°. The snow, however, does not fall equally every year; the natives say every third year is one of heavy snow; but in general it does not lie long, except on the mountain tops and ridges. The heat, however, diminishes as the height increases. At Massouree (6700 feet), the mean annual temperature is only 57°; and, at an elevation of 4000 feet the hot winds cease, and vegetation assumes a European character. The quantity of rain which falls at Almora is from 40 to 50 inches. (*See antè* VEGETABLE PRODUCTIONS.)

The tiger is found quite up to the glaciers, of size and ferocity undiminished; there are also lynxes and hyenas, and bears are common, and mischievous. The chamois is not uncommon among the snowy mountains; the musk deer is found only in the highest part of the province; it is unable to bear even the heat of Almora; the *yak* or Thibet cow also droops as soon as it leaves the neighbourhood of the ice. The shawl-goat will live, but its wool soon degenerates; whil the English dog is said not only to improve in strength, size, and sagacity among the Bhooteas, but to acquire in a winter or two the same fine short shawl wool, mixed up with its own hair, which distinguishes the indigenous animals. The same is to a considerable extent the case with horses. Hares are found here, much larger and finer than in the southern provinces, and not inferior to those of Europe. A beautiful flying squirrel is not uncommon in the higher and colder parts of the forests; small marmots, of the Alpine species, abound in the neighbourhood of the snow; and rats of the same species as those of India are numerous and troublesome. There is also a beautiful and rare animal of the deer species, called *goonh*, sometimes employed in carrying the children of chiefs. But the most remarkable animal is a wild dog, in form and fur resembling a fox, but considerably larger and stronger, and very wild and fierce. These dogs hunt in packs, giving tongue like dogs, and possess a very fine scent; they make tremendous havoc among the game of the hills; but compensate this mischief by destroying other wild beasts, and even tigers. Eagles are numerous and very formidable. Quails, partridges, pheasants, larks (not very different from those of England), a black thrush, a little black and red bird, with a note like a robin's, and the goldfinch, are also found. The inhabitants of the hill country are almost all Hindoos, or at least claim a descent from Hindoo colonists who took refuge there from the Mahometan invaders; while their chiefs boast of Rajpoot blood; but they are held in little esteem by their brethren of the plains. In many points which are held to be of the highest importance, they are by no means orthodox; and the circumstance of their dispensing with the ablutions, considered to be so necessary by the worshippers of Gunga, forms an abomination which Europeans unite in

reprobating. Mahadeo (Siva) is the god to whom they pay the greatest homage; but their brahmins are an ignorant race, utterly unacquainted with their sacred writings.

Kumaon, which is the eastern portion of the territory, and contains a superficial area of about 10,697 square miles between the Kali and the Ganges, is directly under the British Government. The portion to the north-west of the Ganges, as far as the Suttlej, and up the valley of the latter river to the borders of Thibet, is governed by native chiefs, who are completely subject to British control, and are under the charge of a resident or commissioner, who resides at Umbala or Subhatoo. That part of the valley of the Suttlej which is under British control, and named *Kunawur* or *Kinnaour*, stretching between the Himalayas and Chinese Tartary or Thibet, is the most delightful region that the pen of the traveller has ever attempted to describe. The climate is the finest in the world, being beyond the reach of the periodical summer rains, and subject only to such gentle and refreshing showers as are necessary for the cultivation of the land. The fruits and the flowers of all countries flourish in this delightful spot; those of Europe are indigenous, and reach perfection with little care. The grape grows in such luxuriant abundance, that from this province alone the whole of India might be supplied with wine. It contains eighteen species of the vine. Honey also is plentiful; but bears are numerous, and very destructive to the vineyards and the hives. Though covered with hills apparently too steep for cultivation, the country is nevertheless very fertile, yielding more corn and vegetables than are sufficient for the support of a numerous population. The country, however, is very high; the villages are generally at the elevation of 8000 or 9000 feet, and some are so high as 12,000; at the north-east frontier, the elevation of more than 20,000 feet above the level of the sea has been attained by travellers without crossing snow; but, nevertheless, the sun's rays for a few months in summer are oppressive, though the atmosphere in the shade is freezing. The nights become frosty in the middle of September; the thermometer sinks below the freezing point in the mornings in October; snow falls towards the end of that month, and covers the ground till March or April. The climate being dry, the falls of snow are not heavy; but the winters are, nevertheless, extremely rigorous. The passes by which Kunawur is approached from the Indian side of the Himalayas are at present somewhat difficult, but might easily be rendered very passable. Kunawur belongs immediately to the Rajah of Bissaher, whose territory includes a large portion of the valley of the Suttlej and the adjoining mountains.

The ceded districts on the Nerbuddah and in Gundwana and Orissa, extend through the middle of India, comprising a large tract of hilly, ill cultivated, and imperfectly explored country, intersected by deep ravines and fertile valleys, and covered in many places with dense forests. They have not yet been reduced to the form of regular provinces, but are placed temporarily in the charge of commissioners, who exercise the whole functions of government.

The principal towns in the north-west provinces, with their distances from Allahabad, are stated in the following table:—

Agra,	280 N.W. by W.	Gohud,	230 W.N.W.	Nugeeana,	354 N.W. by W.
Ajmere,	440 W. by N.	Gooroodwara,	400 N.W. by N.	Nusseerabad,	430 W. by N.
Ajmerghur,	190 S.	Gurrah,	200 S. W.	Paniput,	410 N.W.
Allyghur,	280 N.W.	Hansi,	442 N.W. by W.	Patialah,	475 N.W.
Almora,	320 N.N.W.	Hattras,	274 N.W.	Peelebheet,	260 N.N.W.
Anopshehr,	300 N.W.	Heerapore,	210 S.W. by S.	Punnah,	112 W.S.W.
Bareilly,	260 N.W. by W.	Hissar,	462 N.W. by W.	Rampore,	
Belaspore,	510 N.W. by N.	Hurdwar,	385 N.W. by N.	Rewaree,	370 N.W. by W.
Benares,	53 E.	Jehangeerabad,	305 N.W.	Rohtuk,	400 N.W.
Bhutnere,	535 N.W. by W.	Jubbulpore,	190 S.W.	Rotasghur,	136 E.S.E.
Boolundshuhr,	320 N.W.	Jushpore,	250 S.E. by S.	Saharunpore,	400 N.W.
Callinger,	90 W. by S.	Kallinger,	90 W. by S.	Samanah,	474 N.W.
Calpie,	140 W.N.W.	Kalpie or Calpie,	140 W.N.W.	Sasseram,	140 E. by S.
Canouge,	165 N.W.	Khimlassa,	226 W.S.W.	Saugur,	215 S.W. by W.
Cawnpore,	120 N.W.	Konkelnugger,	230 S.E.	Seheraunpore,	400 N.W.
Chunarghur,	70 E. by S.	Koonch,	172 W.N.W.	Seronge,	280 W.S.W.
Coel,	280 N.W.	Kurnaul,	420 N.W.	Shahjehanpore,	220 N.W. by N.
Cutterah,	232 N.W. by W.	Kuttrah,	232 N.W. by W.	Simla,	490 N.W. by W.
Darahnugger,	350 N.W.	Landour,	420 N.W. by W.	Sirdhana,	370 N.W.
Dehra,	410 N.W. by N.	Loodiana,	520 N.W.	Sirgoojah,	180 S.E. by S.
Delhi,	360 N.W.	Mandouthee,	380 N.W. by W.	Sirhind,	490 N.W. by N.
Deohun,	390 N.W.	Massouree,	420 N.W. by W.	Sirinagur,	380 N.N.W.
Etawah,	200 N.W. by W.	Maunooo,	450 S.W. by W.	Sohagepore,	160 S.
Ferozepore,	580 N.W.	Meerut,	350 N.W.	Sookertal,	370 N.W.
Furruckabad,	200 N.W.	Mhow,	420 W.S.W.	Soonput,	380 N.W.
Futtehpore-Sikri,	270 W.N.W.	Mooradabad,	300 N.W.	Subhatoo,	490 N.W. by W.
Gangpore,	295 S.E.	Mundlah,	205 S. by W.	Sumbhulpore,	305 S.S.E.
Ghazipore,	112 E. by N.	Muttrah,	295 N.W. by W.	Thanesur,	440 N.W.
Ghoosghur,	400 N.W.	Narwar,		Umballa,	456 N.W.

Allahabad, the seat of government, is an ancient city situate at the point of the peninsula formed by the confluence of the Ganges and the Jumnah, 820 miles from the sea by the course of the Ganges, but only 475 W.N.W. in a straight line from Calcutta. The houses are built of mud, and so lately as the time when it was visited by Bishop Heber, the city bore a desolate ruinous appearance; but it is now improving, and the population which, in 1803, was estimated at 20,000, had increased, in 1831-2, to 64,785. The fortress erected by the Emperor Akbar has been much improved since it came into the possession of the British Government; it is lofty and extensive, and, being situate at the very point of confluence, completely commands the navigation of both rivers. Allahabad is the grand military depot of the upper provinces. The Ganges is here a mile wide, and the Jumnah 1400 yards. The confluence of the rivers forms one of the five *prayagas* or holy junction; on which account it is visited by multitudes of pilgrims who come to bathe in the sacred spot; and some for the purpose of drowning themselves, with the certainty of reaching paradise through so holy an entrance. In some years the number of pilgrims has amounted to 220,000. They believe that a third river, the Sereswati, joins the other two below ground; and it is owing to this extraordinary circumstance that the prayaga of Allahabad is reckoned peculiarly holy.

Benares or Bunarus, called also Kashi, the sacred capital of Hindûism, is a large city on the left bank of the Ganges, 53 miles E. of Allahabad. The Ganges here forms a fine sweep of four miles, and the convex side of the curve, which is a high bank, is covered with buildings to the water's edge. The streets of the city are very narrow, and the houses generally lofty. Benares has long been celebrated as the chief seat of Brahminical learning; but, in addition to the holy character of the city, the inhabitants are also very industrious and wealthy. It is the great mart or entrepot for the trade between the north-west and the south-east provinces, and has, besides, considerable manufactures of its own. A new road is forming between it and Calcutta. Benares is built, say the Brahmins, not on common earth, but on the point of Siva's trident; and is so holy that whoever dies here, of whatever sect, and even though he should be an eater of beef, provided he is charitable to

the poor Brahmins, is sure of salvation. This reputation for holiness makes Benares the great resort of beggars; because, besides the attraction of the alms of the multitudes of pilgrims who are continually going and coming, many rich individuals in the decline of life come here to wash away their sins, and expend large sums in profuse and indiscriminate charity. The principal place of worship is a pagoda called Visswishor or Visshishor; which, though small, is handsome, and contains a black cylindrical stone, representing Siva, the Mahadeo or Great God. Both men and women resort in crowds every morning and evening to adore this idol. There is besides a stone figure of Siva's bull, and usually a sacred live bull also within the court of the temple. There are also numerous smaller temples, and a celebrated observatory erected by a rajah of Jyenugger; but there are only a few Moslem mosques. The largest was erected by the Mogul Emperor Aurungzebe on the highest part of the bank of the river, on the site of a famous Hindoo temple, which he destroyed for the purpose. This mosque is distinguished by its two slender and very lofty minarets, peering far above every other object. All the principal houses of Benares are built of stone; but the streets are so very narrow that a palanquin has barely room to pass. The city is divided into 390 mehalas or wards, each with gates regularly closed at night. The population was estimated, in 1803, to exceed 582,000; but, since 1822, it has been ascertained by Mr. Prinsep to be only about 200,450, of whom 181,482 live in the city, and 18,968 in Secrole, and sixteen neighbouring villages. About a fifth part of this population is Moslem; but the city itself is exclusively inhabited by Hindoos; the Brahmins forming a very considerable part of their number. The number of pilgrims who attend the great festivals varies from about 50,000 to 100,000. The British cantonment is at *Secrole*, to the west of the city; and at *Ramnagur*, on the opposite bank, but five miles up the river, is the residence of the Rajah of Benares, one of the East India Company's pensioners.

AGRA, which gives its name to the government, is situate on the right bank of the Jumnah, 830 miles W.N.W. of Calcutta, and 710 N.N.E. of Bombay. It was formerly a very large and populous city, one of the capitals of the Mogul empire; but has fallen greatly to decay, though it still contains about 96,576 inhabitants, of whom two-thirds are Hindoos and the rest Moslem. The city rises in a vast semicircle from the river, which is here half a mile wide, and consists of narrow streets, lined with flat-roofed brick houses. It is very conveniently situate for commerce, and is the entrepot of a very considerable inland and frontier trade. The plains, for several miles around the city, are encumbered with shapeless masses of bricks, stones, and mortar, the remains of beautiful buildings; and occasionally with the fading relics of a garden still surrounded by its ruined wall. In the midst of all this desolation rise two celebrated fabrics, the *Taj-mahal* and the fort. The latter is very large, surrounded by high walls and towers of red hewn stone, enclosing a splendid palace built by the Emperor Akbar, the mootee-musjed, or pearl mosque, a beautiful structure of white marble, and numerous other buildings now sadly disfigured and destroyed. The *Taj-mahal* is a splendid sepulchre of white marble, adorned with the finest mosaics, erected by the Emperor Shah Jehan for his beloved wife Noor-Jehan, called also Noor-mahal (Light of the World, Light of the Empire.) It stands on a terrace within a quadrangular enclosure, measuring 300 yards by 190, and consists of a square building surrounded by a bulbous dome, and adorned with minarets. Shah Jehan intended to erect a similar tomb for himself on the opposite bank of the river, and to connect the two by a bridge; but, dying before his intention could be carried into effect, he was laid beside "the Light of the World," in this, the most splendid monument of conjugal affection ever erected. The Taj-mahal is said to have cost £750,000. It has been repaired, and the surrounding garden put in order, at the expense of the British Government, who have also assigned a handsome annual sum to keep it in repair. All who have seen it agree in considering the Taj-mahal to be the finest architectural structure in existence, and represent it as one of the wonders of the world. Six miles north of the city is *Secundra*, a ruinous village, which, however, contains one of the most splendid buildings in India, inferior only to the Taj-mahal. This is the tomb of Akbar or Ukhbar, the greatest and the best of the Mogul emperors; it is built of red stone, and consists of several tiers of arcades and galleries, over which, at the top, is an area surrounded by a marble screen richly carved. In the centre of the area is the monument of Akbar, of white marble, containing this inscription: "The God Akbar, may his glory be magnified!" together with the hundred names of God inscribed upon it in Arabic, interwoven with flowers and leaves beautifully executed in relief. The body of Akbar reposes in a plain tomb, under a lofty dome on the ground floor. From the top the view is extremely fine; the immediate neighbourhood is covered with the tombs of his wives, ministers, nobles and courtiers, while in the distance is seen the town and fort of Agra, amidst ravines and ruins, and rising above them all the beautiful Taj-mahal, "the diamond of the desert." *Futtehpoor-Sikri* or *Futtypore-Sicri*, 23 miles west of Agra, though now a collection of huts and ruins, was formerly the Versailles of the Mogul emperors, and the favourite retreat of Akbar, whose palace is also in ruins. It contains a splendid mosque still tolerably entire. *Laswaree*, a village 70 miles W.N.W. of Agra, is celebrated for a great victory gained by General Lake over Scindiah's forces in 1803.

DELHI *(Dehli, Dehlee, Delli, Delly, Dilli)*, formerly the capital of the Mogul empire, and still the residence of the Great Mogul, whose empire is now limited to the walls of his palace, and whose revenues consist of a pension from the British Government, is situate on the right bank of the Jumnah, 137 miles N.W. by N. of Agra, and 800 feet above the level of the sea. Delhi is one of the most ancient cities of India, and celebrated in its history under the name of *Indraprest*; it formerly occupied a space of 20 square miles, but great part of its area is now covered with ruins. The city of New Delhi, founded by Shah Jehan in 1631, is about seven miles in circumference, and is surrounded on three sides by walls faced with substantial masonry of huge blocks of sparkling granite, and pierced by seven gates. Within are the remains of many splendid palaces and fine mosques. The imperial palace was also built by Shah Jehan, and stands within an inclosure of red stone walls which is a mile in circumference. It is built of red granite in a beautiful style. The gardens of Shahlimar were laid out by the same emperor, at the cost of about £1,000,000 sterling, but are now destroyed. The prospect to the south of the Shahlimar, as far as the eye can reach, is strewed with the remains of extensive gardens, pavilions, mosques, and tombs, all of which are desolate and ruinous. In the reign of Jehangire, Ali Merdan Khan brought a canal from the upper part of the Jumnah, a distance of 120 miles, to Delhi; but in the general wreck of the empire it became choked up and useless. It was, however, completely restored in 1826 by the British Government, and now supplies the city with good water. The original purpose of the canal was to irrigate the lands; but it is now used to drive saw and flour mills, near Delhi. Under the rule of its present masters, Delhi has been for many years rapidly recovering from its ruined condition, and its population exceeds 150,000, one-eighth of whom, it is said, derive their means of subsistence from digging amidst the ruins of the old city, where they often find articles of value. About nine miles S. of Delhi stands the *Cuttub Minar*, a remarkable tower or pillar 242 feet high; it seems to have been intended as a minaret to a mosque, which was never completed; it was erected upwards of 600 years ago by the Affghan Emperor of Delhi, Cuttub Shah, whose tomb, a humble edifice, stands near it. The emperor died A. D. 1210.

AJMERE *(Agimere, Adjmhair)*, a beautiful and flourishing city, situate in a small detached territory on the eastern flank of the Aravulli mountains, in Rajpootana, was formerly the capital of one of the provinces of the Mogul empire, but fell completely to decay. Since, however, it came into the possession of the British Government, the security thereby provided has induced many merchants of Marwar to settle in it; streets, squares, and bazaars rise up almost daily; a general uni-

formity of plan has been maintained; and the city promises to become the ornament of the country. Population in 1830, 25,000. Though surrounded by bare and rocky hills, the valley of Ajmere is beautiful, being wooded with neem, peepul, and tamarind trees, and watered by extensive lakes. It contains a strong fortress, which has been deemed impregnable, and has within its walls the tomb of Sheikh Kojah Mow-nud-deen, one of the most celebrated Moslem saints in India. The tomb is, externally, a very elegant Saracenic structure of yellow polished lime-stone, apparently inclosing an ancient Jain temple; and the Emperor Akbar is said to have made a pilgrimage to it on foot. It is still visited by numerous devotees. *Pokhur* or *Poker*, six miles W. by N. of Ajmere, is a flourishing and populous town with a great yearly fair, and containing the only temple in India dedicated to Brahma, the Creator, or first person of the Hindoo triad. It is situate on the edge of a lake, an ablution in whose waters is believed to wash away the sins, not only of the person who bathes, but of the family he represents. It is annually visited in October by prodigious crowds of pilgrims, and a strong detachment of troops is despatched to the town to keep the peace among the Soniyasses, Yogies, Ghossains, and other holy devotees, who often come to blows and blood-shed in upholding their respective claims to superior sanctity. Poshkur is also renowned for its gardens and vineyards, the grapes of which are said to equal those of Shiraz, and are the largest and the best in India. *Nusseerabad*, 14 miles E.S.E. of Ajmere, a British military station or cantonment, is one of the healthiest in India, though very dreary. *Beawr*, one of the wildest stations in India, forms a sort of outpost to Nusseerabad, from which it is 30 miles distant. *Bhutneer* or *Bhutneer*, is a large fortress in the desert, 183 miles N.N.W. of Delhi. At *Hissar* there is a stud belonging to the Company. *Sheipoora*, near Ajmere, is also a large place, with signs of prosperity, besides a large lake abounding with alligators.

Ghazeepore or *Ghazeepur*, is a large town and military cantonment on the left bank of the Ganges, nearly midway between Allahabad and Patna, celebrated for the salubrity of its atmosphere and the beauty and extent of its rose gardens. *Chunarghur*, a strong fortress on the right bank of the Ganges, 18 miles S.W. of Benares, was formerly the key of the British frontier on this side, but is now of less importance. It is built on a steep rock, which rises abruptly from the plain, and projects into the river. *Cawnpore* or *Kanpur*, a town on the right bank of the Ganges, with extensive military cantonments, occupying a space nearly six miles in length. At the distance of a few miles is *Bithore*, the place of confinement for the deposed Peishwah of the Mahrattas. *Punnah*, the capital of the diamond district in Bundelcund, a large town situate in a barren rocky plain. It has several handsome temples, in one of which is an idol with a diamond eye of great brilliancy and of immense value. The principal mines are now at *Sukseria*, a village 12 miles from Punnah.

Baroda, the chief place of Rohilcund, is a flourishing town of 70,000 inhabitants, of whom two-thirds are Hindoos and one-third Moslem, noted for their cutlery, brass, and cabinet work, fine carpets, embroidery, and jewellery. The civil and military servants of the East India Company reside in cantonments to the south of the town, protected by a kind of citadel built in 1816, and strong enough to resist any attack from the natives. *Furruckabad*, near the west bank of the Ganges, is a flourishing town with a population of 70,000. Three miles distant, close on the Ganges, is the British cantonment of *Futtehghur*. *Canouje* or *Kenouje*, an ancient capital of Hindustan in the Doab, two miles from the Ganges, consists at present of a single street, but is surrounded with ruins for many miles; 217 miles E. by S. of Agra. *Muttrah*, a large and remarkable city on the right bank of the Jumnah, 30 miles N.N.W. of Agra, is much reverenced by the Hindoos for its antiquity, and its connection with many of their legends; more particularly as the birth-place of the demi-god Krishna. *Meerut*, 32 miles N.E. of Delhi, is a town of some antiquity, and now the principal military station of the British troops in this part of India. It stands in a wide dry plain, and has a church with a high and elegant spire, capable of holding 3000 people. *Sirdhana*, 11 miles N.N.W. of Meerut, was lately the capital of a small principality belonging to the Begum Sumroo, the widow of an adventurer named Sumroo or Sombre, who acquired a gift of it from Najib Khan, and died in 1776. It contains about 4000 inhabitants, of whom 600 are native Christians. The Begum Lady, who died in December 1836, was a devout Catholic; she built an elegant church in the city, and endowed it with a lac of rupees (£10,000); and also erected and maintained at Meerut a Catholic chapel, for the benefit of the British Catholic soldiers. At her death the territory reverted to the East India Company. *Panipat*, 50 miles N. by W. of Delhi, a large commercial town, built of brick on a rising ground in the midst of a very extensive plain, is famous as the scene of two of the greatest and most important battles ever fought in India; the first in 1526, in which Ibrahim Lodi, the last Patan king of Delhi, was defeated and slain by Sultan Baber, the founder of the Mogul empire; the second in 1761, in which Ahmed Shah Abdalee, the first king of Cabul, defeated the Mahrattas, and broke their power. *Kurnaul*, an important military station, 74 miles N. by W. of Delhi. *Jumnoor*, *Jumnour*, or *Thanesur*, 94 miles N. by W. of Delhi, and one of the most celebrated places in Indian mythology, and was formerly filled with temples and crowded with devotees. The Saraswati or Sereswatee, or Surri watty river, a famous mythological stream, flows through it, and is lost in the desert, but is believed to rise again at the prayag of Allahabad, 600 miles distant. In the vicinity are the plains of *Kurkhet*, famed in the Mahabarat. *Puttee Ghur* or *Puttee Ala*, the seat of a rajah, is a compact brick town, but thinly inhabited. *Sohna*, a large city of great extent, is now a mere provincial bazaar or market town. *Ferozepore*, a fortified town near the Sutlej. The capital of a small state, which lately reverted to the East India Company on the death of an old Sikh lady. It was formerly a large city, and still contains a commanding castle and keep. It has been newly surrounded with a wall and ditch; bazaars have been laid out, and shops constructed, and it is rapidly filling with settlers anxious to participate in the new opened trade of the Indus. A fair has been established, and commerce is in a very active state. Steam vessels now ascend from the mouth of the Indus 500 miles by the Chenaub and Sutlej to Ferozepore. *Loodiana* or *Lodeanee*, a large military station near the Sutlej, 200 miles N.W. by N. of Delhi, has been for many years the residence of Shah Zeman and Shah Shuja, the exiled kings of Cabul, and other Families, who are pensioners of the British Government. *Sekranpore* or *Saharanpur*, 92 miles N. by E. of Delhi, and 1000 feet above the level of the sea, contains a fine botanic garden belonging to the East India Company, and a school of monkeys, kept by a set of devotees called Gossens, who have tutored their pupils, an innumerable swarm, into something like discipline. *Hurdwar* or *Hurdeo*, 117 miles N.E. by N. of Delhi, is a celebrated place of Hindoo pilgrimage, on the right bank of the Ganges, where it issues from the mountains. The principal object of pilgrimage is to bathe in the sacred stream; and, for the accommodation at one of bathers, a fine *ghaut* or flight of steps has been erected on the bank of the river by the British Government. A great fair is also held at the bathing season, and sometimes as 200,000 of people have been known to assemble; but the usual numbers vary from 200,000 to 400,000. The water is supposed to acquire additional sanctity every twelfth year; and the concourse of pilgrims is then always greatest.

Deyra, the capital of Lunnoor, is a small town, built on the ridge of a mountain, 5400 feet above the level of the sea, in the midst of an extremely bleak and naked country. *Srinagur* or *Sreenugur*, three miles from Gurhwal, is situate in a valley on the left bank of the Alacananda, 1700 feet above the level of the sea. It was almost destroyed by an earthquake in 1803, and is in a state of decay. *Gurwahl*, a small town of 20. *Deyra-Doon*, a fertile valley, 1350 feet above the level of the sea, 45 miles long and from 15 to 20 broad, between the Jumnah and the Ganges. S1°41′ E. lat. 31° 6′ N. long., 77° 9′ E., 7186 feet above the level of the sea, is a European station in Simoor, near the Suttlej, a small straggling town on a narrow ridge, every ledge and gentle slope of which has been eagerly pitched upon for the site

of a house. The gardens produce European fruits, and culinary vegetables, while the open country abounds with daisies, primroses, rhododendrons, oaks, firs, and dog roses. Rhubarb and ginger are also indigenous, and immense quantities of the finest honey may be had all over the hills. The climate in summer is very fine, and makes the place appear a perfect paradise to those whose constitutions have been exhausted by the heat of the plains; but in winter it is covered with snow. *Landour* and *Mussouri* or *Massuri* or *Massouree*, are two other summer stations of the same kind as Simla, but more easily accessible. They are both situate on the hills on the north side of the Dehra or Deyra-Dhoon; Landour, at an elevation of 7559 feet, and Massouree, 6700. The houses of both are merely thatch-roofed bungalows, and there is so little flat ground that the foundations of many of them are built up with masonry against the edge of precipices; the roads are narrow, being cut along the sides of the most frightful precipices, and yet ladies gallop along them without alarm, and drunken soldiers stagger on them with impunity. Another new station has also been formed at *Sirsa*, in the Bhootea country. *Dehra* is another lovely spot lower down, situate in the valley to which it gives its name, with neat European houses, and an enchanting view from the parade ground. *Subhatoo*, the occasional residence of the political agent who superintends the petty princes of Gurhwal, is a small place, a few miles S.W. of Simla. The proper or official residence of the agent is at *Umballa*, a town on the road from Kurnaul to Loodiana.

Saugur or *Saugor*, the chief town of the ceded districts on the Nerbuddah, occupies a pleasant situation, 2000 feet above the level of the sea, on the banks of a beautiful lake, which is five miles in circumference, surrounded by an amphitheatre of basaltic and sandstone hills, and abounding with a great variety of fish, and in the cold season, with teal, widgeon, wild ducks, numberless snipes, and sometimes geese. The town contains a stationary population of 50,000 inhabitants, chiefly Mahrattas. Ten miles from Saugur an elegant suspension bridge, of 200 feet span, has been erected over the river Bess. Saugur is usually garrisoned by four battalions of infantry, a company of European artillery, and a regiment of local cavalry; it has also a mint, and a large civil establishment. The station is perfectly isolated, and, except in the cold season, the British residents seldom enjoy the sight of a stranger. The climate is damp and chilly. *Hussainabad* or *Hussingabad* or *Hoshungabad*, a considerable town on the left bank of the Nerbuddah, where it is 900 yards wide; but the bed of the river is much broken, and there are 13 fords across it within 14 miles of the town. *Jubbulpore*, 90 miles S.E. of Saugur, is the residence of the political agent for the Saugur and Nerbuddah territory.

§ 3. *The Presidency of Madras.*

The authority of this presidency extends over a great part of the peninsula of India, stretching along the east coast, from the Chilka lake to Cape Comorin; and including, on the west coast, the maritime provinces of Malabar and Canara. The presidency consists of five large provinces, namely, the *Carnatic-payen-ghaut*, or Lower Carnatic; the *Carnatic-bala-ghaut*, or Upper Carnatic; the *Northern Circars*; *Malabar*; and *Canara*. The Lower Carnatic, which extends for 560 miles along the coast of Coromandel, (*Cholamandala*), and inward to the eastern ghauts, is a flat country rising very little above the level of the sea. The soil along the coast is for the most part light and sandy; inland it seems to consist of a decomposition of syenite impregnated with salt, which, in dry weather, covers the ground with a saline efflorescence. The climate is the hottest in India; but in May, June, and July, the air is cooled and the ground refreshed by frequent showers, or by torrents of rain, which sometimes flood the country. At other times vegetation is burnt up, or buried beneath the clouds of fine dust which are driven along by the hot winds from the interior. The Lower Carnatic is not remarkable either for mineral or agricultural produce. The latter consists of dhourra, betel, tobacco, dwarf cotton tree, and raghi, a small grain on which the poorer natives chiefly subsist. The Coromandel coast is low and barren; and the sea, which is extremely shallow, beats upon it with a tremendous surf and a perpetual current. The only signs of vegetation observable from sea, are thickets of low bushes, and wild nopal trees. Around Madras the ground, when well cultivated and watered, produces good crops of rice, and a pleasing verdure is maintained by the indefatigable industry of the natives; but beyond this small circle, the northern part of the Carnatic is nothing but a vast naked and dusty plain, with few villages or signs of animal life. In the southern portion, however, particularly in Tanjore, the country is highly cultivated and productive, a result to which the waters of the Cauvery, which are widely distributed by canals, most materially contribute; the delta of that river forms, indeed, one sheet of rice ground. From Cape Comorin also, through Tinnevelley and Dindigul, the scenery is magnificent and beautiful; the mountains assume every variety of form, and are clothed with stupendous forests, while the smaller hills which skirt the plain are graced with temples and choultries. Winding streams flow from every hill, and the soft and lovely valleys afford a striking contrast to the dark forests which overhang them. The *Bala-ghaut* or *Upper Carnatic*, including Mysore and the districts of Salem and Barramahal, is a lofty table-land, exceeding 3000 feet above the level of the sea; and enjoys a temperate and generally healthy climate. The force of the monsoons is broken on both sides by the Ghauts, and the rain which falls is merely sufficient to clothe the fields with perpetual verdure, and preserve an agreeable temperature. The principal products are rice, raghi, oriental sesamum, sugar-cane, and the castor-oil plant; cocoa nut trees are in some places so numerous as to form forests. Some parts of the Coimbatoor district are, however, only 500 feet above the level of the sea, while other parts rise prodigiously, as the *Nilgherries*, which are the loftiest mountains to the south of the Himalayas. These form a mountain tract 42 miles N.E. and S.W. and 14 broad, with a general elevation of about 8000 feet. No part of the surface can be called table-land; it is interspersed with hills and valleys, generally susceptible of cultivation. The higher parts are sometimes visited by frost even in summer, and in winter they are covered with snow. Lower down there is fine pasture, and the wild fruits of Europe are found in abundance. Some of the deeper valleys are narrow and marshy; every valley has its running stream, and several of these streams meet and form a lake, six miles in circuit, now surrounded by a good carriage road, which affords one of the most delightful drives to be met with in India. The climate is of every variety. That of the higher districts resembles the climate of the intertropical table-lands of America; but is never subject, like them, to the sudden changes and cold piercing winds, which descend from their snow-capt mountains. Spring reigns throughout the year; yet, though there is no winter, the heat is never sufficient to bring to perfection the more delicate European fruits. The lower valleys, however, enjoy the climate of Italy. Game is abundant. These valleys are inhabited by several tribes quite distinct from each other, and from the people of the plains, which were discovered so lately as 1818, by two English sportsmen. From Coimbatoor the passage into Malabar is through a funnel-shaped pass 7 miles wide at the east, and 16 at the west, and 31 miles long, which affords a free course to the N.E. and S.W. winds. To the S.W. of Mysore is the extremely rugged hill country of *Coorg* or *Koorg*, called also *Codagu male* or *Semustan*, containing 2165 square miles, and recently the territory of a sovereign prince, who has now been deposed. Coorg is a woody district, healthy and fertile; interspersed with highly cultivated valleys, the rice of which is proverbial for its size and whiteness. *Malabar* and *Canara* form together a very narrow strip between the western Ghauts and the sea, but extending above 300 miles along shore. A great portion of Malabar is comparatively low, but it is intersected with narrow ravines, covered with forests and jungle, and watered by innumerable streams. Part of the province consists of small low hills, with steep sides formed into terraces for cultivation. The interjacent valleys are extremely fertile, and support a numerous population. In some places a sandy plain three miles wide runs along shore, rising into downs covered with cocoa-nut trees, and

farther inland, producing excellent rice. The coast is indented with numerous inlets. In every stream and river, and also in the sand along the sea shore of South Malabar, near the mouths of the rivers, gold is found; and on some of the mountains there are mines from which this precious metal is extracted. The quantity collected annually is about 730 ounces. The chief vegetable produce is black pepper, cocoa-nuts, cardamums, teak, and sandal wood. Canara, which lies to the north of Malabar, has a broken and rugged surface, and the Ghauts in some places approach quite close to the shore. It is for the most part well cultivated, and produces considerable quantities of rice, betel nut, black pepper, cardamums, and plantains. On the high grounds red gravel prevails; near the coast the soil is sandy; but the valleys are well adapted for rice. The *Northern Circars* extend about 470 miles along the coast of the Bay of Bengal, from Motupalli, south of the Kistnah river, to the Chilka lake. They are separated from Hydrabad by a range of small detached hills, extending between the Kistnah and the Godavery; and from Berar by a continuous ridge of mountains which is nearly impassable for horses or wheeled carriages. The northern border is formed by a continuation of the same range, which, in Goomsur, bends to the eastward, and, with the Chilka lake, forms a barrier of 50 miles in length. Here the hilly districts of Goomsur form a beautiful table-land, of great elevation, with a delightful climate, which is healthy throughout the year. The river Gundezama forms the southern boundary, separating the Circars from Ongole and the Lower Carnatic. The superficial area is about 18,800 square miles. The coast, viewed from seaward, appears mountainous to the beach; but has, nevertheless, along its whole extent, a sandy waste about 3 miles broad, beyond which the land rises into detached hills, which cover the country to the frontiers of Hydrabad. The province receives its name from the circumstance of its comprehending five *circars* or districts *north* of the Carnatic. Four of these were acquired by Lord Clive, by grant from the Great Mogul in 1765; but the fifth was not acquired till 1788. The province is now divided into the five collectorships or districts of *Ganjam*, *Vizagapatam*, *Rajamundry*, *Masulipatam*, and *Guntoor*. The following is a list of the principal towns in the presidency, with their distances from Madras:—

Adoni or Adwany,	270 N.W. by W.	Elloor,	260 N. by E.	Pondicherry,	85 S. by W.
Alvar-Tinnevelly,	350 S.S.W.	Gahgoondaun,	343 S.W. by S.	Poodoocottah,	210 S.W. by S.
Arcot,	65 W. by S.	Ganjam,	530 N.E. by N.	Porto-Novo,	116 S.
Attoor,	152 S.W.	Ginjee,	85 S.W.	Pulicat,	25 N.
Ballary,	265 N.N.W.	Girsupah,	380 W. by N.	Rachur,	200 N. by E.
Bangalore,	180 W.	Goomsurgurh,	535 N.E. by N.	Rajamundry,	295 N.N.E.
Barcelore,	368 W. by N.	Gooty,	225 N.W.	Ramnad,	270 S.S.W.
Batticolah,	380 W. by N.	Guntoor,	220 N.	Repalle,	200 N. by E.
Bednore,	360 W. by N.	Honauwur,	390 W. by N.	Sadras,	40 S.
Bellamcontah,	240 N. by W.	Hunsoor,	390 W. by N.	St Thomas' Mount,	8 S.W.
Bimliapatam,	395 N.E. by N.	Kivalur,	165 S. by W.	Salem,	175 S.W. by W.
Bobilly or Bobilee,	420 N.N.E.	Kotagheri,	260 W.S.W.	Salour,	400 N.N.E.

Dindigul,	240 S.W. by S.	Palamcottah,	350 S.W. by S.	Vizianagram,	400 N.E. by N.
Doopaud,	210 N.N.W.	Penang or Ponany,	330 S.W. by W.	Wallajahabad,	37 S.W.
		Periapatam,	280 W. by S.	Wandiwash,	60 S.W.

MADRAS, the capital of the presidency, is situate on the coast of Coromandel, in the Lower Carnatic, in 13° 6′ N. lat., and 80° 25′ E. long., 1030 miles travelling distance S.W. of Calcutta, and 770 S.E. of Bombay. The principal part of the city is Fort St. George, which is handsome and strong, and requires for its defence only a moderate garrison. It stands on commanding ground, and may be easily relieved by sea. In the middle stands the original fort, now converted into government offices, the governor's house, and the exchange. The Europeans, however, reside entirely in their garden-houses in the vicinity, repairing to the fort in the morning for business. The pettah or black town, is somewhat less than half a mile north of the fort, from which it is separated by an esplanade; it is very extensive, but in general meanly built, and dirty. There are in it, however, many fine houses belonging to merchants and shopkeepers, and many streets of neat small houses occupied by Portuguese, Armenians, and half-castes, or by such of the native merchants and clerks as have acquired European habits. A census in 1827 gave only 27,000 houses; but, including all the neighbouring villages, the population is estimated at 420,000, of whom 5-10ths are Hindoos, 3-10ths Moslems, and 2-10ths Anglo-Indians, Europeans, and Armenians. Madras trades with Europe, America, the Asiatic islands, China, Birmah, Calcutta, and Ceylon. The principal articles of import are rice and other grain, chiefly from Bengal; cotton-piece-goods, iron, copper, spelter, and other British manufactures; raw silk from Bengal and China; betel-nut or areca, gold-dust, tin, and pepper, from Malaysia; rice and pepper from Malabar; and teak-wood from Pegu. The exports consist of plain and printed cottons, &c. Madras has no harbour; but large ships moor in the road, in from seven to nine fathoms water, two miles from the shore, and goods and passengers are shipped or landed by means of massulah boats, which, being light, buoyant, and elastic, carry them safely through the tremendous surf which always beats upon the coast, and in which no European boat could live. From October till January is considered the most unsafe season of the year for shipping, in consequence of the prevalence of storms and typhoons. In the fort there is a light-house, 90 feet above the level of the sea, which may be seen from the deck of a large ship 17 miles distant, or from the mast-head at the distance of 26 miles. The principal artillery station of the presidency is at *St. Thomas's Mount*, 8 miles S.W.; the cantonment consists of good houses, built at the base of a hill, with a fort at the top and a Catholic chapel, to which, on certain days, the Catholics of the vicinity resort in great numbers.

Arcot, the capital of the Carnatic when it was a soubah of the Mogul empire, and the residence of the Soubahdar, commonly called the Nabob of Arcot, consists of a fort surrounded by a large town, on the banks of the river Palar. *Vellore* is a fine fortress partly of European, and partly of native construction; but is not of much value as a military position, being commanded by the adjacent hills. It is used as a kind of state prison, and as such is tolerably secure, being surrounded by a wet ditch which abounds with alligators of great strength and ferocity. *Tripetty*, 52 miles N. of Arcot, in a secluded hollow surrounded by mountains, contains the temple of Vencata-Rama, an avatar of Vishnu; whose shrine is considered too holy even to be looked on by a Moslem or a Christian. *Kurnool*, on the Tungabudra, the capital of a petty state, the Nabob of which has been recently deposed, and his state confiscated, for a rebellious plot. *Nundidroog*, a celebrated fortress, fast falling to decay, on a hill 1700 feet high, and almost inaccessible, is only noted now for the growth of potatoes, and for the manufacture of a very fine kind of soft white sugar. *Bangalore* is a town in Mysore 2900 feet above Madras, in a very temperate climate, where the thermometer seldom rises above 80°, and where the cypress and the vine grow luxuriantly. It contains a large proportion of good sized houses, built of red earth covered with tiles, carries on an extensive commerce, and contains about 60,000 inhabitants. The fort is still a strong position; the cantonment, about three miles distant, generally contains four or five regiments of native infantry, two Queen's regiments, with Company's artillery, and numerous civilians, forming altogether a large society. At a little distance is the *Wynaud Jungle*, which contains many wild elephants. *Seringapatam*, a fortified city upon an island in the Cauvery, formerly the capital of the kingdom founded during last century by Hyder-Ali, and which terminated with the death of his son and successor Tippoo Saib, who perished at the storming of Seringapatam by the British forces, 4th May 1799. Population about 30,000. The place, however, is so unhealthy that the garrison has been removed to a plain seven miles off, called the *French Rocks*, where the atmosphere is more salubrious. At *Malavelly*, 25 miles E., and *Seedapore*, 54 miles W. of Seringapatam, Tippoo was defeated by the advancing British armies in 1799. *Hunsoor*, about 30 miles N.W. of Seringapatam, was originally merely a depot for the cattle bred for the transport of ordnance and army stores; but of late the preparation and manufacture of tanned and buff leather have been introduced, and have so rapidly improved that the town is now able to supply every sort of leather equipments as good as those from England at half the price. All sorts of work in brass, iron, copper, and wood, are also neatly executed, sufficient in every respect for the Madras army. Hunsoor has so many advantages that at the shortest notice it can supply all the requisites for an army of 50,000 men. It enjoys a fine climate, and in no part of the presidency are the gardens of flowers, fruit, and vegetables, so beautiful and so productive. *Sravana-belgula*, a village wholly inhabited by Jains, 36 miles N. by W. of Seringapatam, is noted as the principal seat of the Jain worship in the south of India. It contains a colossal statue 70 feet high, apparently formed by cutting away the rock of which it consists. *Ootacamund*, a town or village in the Nilgherries, 6416 feet above the level of the sea, is a great resort for valetudinarians. The temperature near the town is never so high as that of an English summer, nor so low as that of an English winter. A register kept for four years showed a variation from 36° to 70° Fahrenheit, but in nineteen days out of twenty the variation was from 42° to 65°. The average fall of rain has been found to be 45 inches in the year, more than double the quantity which falls at London. *Wallajahabad* contains extensive military cantonments. *Cuddalore* is one of the great stations for soldiers who wish to remain in India after having served out their time, or having become invalids. *Tanjore*, the capital of a rajah, contains the finest pyramidal temple in India, in the precincts of which is the figure of a bull in black marble, finely sculptured. *Combaconum*, in Tanjore, contains 40,000 inhabitants, and is distinguished for its sanctity; near it, in the midst of a richly cultivated country, is a sacred pond, which once in twelve years is filled with the waters of the Ganges, which are supposed to travel so great a distance under ground, and to have the quality of washing away the sins of those who bathe in them. It is in consequence resorted to on these occasions by multitudes of pilgrims. *Porto-Novo*, on the coast of the Carnatic, contains flourishing iron-works which supply steel and steel-ware of excellent quality at a very low price. *Mahabalipuram* or *the Seven Pagodas*, near Sadras, a collection of extraordinary ruins, consisting of temples cut from the solid rock, and covered with sculptures, which are said to mark the site of a great city now partly covered by the sea. *Chillambarum* or *Chillumbrum*, 9 miles S.W. of Porto-Novo, contains several celebrated pagodas, the principal of which is an exquisite specimen of Hindoo architecture; and at *Trivicary*, 15 miles W. by N. of Pondicherry, is a magnificent pagoda, with a stupendous stone tower rising over its gate. In its vicinity are found the most extraordinary petrifactions. Near Trichinopoly, in the Cauvery, is the island of *Seringham*, also celebrated for its pagodas. This part of the peninsula is indeed renowned for its temples and ruins. *Trichinopoly*, on the Cauvery, is a strongly fortified city with 80,000 inhabitants; is very salubrious, and garrisoned by five or six regiments. *Chitteldroog* is a hill fort of such amazing strength as to be reckoned impregnable; but it has become so unhealthy that it has been found necessary to abandon it. *Calicut*, in Malabar, the residence of a prince styled the Zamorin, the first place in India where Vasco da Gama touched after his successful voyage round the Cape of Good Hope in 1498. It contains about 30,000 inhabitants. *Cananore*, a large town with a strong fortress, the principal military establishment on the coast of Malabar. *Mangalore*, a flourishing sea-port town in Canara, with 30,000 inhabitants. *Onore* or *Honauwur*, a sea-port town at the entrance of an estuary or large lake which reaches almost to the Ghauts, and in the dry season is salt. It is the estuary of a river which has a tremendous fall of 872 feet near *Girsupah*. It was at Onore that Hyder Ali built docks, and established a naval arsenal, which were subsequently destroyed. *Mangalipatam*, in the Northern Circars, a square fort in the midst of a salt morass, with a large pettah or native town, a mile and a half N.W., communicating with the fort by a causeway 6000 feet in length, is a place of considerable trade, and also of some military importance. It stands on a semicircular bay which affords tolerable shelter from all winds but the south-east. *Coringa*, a populous town on the coast of a large manufacturing district in the Northern Circars, near the mouth of the Godavery. The bay of Coringa affords excellent shelter for ships, and is said to be the only place on the east coast of India where a vessel of any burden can be refitted with safety.

§ 4. *Presidency of Bombay.*

The authority of this presidency extends over a considerable stretch of territory of the most irregular outline, with several detached parcels in the old Mogul provinces of Arungabad, Beejapore, Khandeish, and Gujrat; comprising altogether an area of 64,938 square miles. The principal part of the territory stretches along the west coast of the peninsula, from near Goa to the mouth of the Nerbuddah, 420 miles. It is divided into thirteen collectorates, namely, *Bombay*, *Poonah*, *Ahmednuggur*, *Khandeish*, *Dharwar*, *South Jagheerdars*, *Satara Jagheerdars*, *South Concan*, *North Concan*, *Surat*, *Broach*, *Ahmedabad*, and *Kairah*. The last four are situate in Gujrat, along the Gulf of Cambay; Poonah, Ahmednuggur, Dharwar, and the Jagheerdars, are situate in the table-land of the Deccan; Bombay and the two Concans below the Ghauts, along the sea-coast. The *Concan* or *Konkun*, is a long narrow tract, a continuation of Malabar and Canara, intersected by numerous rivulets flowing westward from the mountains, and indented with small bays and shallow harbours or coves. It presents a series of steep rocky mountains, rising abruptly like a wall, and affording scarcely any practicable access to the table-land for wheel-carriages. The districts of *Poonah* and *Ahmednuggur*

in the *Deccan*; are elevated 2000 feet above the level of the sea; and are intersected by rivers and streams flowing through the most beautiful valleys, overtopped by trap hills, many of which are crowned with castles of a highly picturesque appearance. Some parts of the country are exceedingly fertile; but, in general, owing to the mountainous and rocky nature of the surface, the district is very barren. In the districts of *Dharwar*, *Satarah*, and the *Jagheerdars*, the country near the Ghauts is extremely rugged; but the eastern portions are less so, and contain level tracts, where the rocks, which in some places stud the surface, are buried in a rich black mould. The Ghauts along the western border are not so much broken into masses as in some other places, but present continuous lines of mountain forests; and, along the banks of the rivers, the country is exceedingly rich and picturesque. At Poonah the annual fall of rain is only 25 inches, while at Bombay it is 100. Dews, however, are very copious, but fogs are little known. The climate is salubrious; there are two harvests, one during the hot and wet season, consisting principally of rice, the other during the cold or dry season. The rivers, during the monsoons, are magnificent streams; but in the dry season, their beds are often only sandy plains, with a mere thread of water. *Khandeish* is an extensive, fertile, well-watered plain, interspersed with low barren hills, at the base of which run numerous limpid rivulets which find their way to the Tuptee. Great part of the district is still covered with jungle. *Gujrat*, when a province of the Mogul empire, comprised a large extent of country along the eastern and northern shores of the Gulf of Cambay, with the whole peninsula of Kattiwar; but the name is now understood to comprise only the districts on both sides of the gulf which are dependent on the civil jurisdictions of Ahmedabad, Kairah, Baroda, Broach, and Surat; the remainder being distinguished as Kattiwar, which is under separate authority. In this restricted sense Gujrat is, generally speaking, a dead level, through which the mountain torrents of Rajpootana, Khandeish, and Malwah have cut their channels. The soil in most places consists of a loose, rich, alluvial deposit, in others of a deep sandy and mixed soil, resting on a calcareous formation, similar to that of Bengal and Bahar, and termed by the natives *Kankars*. The Nerbuddah and the Tuptee are the only rivers properly so called; for the Subermatti and the Mhye are merely great water-courses, which are almost completely dried up within three or four months after the rains. The climate is reckoned one of the worst in India, being intensely hot during the greater part of the year, with a heavy thick atmosphere, which few people can endure. During December, January, and February, the mornings and evenings are cold, and the rest of the day temperate and pleasant; the thermometer is then often under 60°, sometimes considerably lower, and at noon seldom exceeds 70°. But during the hot winds, in the ensuing months, it rises from 70° to 100°; and in the plains of Cambay it has been seen at 116° in the soldiers tents. (*Forbes' Oriental Mem.* III. 245.) The soil is particularly fertile; several sorts of grain may be seen growing in the same field. The Parsees are numerous, and form the most respectable part of the population of Gujrat.

BOMBAY, the capital of the presidency, is situate on a small, rocky, barren, and once pestilential island, on the north-west side of the entrance to the bay, in 18° 56′ N. lat., and 72° 57′ E. long. The city is built on the south-east side of the island, and is surrounded by walls about two miles in circuit, which are mounted on the sea side by formidable batteries. The houses are picturesque, but inconveniently crowded together; they are very lofty, and generally built in the Portuguese style. Three sides of the walls are washed by the sea; on the fourth is the esplanade, and beyond it the Black town, spreading out amidst a wood of cocoa nut trees, a curious, busy, bustling, and dirty place; and, still farther off, the cocoa nut gardens are studded with villas. Those who are obliged by business or duty to remain near the government house in the fort, live in town only during the rainy season; at other times they live in bungalows, or huts and tents on the esplanade, where they enjoy the benefit of the sea breeze. The population amounts to about 210,000, who occupy 30,786 houses, grouped into the several towns, called *Bombay Castle*, *Dungaree*, *Mahim*, *Byculah*, and *Colabah*. Including English and Portugese, there are no less than nineteen languages spoken in the island; a circumstance which proves the heterogeneous character of the population. Of the native community a large number are Parsees or Persians, who, driven from Persia in the eighth century, took refuge in Gujrat, and have now established themselves in Bombay. The greater part of the wealth of the place is in their hands. The Jews are more numerous, and a more respectable class than is to be found in any other part of India; they make good soldiers, and are found in considerable numbers in the ranks of the army. The markets are well supplied; and water is furnished from large cisterns or tanks, where it is collected during the rains. It is not considered wholesome; and a singular disease is ascribed to the use of it. An insect or worm appears on the body in a large vesicle or bag, sometimes as large as a hen's egg; when the bag is opened, the end of a worm, like a white thread, is seen in the midst of a gelatinous fluid. To remove the disease the end of the worm is seized, and gradually wound on a dossil of cotton wool, a few turns being taken daily till the whole is extracted. It is sometimes several feet long, and occasions great pain. Bombay is the only principal settlement in India, where the rise of the tides is sufficient to permit the construction of docks on a large scale. The highest spring tides rise 17 feet; but the usual height is only 14. The docks and dockyards are capacious, and are entirely occupied by Parsees, who are complete masters of the art of ship-building, and construct vessels of the largest class. Bombay is the great entrepot for the trade of the Red Sea, the east coast of Africa, Arabia, the Persian Gulf, Indian archipelago, and China. European and American vessels find cargoes here from the greater part of India, consisting of drugs, spices, arrack, shawls, carnelians, agates, cotton-wool, &c. Many fine ships are owned by Parsees and other native merchants. The island is composed of two unequal ranges of whinstone, with an intervening valley about three miles in width; it has been converted from an unwholesome swamp into a very salubrious residence; is traversed by five roads and connected by a causeway with Salsette, a great portion of which is now under cultivation. The principal objects of curiosity near Bombay are the caves of *Kenery*, in Salsette, and *Elephanta*, on a small island in the bay, six miles E.S.E. of the town; the latter containing a remarkable three-headed figure of Siva and his wife.—(*See Journal R. As. Soc.* V. 81.)

SURAT or SOORUT, a very large city, with 600,000 inhabitants, on the right bank of the Tuptee, 20 miles from the sea, is the station of a considerable military force, of a collector, of a board of customs, a circuit court, and the Sudder-Adawlut, or supreme court of the presidency. It is nevertheless falling rapidly to decay, in consequence of its trade having been diverted to Bombay; and in April 1837 many thousand houses were destroyed by fire. The most remarkable object in Surat is the pinjra-pol, an hospital for sick, aged, and maimed animals, supported by the Banians. Even rats, mice, and insect vermin of all kinds, are not only tolerated, but fed. Surat and its neighbourhood are thronged with religious devotees, as fakirs, jogies, and gossaens; and at *Pulparrah*, on the Tuptee, six miles distant, is a holy place, abounding with altars, temples, and sacred trees. *Baroche* or *Beroach*, *Beroatch* or *Broatch*, a poor dilapidated town, 25 miles from the sea, on the left bank of the Nerbuddah, which is here two miles across, even at ebb tide, but very shallow, has a considerable trade in exporting cotton to Bombay, and contains about 30,000 inhabitants. In an island 12 miles above the town, is the banyan tree which has been renowned ever since the arrival of the Portuguese, and is still flourishing. *Kairah*, a large and neat town, surrounded by a lofty wall, at the confluence of the small rivers Wartuk and Serry, 30 miles north of Cambay. There is a large military cantonment, a mile and a half from the town, which is extremely unhealthy. *Gundivi*, *Monsera*, and *Balsun*, are large and populous towns, remarkable for their order and cleanliness. *Bassein*, 16 miles N. of Bombay, once a celebrated Portuguese colony, was formerly a town of considerable size, surrounded by a regular

rampart and bastions, but is now forsaken and desolate. It contains eight churches, and the ruins of several magnificent buildings; but is inhabited only by a few fishermen and shikaries. *Tannah*, a neat and flourishing town, and *Gorabunder*, a village, are both in Salsette.

POONAH or PUNAH, lately the capital of the Mahratta empire, is situate in a small hollow, on the banks of the river Moota-Moolla, in a very extensive and barren plain, 2000 feet above the level of the sea, and surrounded by trap hills of singularly scarped forms, which rise from 1500 to 2000 feet higher. The city is without walls or fort, and till recently was very irregularly built and ill paved, with inferior bazaars, and ruinous streets; but it now presents a totally different appearance. Excellent streets and drains have been formed; all the nullahs (river channels) have been covered, and every part of the city made conveniently accessible. Population 70,000. Poonah contains a Sanscrit college, where grammar, logic, law, rhetoric, and astrology are taught. At the governor's bungalow, called *Dapourie*, a mile or two from Poonah, is a good botanical garden, filled with the choicest plants. *Singhur*, 10 miles S.W. of Poonah, affords a cool and salubrious retreat; but possesses no accommodation for visitors. *Kirkee* or *Kirky*, a small but pretty cantonment, is connected with Poonah by an excellent road. *Candala*, the Montpellier of Western India, is a village on the road to Panwell. *Chinchoor*, 10 miles N.W. of Poonah, is the residence of a live god, a supposed incarnation of Ganesa or Ganputty, the tutelar deity of the Mahrattas, whose revenues are about £5000 a year. *Carli* or *Karli*, 45 miles N.W. by W., contains a famous cave temple. *Panwell*, a small and dirty village on the east side of Bombay harbour, the landing-place for travellers from Bombay to Poonah, which are connected by a splendid road over the Ghauts. *Ahmednuggur*, 83 miles N E. of Poonah, once a large city, and the capital of a kingdom, is now little better than a heap of ruins; it contains a strong stone fort, of an oval shape, about a mile in circuit. *Joonere* is a town and fortress of great natural strength, 48 miles N. of Poonah. *Trimbuck*, a formidable and wonderful hill fort at the source of the Godavery, measuring 10 miles round the base, and rising in a perilous steep of 600 or 700 feet. *Unkietunkie*, 130 miles N.N.E. of Poonah, is one of the most complete specimens of natural fortifications that exist. It rises on every side from 150 to 200 feet in perpendicular height, inclosing on the top a level plain a mile in circuit; the ascent is made by flights of steps cut in the rock, and secured by strong gateways. It has granaries, magazines, and armouries, all hewn in the rock, and thus setting bombardment at defiance. *Asseergurh*, a town and fortress of great strength, in a small detached territory, near the north bank of the Tuptee, 215 miles E.N.E. of Surat. The fortress is built on a rocky hill, surrounded by a precipice 80 to 100 feet in perpendicular height, and measuring 600 yards in length by 100 in breadth. *Dharwar*, the capital of the South Mahratta country, is a large military station. *Belgaum*, a strongly-fortified town, in a small isolated division of Dharwar, has a healthy climate, but the trade is stopped for six months in the year by the rains.

§ 5. *Subject States.*

The KINGDOM of HYDRABAD, belonging to his Highness the Nizam-ul-mulk, the hereditary Mogul Soubahdar of the Deccan, occupies the middle portion of the table-land of the Deccan, measuring about 460 miles in its greatest extent, N.S. and E.W., and containing above 100,000 square miles. The country comprises some fine tracts of land; and, towards the north, the valley of Berar is particularly fertile. It is traversed by the Godavery and the Kistnah, with their numerous tributaries; the occupations of the people are chiefly agricultural; but the government is very indifferent, and everything is in the worst condition. The Nizam's subsidiary force consists of six battalions, disciplined and officered like the British seapoys; some of the officers have no rank but in the Nizam's service, but most of them, especially the commandants of corps, are in the service of the East India Company. The appointment to the higher ranks is in the patronage of the governor-general; but the minor appointments are generally made by the resident at Hydrabad. His proper army contains cavalry, infantry, and artillery. The infantry consists of from 12,000 to 15,000 regular troops, who may, however, be regarded as a sort of militia, being rarely employed beyond his frontier. The artillery are also under the direction of European officers, and form a very efficient body. His cavalry, generally called the irregular horse, are not equal to the infantry in order, dress, and discipline, nor have they the same proportion of European officers; most of them are Moslems, and bigotted in their attachment to ancient customs. A great part of the country is possessed by Jaghiredars, or persons who have districts assigned to them in Jaghire, who draw all the rents, and are, in short, almost the counterparts of the feudal barons of Europe during the middle ages. Only a small portion of the kingdom is governed directly by the Nizam himself. His Highness is the descendant of Nizam-ul-mulk, who, after the death of Aurungzebe, obtained possession of the Mogul conquests in the Deccan about the year 1717; but, since that time, the limits of the territory have experienced great fluctuations. His capital is Hydrabad; and the other principal towns, with their distances from the capital, are stated in the following table:—

HYDRABAD, the capital, N. lat. 17° 15′; E. long. 78° 42′; 380 miles E.S.E. of Bombay, and 320 N N.W. of Madras.

Ajuntah,	280 N.W. by N.	Eilgundel,	85 N.N E.	Manickdroog,	170 N. by E.
Akola,	270 N.N.W.	Ellichpore,	280 N.W. by W.	Moodgul,	160 S.W.
Anagoondy,	190 S.W.	Ellora,	280 N.W.	Muktul,	85 S.W.
Argaum,	280 N.W. by N.	Gawulgurh,	290 N.W. by W.	Mulkher,	85 W. by S.
Assaye,	260 N.W. by N.	Golconda,	6 W.	Mullangoor,	85 N.E.
Aurungabad,	265 N.W.	Jaffierabad,	256 N.W. by N.	Mungahpett,	148 E.N.E.
Beeder,	78 N.W.	Jaulnah,	240 N.W.	Omrawutty,	250 N. by W.
Bongneer,	30 E.N.E.	Kulburga,	110 W.	Puralnda,	200 W.N.W.

Eidgeer,	96 S.W.	Maiduck,	53 N.N.W.	Warungul,	84 N.E. by E.

Hydrabad is a large city, densely inhabited by Moslems, Patans, and Hindoos; but the first class greatly predominate, and are the most turbulent and ferocious set of ruffians within the limits of India. Riots and tumults are of almost daily occurrence, and are rarely checked without the interference of the military. The state of morals is very low; unnatural crimes are so common that they form a topic of ordinary conversation. An officer who resided a short time in the city declared that, "compared with Hydrabad, Sodom would be found innocent, and Gomorrah the perfection of purity." The lives and properties of the nobles, merchants, and bankers, would not be safe for a single day were the British troops withdrawn; the crowds of half-starved ruffians that infest the streets would plunder the city, but for the awe in which they are kept by the garrison. There are few manufactures of importance; the principal are silks interwoven with gold, called kinkaabs, turbans, and small ornaments. The British subsidiary force, with the Nizam's contingent, are stationed at some distance on the outside of the city, in the cantonments of *Secunderabad* and *Bolarum*. They consist of about 12,000 men, one-tenth of whom are Europeans; the whole are kept in a high state of discipline and efficiency. A fine house built in the European style, from the design of a British engineer officer, was recently erected by the Nizam for the British resident. The population is estimated at 80,000. The neighbourhood of Hydrabad is beautiful and highly diversified, meriting the character which an old

traveller gave of Italy,—"It is a paradise inhabited by devils."—(*Beveridge*, II. 75.) The fort of *Golcon* 6 miles W. of the city, is the depository of the Nizam's jewels and treasures; it is strictly guar and no stranger is permitted to enter it; but the bankers of Hydrabad are allowed to have ho within the fort for the security of their property. It is built on a rocky ridge, and has some re blance to the castle of Edinburgh, but the rock is not so high nor so abrupt; and at the distanc 600 yards from the fort, on a plain, are the tombs of the kings of Golconda, a dynasty who ruled this part of India in the 16th and 17th centuries. The tombs present several splendid specimen the Saracenic style of architecture, and consist generally of square buildings surmounted by bull domes, which are highly decorated. The diamond mines, for which Golconda has acquired so m repute, are not near the fort, but at the base of the Neela-moolla mountains, between the Kris and Pennar rivers. They are now exhausted and deserted. *Ajuntah*, a village, beyond which is celebrated *Ajuntah-ghaut* or pass, leading from the table-land down to the valley of Khandeish. descends about 800 feet with a gentle declivity of about 1 in 25. *Argaum*, a village 40 miles W. b of Ellichpore, where a battle was fought in November 1803 between the British, under Colonel W lesley (Wellington), and the forces of Scindiah and the Rajah of Berar, the latter of whom was c pletely defeated. *Assaye* or *Asye*, an insignificant village at the confluence of the rivers Ketnah Juah, 50 miles E.N.E. of Aurungabad, is celebrated for a decisive victory gained by the British tr under Wellesley over the combined armies of Scindiah and the Rajah of Berar, 23d September *Aurungabad* is still a large city, though greatly fallen from its former grandeur when it enj the favour of the Mogul emperor Aurungzebe, whose name it bears. It is situate in a hollow, the banks of the Kowlah, a mountain stream which separates the city from a suburb called *Beg poora* (Lady's-town), the communication being preserved by two substantial bridges. Nearly the town is in a state of decay and ruin; but the population still amounts to about 60,000. Aur gabad is the station of a British political resident, and the head-quarters of a portion of the Niza army, under British officers and control. The cantonments stand about a mile S.W. of the upon a rocky plain, which is free from the malaria by which the banks of the Kowlah are fested. Aurungabad contains the palace of Aurungzebe, and the tomb of his favourite wife Ra Dooraunee. The tomb resembles the Taj-mahal at Agra, but is built of coarser materials, with the defects and few of the beauties" of its model. The tomb of Aurungzebe himself is at *Roza* small town 8 miles N.W. of Dowlatabad. *Beeder*, a large but decayed city, was formerly the capit a *soubah* or province of the Mogul empire. *Dowlatabad*, the Hindoo *Deoghur*, one of the most rem able fortresses in the Deccan, 7 miles N.W. of Aurungabad, is an isolated mass of granite, about yards distant from the hills which stretch to the north and west, which rises 500 feet above the pl For nearly a third of the height the rock has been scarped like a wall, and presents all round a pendicular cliff. Above this the hill assumes a conical form, on the peak of which is the Niza flag-staff, and a large 24-pounder. The only access to the fortress is by a sloping passage cut in body of the rock, and carefully secured. Strong as it is, and apparently impregnable, Dowlata has nevertheless been taken several times, and is now of small importance, as it does not comm any road, pass, or district of country. At the foot of the rock is the pettah or town. At *Ellora*, a miles N.W., are celebrated cave temples. *Ellichpore*, the former capital of the Mogul provinc Berar. *Gawulgurh*, a fortress, 32 miles N.N.W. of Ellichpore, was stormed by the British tro under Wellesley and Stevenson, 14th December 1803. *Jaulnah* or *Jalnah*, a British military stat situate in an open fertile country, on the banks of the Ketnah, with a small but strong fort. *Mal* is a hill fort, three miles in circumference, consisting of walls of solid masonry, with parapets loop-holes for musketry. The town is in ruins, and would have been quite deserted had it not b a place of peculiar sanctity, in consequence of containing a temple of the goddess Bhowani, to wh pilgrimages are made from every part of the Mahratta country. *Omrawutty*, a large town, the c mart of the Deccan, and the residence of several rich bankers, is three miles in circumference, is surrounded with a stone wall.

BERAR, or the KINGDOM OF NAGPORE, is situate chiefly in Gundwana and Orissa, between Nizam's territory on the south-west, the Northern Circars on the south-east; the ceded distr on the Nerbuddah on the north-west, and the ceded districts of Gundwana on the north-east. extends about 330 miles from N. to S., and 300 from E. to W., and comprises about 56,000 square E lish miles. Berar is fertile in dry grains; peas, vetches, flax, sugar, betel, and tobacco, are also rai The wheat is reckoned the best in India, and, with maize, forms the principal food of the people. large proportion of the country has been brought into cultivation since it came under British cont The sovereign is the Bhoonslah rajah, recently a feudatory of the Mahratta empire, who is allowe maintain a standing army of only 1000 horse. The principal towns are:—

NAGPORE, the capital, N. lat. 21° 9′; E. long. 79° 45′; 600 miles W. by S. of Calcutta, 420 E.N of Bombay, 570 N. by W. of Madras.

Ajmerghur,	220 N.E. by E.	Dhumterry,	118 E.	Pownar,	44 S.W.

Comptah,	74 N.E. by E.	Pertabghurgh,	66 E.S.E.		

Nagpore or *Nagpoor* is a large town, rather more than 5 miles in circuit, and contains about 80 inhabitants. The greater part of the houses are merely mud hovels, arranged along narrow wind paths; but there are also several lofty houses roofed with red or black tiles, and handsomely or mented with stucco. The town contains two palaces, the one possessed by the Goond-rajah, the scendant of the former sovereigns of Gundwana, who has a small allowance, barely sufficient for subsistence of his family; and the other, a new palace, inhabited by the Bhoonslah rajah, a small beautiful building, consisting of stone walls covered with stucco, and adorned with highly car balustrades. Nagpore has a few manufactures of silk, cotton, arms and accoutrements, and a c siderable transit trade. The neighbouring country is fertile, and contains many beautiful garde but scorpions are abundant among them. The British residency and fort on the Seetabuldee h which adjoin the city, are now garrisoned only by a small detachment of infantry, relieved at st periods from the cantonment at *Kamptee*, about 9 miles distant N.E., on the left bank of the Kha river; which has been selected in preference to the original station near Nagpore, on account of superior advantages. The change has proved equally beneficial to the health and to the moral the soldiers. The force usually consists of about 6000 men. *Ramteak*, 22 miles N.E. of Nagpore, within the British territory, is a place of great sanctity among the Hindoos, who have numer temples all over the hills. *Chandah*, a walled town 3 miles in circumference, with a tolerably str citadel in the centre, stands on the confines of a dense jungle, and is protected on two sides by a l and on the other sides by deep ravines, broken ground, and the sandy bed of river.

The Rajahs of SATTARAH, KOLAPORE, SAWUNTWARRE and others in the Deccan, are Mahr princes. The first possesses a large territory in the old Mogul province of Bejapore or Visiapore, is the descendant of Sivagee, the founder of the Mahratta empire. The rajahs were for many y

kept prisoners at Sattarah, while the government was administered by their hereditary *Peishwah*, who resided at Poonah; but, on the downfall of the latter in 1817, the sovereign was restored to his throne by the British Government, with a considerable portion of the Mahratta territory. The territories of Kolapore and Sawuntwarce are petty states; the former in the Deccan, to the south of Sattarah; the latter in the Concan, to the north of Goa. *Sattarah* is a strong hill fort, and town, 47 miles S. of Poonah. The British cantonment at Sattarah is beautifully situate in a lovely valley, which is surrounded by towering mountains. The summer retreat of the Europeans of Sattarah and Western India, is a spot on the *Mahabaleeshwar hills*, 30 miles N.W. of Sattarah, computed to be 4500 feet above the level of the sea, where several pretty bungalows have been erected, also a sanitarium for invalids, and a church. The view is most extensive and magnificent, including a great part of the Concan, and the sea at the distance of 30 miles. Four miles from the sanitarium, at the village of Mahabaleeshwar (*i. e.* the great and good God), are the two sources of the river Kistnah or Krishna, over whose sacred waters are placed large and curious temples, in each of which the stream, issuing from the mouth of a figure of the sacred bull Nandi, is received into a small tank, whence it flows through a beautiful and fertile valley. The climate of the hills is often cold enough to render fires necessary, and is found to be highly renovating; fogs are prevalent in autumn, but produce no unpleasant or dangerous effects. The walks and drives about the hills are numerous and beautiful. The rajah is constructing a great *bund* or dam for a tank on the hills; and other great public works, as bridges and roads, are in progress throughout his territory. From the village of *Mhar*, on the western side of the Ghauts, there is a conveyance by boats to Bombay. The hills are overlooked by *Pertabghurgh*, the finest fort in the Deccan, built by Sivagee, and containing a temple of great sanctity, which is visited yearly by his descendant, the rajah. The fort is now abandoned as a military station, and contains only a few seapoys for the garrison, and a few Brahmins for the service of the temple. *Bejapore*, *Bijapur*, or *Vejapore*, "the Palmyra of the Deccan," a large decayed city, 125 miles E.S.E. of Sattarah, is an immense mass of ruins, and of half-decayed tombs, palaces, mosques, caravansaries, and other buildings of every kind. It was formerly the capital of a powerful kingdom, ruled over by the Adil Shahee dynasty, the last of whom was subdued A.D. 1685, by the Mogul Emperor Aurungzebe, who made it the capital of one of his provinces Bejapore is said to have contained 984,000 inhabited houses, and 1600 mosques. Though not so totally abandoned as some other famous cities, it contains a very scanty population, composed chiefly of Moslem priests and religious mendicants attached to the mosques, poor Mahrattas, and some very orthodox Hindoos. The walls of the citadel and principal buildings are of hewn stone. *Punderpore*, 86 miles east of Sattarah, on the right bank of the Beema, is a very prosperous and populous Mahratta town. It is a holy city, and has a temple of peculiar sanctity, to which vast numbers of pilgrims resort. There are also in the city 12 large palaces belonging to the principal Mahratta chieftains, each strongly fortified, and proof against any attack without guns. In former times these chiefs used to visit Punderpore annually, either in person or by deputy; but the concourse of ordinary pilgrims still remains undiminished.

TRAVANCORE extends along the coast of Malabar, 140 miles northward from Cape Comorin, by about 40 in breadth. The whole territory is in the highest degree picturesque and beautiful, consisting of hills, valleys, and mountains, watered by numerous streams, and covered with magnificent forests. Elephants, buffaloes, tigers, monkeys, and apes abound in the woods. The produce consists of rice, pepper, betel, cocoa nut, tobacco, cassia, maize, long nutmegs, and wild saffron. COCHIN, a small territory, adjoins Travancore immediately to the north, and consists of a succession of narrow valleys watered by small streams, where rice is cultivated. The mountains are covered with forests, and the groves are studded with palms, jacks, mangoes, and plantains; the forests abound with teak, ironwood, blackwood, and jackwood. The chief exports are pepper, cardamums, teakwood, sandalwood, cocoa-nuts, coir, cordage, cassia, and fish maws. *Trivandrum*, the capital of Travancore, is a populous town, 60 miles N.W. of Cape Comorin. *Anjengo*, *Quilon*, *Alipee*, or *Alipelly* or *Aulapolly*, are seaport towns on the coast northward. *Cochin*, a large town 3 or 4 miles in circumference, was formerly the capital of the Dutch possessions in India, but is now very much reduced, and contains only 10,000 inhabitants. It is situate at the mouth of a sort of river, which is entered over a dangerous bar, having 17 or 18 feet at high water of spring tides. On the outside of the bar the anchorage is good, and within, the river expands into a fine estuary, 3, 5, and 6 miles wide, 12 miles long, and deep enough for the largest ships. As a place for ship building Cochin is still superior to all the ports on this side of India, except Bombay. The river communicates with the *Backwater*, a natural system of inland navigation, which extends parallel with the coast from Chowghaut in Malabar to Trivandrum, a distance of about 170 or 180 miles, being sometimes only a few hundred yards, at others, 3 or 4 miles from the sea, varying in width from 12 miles to 200 yards, and in depth, from a few feet to many fathoms. Into this backwater, as a grand trunk, all the numerous rivers and streams which flow westward from the Ghauts are discharged. It communicates with the sea by six openings, the only one of which that is navigable for ships is at Cochin.

MYSORE, a territory of considerable extent in the southern division of the table-land formed by the converging of the Eastern and Western Ghauts, was constituted a kingdom in 1799, in favour of the descendant of the ancient rajahs of Mysore, who had been dethroned by Hyder Ali. But his Highness having been guilty of the grossest misrule, was superseded by the British Government in 1833, and his states are now administered by officers of the Madras presidency.

SIKIM is a small principality in the hill country between Nepaul and Bhotan, containing about 4400 square miles. The chief town is *Sikim*, on the west bank of the Jamikuma river, which rises on the south side of the Himalayas, and opposite the town, separates into two branches, that flow round a large mountain, upon the top of which is a stronghold named *Tasidong*. *Darjeling* or *Darjelling* or *Dorjeeling*, 36 miles S.E. of Sikim, and 340 north of Calcutta, has been fixed upon for a sanitarium. It can be reached from Calcutta in four days, and steam-boats can ascend the Teesta to *Kishengunge*, which is only one day's journey from the hills.

The KINGDOM OF OUDE is situate in the basin of the Ganges, to the north of Allahabad, and contains about 25,300 square miles, being about 250 miles in length, by 100 in breadth. The whole surface is flat, extremely fertile, well watered, and produces abundantly wheat, barley, rice, and other grain, sugar, indigo, opium, and all the richest articles used in India. The kingdom is governed by the hereditary vizier of the Mogul empire, a descendant of Saadut Khan, a private horseman in the Mogul army, who obtained the *soubah* of Oude in 1722. In 1819 the Vizier-Soubahdar, with the sanction of the British Government, assumed the sovereign title of *Padishah* or king, thereby renouncing his nominal dependence on the Mogul emperor; but the government is of the worst description, and the people are sunk in poverty and misery. *Lucknow*, the capital, is situate on the right bank of the river Goomtee, 650 miles N.W. by W. travelling distance from Calcutta. Great part of it consists of narrow dirty streets, with mean clay houses and abounds with beggars. There are, however, some fine streets, with handsome houses, and well filled bazaars; and the king's palaces, the tombs, and principal mosques, built in a highly ornamental style, display considerable splendour. Population about 500,000. *Constantia*, the residence of the late General Claud Martin, by whom it was built at the cost of about £150,000, stands in the neighbourhood. *Fyzabad*, the former capital, is situate on the right bank of the Gogra, 80 miles E. of Lucknow; and is still of considerable extent, with a numerous population. A few miles distant to the eastward, are the ruins of *Oude* or *Ayodhya*, the ancient capital of the demigod Rama, situate on the banks of the Gogra, which is still resorted to by numbers of pil-

grims, who walk round the supposed sites of its temples, bathe in its sacred pools, and perform other ceremonies. Oude is said to have been built by Menu, the legislator of India, and to have been a very large and splendid city. The other principal towns are: *Beraytch*, *Bulrumpore*, *Tandeh*, *Biswa*, *Khyrbad*, *Shahabad*, *Roy-Bareilly*, and *Manickpore*.

BUNDELCUND or BUNDELKHUND is an elevated country to the south and south-west of Allahabad, consisting of parallel ranges of mountains supporting successive table-lands. Part of it is within the immediate territory of the British Government; the remainder is divided among the petty princes of *Rewah*, *Sumpthur*, *Jhansi*, *Jalown*, *Oorcha* or *Tehree*, and *Dutteeah*.

BHURTPORE is a small state to the westward of Agra, inhabited by Jauts, who originally migrated from Moultan. The inhabitants are descended from a low Sudra caste, and are distinct from the Jauts, or old Moslem peasantry of the Punjab. *Bhurtpore*, 34 miles W. of Agra, was a strong fortress, which twice defied the British power. In 1805 it maintained an obstinate defence against Lord Lake; but in 1826 it was again besieged, taken by storm, and its ramparts demolished. The Rajah has another fort named *Deeg*, 22 miles W. by S. of Muttra.

The Rana of DHOLPOUR, BARREE, and RAJAH KAIRAH, acquired these possessions in 1804, in exchange for Gwalior and other hereditary estates surrendered to Scindiah and the British Government. His revenues amount to about £50,000 a-year. His ancestors were, in the beginning of last century, Zemindars of Gohud, then a petty village, but raised to a town and the capital of a principality by their warlike qualities and industry. They were afterwards tributaries of the Mahratta empire, and latterly of Scindiah. The capital is *Dholpour*, a considerable town about a mile from the left bank of the Chumbul, and 40 miles S.S.W. of Agra.

BHOPAL is a considerable territory in Malwah, or Central India, extending about 120 miles along the right bank of the Nerbuddah, and including an equal extent of the Vindhya mountains, with a portion of the table-land; altogether above 7300 square miles. The surface is very uneven, and full of jungle; but the soil is generally fertile, especially in the valleys. The dominant people are Patans, who were established here in the 17th century by Aurungzebe; the state was constituted in its present extent by the Marquis of Hastings in 1817. The principal towns are *Bhopal*, *Islamnuggur*, a fortress 5 miles N. of Bhopal, and *Ashtah*. In Malwah are also situate the small principalities of *Dhar*, *Dewas*, *Rutlaum*, *Sitana*, *Nursinghur*, *Amjheera*, &c. *Dhar*, is an ancient city once containing 20,000 houses, but has now only about 5000, which are surrounded by a mud wall. The Rajah also possesses *Burwiah*, a town of 3300 houses, 24 miles N of Bhopal.

HOLKAR or HOLCAR, one of the principal feudatories of the late Mahratta empire, whose dominion, at the beginning of the present century, extended over a large portion of Central India, is now reduced to the possession of a small territory of 4245 square miles, lying chiefly in the valley of the Nerbuddah, but extending also over the Vindhya mountains into the table-land of Malwah, the extremities being about 120 miles distant N.S. His capital is *Indore*, a small town in Malwah, 456 miles N.E. of Bombay. In 1840 an English school for native youth was established at Indore by Sir C. M. Wade, the British resident, to be supported by contributions from the sirdars (officers of government) and rich natives of the city. *Mhow*, or *Mow*, 10 miles S. of Indore, and 2019 feet above the level of the sea, is a cantonment for British troops, who have a depot for their stores in the citadel of *Jaum*, a small town 22 miles further south, at the head of a steep but much frequented ghaut, or pass, which has a descent of 1632 feet down to *Mundlesir*, a small town on the Nerbuddah, with a well built fort of masonry, and a British cantonment. *Mhysir*, 8 miles W. of Mundlesir, also on the right bank of the Nerbuddah, is a city with 3500 houses, a large fort, and several beautiful temples. *Mundutta*, 35 miles E. of Mundlesir, and 42 S.E. of Indore, a small town on an island, which rises from the Nerbuddah in the form of a hill of moderate height, contains a pagoda dedicated to Ongkar, the phallic emblem of Mahadeva-Siva. It is one of the twelve places where the deity is considered to be peculiarly present; he is known here in the form of the mystic syllable OM. About three-quarters of a mile east is a sacrifice rock, called Bheercailah, from which devotees throw themselves, during the feast of Cartic-jattra. *Woon*, or *Wone*, a decayed town also in Holkar's territory, 27 miles S. by W. of Mhysir, was formerly a large city, said to have contained 99 Jain temples, of which the remains of about 20 can still be traced. *Maundoo*, the ancient capital of Malwah, situate 27 miles S.W. of Mhow, is now completely deserted, but still contains numerous remains of fine buildings overgrown with jungle.

The GUICOWAR or KING OF BARODA, also one of the feudatories of the Mahratta empire, possesses a large scattered territory in Gujrat, on both sides of the Gulf of Cambay, which comprises altogether about 35,000 square miles, including the peninsula of Kattiwar. The peninsula, however, does not belong to the Guicowar in absolute sovereignty; but is possessed by a great number of petty chiefs, of whom 137 were tributary to the Peishwah, and 111 to the Guicowar. The Peishwah's share of the tribute was ceded to the British Government in 1818; and these turbulent chiefs are now not only secured against external aggression, but are kept at peace among themselves by their powerful masters. They are free to exercise sovereign authority on their own estates, and are exempted from the authority of the British courts of law. The peninsula is hilly in the interior, and, being rather scantily supplied with water, is not productive of grain; but has everywhere abundance of the coarse vegetation suited to the soil. The coasts are full of creeks and inlets, which used to shelter numerous pirates, who easily escaped from cruizers, through the difficulty of the navigation. The Guicowar is the descendant of Piliajee Guicowar, the potail of a Mahratta village, who, early in the 18th century, assumed sovereign power. His capital is *Baroda*, or *Behroda*, *Brodera*, or *Brodra*, a large and populous city, with considerable trade, 240 miles N. by E. of Bombay, and about 12 miles E. from the estuary of the Mhye. The British cantonments are prettily situate two miles from the city. The other principal towns are: *Cambay*, at the head of the Gulf to which it gives its name, an ancient and renowned city, now very much reduced; *Puttun Sidhpore*, *Rhadunpore*, *Pulhanpore*, and *Deesa*, to the eastward of the Runn of Cutch; *Durraungdra*, *Hulwud*, *Mallia*, *Moravee*, *Wankaneer*, *Surdham*, *Paulytanna*, *Jaffrabad*, *Puttun-Somnath*, *Villawul*, *Joonaghur*, *Kotyana*, *Poorbunder*, *Juggut*, *Bate*, *Nowanuggur*, and *Jooria*, all in the peninsula of Kattiwar. *Puttun*, situate near the right bank of the Surraswuttee river, 64 miles N.N.W. of Ahmedabad, represents the ancient *Nehrwalleh* or *Anhulwarra*, the capital of Western India, a great emporium of commerce, and the residence of powerful princes, styled Balcaraes or Balharas, from the 8th to the 14th century. To attest the former splendour of this great city only four architectural relics exist; everything available was carried off in the 15th century to build Ahmedabad. *Puttun* or *Puttan-Somnath*, on the southern coast of Kattiwar, contains the remains of a celebrated temple of Somnath (Lord of the Moon), once possessed of immense wealth, which was plundered by Sultan Mahmud of Ghuznee, A.D. 1025. A Mahratta princess, Ahalya-Bhai, wife of Holkar, subsequently erected near the same spot a temple to Siva, which is still visited by pilgrims. The remains of the ancient temple stand on a bold promontory, visible at the distance of 25 miles; and the town contains abundant evidence of its original character as the capital of an extensive Hindoo territory. Its walls and gates are rich in the remains of Hindoo architecture, and the magnificently chiselled shrines of Hinduism form the bases of the finest mosques. It is now entirely Mahometan, but almost an entire ruin.—(*Burnes' Jour. R. As. Soc.* V. 105. *Postan.*) *Paulytanna* or *Palitthana*, is situate at the eastern base of *Satrunja*, the mount sacred to Adinath, the first of the Jain hierophants. A flight of steps cut in the rock lead to the top, through a variety of shrines, amongst which that of Adinath is the most holy.

Joonaghur, 46 miles N. by E. of Puttun-Somnath, is a large Moslem town with 16,000 inhabitants, and the capital of a Nawab. Near it is an ancient Rajpoot citadel called *Upah-kote*, a place of great historical interest, but now deserted; and a few miles E. of the town is the sacred *Mount Girnar*, a granite peak rising to the height of 2500 feet from an extensive plain. On a small flat near the summit are the walls of a fort inclosing a group of seven Jain temples of exquisite beauty, filled with idols, which give the place a peculiar sanctity. The summit consists of two peaks, the higher of which, the Gunidattara, is crowned with a small white temple kept by a Gosain, to which the ascent is very difficult. Great numbers of Banians, pilgrims, devotees, and travellers daily ascend the sacred mount; and in February a religious assembly or jattrah is held, when thousands of people attend. Outlaws and religious devotees are the usual inhabitants of Girnar; the scenery of the mount is of great beauty, unequalled even by that of the Ghauts.—(*Postan's Western India.*) *Dwaraka*, *Dvoarka*, or *Dwarrica*, near the western extremity of Kattiwar, is a small walled town with a magnificent pagoda dedicated to Krishna, which is visited by pilgrims from all parts of India. About 20 miles N. by E. of Poorbunder are the remarkable and splendid ruins of the ancient city of *Ghumli* or *Bhumli*, formerly the capital of the Ranas of Jaitwar, whose territory comprises that part of the coast within 30 miles of Poorbunder. (*Jour. R. As. Soc.* V. 73.)

CUTCH or KACH'H is a long narrow peninsula between the gulf of Cutch and the Runn, 165 miles in length, and varying in breadth from 15 to 52 miles. Through the middle, from east to west, stretches a range of hills called *Lunkhi-Jubberi*, from 1 to 8 miles in breadth, forming a mass of volcanic rock, destitute of wood, soil, and water, except during the rains, when numerous torrents pour down its sides. North of the Lunkhi is another range running parallel, and nearly mixing with it; the valley between the two ranges, and the plain between the Lunkhi and the sea, from 20 to 30 miles broad, interspersed with detached hills, form the arable part of the province. Close to the sea-beach is a high bank of sand, called *chigo*, which extends from the Indus to the gulf, and makes the country appear lower than the sea. Along the north side of Cutch, a tract of land, called the *Bhunni* or *Bunnee*, 40 miles long, and in few places less than 7 wide, and nearly separated from the rest of the province by an arm of the Runn, produces most luxuriant pasturage. The eastern part of Cutch is also a sort of peninsula, called *Wagur*. To the north of the Bhunni are two large islands, named *Puchum* and *Khureer*; and further east, the large island of *Sauntulpoor* so nearly occupies the neck of the Runn as to leave only two narrow straits between Cutch and the mainland. Nearly in the centre of Cutch is a conical hill called *Nunow*, well known to navigators, who distinguish it at sea by the name of *Chigo*; and a little to the east and north of Nunow is *Warra*, a remarkable hill, quite flat on the top, and with its edge so evenly defined as not to have a notch observable. Cutch consists mostly of secondary formations, such as laminated shales, a series of sandstones and shales inclosing beds of iron ore and coal, sometimes tolerably good, but generally very impure. The latter series forms the central and principal part of the province, where it rises into hills. The iron ore is smelted by the natives to some extent near the town of *Doodye*. In the southern part of the province is a range of hills composed entirely of basalt and other volcanic matter; traces of volcanic influence occur besides in different places, and the country suffers occasionally from violent earthquakes, one of which, in 1819, buried the town of Sindree, formed a large lake on the Koree or eastern branch of the Indus, raised a great embankment across its channel, which is now called the *Ullah-bund* (God's dam), and destroyed 1500 houses in the town of Anjar, and 7000 in Bhooj. The hills seem to have recently cooled from a state of fusion, the masses of rock are black and bare, thrown together in wild and chaotic forms, in many parts presenting large chasms, down which, during the monsoon, rapid torrents sweep into the plains, irrigating the valleys, which are covered with stunted brushwood, and afford good pasture for numerous flocks of sheep and goats. The vegetation, however, falls with the rains, and a soft sandy soil is again the principal feature of this sterile land. A few fields in the vicinity of the villages are cultivated; but the rest of the country presents nothing but a rocky and sandy waste, in many places scarcely relieved by a show of feeble vegetation, which consists of a stunted, thorny sort of brushwood, and a singular species of bramble called the *kheie*. Water is scarce, and is often brackish. The rains are usually slight; and the climate may be considered healthy, though at the close of the rainy season fever is prevalent, and, during the cold season, rheumatism. For nine months in the year the atmosphere is temperate and agreeable; in the hot months the temperature is high, and the weather stormy; in winter the cold is frequently intense, and ice is very commonly found on water placed in vessels which are exposed to the air during night. The produce of the land under cultivation is not sufficient to support the scanty population, so that Cutch, even in the best seasons, is dependent on Sinde for supplies of grain. But this deficiency of vegetable food is amply compensated by the abundance of animals. Perhaps no country of equal size so teems with animal life as the whole province, which literally abounds with game and wild beasts. Cutch is famous for a breed of horses, of very singular appearance, having a dip in the back, which looks as if the piece had been cut away. The wild ass, which is peculiar to the Runn and its borders, is singularly marked, and stands about 13 hands high; it is of a light fawn colour, with a broad dun stripe down the middle of the back, and is a handsome and well-shaped animal. The wild ass delights in the salt vegetation of the Runn, and is sometimes seen in herds of 60 or 70, but is so fleet as to defy pursuit; it is, however, taken in pitfalls, and the flesh is considered a delicacy by the Moslems, while it is abhorred by the Hindoos, who, on the contrary, eat the hog, which the Moslems hold in abhorrence. There are also great numbers of pea-fowl, which the Hindoos deem sacred. The moisture of the Runn is exceedingly conducive to the production of insects; musquitoes are seen in thick clouds; and, during the monsoon, the people of the Bhunni are obliged to quit their houses, and seek refuge in Cutch from the swarms of flies. The inhabitants of Cutch are partly Brahminical Hindoos and partly Moslems, the numbers of both being nearly equal. The dominant class are the Jarejahs (see *ante*, p. 695), who hold their lands of the Rao by military tenure, and have themselves numerous retainers called Grasias, who owe them immediate allegiance. There is also a class of warriors called Meyannahs, who were originally shepherds, but have become a fierce and warlike tribe, noted as robbers and mercenaries. They are Moslems, and can muster 3000 warriors. The total population of Cutch is only about 350,000. There is now some prospect of improvement in their condition; the country is protected by a British subsidiary force; the tyranny and misrule of the Rao and his military chiefs have been completely checked, and peace prevails to foster and reward industrious habits. The mariners of Cutch are a fearless and enterprising race; and for centuries past have traded to the Red Sea, the coasts of Africa, Ceylon, and even the Chinese Sea. Their principal exports consist of cotton cloths, in return for which they receive dates, coffee, dried grapes, antimony, senna, and coloured mats from the Red Sea; elephants' teeth and rhinoceros' horns from Zanzibar. Their moallims or pilots are singularly intelligent and well informed.

Bhooj, the capital of Cutch, is a large town of 30,000 inhabitants, surrounded with a strong, well-built wall. The streets are narrow, dirty, and rendered scarcely passable by herds of sacred bulls; the Rao's palace is a large white stone building, decorated with beautiful carvings and fine fret work. The British cantonment is about a mile from the city, and half a mile N.E. is the citadel or fortress, called *Borjeah*, on a hill. On 16th June 1819 both the city and the fort were nearly destroyed by an uncommonly violent earthquake. *Mandavee* or *Mindivee*, the principal sea-port, is situate on the south coast; it enjoys a considerable trade, and boat-building is carried on to some extent. On the same creek, two miles inland, are the ruins of a city called

Raipore, but supposed to have been the ancient Mandavee, which is still called Raipore in official documents. *Anjar*, a fortified town on a hill near the gulf, in the most fertile part of Cutch, was for some time the seat of the British residency, and contains a Hindoo temple, where at one time about 3000 rats were kept by an old Gosain, who summoned them to their meals three times a-day by the tinkling of a bell. At *Danodhar*, on a lofty hill, 20 miles S.W. of Bhooj, is a monastery of Kanuphtics, forming a kind of brotherhood, who dispense food and shelter to all applicants, without distinction of creed, country, or caste. They possess the revenues of about 20 villages, and are reputed rich; their superior is a rajah, who is treated by the Rao with high consideration. At *Mhur*, a village west of Bhooj, is a fraternity of Kaprias, about 120 in number, governed by a rajah, who enjoys many immunities and privileges; like the Kanuphtics, they are sworn to celibacy. They possess five villages, the revenues of which they devote to the charitable purpose of supplying with food all who apply. *Luckput*, or *Luckipat*, or *Lak'hpat*, is a fortress, situate on elevated ground, 39 miles from the sea, and about a mile from the left bank of the Koree, once the most easterly branch of the Indus, but now a mere tide creek or estuary. The walls, defended by numerous towers and bastions, with guns of all sorts and sizes, inclose a space about 800 yards square, of which not more than a third is occupied by houses.

RAJPOOTANA, RAJWARRA, or RAJAHS'TAN, is the name of a country of indefinite extent, situate in Hindústan, mid-way between the Indus and the Ganges, and traversed diagonally by the Aravulli mountains. The dominant inhabitants are the Rajpoots, from whom it takes its name. The country, in its present dimensions, is divided among the Rajahs of *Oudeypore*, *Jyepore*, *Joudpore*, *Kotah*, *Boondi*, *Alwar* or *Ulwar*, *Bicanere*, *Jeysulmere*, *Kishengurh*, *Banswarra*, *Purtabgurh*, *Dongerpore*, *Kerouly*, and *Sirohi* or *Serowy*. The territory of *Oudeypore* is also called Mewar, and consists chiefly of a table-land in the angle formed by the Aravulli mountains, and the hills which extend along the left bank of the Chumbul. It is hilly, well watered, and well adapted for cultivation. *Oudeypore* or *Oodeypore*, the capital, is situate in a valley 60 miles in circuit, which has only one entrance passable for carriages, 2864 feet above the level of the sea, and contains two lakes of considerable extent. The city is built on an elevated ridge of rocks. The Rana of Oudeypore is of the most ancient and purest descent of all the Rajpoot princes, and is on that account the most honoured among them, though not the most powerful. *Chittore*, the ancient capital of Mewar, is situate 70 miles E.N.E. of Oudeypore, and contains a very celebrated fortress, built on a steep hill above the town. *Nat'dwara* (the portal of God) 22 miles N.E. of Oudeypore, on the right bank of the Bunass, is one of the most remarkable temples in India. It was founded in the reign of Aurungzebe, when Vishnu was exiled from his ancient temple in Vrij, on the Jumnah, and is one of the best frequented places of Hindoo pilgrimage. A considerable town has grown up around it, and the priests and their retainers are supported by contributions from all parts of India. *Komulmair* or *Comulmere*, a formidable hill fortress, 45 miles N. by W. of Oudeypore, 2500 feet above the level of the sea, contains a Jain temple dedicated to the supreme God, which is considered as among the most beautiful of the shrines of India. *Jyepore* or *Jeypur*, *Kishengurh*, *Kotah* or *Harraoutee*, *Boondi*, *Kerouly*, and *Alwar*, are situate to the north-east and east of Mewar, and partake of the same character, being hilly and well watered, fertile and populous, though in some parts arid and desert, particularly in the western part of Jyepore. *Jyepore* or *Jaipore*, is a handsome well-built town, with a fine castle situate on a steep and lofty rock, 80 miles E.N.E. of Ajmere. It contains by native calculation 80,000 houses, which would give a population of 400,000. It is a magnificent city, and may challenge comparison with any other in India; it is built in a sandy plain, with streets crossing at right angles. *Joudpore* or *Marwar*, which lies to the west of the Aravulli mountains, and extends into the desert, is an arid territory of about 70,000 square miles, but generally well peopled, and valuable, producing wheat and other grains. It is traversed by the singular river Loonee or Loony, which, at the distance of 50 miles from its mouth, sends off numerous branches, intersecting a flat and fertile district of 350 square English miles, called *Nuegur*. The soil is there very rich, and wheat is its universal product; it abounds with herds of cattle, and the cows and oxen are of a superior kind. Buffaloes are also reared, and there is abundant fodder for camels. Wild hogs and game abound on the banks of the river among the peloo and tamarisk shrubs; and tigers, hyenas, and wolves are attracted by the herds. Small crocodiles are found in the pools; wild ducks and partridges are plentiful, and among the latter is the black partridge, noted for the richness and beauty of its plumage. The Nueyur is studded with villages, the chief places of note being *Gurra* and *Nugger*; the one with 200 inhabitants, the other with 1500; to the Loonee alone is the abundance of vegetable and animal life to be attributed. During some seasons the Nueyur is a sheet of water. *Joudpore* (*Judpur*, *Jhodpoor*), the capital of Marwar, 100 miles W. by S. of Ajmere, a beautiful city, filled with temples and ornamented houses, is built in a hollow, surrounded by rocky eminences, on which are three forts, the largest of which contains the Rajah's palace, a very extensive edifice, and visible from a great distance. This fort is amazingly strong, and stands on a rocky and perfectly impracticable hill. Joudpore is the centre of a very extensive trade, and contains about 60,000 inhabitants. Marwar contains altogether about 500 towns and villages; few of the towns are large, but many of the villages contain from 1500 to 2000 houses. *Pallee*, 40 miles S.S.E. of Joudpore, a large open town in a low swampy plain, but commercial and wealthy, with 50,000 inhabitants. *Nagore*, 70 miles N.N.E. of Joudpore, is a walled town with a substantial fort, famous for its manufactures in brass and iron, and containing 40,000 inhabitants. The territory of *Jeysulmere* is barren and unproductive, with little arable land. The surface is generally uneven, covered with rocks, which never rise into hills, or extend in chains, but are scattered irregularly. Not more than a third of the country will admit of tillage; the parts which are cultivated, yield good crops of the coarser grains, as bajree and moong, but no wheat; and the cotton crops are only reaped after a three years' fostering care. *Jeysulmere*, the capital, is a fine city with 20,000 inhabitants, and a fort or castle of a most commanding and magnificent appearance, 140 miles W.N.W. of Joudpore. The territory of *Bicanere* forms a portion of the Great Desert, and is flat, sandy, and destitute of water, except from wells, which are dug from 100 to 200 feet deep. The crops are very precarious, and greatly dependent on the rains. Horses and bullocks are the only articles of export. *Bicanere* (*Bicaneer*, *Bikanair*), the capital, is a large town, presenting externally the appearance of a great and magnificent city in the midst of a desert, but the interior is composed of mud huts. It is surrounded with a strong wall and towers. *Sirohi* or *Sirowy* is a small principality to the south of Marwar, at the south-west extremity of the Aravulli mountains. It contains the sacred mount *Aboo* (*Abu*, *Aboji*, *Abughad*), which is about 5000 miles round the base, and rises 5000 feet above the level of the sea. Its various elevations and platforms are covered with shrines, temples, fortresses, and tombs, adorned with sculptures and statues, which are relieved at intervals by all the varieties of wild and beautiful scenery. On the very summit is a small circular platform, containing a cavern with a block of granite bearing the impression of the feet of Data-Briga (an incarnation of Vishnu), which is the grand object of pilgrimage; but in that part of the mountain called *Dailwarra* or *Dewulwarra* (region of temples), is the most superb of all the temples of India, to which no other edifice but the Taj-mahal can be compared. It is sacred to Vrishabdeva, the first of the Jains, was erected by Bimul Sal, a merchant of Anhulwarra, one of the richest of their votaries, and attracts pilgrims from every region of India. The principal building is surrounded by numerous minor temples, the chief features of which are not mere solidity and vastness; their merits consist rather in the proportions, the endless variety and richness of the

sculptures, the extended colonnades and vaulted roofs, which give evidence not only of unbounded wealth in the founders, but also of high refinement in the arts.—(*Todd's Travels in Western India.*) The other places in Rajpootana are of little importance; the names and situations of the principal of them are arranged in the following table, with their distances from Ajmere:—

Aboo,	160 S.W.	Jyepore,	80 E.N.E.	Pokrun,	165 W. by N.
Alwur,	146 N.E. by N.	Kerowley,	160 E.	Purtabgurh,	170 S.
Banswarra,	200 S.	Kishengurh,	18 N.E. by E.	Rampoora,	97 E.S.E.
Bhilwarra,	70 S.W. by W.	Komulmair,	120 S.W. by S.	Rutlam,	220 S.
Bicanere,	125 N.W.	Kotah,	120 S.E.	Ryepore,	S.W.
Bundi,	110 S.E.	Machery,	160 E.N.E.	Sambre or Sambur,	47 N.E.
Bunaira,	S.	Mairta or Meerta,	40 W.N.W.	Sanganeer,	S.
Chittore,	110 S.	Mandulgurh,	90 S. by E.	Sawa,	S.
Chooroo,	133 N. by E.	Mokundurra,	140 S.E. by S.	Seywanah or Seywanoh,	S.W. by W.
Deedwana,	66 N. by W.	Nagore,	70 N.W.	Sirohi,	140 S.W.
Dehgong,	252	Narnol,	147 N.E.	Sojut,	73 S.W. by W.

Jeysulmere,	200 W. by N.	Palce,	95 W.S.W.	Wallotra,	S.W.
Joudpore,	80 W.	Parbusir,	S.W.		
Julra-Patun,	160 S.E. by S.	Peepur,			

Kotah, a large city on the right bank of the Chumbul, is the capital of the state of Haraoutee, which extends southwards to the Mokundra range of hills; and contains *Julra-Patun*, a well-built modern town, surrounded by a substantial wall, with round bastions. *Neemuch* is a British military station, 80 miles E. of Oudeypore; it has a small stone fort, constructed for the purpose of affording protection to the wives and families of the troops, should they take the field, and of serving as a depot for military stores. The climate is very salubrious; but the scanty supply of water is drawn from wells. Neemuch is situate within Scindiah's territory; and usually contains four regiments of native infantry, one of cavalry, some artillery, and a corps of local horse.

SINDE is a large territory occupying the lower part of the basin of the Indus or Sinde, which traverses the country in numerous and ever-changing branches, along the banks of which, and within reach of irrigation are the only cultivated districts. To the eastward of the river there is not a rising ground or a stone, except the hillocks of Buckhur and Hydrabad. The country is flat and covered with bushes, till at last it joins the desert of sandhills which separates it from Rajpootana. Westward, as low down as Sehwun, the same flatness prevails to the foot of the Beloochee mountains; from Sehwun to the sea the land is rocky and barren. The delta of the Indus has a rich alluvial soil, but is poorly cultivated. The depressed shore offers no remarkable object to the eye of the mariner; the coast line is covered at spring tides. Ten miles from the sea the country is often an impervious jungle; higher up it is overgrown with tamarisk shrubs; but the greater part of it presents a naked plain of hard caked clay. Much of the land adapted for cultivation is only used for pasture, and great part of it lies waste; yet the crops of rice are extensive, and their produce far exceeds the consumption of the inhabitants; wheat, barley, juwaree, and other grains, indigo, sugar, tobacco, and hemp, are also grown. Very little labour is bestowed upon them; the seed is scattered after the inundation subsides, and the harvest is certain. Sinde, indeed, owes its fertility entirely to the Indus, without which it would be as barren as the country to the eastward. In winter the climate of the delta is delightful, being cool and bracing; ice is occasionally found in the morning, but the temperature generally ranges from 45° to 82°, and during the day is most agreeable; fogs, however, sometimes occur, but they are not very prevalent, and quickly dissipate as the sun rises. In summer the heat is excessive; at Sukur, on the Indus, 27° 43′ N. lat., in June 1839, the thermometer stood at 100° in the shade, 105° in the hospital, 123° in the seapoy's tents, and 146° in the sun. Little rain falls, but during the inundation the climate is very unhealthy; fevers, dysentery, and agues then prevail. The population is very mixed, being composed of Hindoos, Jauts, Beloochees, and various other tribes from the adjacent countries. The Seids or Sayyads (descendants of Mahomet), and Fakirs (religious vagabonds), are very numerous, and are estimated at so many as 100,000. The wealth of many families consists of their herds of horned cattle; and of their produce, hides and ghi, Kurachi exports a considerable quantity. The buffalo furnishes the principal supply. Sinde formed till lately an independent state, ruled by the three chiefs of a family called Talpoora, with the title of emirs or ameers; but, in 1839, it was reduced to subjection by the British army of the Indus, on its march to Cabul; and is now classed among the subject states. The revenue of the ameers is said to amount to £400,000 a-year. They are besides reputed to have hoarded a treasure of seven or eight millions sterling, the capture of which strongly excited the hopes of the British troops on their approach to Hydrabad, but it was saved to the ameers, by their timely submission without fighting, to the great disappointment of their unwelcome visitors. *Hydrabad* or *Haiderabad*, the chief town, is situate on the eastern bank of the Indus, 120 miles from the sea, and contains about 20,000 inhabitants, who live in mud hovels scattered about the south end of a rocky hillock, on the top of which is the fort, a mere shell, consisting of a single brick wall surrounded by a dry ditch; at the northern extremity of the hill are the tombs of the chiefs, some of which are beautiful structures. *Tatta* or *T'hat'hah*, the ancient capital, stands at the head of the delta of the Indus, 60 miles from the sea, and 3 from the river, upon a rising ground surrounded by a brick wall, and contains about 18,000 inhabitants. The town is dirty, with narrow irregular streets, and consists chiefly of mud huts, or of bricks plastered over with mud and straw. The cemetery extends for several miles, and contains a number of beautiful and magnificent tombs, erected in the days of the city's prosperity. Tatta has acquired some celebrity for the lungi, a rich fabric of silk, cotton, and gold, of variegated pattern and close texture. The raw silk in most estimation with the weavers is that from the Persian province of Ghilan. In the vicinity are the ruins of *Kullancoté* and *Saminnuggur*, places to which the natives ascribe a high antiquity. *Kurachi* or *Curachee*, between Ras Mooare and the delta of the Indus, the principal seaport of Sinde, is a large town of mud houses, with narrow, irregular, and incommodious streets, and containing no building worthy of notice. Though it has long been the commercial emporium of Sinde, no attempt has been made to improve the creek which forms its harbour; the goods have to be put into large punts or flat boats, and hauled through the mud, or carried on men's shoulders. The bazaar is very extensive; some of its streets are entirely shaded from the sun by matting. The principal merchants are Hindoos, and that people form the greater proportion of its 10,000 inhabitants. They carry on a brisk trade with Bombay, Malabar, and Arabia. The town enjoys a great celebrity for the tanning and preparation of hides, which are chiefly exported to Muscat, but are also used to some extent in Sinde. From February till October, Kurachi is the only accessible harbour on this coast. With the exception of the gardens in the vicinity of the town, the country around Kurachi is literally a waste; there being no vegetable production except the clumps of prickly pear with which the face of the ground is thickly studded; it is, nevertheless, the healthiest place in Sinde, and the prevalent diseases are few and tractable. *Fort*

Manorah, on a rocky promontory between the open bay of Ras Mooaree and the roadstead of Kurachi, guards the entrance to the harbour. Among the outlying hills which skirt the Hala mountains, about 9 miles from Kurachi, is a hot spring, the temperature of which, where it wells from the ground, is 136 Fahrenheit. The stream waters a small valley, and supplies some ponds or swamps, in which the fakirs keep numbers of tame alligators. *Bunder Vikkar* or *Vikkur*, on the Hajimari branch of the Indus, ranks next to Kurachi among the seaports of Sinde, but is an inferior town. *Dharaja*, the port of Tatta, 20 miles from the sea, is also conveniently situate for trade. *Sehwun*, a miserable collection of huts, with 10,000 inhabitants, 2 miles from the right bank of the Indus, 105 miles above Hydrabad, is a place of great antiquity, with a very remarkable castle now in ruins, which overlooks the town, and contains the shrine of a saint named Lal-shah-baz, whose tomb is a place of pilgrimage to both Hindoos and Musulmans; the neighbouring country is rich and productive. Between Sehwun and Hydrabad, near the left bank of the river, is *Hala*, a considerable town, which derives no small degree of importance from the shrine of a saint, named Pir Mukdumnu. It has also been long noted for earthenware and Sindian caps. The ruins of *Khodabad*, once the favourite residence of the Talpoor chiefs, are situated a little to the N.W. of Hala. *Bukkur* or *B'kkur*, 160 miles above Sehwun, a fortress on a rocky island in the channel of the Indus, about 800 yards long and 400 broad, is considered by the natives as impregnable, but is entirely wanting in every point which can make it a place of strength. It was ceded to the British Government by the Khan of Khyrpore in 1839. *Roree* or *Rori*, a town of 8000 inhabitants, built on a precipice of limestone and flint 40 feet high, on the left bank of the Indus, facing Bukkur. *Sukur*, on the opposite side of the river, situate on lower ground, is about half the size of Roree. In the channel of the Indus, between these towns, are several rocky islets, one of which is occupied by Bukhur, and another, *Khadja Kizr*, is noted for its sanctity. *Khyrpore*, 14 miles S.S.W. of Bukkur, a very large open town, with 15,000 inhabitants. *Larkhanu*, 14 miles W. by S. is also a large straggling town, with 10,000 inhabitants, in the midst of a date grove, on the banks of a fine canal drawn from the Indus. *Shikarpore*, a very large town 15 miles W. from the Indus, chiefly inhabited by Hindoo bankers and merchants, who have commercial connections all over the East. The houses are entirely of mud, or sun-dried brick, but the town is surrounded with gardens.

DAOUDPOOTRA, the territory of the Nawab Bhawul Khan, which extends along the left bank of the Indus and the Gharra for more than 300 miles, is only a portion of the great desert, an endless expanse of sandhills thinly covered with jhow and phog bushes, which furnish food merely for camels; the only cultivable part of the country being what is within reach of irrigation by the waters of the rivers. The Nawab is nominally independent, but is in alliance with, and under the protection of the British Government. *Bahawulpore*, his capital, is a large commercial town of mud houses, surrounded with a low mud wall, and crowded with koojur and peepul trees, on the left bank of the Gharra, with 20,000 inhabitants. It enjoys great reputation for its silk manufactures. His other towns are *Ahmedpore*, about half the size of Bahawulpore; *Derawul*, an ancient fort in the desert; and *Ooch*, *Uch*, or *Utch*, 3 miles E. of the Chenab, and 5 miles below its confluence with the Gharra, in a fertile plain, shaded with trees, and containing 40,000 inhabitants, who are miserably poor, though the neighbouring country is richly cultivated. Tobacco grows luxuriantly; indigo is also reared successfully. Wheat and other dry grains are cultivated in preference to rice, which does not form here, as in Sinde, the principal food of the people. The country abounds with game. Uch is highly celebrated for the tombs of two Moslem saints.

The PROTECTED SIKH, and other states on the right bank of the Suttlej, are about 150 in number. The country and the principal towns have been already described at page 717. The territory of the Rajah of Bissahar extends to the northern side of the Himalayas, along the valley of the Suttlej.

§ 6. *Independent States.*

The MAHARAJAH SCINDIAH, one of the principal feudatories of the late Mahratta empire, possesses a large territory of the most irregular form, which extends through the middle of Hindústan from near Baroda to the neighbourhood of Agra, a distance of 450 miles, and comprises about 42,300 square miles, with a population exceeding 4,000,000. Ranoojee Scindiah, the first of the family who attained eminence, was one of the commanders under the Peishwas in the Mahratta expeditions into Hindostan in the early part of last century; and he and his successors acted a distinguished part in all the wars and revolutions of the country down to 1817, when the present limits of their territory were fixed by treaty with the British Government. The territory is capable, under proper management, of realizing a revenue of 140 lacs of rupees (£1,400,000 sterling). The rajah is bound to aid the British Government when required, with a contingent of 5000 men; and he maintains, besides, a large military force, which, at the death of the late Maharajah, the last of the original family, in 1827, was estimated at 14,000 infantry, 10,000 cavalry and 250 pieces of cannon. The present rajah is only a distant relation, brought from the original seat of the family in the Deccan in 1827, and adopted by the widow of the late Maharajah, after his death, and married to his grand daughter. His capital is *Gualior*, a large town of 50,000 inhabitants 80 miles S. of Agra; with a celebrated fortress, built on a long flat insulated hill, half a mile in length, three or four hundred yards broad, and rising in the highest part 450 feet above the plain. The rock is for the most part inaccessible, and is surmounted by a stone rampart along its edge. It formerly belonged to the Rana of Gohud. The other principal towns, with their distances from Gualior, are arranged in the following table:—

Oujein or *Ougein*, which holds a high rank among the holy cities of India is situate in Malwah, 1698 feet above the level of the sea, and 350 miles N.E. by E. of Bombay. It is of the most remote antiquity, being described in the Puranas; and the Hindoo geographers and astronomers consider it their first meridian. The ancient city, however, was destroyed by some physical catastrophe; the Hindoo legends say a shower of earth buried the city and its inhabitants. The modern town is a mile N. of the ancient site; is surrounded with a wall six miles in circumference, and is very populous. At *Mehidpore* or *Mahidpore*, on the banks of the Seeprah or Siprah, 20 miles N. by W. of Oujein, Holkar was defeated by the British forces, 21st December 1817. *Burhanpore* or *Burhaunpore*, the late capital of the soubah of Khandeish, is one of the finest cities in the Deccan, and the head-quarters of a singular sect of Mahometans called Bohrah, who all actively engage in commerce, wear a peculiar costume, and retain in their form and features characteristic traits of their foreign Arabic ancestry. It is situate on the right bank of the Tuptee, 260 miles N.E. of Bombay. *Hindia* is a town and fortress on the right bank of the Nerbuddah, where the river is 1000 yards broad. *Champanere* was once a large city, whose ruins extend several miles, but are covered with jungle. A small area inclosed with a wall and inhabited by silk weavers, forms the modern town. Overlooking it the stupendous

rock of *Powan-gurh* rises abruptly from the plain to the height of 600 yards, presenting a perpendicular face except on the north side, where it is fortified with five walls. On the top is a famous pagoda, dedicated to the goddess Kali; and also the tomb of a Mahommetan saint. The fort has also an inexhaustible supply of water, but was nevertheless taken by storm by the British forces in 1803.

The KINGDOM of LAHORE, established during the present century by an enterprising Seikh chieftain, Runjeet Singh, who died in 1839, is situate in the N.W. part of India, including all the country between the Indus and the Suttlej, and from the crests of the Himalayas to the borders of Sinde. It comprehends also the narrow tract to the west of the Indus, between that river and the mountains of Affghanistan; being altogether about 500 miles in length from N.E. to S.W., by about 400 in its greatest breadth, and comprises an area of 160,000 square miles. The southern and south-eastern portions of the kingdom form part of the great plain of Western India, and consist of sandy wastes, or hard clay plains covered with jungle, admitting of cultivation only along the banks of the rivers. There, however, the soil is remarkably fertile, and produces abundantly all the necessaries of life. Towards the north-west the country is crossed by the *Jungher* or *salt range* of hills, which stretches from the Suffeid-koh in Affghanistan to the west bank of the Jhylum. The hills rise abruptly from the plain to the height of 2100 feet above the level of the sea, and support on their northern side the table-land of Taxila, about 800 feet above the level of the plains below. The Salt range has a breadth of about five miles; the formation consists of sandstone, and the bold and bare precipices rise at once from the plain. Hot springs are found in various parts of them; alum, antimony, and sulphur also occur; but their principal mineral wealth consists of salt, which has a high reputation in India, on account of its medicinal virtues; but being impure it is not fit for curing meat. About 80,000,000 lbs. are yearly extracted for behoof of the government. The salt occurs in compact glassy strata, dipping at an angle of 65° The southern part of the table-land, from want of water as well as from the presence of salt, is little adapted for cultivation, and the villages are consequently very thinly scattered. In the northern part, however, are beautiful valleys, copious springs, and a rich soil, which supports a dense population; but, owing to the oppressive character of the government, agriculture is neglected. The climate embraces extremes, and the inhabitants exhibit striking varieties of character and manners. The Moslems who border on the Jhylum closely resemble the Hindoos of the Punjab, while those on the east bank of the Indus have all the peculiarities of the Affghan character. The mountain tribes who are found along the west bank of the Jhylum are in a very savage state; most of them live only by plunder; but the tribes of the plains having a fertile country, are in comfortable circumstances, though greatly oppressed by their chiefs. To the northward of this table-land, and eastward from it to the Suttlej, the country rises into hills, which increase in elevation till they terminate with the Himalayas themselves, the whole space, 150 miles where broadest, being occupied by mountains and valleys, the principal of which is the celebrated valley of Cashmere. The dominant people are the Seikhs, who form, however, no more than about a seventh part of the total population, which amounts to three and a half or four millions. Their original country is the *do-ab* (peninsula) between the Ravee and the Suttlej, but few are found 30 miles below Lahore. There are none westward of the Jhylum; and even to the east of Lahore, where they are most numerous, they do not form more than one-third of the people. The rest of the population of the kingdom consists of Brahminical Hindoos, Affghans, Jauts, and various other Moslem tribes. The late Maharajah, Runjeet Singh, formed a large army, 100,000 men of all arms, well dressed and disciplined; the infantry, 26,000, are disciplined in the European manner; the regular cavalry and artillery may be reckoned at 8000; the remainder are irregulars, chiefly cavalry. Nothing satisfactory can be said respecting the amount of his revenues. The principal cities and towns are arranged in the following table, with the distances from Lahore.

Lahore, the capital of the kingdom, stands on the right bank of the Ravee, in N. lat. 31° 33′ and E. long. 74° 22′, about 1000 miles from the mouth of the Indus, 38° from Delhi, 1070 from Bombay, and 1360 from Calcutta. The city is of an oval form, about 3 miles in circumference, surrounded by a strong brick wall and a ditch, with twelve gates, and as many semicircular outworks. Population about 80,000. It contains several splendid mosques; and the Shah-limar, a beautiful garden of the Mogul emperors, is still kept in good order, about five miles from the city. At *Shah-Durrah* or *Shahdera*, 2 miles N., is the mausoleum of the Emperor Jehangeer, a magnificent and strikingly elegant building, of the same style as the Taj-mahal at Agra, and apparently from the hands of the same workmen. *Amritsir* or *Umritsir* (pool of immortality) is a large town, 8 miles in circumference, and surrounded by a mud wall faced with brick. During the existence of the Seikh confederacy, till it was dissolved by the ascendancy of Runjeet Singh, Amritsir was the federal capital, as it still is the principal seat of their religion. It was anciently called *Chak*, afterwards *Ramdaspoora*; and acquired its present name from the famous reservoir or tank built here by the Gûrû Ram-dass. This tank is a basin 135 paces square, built of burnt bricks; in the centre of it stands the *gurunt*, a small square temple, all fretted, and covered with gold outside, and in the inside splendidly and gorgeously decorated, and inlaid with precious stones. In this temple, which is dedicated to the Gûrû

BHOTAN, BOOTAN, BOODHTAN, or B'UTHAN, situate to the east of Nepaul and Sikim, is about 210 miles in length, and 90 in breadth. It is a mountainous country, cold, and rugged. The climate is very various, and rendered at times exceedingly disagreeable by violent gusts which blow up the ravines, and are loaded with dust. The vegetation exhibits considerable peculiarities; the bases and lower portions of the mountains are scantily covered, and it is only at great elevations that the grand forests make their appearance. The lowest edge of them is scarcely ever less than 7000 feet, generally 8000 or 8500, where oaks, magnolias, rhododendrons, and several kinds of fir attain great perfection; but the southern faces of the mountains are bare of trees, in consequence of their exposure to the south-west monsoon. The sovereignty of the country is vested in the Dhurm-rajah, a spiritual prince, who never dies; but the government is exercised by the Deb-rajah, who holds office for three years, and is checked or assisted by a council; but, so bad is the whole system of government, that there is no security for property, and not much for life. Fines, however, are deemed more profitable than bloodshed, and the only safety of the lower orders consists in their extreme poverty. The people seem to belong to the Mongolian stock, their features being purely Tartar; they are rather under-sized, more remarkable for tension of sinew than for weight; they are very quiet and industrious; but the population is scanty, and the villages few and small. The palaces and castles are the only places which are well inhabited, being occupied by idle priests and their followers, who live at the expense of the poor cultivators. The causes of this scantiness of population are polyandry and agyny, bad government, and the filthy and licentious habits of the people. The Booteas seem to have no castes, though they are divided into several sects; but it does not appear that the possession of the higher offices is confined to the higher sects. They may be classed into labourers, priests, idle retainers, and grandees. Perhaps the most numerous, and certainly the most pernicious class is that of the gylongs or priests, whose number is unusually great; they inhabit not only the palaces and castles, but also whole villages. Their chief duty is to be idle, to feast at the expense of the country, to tell their beads, and mutter prayers. Their religion consists in external forms; they are remarkably superstitious, believing in hosts of spirits whose supposed abodes they dare not pass without numerous incantations. The moral character and social habits of the Booteas are very low. They have no genius for war; and though they go armed, even the women, at all times, yet they are afraid to fire the matchlocks which they carry. Their religion is Buddhism. Many of their laws and customs have been copied from the Chinese; and they are equally scrupulous with their celestial neighbours in guarding against the entrance of foreigners into their country. The people are chiefly employed in agriculture; many of them cultivate one farm in the mountains in summer, and another in the lowlands in winter. Their commerce is trifling, as they have few articles to give in return. They export ponies, mules, woollen cloth, rock-salt, and a peculiar spice, very pungent and aromatic, which is the capsule of a species of *xanthoxylon*, found on the mountains to the north-east. Their political relations are very limited. They are tributary indirectly to Lassa, and now directly to China, though the official people strenuously deny it. The summer capital is *Tassiudon*, which, in winter, on account of the cold, is deserted for *Dosen* or *Punukha*. The eastern part of Bhotan is governed by the Towang rajah, and is a portion of the government of Lassa.—(*Journal of a Mission to Bootan* 1837-8, *by Capt. Pemberton; As. Jour.* XXXI. 81., &c. *Journal As. Soc. Bengal, March and April* 1839.)

§ 7. *Foreign Possessions.*

The FRENCH TERRITORY in India consists of several detached portions, forming the single government of *Pondichery*, but arranged in five districts, namely, *Pondichery* and *Karikal* or *Carical*, in the Carnatic; *Yanaon*, in the North Circars; *Chandernagore*, in Bengal; and *Makí*, in Malabar; which comprises an area of about 530 square miles, with a population of about 210,000. *Pondichery*, the capital, which is situate on the coast of Coromandel, 85 miles S. by W. of Madras, is a fine city, laid out very much in the European style, with wide and regular streets, and 40,000 inhabitants. It has a college, and several schools, a mont de pieté, and a botanic garden; in the vicinity indigo, sugar-cane, and mulberries are cultivated. It has no harbour, but a tolerable road. *Mahé* is a small settlement on the Malabar coast, about two miles in circumference on the land side; it contains a well-built town, and carries on some export trade in pepper, arrow-root, and cocoa-nuts. It is very salubrious, and is on that account much frequented by the military from Cananore.

The DANISH TERRITORY consists of the two small establishments of *Tranquebar*, on the Coromandel coast, and *Serampore*, in Bengal, forming together about 93 square miles, with 35,000 inhabitants. *Tranquebar* is a fine town, built almost entirely in the European style, and protected by a citadel named *Dansborg*. It is situate in Tanjore, on the coast of the delta of the Cauvery, a branch of which serves for its harbour. It carries on a considerable trade, and has a population of 12,000 souls. The Danes pay for Tranquebar and its territory an annual rent of 2000 sicca rupees (£200 sterling) to the rajah of Tanjore.

PORTUGUESE INDIA is now reduced to the territory of *Goa*, on the west coast, between the Concan and Canara, *Damaun*, in Gujrat, and the island of *Diu*, on the south coast of Kattiwar. *Goa* consists of two provinces, *Salsette* and *Bardes*, with several islands, measuring altogether along the coast, about 60 miles, with a breadth varying from 15 to 30. The physical characteristics of the country are the same as those of the adjoining British provinces; many parts of it are well cultivated, and its revenues, estimated at 900,000 rupees (£90,000 sterling) defray all the expenses of government, besides furnishing £20,000 to the royal purse of Portugal, that being the proceeds of the tobacco monopoly. The population amounts to 500,000, two-thirds of whom are Christians. GOA, once the splendid capital of the wide-spread Portuguese dominions in Asia, is now deserted, fallen to ruins, and overgrown with jungle. The cathedral, however, and several other churches are still in good preservation; but the whole population, including monks, nuns, priests, and their servants, amounts only to a few hundreds, instead of the 200,000 which the city once contained. The seat of government is now at *Pangi*, called also *Villa Nova de Goa*, 6 miles nearer the sea, a collection of huts built on the low shelving shore of the river. Some of the buildings, however, including the government house, present a handsome appearance from the water. Population about 9000. The river of Goa forms a harbour scarcely if at all inferior to that of Bombay; it is navigable up to Goa, 8 miles from the sea. On the north bank stands the fortress of *Reis*, a striking object, bristling with cannon. The scenery is most beautiful, but the climate of Goa itself is very unhealthy, a circumstance which has chiefly led to the town being so completely deserted. The archbishop of Goa takes the title of Primate of India, and resides at *San Pedro*, 3 miles from Pangi, with which it is connected by a fine road. The entrance to the harbour is formed by *Agoada*, an elevated rocky promontory on the north side, and *Cabo*, a similar but less celebrated point on the south. The only passage for large ships is commanded by the guns of two forts at Agoada. On the point of Cabo is a Dominican monastery, which forms a fine object. *Mergaon*, in Salsette, and *Marpuca*, in Bardes, are considerable towns, with each about 10,000 inhabitants. *Damaun* is a seaport town in Gujrat, on a small river, 82 miles N. of Bombay. The houses are whitened, and give to the town externally a handsome appearance, but the streets are narrow and dirty, and the walls are incapable of defence. Damaun contains several churches and convents, and a Parsee temple, in which the sacred fire brought from Persia has been preserved for 1200 years. Damaun is noted for its docks and shipbuilding. Population about 6000. *Diu* is a small town and fort, now fallen to decay, at the east end of the island of the same name in Kattiwar. The

Governor-General has recently (1840) declared that all kinds of merchandise may be deposited in th ports of Goa, Diu, and Damaun, on the payment of an *ad valorem* duty of one per cent. and that n further tax will be levied on their exportation.

§ 8. *The Islands of India.*

CEYLON.—This large and beautiful island, "the Jewel of the Eastern Seas," and "the Jem o Paradise," is situate between 5° 56' and 9° 56' N. lat. and 79° 51' and 82° E. long. to the south-east o the southern part of the Carnatic, from which it is separated by the Gulf of Manaar and Palk Straits, which, at the narrowest part, along Adam's Bridge, are 62 miles wide. It is of an oval shape the northern portion is an extensive plain, with only a sandy beach, overhung by groves of cocoa-nu trees fringing the coast, and not an eminence of any kind can be distinguished from the sea as breal ing the line of those trees from the interior. The southern portion is hilly near the sea, and mour tainous inland towards the centre, some of the ranges presenting masses of the most fantastic shape All round the island, however, there is a belt of rich alluvial soil well watered by numerous stream On the west side the country is flat; and the north coast is broken into a number of islands an rocks. The centre of the southern portion is occupied by a picturesque table-land, 67 miles by 5 between 2000 and 3000 feet above the level of the sea. From this elevated region some conical moun tains rise several thousand feet higher. The mountains run in general in continuous chains, inter spersed with the loveliest valleys; the hills are clothed to their very tops with gigantic forests, fro which issue magnificent cascades, and foaming cataracts form in the valleys placid rivers, and babblin brooks, which are fringed with turfy banks, and all the beautiful verdure of the inter-tropical re gions. The highest mountain is *Pedrotallagal'la*, near Newera-ellia, 8280 feet high. *Kirrigal-pó* is 7810; *Totta-pelle*, 7750, and *Adam's Peak*, formerly supposed to be the highest in the island, is no ascertained to be only 7420. The *plain* of Wilmantalawe is so high as 6690, and that of Newera-ell 6210.

Though there are no natural lakes in Ceylon, yet probably no country is better watered by river and innumerable streams and rills than the hill country of the interior and the adjacent districts while the ingenuity and labour of the earlier inhabitants, by the construction of immense reservoir had almost rendered it independent of such droughts as occasionally happen. The principal river are: The *Mahaveli-ganga*, or *Mahaweli-ganga* (Great Sandy River), which rises from the Newera ellia Mountains, flows by Kandy, from which to the plains of Bintinne, a distance not exceeding 30 mile it hurries down a descent of more than 1000 feet perpendicular, receiving in its course a great accessio of waters. It then flows north-east with a slow and tedious course, through the flat country, int the sea between Trincomalee and Batticaloa. It is believed to be navigable to Bintinne, but th lower part of its course is obstructed by sandbanks; and below Kandy, by rocks and a succession o rapids. It is subject, like all the other rivers and streams, to great and sudden floods during th rainy season. In 1834 the Mahavila-ganga rose 60 feet above its ordinary level. *Kalany-ganga*, rise from the group of mountains of which Adam's Peak is the centre, and enters the sea three miles north of Colombo, after a course of 60 miles, through three-fourths of which it is navigable for boats. *Kalu ganga*, Black River, rises on the south side of Adam's Peak, and falls into the sea at Caltura: it i navigable for boats 40 or 50 miles. *Wellaway-ganga*, enters the sea between Tangalle and Hamb bangtotte. The other rivers of the island are of little consequence. They are more numerous on the west than on the east coast, and less unfrequent in the south than the north.

Ceylon is completely under the influence of the monsoons; the north-east prevailing from Novembe till February, the south-west from April till September, and the intervening, or equinoctial month having variable winds or calms. The east side of the island is hot and dry; the central, western, an southern provinces are temperate and moist. The south-west wind is felt generally over the island but the north-east wind does not, during half its duration, reach across the mountains to Colombo on the west coast. A great deal of rain falls, particularly among the mountains, and on those parts o the coast which are most directly exposed to the monsoons. The rains are periodical and very heavy In the northern part of the island, and along the east coast, the rainy season begins in November, an lasts about two months with great violence; during the rest of the year the country is dry, and i rarely visited by scanty showers. On the west coast the greatest quantity of rain falls about the set ting in of the south-west monsoon, but it is not so heavy, nor so constant as on the other side; th dry season, however, is more apt to be interrupted by showers. The seasons among the mountain are more or less of the same kind, according to the localities and aspects. Rains are frequent i the interior, and the country is accordingly well watered. The heat varies in different places. Th west coast is remarkable for equality of temperature, the mean being about 78° and the atmospher exceedingly moist. At Colombo the mean daily variation does not exceed 3°, while the annual rang of the thermometer is from 76° to 86°. The east coast about Trincomalee is remarkable for intens heat, the mean temperature of the hot months being about 82°, the greatest daily variation 17°, an the annual range from 74° to 94°. Among the mountains the heat is less violent; the mean annua temperature at Kandy is 73° 5', the mean daily variation 9°, and the annual range from 66° to 86° Higher up, at Newera-ellia, the mean daily variation is 11°, and the annual range from 35½° to 80½ The healthiest parts of the island are the south-west coast, and the hills and table-lands of the interior The most unhealthy regions are the wooded parts between the mountains and the sea, all round ex cept on the south-west, where the hills come down to the coast. Hurricanes are unknown.

Uniformity of formation is the most remarkable feature in the geological structure of the island With very few exceptions, the whole island is composed of primitive rocks, granite or gneiss, wit some large veins of quartz, hornblende, and dolomite. Limestone is found near Kandy and Jaffnapa tam, and is of the shell kind, mixed with coral rock; grey and blackish sandstone occurs along th shores. The only metallic ores hitherto found are iron pretty generally diffused, and manganese The island has been long famed for amethysts, topazes, garnets, cat-eyes, cinnamon-stone, sapphires rock-crystals, shorl, zircon, rubies, and diamonds, &c.; but in general the gems are not of muc value, and the ruby, the most valuable, is rarely met with. The pearl fishery in the Gulf of Manaar sometimes produces great abundance of that valued gem. The most productive pearl banks ar situate off *Condatchy* or *Kondatchie*, a miserable village, 120 miles N. by E. of Colombo; and exten 30 miles from N. to S. with a breadth of 20 in the lower part of the Gulf of Manaar. The fisher generally begins in March, when the calm weather permits the boats to go out and in daily. Th average net revenue produced to government from this fishery for 32 years, ending in 1832 wa £14,622 per annum. The season lasts only 30 or 35 days; and each bank being available only fo a period of about 20 days, once in seven years, the fishery is sometimes small, and sometime there is none at all. The pearl oyster, though neither palatable nor wholesome, is not poisonou and is sometimes eaten by the poorest of the people who frequent the fishery. None of the pea divers are Singalese; the most of them come from the opposite coasts of India. There are som other detached banks, but of inconsiderable value, compared with those of Manaar, situate fa ther south, nearly opposite *Chilaw*. Repeated examinations of the banks, and judicious restric tions of the fishery to those places where the oysters are of full size, have almost brought the pea fishery to be a regular item in the annual revenue of Ceylon.—*Tennent*, I. 255-7. Nitre-caves ar

numerous; alum is plentiful, and the coast from Chilaw to Manaar and Jaffna, on the west side, and from Tangalle, through the Mahagampatoo to the eastward, contains extensive and valuable salt formations.

The vegetable productions are not less valuable, the most celebrated and the most precious of which is the *cinnamon-tree*, which grows wild as well as in a cultivated state, in every southern part of the island where there is sufficient moisture. Hitherto the cultivation and sale of the article have been monopolised by government; but even under this vicious system, the cinnamon gardens covered upwards of 17,000 acres on the coast, the largest being near Colombo. The cinnamon-tree grows wild in the woods to the size of a large apple tree; but, when cultivated, is never allowed to exceed ten or twelve feet in height. Next to the cinnamon in repute, though in reality far more valuable, is the cocoa-nut tree, which furnishes a large portion of the people with their principal subsistence. From Tangalle to Chilaw, a distance of 135 miles, the country is nearly one continued grove of cocoa-nut, bread-fruit, and jack-fruit trees. Cotton is produced with the greatest facility; every village or hut has its patch of sugar-cane and tobacco; coffee grows luxuriantly, and, without care, even of an excellent quality. Of late, the attention of speculators has been strongly directed to this article, which has already become the staple production of the island, instead of cinnamon, the demand for which was so capricious that it could hardly be cultivated with profit; but the coffee planter has a quick and sure return for his expenditure. In five years the tree reaches maturity, and before the expiration of the sixth, the receipts cover the original and current expenditure. During 1838 more than 40,000 acres of land were purchased from government for this purpose; and, if the progress of cultivation continue to advance at the same rate as it has done for the last few years, an immense improvement will soon be effected in the desert wastes of the island, and, as a necessary consequence, in the moral character and intellectual advancement of the people. Almost all the coffee plantations are situate in the Kandian or inland provinces. Many of them are scattered over the high country between Kandy and Newera-ellia, where the road frequently winds through estates in a high degree of cultivation.—(*Lieut. Butts. As. Jour. April* 1841.) The pepper vine grows nearly wild all over the island; cardamum plants are equally plentiful; areca-nut and rice are produced of the best quality; teak forests abound, and excellent masts and yards are everywhere procurable. Calamander, ebony, satin, rose, sappan, iron, jack, and every kind of the most beautiful wood for cabinet work are found in rich profusion. Enchanting groves of the palmyra palms surround the villages in the northern part of the island, and, like the cocoa-nuts of the south, are of the greatest value to the people in seasons of drought. It was at Fort Macdonald and its neighbourhood that potatoes were first successfully cultivated, so as to supply the market at a moderate price; and although at Newera-ellia they grow still larger and finer, it is from Upper Ouva that the general supply is obtained. Not only potatoes, but most of the other European vegetables, are now general in every good garden in the Kandian country; but the seed must be continually renewed from Europe or South Africa.

The animal kingdom is not less rich; earth, air, and water, are instinct with life. The elephants are large and docile; the tiger formidable and destructive; and likewise the buffalo in its wild state. There are deer of every kind, and elks resembling the fossil remains of Ireland. Snakes, even poisonous ones, are very numerous and large, but deaths caused by them are very few. The most dangerous snake is the tic-polanga; the formidable cobra-di-capello is comparatively harmless, being less vicious and less easily provoked. The *puribera* is the monarch of the island snakes, being sometimes more than 20 feet in length; but it is little dreaded, and seems to confine its ravages to the birds. Alligators are found in most of the rivers, and jackals abound in every grove. The mountain districts are infested with a kind of leech which clings pertinaciously to the skin, and extracts much blood, occasioning even painful and dangerous ulcers. In short, there is the greatest abundance of fishes, animals, and fowls; and, taken altogether, Ceylon is one of the most luxuriantly productive, and most highly favoured regions on the face of the globe.

The population may be divided into four distinct classes: *Ceylonese* or *Singalese*, who occupy Kandy, and the south and south-west coasts; *Malabars* or *Hindoos*, who occupy the north and east coasts, with the Island of Jaffna; *Moors* or *Arabs*, who are dispersed all over the island, and form the mass of the population in the Pultam district. *Veddas* or *Beddas*, the aborigines of the island, who were said to be found in the most savage state, in the great forests which extend from the south to the east and north, and also in the most inaccessible parts of the interior, wild-beasts and wild-fruits being their only food, small huts formed on the branches of large trees their resting-places, and a cloth round the loins their only dress. But this account of them is believed to be greatly exaggerated. They are indeed an uncivilized race, thinly scattered over an extensive and unhealthy tract of country, lying between the maritime province of Batticaloa on the eastern coast, and the Kandian hills; but they are all considered to be of the Goyawanzae or highest caste, and do not appear to differ from what other natives would become, if compelled to make the same exertions, and to endure the same privations. The village Veddas have permanent places of residence, cultivate small portions of land, and communicate, although they do not mix with the other natives. The forest Veddas subsist by hunting, or on the spontaneous productions of the earth; and they obtain arrowheads, the only article of manufacture which they covet, through the intervention of their own chiefs, and their brethren of the villages. They are, however, very scantily clothed; their whole dress consisting of a small piece of cotton cloth hanging in front from a string tied round the loins. They may more properly be termed rude than savage, because they are as free from ferocity as from any trace of civilization. Their present state is an inheritance from their ancestors, the Yakkas or aboriginal inhabitants, who were in possession of the eastern part of Ceylon when Vijeya landed, B. C. 543; and, having then escaped from the fury of the invaders, into the forests of Bintinne and Veddarata, they have there preserved the purity of their race, and the superstitions of their fathers.—(*Forbes*, II. 75.) There are also *Malays*, *Moormen*, *Caffres*, and *Javanese*, a few *Chinese* and *Parsee* traders, and many descendants of the Portuguese, Dutch, and English, mixed with native blood, scattered over the island. The pure Singalese of the interior are completely Hindoos in person, manners, customs, religion, and government; and differ from Europeans less in features than in colour, size, and form. The colour of their skins varies from light-brown to black; the colour of their hair and eyes also varies; but hazel eyes are more common than brown hair. In size they generally exceed the lowland Singalese and the Hindoos of Coromandel and Malabar, but are inferior to Europeans; their average stature may be about 5 feet 4 or 5 inches. They are clean made, with neat muscles and small bones; their features are commonly regular and often handsome; their faces intelligent and animated. The women are generally well-made, and good-looking, and often handsome. The Singalese of the coast are generally a finer race of men than the Bengalees, and more elegant than the Rohillas or Rajpoots. The expression of the countenance is fine; their skins nearly black; and their hair long and black, but not coarse. From the genial climate little clothing is requisite, and abundance of food (at the worst, fruit and yams), with fuel at command, probably places the peasant of Ceylon in a better position than the peasant of any other country. The higher classes, with the exception of the old chiefs, have already lost the recollection of barbarous power, and, by giving their children an English education, are teaching them to aspire to those offices which confer real importance and just influence on the possessors. The highest rank of natives have generally mild manners and quick abilities; and, from the laudable ambition with which they are inspired, it may be expected, ere long, that many of them will be found

filling with respectability the high official situations which have been opened to their competition.—(*Forbes*, I. 62.)

The Singalese recognise the four Hindoo castes, which they call *wanes*: the *Echshastria* (*Kshetrya*) or royal caste; the *Bramina*; the *Wiesia*; and the *Sudra*. The first two, however, have now no existence in Ceylon; for the royal family, who were believed to be of the Echshastria caste, are now extinct; and there are no Brahmins. The *Goewanse* or cultivators, form the highest caste in the interior; and were formerly a privileged class, who monopolised, under the Kandian government, all the honours, and all the hereditary rank; while the labourers and tradesmen formed the other caste called *Kushdra-wanse*. In this inferior caste, not only each service or trade was distinct, but was also subdivided into branches, the families of which did not intermarry. Below all these are the *Rhodias*, a race of outcasts, who are employed in the lowest and most degrading professions. The Singalese are, generally speaking, on a level with the Hindoos. In courtesy and polish of manners they are little inferior to the most refined people of the present day; but in intellectual acquirements and proficiency in the arts and sciences, they are not advanced beyond an equality with the darkest period of the middle ages in Europe. Their character on the whole is low, tame, and undecided, with few strong lights or shades; possessing few prominent virtues or vices, it may be considered as a compound of weak moral feelings, of strong natural affections, and moderate passions. In religion they are Buddhists, and, like all uninstructed people, extremely credulous and superstitious; believing in omens, demons, and spirits. By the last census in 1835, the amount of the population was found to be 1,250,000. Ceylon is now entirely in the possession of the British; the government is regulated by a charter granted by the Crown in 1833, and is under the charge of a governor, appointed by the Crown, who is assisted by two councils, the one legislative, the other executive; and for the administration of justice there are a supreme civil and criminal court at Colombo; a vice-admiralty court, and provincial courts in various districts; besides magistracies. Trial by jury was introduced several years ago, with great success, and highly to the satisfaction of the natives, who have proved themselves to be well qualified for the enjoyment of the privilege, and the performance of its duties. For administrative purposes the island is divided into five provinces, named the Eastern, Western, Northern, Southern and Central, and each of these is subdivided into districts. In each province there is a government agent, besides 19 assistants, who are stationed in various districts. These functionaries administer the affairs of government, and also officiate as magistrates. The ecclesiastical establishment of the Church of England consists of an archdeacon, 6 chaplains, and 11 proponents. At Colombo a regular police has been organized on the London system; and throughout the island the police is generally good; but crimes are rare. Good roads, some of which are said to be equal to any in England, have been formed and are forming by Government throughout the island, rendering the various regions easily accessible, and contributing largely to their rapidly advancing prosperity. Various reforms have also been effected in the revenue expenditure, in the system of taxation, and the regulation of commerce; and the moral character of the people has already been raised very perceptibly by making them eligible to every government situation, by the general extension of education, and the introduction and rapid diffusion of the English language; but most of all by the abolition of compulsory service, in making the people all equal in the eye of the law; and abridging the authority and influence of their chiefs.

The mythological history of Ceylon extends backward to the conquest of Lanka, which was effected by the Hindoo demi-god Rama, about 23 centuries B.C.; but the authentic history commences only with the year 543 B.C., when Vijeya, a Hindoo of the solar race, conquered the island, and established a dynasty which continued to exist uninterruptedly till A.D. 1815, when the last of 165 Singalese kings was dethroned by the British Government. The family, however, of Vijeya's descendants had become extinct in 1739; the subsequent kings were only connexions by marriage with the solar race; and from an early period in the sixteenth century their dominion was restricted to the interior of the island by the Portuguese and Dutch, who were finally succeeded by the British in 1796. It has been usually asserted by European travellers and residents in Ceylon, that there were no authentic historical records; but, since the British Government acquired the complete possession and ascendancy in the island, a multitude of records have come to light, from which it is possible to compile a perfectly authentic history of the kings of the solar dynasty; or, from the year 543 B.C. to the present day, a long period of 2383 years. The earlier history is only traditional, or mythic, and, during the long period which elapsed between Rama's conquest and the arrival of Vijeya, is very obscure or almost a blank.—(*Turnour's Epitome of Cingalese History, in Appendix to vol. II. of Forbes's "Eleven years in Ceylon."*) Laka, Lanka Lankawa, Laka-diwa, Lanka-dwipia, or some other variety of these words, is the most ancient appellation of Ceylon to be found in Sanscrit or Singalese records. *Laka* is the ancient Singalese, *Lanka*, the Sanscrit name of the island. The most common name of the island is *Singhala*, variously written *Sihala*, *Seha'en*, *Singhalen*, *Ceylon*, *Seilan*, derived from Singha or Siha, the race to which Vijeya, the Hindoo conqueror and his followers, belonged. Vijeya was banished by his father, who ruled over a country named Lala, whose capital, Singhapura, is probably the same as Singhea, on the banks of the Gunduck, where the site of an ancient city is discernible, covered with numerous ruins and Buddhist monuments.—(*Forbes*, I. 9, 12.) It is asserted by the Singalese, and the Greek and Roman geographers seem to confirm the assertion, that Ceylon was formerly of much greater extent than it now is. Lanka is said to have been 5120 miles in circumference; but by successive encroachments of the sea, to have been reduced to a circumference of 964 miles, which is considered by the Singalese to be the present extent of their island. By Europeans its circumference is reckoned about 800. The first partial submerging of Lanka is stated in the Singalese records to have occurred about 2387 years, B.C.; the second in the time of King Panduwas, who reigned from 504 to 474 B.C.; and the third and greatest in the third century before the Christian era. The Singalese traditions also mention that thousands of isles attached to the kingdom of Lanka were overflowed by the sea B.C. 2387, along with the splendid capital of Sri-Lanka-poora, which stood to the westward of any part of the present island.

The revenues derived from land-rents and various other sources, averages somewhat more than £330,000 a-year, and now generally exceeds the expenditure. The military force consists of 4 regiments of the line, 2 companies of artillery, and the Ceylon rifles, consisting of 16 companies, principally composed of Malays.

Towns, with their distances from Colombo.

Colombo, the capital of the island, is situate on the south-west coast, lat. 6° 57', long 80° 2', with a

strong fort built on a peninsula, which is defended by 300 pieces of cannon. The town is handsome, and divided into four parts by two broad streets. The *Rettah*, or native town, is very extensive, having so many as 50,000 or 60,000 inhabitants. There appears to be little traffic, except in cinnamon and pepper; the harbour is safe at one season only; during the south-west monsoon, the whole coast is wind-bound. *Kandy*, 72 miles travelling distance from Colombo, by a carriage road equal to any in England, is situate at the head of a valley 1678 feet above the level of the sea, and surrounded with hills. The houses are all of clay, those of the chiefs tiled and white-washed, the others thatched; but all arranged in regular straight streets. Kandy was the residence of the latter kings of Ceylon, and is now the occasional residence of the British governor. It contains several temples, and two colleges for Buddhist priests. It is nearly surrounded by the Mahavelligunga, over which there is a splendid wooden bridge at *Paradeinia* or *Paradennia*, 4 miles from Kandy, of one arch 205 feet span, 22 feet wide, and 67 high. Immediately adjoining the bridge, in a bend of a river, is the botanical garden, which is a pretty spot. Kandy is connected by four great roads with Colombo, Trincomalee, Baddula, and Kurunaigala. *Newera-ellia* or *Neweralia*, 50 miles S. from Kandy, upon a table-land 6210 feet above the sea, is a place rising fast into repute, from its salubrity, the lowness of its temperature, and its approximating in many respects to a European climate. Most of the European vegetables grow to great perfection; strawberries are abundant. There is also an hospital for convalescents. The mountain *Pedrotallagalla*, rises above the plain of Newera-ellia, about 2000 feet, and a road has been cut to its top, where a superb view is the reward of those who ascend it. Between Newera-ellia and Kandy, the road is so good that the distance has been ridden in five hours, and the scenery is not to be surpassed in Switzerland or Wales. The valley of *Cotamalie*, in particular, situate at the base of the hills which skirt the plain of Newera-ellia, is considered by many to be the most enchanting spot in the island. The general range of the thermometer at Newera-ellia is from 45° to 65°, but it often falls to the freezing point, when of course, ice is formed; and there are few evenings in which a fire is not found to be necessary for comfort. South-west of Newera-ellia, overlooking Saffragam, is the highest table-land in Ceylon, named by the Ceylonese *Maha-ellia* (the great plain), and part of it *Wilmantawale;* but by Europeans *Horton Plains*, 6690 feet above the level of the sea. *Trincomalee* (*Trinkomalee*), on the north-east coast, in lat. 8° 32′, long. 81° 17′, communicating with Kandy and Colombo by a fine road, is a small and mean town with few European inhabitants, and few Singalese, the lower people being chiefly Roman Catholic Malabars. The fortifications form a sweep of about a mile in length; and might be rendered almost impregnable. The rocky promontory occupied by the fort is dedicated to Siva, in his character of Eiswara, and is held by his votaries in great veneration. Except a few small coasting vessels with rice, there is no trade. The harbour is so land-locked that it appears like a lake; its surface is beautifully diversified with islands, covered with luxuriant vegetation, as are also the hills which surround it. It is capable of containing any fleet of the largest ships in perfect safety, and is the place of refuge for such as are overtaken at sea by the north-east monsoon. Trincomalee is considered the worst station in the island. The vicinity is a wild uncultivated country, abounding with game of all kinds, from the snipe to the elephant. The temperature is much higher than that of any other of the stations. October and the three following months are the cool season, and the climate is then truly pleasant; in March, April, and May, the heat is oppressive; the thermometer is seldom below 94° during the day, and is often at 99°; the nights are usually cool. There are often long intervals of dry weather: six months sometimes pass without rain. The coast is celebrated for beautiful shells. The hot wells of *Kanya*, situate near a range of wooded hills, eight miles from Trincomalee, are seven in number, of small size, and of different degrees of temperature, varying from 100° to 110°, and consist of warm, pure, clear water. About 30 miles from Trincomalee is the celebrated lake of *Candelay*, formed by an embankment across a valley, and covering an area of about 15 square miles. *Point de Galle*, a strong fortress and excellent harbour, on the south coast, lat. 6° 1′, long., 80° 10′. The outer and inner harbours are spacious, and the inner is secure at all seasons. The town is situate on a rocky promontory, with works upwards of a mile in circumference; and is remarkable for its salubrity. The usual range of the thermometer is from 80° to 84°, but the heat is tempered by the sea-breeze, which blows nearly the whole year. The south-west monsoon blows full and fresh from the ocean, renovating the constitutions of those who have suffered in the more unhealthy parts of the island. The inhabitants are celebrated for their skill in the making of dressing-cases, work-boxes, and jewellery. *Dondra* or *Dewinuwara* (God-town), a village at the most southerly point of Ceylon, lat. 5° 50′ N., long. 80° 40′ E. *Jaffna* or *Jaffnapatam* stands in a flat country, but the richness of the vegetation, and the beauty of the scenery render its appearance exceedingly picturesque. The houses are neat and clean, and are all white on the outside; the principal street, which runs through the centre of the town, is finely shaded on each side by rows of large trees, towering above the houses, which, indeed, are only one storey high, but raised a few steps from the ground on a paved terrace. At the distance of a quarter of a mile westward from the town, stands a commodious pentagonal fort, having five bastions, and surrounded with broad ditches and an extensive glacis; a large square occupies its centre, enclosed by rails, and bounded by streets of excellent houses. At two miles distance from the fort are the Pans, where a great quantity of salt is gathered, which is disposed of for twopence the paralt (40 pounds weight), to Government, who afterwards sell the same quantity to the traders for two shillings. Vast quantities are exported to Madras, Calcutta, and other parts of India. Jaffna is situate on an island at the northern extremity of Ceylon. Near *Mantotte*, opposite the island of *Manaar*, are the ruins of a very large city, built of brick and mortar, and an immense tank 16 or 18 miles in extent, said to have been founded by the Hindoos, and made the capital of a kingdom which they established in the northern part of the island. *Anaradhapoora*, one of the ancient capitals of Ceylon, an honour which it held for twelve centuries, was surrounded by a wall 16 miles square. Among its ruins are six pagodas of immense size, the form being a hemisphere surmounted with a spire; the two largest are each 270 feet high, of solid brick work, once entirely covered with chunam; the roofs are composed of curiously carved rafters of wood. All the ruins, and even the lofty monuments are either covered with jungle, or obscured by forests; it is nearly a thousand years since it ceased to be the capital. Its successor *Polennaraia*, which was the capital for 550 years, is likewise completely in ruins; it is situate about 36 miles S.W. of Kandy, and was finally deserted in A.D. 1319. It is now generally called by Europeans *Topare*, a corruption of *Topaweva*, the name of the tank which extends along one side of the city.

The most celebrated place, however, in Ceylon, is *Adam's Peak*, so called by the Mahometans, who believe that Adam, whose stature was equal to the height of a tall palm tree, after having been thrown down from Paradise in the seventh heaven, alighted on this peak, and remained standing on one foot until years of penitence and suffering had expiated his offence, and formed the footstep. The Hindoos ascribe the impression to their god Siva. By the Singalese it is called *Siri-pada* or *Sreepada;* also *Samanella* or *Hamanella*, from Saman, the guardian god. The top of the mountain is 7420 feet above the sea; its area measures only 70 feet by 30, and is surrounded by a stone wall 5 feet high, built in some places on the brink of the precipice. Within the inclosure is a granite rock, the highest part of which is 9 feet above the ground, and on the top is the Sree-pada, the impression of Buddha's foot, which he made on his first visit to the island. It is a superficial hollow, 5 feet 3½ inches long, and 2 feet 5 or 7 inches wide. The cavity certainly bears a coarse resemblance to the figure of a human foot; but that is helped out by a margin of plaster, which is coloured like the rock. It is covered by a small wooden temple, fixed by chains, and usually attended by a priest; and is

THE LACCADIVES are a cluster of 17 islands, due west of Malabar, between 10° and 12° N. lat., and 72° and 74° E. long., of which only eight are inhabited. The total population, about 6500, are a poor inoffensive race, all Mahometans of the Moplay sect, and subjects of the Bibi or princess of Cananore. There is no safe anchorage among the islands, and they produce nothing of any commercial value but the cocoa-nut. In the south-west monsoon all intercourse among them is interrupted, and their large boats are sent to the Malabar coast for shelter. The islands are all defended by coral reefs to the windward, except *Anderote*, the principal, which not only presents a bold front to windward, but that front is one side of the island itself, and not a reef, as is generally the case. The coral reef on which it is based projects to leeward, instead of windward, south-west being considered the prevalent direction of the wind.

Elscalpine Bank, 11° 16′ N. and 74° 20′ E., has only six or seven fathoms water, with a rocky bottom in some places, on which a large ship would be liable to strike in a heavy sea, 27 leagues from Mount Dilly.

THE SOUTH-EASTERN PENINSULA.

THIS is an extensive region, which lies to the south-east of India, and south-west of China, is possessed by several distinct nations, and divided into various independent states, but bears no general distinctive name. Some geographers have proposed to call it *India beyond the Ganges*, or the *Farther Peninsula*; others, *Indo-China*; and Malte Brun calls it *Chin-India*. But these names are all liable to various objections; we shall therefore adopt another, which involves no theory or geographical impropriety, but simply expresses the situation of the country relatively to the rest of the continent of Asia, namely, *The South-Eastern Peninsula*. It forms one geographical region; and, as such, we shall first describe its general natural features, and then proceed to the particular description of the countries which it comprehends.

This region forms a large peninsula, projecting from the borders of India and China southwards into the Indian Ocean, and terminating in a long narrow promontory, which approaches within two degrees of the equator, and forms the southern extremity of the continent of Asia. The surface is occupied by several long ranges of mountains, which extend from north to south, forming between them wide valleys and maritime lowlands, which are drained and watered by large rivers, the remote sources of which are found in the northern mountainous region between India and China.

The principal rivers in the peninsula are the following:—The IRAWADY, which has its sources among the mountains to the eastward of Assam. The latest accounts trace them to numerous p tty streams, from the mountains of the Laos and Yunnan, which are said to be covered with perpetual snow. In the summer of 1827 the Irawady was crossed in 27° 30′ N. lat. by Lieutenants Wilcox and Burlton, from Sudiya, at a place where it was only 80 yards wide, and which, according to the natives, was only 50 miles from its sources. Klaproth, however, on the faith of Chinese authorities, connects the Irawady with the Sanpoo of Thibet, by means of a river which the Chinese call *Yin-liang*, and which seems to be the same that is called by the Birmans *Tapan-khyoung*; but Captain Hannay, who travelled from Ava to the borders of Assam in November and December 1835, describes the Taping or Japan, near old Bhamo, as not more than 150 yards broad, with only sufficient water to float a small boat; which seems to set at rest the question of its identity with the Sanpoo. So paltry a stream as this would form an insignificant channel for the mighty drainage of a thousand miles of the Himalayas and Kwan-lun.—(*Crawford's Embassy to Ava*, II. 228; *Asiatic Journal*, November 1837.)—The Irawady flows southward through the Birman empire; and, in Pegu, divides into a number of branches, which water a large extent of country, and give important facilities to navigation. It enters the Indian Ocean by more than 14 mouths, in 16° N. lat., to the eastward of Cape Negrais, its delta forming a swampy coast of 170 miles from E. to W. It may be ascended to Ava at all seasons by vessels of 200 tons, and by native boats to Bhamo, near the frontiers of China; the length of its course is reckoned to be 1200 miles. It is in fact the great highway of the Birman empire, and the principal source of its fertility. Its principal affluent is the *Kyen-duen*, which joins it at Yandabo, about 50 miles below Ava.

The SALUEN, THALUEN, THAN-LOUEN, THALOUYEN, or THALEAIN, appears to rise in Thibet, where it is known by the name of *Oir-chou*, and flows through Yunnan under the name of *Nou* or *Lu*. After leaving China it takes the name of *Saluen*, and separates part of the Birman provinces from those of Siam. It enters the Gulf of Martaban to the eastward of the delta of the Irawady, by two branches, which are divided by the island of Balu. The northern branch is so much obstructed by shoals as to be impracticable for shipping; but the southern branch has a width of seven miles, and the tide flows up the main stream and its affluents more than 100.

The MEINAM appears to have its sources in Yunnan, from which it runs due south to the Gulf of Siam. In Siam it divides into several branches, which form a number of fertile islands. The lower part of the main stream is very winding; it has generally a depth of four or five fathoms, and is free from shoals, up to Bankok. The mouth of the river is 5 miles wide, but the navigable channel does not extend more than half a mile, with a low swampy shore. Large vessels anchor out at sea, 8 miles off shore; the tide rises and falls seven feet, but is irregular, ebbing and flowing only once in the twenty-four hours. In the country of the Laos is a river called *Annam-muit*, which connects the Meinam with the river of Cambodia; but it seems to be a small stream, navigable only during the season of inundation. The Meinam is navigable for boats up to Chaugmai.

The MAY-KUANG, MENAM-KONG, or MEKON, rises in Thibet, where it bears the name of *Dza-chou* or *Sa-chou*; it afterwards flows through Laos and Cambodia into the Chinese Sea, by a number of channels, which form an extensive delta. In Yunnan it is called *Lan-thsang*.

The *Saung* or *Don-nai*, in Lower Cambodia, has a course of 300 or 40 · miles, passing the town of Saigon, and forming one of the finest navigable rivers in the world. The *Song koi* is the largest river of Tonquin; the *Che-sui* is another river of the same country; both of which fall into the Gulf of Tonquin.

CAPES.—*Negrais*, at the western mouth of the Irawady; *Romania*, the south-east point of the Malay Peninsula, forming the southern extremity of the continent of Asia; *South Cape*, *North Cape*, *Rocky Point*, and Cape *Patani*, on the east side of the peninsula; *Kuri Point*, on the west side, and Cape *Liant*, on the east side of the upper part of the Gulf of Siam; *Point Kamboja* or *Chrudin*, the south-east point of the gulf; Cape *St. James*, at the eastern side of the river of Saigon; Cape *Padaran*, Cape *Avarella*, Cape *Bantangan*, Cape *Tarom* or North Cape, on the coast of Cochin-China.

ISLANDS.—*Balu*, at the mouth of the Saluen; *Tavoy*, *Great Canister*, *Calasa*, *Tenasserim*, *Kings*, *Tower*, *Domel*, *Clara*, *Tumis*, *Susannah*, *St. Andrew*, *St. Matthew*, *Aladdin*, *Chance*, *Middle*, *Pesbroke*, *Sewer*, *Junk-ceylon* or *Salang*, *Rejia*, *Brothers*, *Pongang*, *Battoo*, *Pilgrims*, *Malacca*, *Sancgald*, *Tebton*, *Bouton*, *Trotto*, *Lancawe*, *Laudda*, *Rat*, *Penang*, *Dinding*, *Sambelang*, *Jarak*, *Callain*, *Arroan*, *Ladoes*, *Pisang*, *Cocob*, all along the west coast of Tavoy, Tenasserim, and the Malay peninsula; *Tingai*, *Aor*, *Pinang*, *Timaon*, *Pabi*, *Varela*, *Brabi*, *Capets*, *Great Redang*, *Lantingan*, *Trantaun*, *Kon*, *Lozon*, *Tantalum*, *Cara* or *Krak*, *Carcam* or *Sarcan*, *Saseeri* or *Thangsan*, *Barida*, along the east coast of the peninsula; *Seachang*, *Nak*, *Kram*, *Phai*, *Rin*, *Sin*, *Sam-sa-sam*, *Kah*, *Samet*, *Kud*, *Chang*, *Koog*, *Dud* or *Klrak*, *Harding's Archipelago*, *Parjang*, *Onbi* or *Oby*, on the east side of the Gulf of Siam; *Condore*, *Caturick*, *Sajata*, *Cicir de Mer*, *Cicir de Terre*, *Tre*, *Buffalo*, *Turtle*, *Cantan* or *Callao Ray*, *Chamcalhao*, *Tiger's Isle*, on the coasts of Cambodia and Cochin-China, besides a great many others. Many of these islands have the word *Pulo* or *Kho* prefixed to their names, both of which mean *island*; the former in the Malay, the latter in the Siamese language. The only islands which deserve particular notice are, *Tantalum*, *Junk-ceylon*, and *Penang*. *Tantalum* lies at the south-west side of the Gulf of Siam, is about 70 miles in length, and is separated from the mainland by a narrow channel, which, at the northern end, is bare at low water. The southern part of the island

is high, but the north is low and marshy. No part of it is cultivated or inhabited except that which contains a portion of the town of *Sungcora*. *Junk-ceylon* lies on the west coast of the peninsula, in the same latitude as Tantalem, 9° N. The name is a corruption of the Malay words *Ujung Salang*, headland of Ceylon. It is the most densely inhabited portion of this part of the Siamese territory, and is under a governor styled Phya, who has subject to his jurisdiction seven districts on the adjoining mainland. The island is of granite formation, and possesses very rich lead mines. It is nearly 40 miles long, by 12 or 15 in breadth, and is separated from the continent by a very narrow shallow channel. *Penang* will be noticed elsewhere. *Preparis*, 70 miles S. of Cape Negrais, is a small island 3 miles long, 8 in circumference, covered with wood and jungle, and surrounded for several miles by sunken reefs, which render it the dread of navigators. It is accessible only on the eastern side.

PEOPLE.—With the exception of the Malays, who possess the coasts of the peninsula which bears their name, and the negro tribes who inhabit the interior of the same narrow tract, the whole of this extensive region is inhabited by many tribes and nations of the same physical type, forming a sort of intermediate variety between the Mongolian and the Malay or Caucasian races, but more nearly resembling the first. They are, in general, shorter than the Chinese and Hindoos, but taller than the Malays; their average height is five feet three inches. Their lower limbs are well formed; their persons are robust, active, fleshy, and well proportioned, wanting, however, the grace and flexibility of their neighbours in the west; their complexion is a light brown, perhaps a shade lighter than that of the Malays, but much darker than that of the Chinese. The Siamese and the Kariens are the fairest, being of a bright cane colour; the Birmese and Peguans are of dark bamboo. The face is flat, with high cheek bones, presenting the form of a lozenge; the hair of the head is abundant, black, lank, and coarse; but the beard is scanty. Their languages exhibit the same characteristics of simplicity, poverty, and deficiency with the monsyllabic languages of China and Thibet. Three distinct languages prevail among them:—the Birmese, which is spoken in Ava and Aracan; the Siamese, in Siam and Lao; and the An-namese in Tonquin and Cochin-China. Pegu, however, is said to have an original dialect called the Mon, of which too little is known to determine its relation to the others. The sacred language of Birmah is the Pali; the Birmans have also borrowed the Sanscrit alphabet; their legal code is one of the commentaries upon the institutes of Menu; and in these and some other respects they discover their affinity to the Hindoos; while the Siamese, An-namese and Peguans bear a more strongly marked resemblance to the Chinese.

GOVERNMENT.—This region exhibits despotism in its greatest purity. As in China, the names of the Emperor of Birmah and of the King of Siam must not be pronounced during their lives by any of their subjects, under pain of death; and these dread names are confided only to a small number of favourite courtiers. In Birmah, Siam, and An-nam, every man above twenty years of age, with the exception of the priests and public functionaries, is obliged to devote not less than every third year of his life to the public service, either as a soldier or as a labourer. It is on this account that, among these people, emigration is considered as a treasonable offence, and equivalent to a theft of the prince's property. There exists, however, throughout these countries, in spite of the faults of their governments, a great degree of order and regularity. Civil and criminal justice are administered with more firmness and with less precipitation than in several other countries of Asia; the result of which is considerable security for life and property. The administrative forms among the Birmans and the Siamese are of interminable slowness; but in Cochin-China the activity of the government is equally vigorous and rapid. The Emperor of An-nam has called himself for a long time the vassal of China; and the King of Siam still recognises his vassalage to that empire; but this dependence is only nominal. The tribute which they pay is merely a formal acknowledgment, and every interference of China in the affairs of government is rejected with firmness. The savage tribes live under their respective chiefs, who are more or less oppressive; but some of them enjoy a considerable degree of liberty.

INDUSTRY.—The civilized portion of the inhabitants of this region have made little progress in the useful or the fine arts. They excel, nevertheless, in gilding, in a kind of varnished work, ornamented with rich mosaic in mother-of-pearl; in idols, from the smallest size to the most colossal, in certain kinds of gold and silver work, in common pottery, and the building of ships and boats. The Cochin-Chinese have made great progress in naval architecture and navigation, as well as in everything pertaining to the military art; a progress which they owe to the Bishop of Adran, and several French engineers. In 1787, the King of Cochin-China having been re-established on his throne by the efforts of the Bishop of Adran and the French missionaries, invited several officers and engineers of that nation, who formed very important establishments, and superintended the various improvements which were made in the naval and military arts. In other respects, the people of these countries are inferior; they cannot make cotton-cloth like the Hindoos, porcelain like the Japanese, or silk like the Chinese. The care which the Cochin-Chinese and Tonquinese take of these latter works gives them a great advantage in the useful arts over the more western nations. They make coarse cotton-cloth for their own use; also slight silk stuffs, which formerly, in the infancy of European manufactures, were eagerly sought for in our markets. The large towns are the principal seats of industry. In Birmah, agriculture is chiefly the lot of the Karyan, the Khyan, and other tribes who do not congregate in towns, and some of whom have not even ceased to be nomadic.

COMMERCE.—For several years past the commercial relations of the Europeans with the civilized people of the South-eastern Peninsula have become much closer than formerly. For upwards of forty years the Chinese have possessed themselves of all the commerce of Siam, of which they are the foreign merchants, the navigators, and the seamen; 140 junks, of 35,000 tons burden, sail yearly to China; and 40 or 50 to Sincapore, which is also frequented by junks from Cochin-China. Besides the commerce carried on in Birmah by European ships, the Birman boats trade to a considerable extent, creeping in fine weather along the coast of Aracan to Calcutta. Commercial business of some importance is also carried on by land between the British and the Birman territories, between Birmah and China, and between China and Tonquin. But with Siam the Birmans have no commercial relations; an implacable hatred, and a state of continual warfare exist between the two states. Their respective frontiers have the appearance of a desert, and slavery awaits the unfortunate adventurer who passes his own frontier, and has the misfortune to fall into the snares which these people respectively lay for each other.

The principal articles of export are cotton, silk, tin, teakwood, eaglewood, and sandalwood, gumlac, catechu, grain, salt, oil, sugar, ivory, pepper, birds' nests, precious stones, particularly rubies and agates, iron, and varnished works. The principal imports are cotton stuffs, wrought silks, cloth, opium, velvet, porcelain, tea, paper, lint, canvas, and a great number of European and Chinese manufactures. The principal inland trading places are, Ava, Prome, and Bhamo, in Birmah; and Ketsho in Anam. The principal maritime trading places are Sincapore, Georgetown, Rangoon, Bankok, Chantibou, Saigon, Huehan or Faifo, and Touron or Hansan.

DIVISIONS.—The whole region may be divided into six portions: 1. The *Birman Empire* or *Birmah*; 2. The *Kingdom of Siam*; 3. The *Empire of An-nam*; 4. The *Country of the Laos*; 5 The *British Provinces of Martaban, Tavoy, Tenasserim, Mergui, Malacca, Wellesley, Penang*, and *Sincapore*; 6. The *Malay States* of *Queda, Perak, Salangore, Johore, Pahang, Kemamang, Tringano, Calantan*, and *Patani*.

§ 1. *The Birman Empire*

Is situate between 15° 45′ and 27° 20′ N. lat., and 93° and 99° E. long.; being about 800 miles in length from north to south, 300 in breadth from east to west, and comprising an area of 200,000 square miles. It is bounded on the north by Assam, and the unexplored mountainous country farther east; on the south by the Gulf of Martaban; on the west by the hill countries of Cachar, Tipperah, Chittagong, and Aracan; and on the east by the Chinese province of Yunnan and the river Saluen, which divides it from Siam. From the sea up to the parallel of 17½°, the country is low and champaign; from that point to 22° it is elevated and hilly; and further north, it is decidedly mountainous. It is watered by four of the great rivers already mentioned, the Saluen, Setang, Irawady, and Kyen-duen, all of which have a southerly course, marking the character of the country as a plain, inclined from north to south. It contains a great many lakes; those in the lower provinces are numerous, but small; the province of Bassein alone contains about 127. The lakes of the upper country are much larger. Birmah has about 240 miles of sea coast, extending from Cape Negrais to the mouth of the Saluen; the whole of which is low, marshy, and broken by at least twenty channels of rivers, or arms of the sea. In a mineralogical view, the Birmese territory may be described as consisting of four divisions: 1. The alluvial plain formed by the mouths of the great rivers; 2. The country of secondary or tertiary formation, extending from between the 18° and 19° to near the 22° N. lat.; 3. The extensive mountainous tract of primary formation, lying to the north, the north-east, and the east of Ava, and the hilly regions which form the western boundary of the vallies of the Irawady and the Kyen-duen. The first region is remarkably destitute of mineral products; but the other two contain limestone and marble, gems, principally of the sapphire and ruby family, beautiful serpentine, iron, gold, silver, copper, tin, lead, antimony, amber, coal, petroleum, nitre, natron, and salt. The most remarkable, however, of these is the petroleum or mineral oil, which is procured from wells sunk in a bed of blue clay, about three miles from the town of Re-nan-k'hyaung (smelling-water rivulet), on the east bank of the Irawady, in lat. 20° 27 N. The wells occupy a space of about sixteen miles square; the oil, when first obtained from the well, is thin, but thickens by keeping, and in cold weather coagulates. Its colour is a dirty green, like that of stagnant water; it has a pungent aromatic smell, which is disagreeable to most people, and, in burning, it emits an immense quantity of black smoke, which soils everything within its reach. It is, however, so much cheaper than any other kind of oil, that it is universally used by the Birmans for their lamps, wherever there is water to convey it. The annual produce of the wells is estimated at twenty-two millions of viss, each 3 65-100 pounds avoirdupois. Among the useful productions, the teak-tree holds a distinguished place; the forests are very extensive, and it appears to be very generally diffused throughout the high lands of the kingdom; there are also oaks and other valuable trees, mimosa, catechu, and others of the same family. The forests also furnish varnishes and stick-lac. Birman agriculture embraces rice, maize, millet, wheat, various pulses, palms, sugar-cane, tobacco, cotton, and indigo. Rice is the great object of husbandry throughout the kingdom. The useful quadrupeds domesticated by the Birmans are the ox, the buffaloe, the horse, and the elephant; the last of which, however, appears to be merely an object of royal luxury and ostentation. The hog is also domesticated, but being neglected, its habits are disgusting and offensive in the highest degree. The dog is seen, but uncared for. Cats are numerous, and dexterous in destroying vermin. The ass, the sheep, and the goat, though bearing native names, are little known in the domestic economy. Of poultry, only a few common fowls and ducks are reared. Wild animals and game are numerous. The most remarkable quadrupeds are the elephant, rhinoceros, hog, deer, ox, buffalo, bear, otter, tiger, leopard, wild and civet cats. The elephant is found in all the deep forests of the country, and is peculiarly abundant in Pegu. Hares, wild cocks, pheasants, partridges, quails, and snipes are also abundant; geese and ducks are numerous in the upper provinces. The Birman territory is but very partially cultivated, and thinly peopled by a race of inhabitants who have made little progress in useful industry. The financial system of the government is rude, barbarous, and inefficient beyond what can easily be believed. No regular land revenue is collected on account of the sovereign, the greater part of the lands being given away in jageer to members of the royal family, to public officers, and to favourites, instead of pensions or salaries, and a mere trifle is reserved for the king. Scarcely any disbursements in the form of money are ever made from the treasury, as no salary is paid to any public officers from the highest to the lowest; those who have no lands live as they can, on fees, perquisites, and extortions. Even the government itself does not encroach upon its hoard, except on very extraordinary occasions, and may be said to depend on the daily supplies. If an embassy is to be sent to a foreign country, a contribution is levied for the purpose; if an army is sent on an expedition, the necessary expenses are raised on the occasion; if a temple is to be built, the same thing is done; and so in all other cases.—(*Crawford*, II. *Appendix*, 23.) Few countries have had their population so variously estimated. Old geographers stated it at 30,000,000; Symes made it 17,000,000; Cox afterwards reduced it to 8,000,000: and Balbi allows only 3,700,000. "The chief woongee at Ava informed me that the last census gave a total of 300,000 houses. After the most careful inquiries, I am led to put down the number of the inhabitants to whom the Birman is vernacular at 3,000,000. The Shyans are probably three millions more, and, with other subsidiary tribes, bring up the total population to about the estimate of Cox."—(*Malcolm's Travels*, I. 208.)

Birmah is inhabited by many distinct nations or tribes, of whom so many as eighteen have been enumerated. The most considerable of these are the proper Birmans, the Peguans or Talains, the Shans or people of Lao, the Cassay or Kathe, the Zabaing, the Karian or Karens, the Khyans, the Ys, and the Lawa, which are respectively numerous and civilized, nearly in the order in which they are here mentioned. Though differing in language, and often in manners, customs, and religion, they have the same physical type which is common to all the tribes that possess the countries between India and China. Widely different from the Chinese and the Hindoos, they approach more nearly to the Malays, from whom, nevertheless, they differ so considerably, that even a stranger may distinguish them without difficulty. The Birmans may be described as of a short, stout, and active, but well proportioned form; their complexion is never of an intense black, but is commonly brown, or resembling dark bamboo. The hair of the head is black, coarse, lank, and abundant. There is a little more beard, and generally more hair on other parts of the body than among the tribes of the same race to the south, as the Siamese and the people of Lao. The proper Birmans inhabit a dry and elevated country; but climate and other physical circumstances appear not to produce any material difference between them and the other tribes of the empire. The Peguans or Talains, who inhabit the alluvial plains, are, however, alleged to be a more robust and active race than the Birmans. The Birmans are greatly inferior to the Hindoos in civilization, and still more so to the Chinese. They are considered by Mr. Crawford to be nearly on an equality with the Siamese; or, more nearly still, with the people of Java; they are, however, more advanced than the other civilized inhabitants of the eastern archipelago. Their laws and political institutions, bad as they are, are commonly better than those of the Indian islanders; yet the latter are superior to the Birmans in enterprise, courage, personal independence, and even morality. In one respect they agree: namely, in the comparative absence of religious or political bigotry, and the freedom from unsocial customs. The practice of tatooing, or staining the skin of an indelible tint, obtains among the Birmans and Talains, and has been followed more or less by the nations whom they have subdued.

the Kyens, the Aracanese, and the Shans. Another practice, which seems to be universal with both sexes, and with all the races which inhabit the Birman territories, is that of boring the lobe of the ear, so as to make a very large and unseemly hole, into which is stuffed a gold or silver ornament, or a piece of wood, or a roll of paper. The Birmans are extensive consumers of the betel mixture, and the smoking of tobacco is universal. With respect to dress, the Birmans are well, and not unbecomingly clad; but much of the body is left naked; and the texture and pattern of the fabrics worn, though substantial and durable, are coarse and homely. The dress of the priests differs entirely from that of the laity. The head is not only without covering, but is, or ought to be, closely shaved, and its only protection against the sun is a small fan of palmyra leaf. The colour of the priestly costume is yellow, which it would be deemed nothing less than sacrilege for any one else to use: so peculiarly sacred, indeed, is this colour held, that it is not uncommon to see one of the people pay his devotions in due form to the old garment of a priest hung out to dry, or to one after being washed. A superficial education is very common, and there is probably not more than one man in ten who is unable to read. This is chiefly owing to the institution of monasteries, and to its being a religious duty of the priests to instruct youth; but their science is of the lowest description; and they have an intense passion for alchymy, the object of which is to change the baser into the more precious metals.

The uniformity of the physical structure of the Birmans extends in an equal degree to the development of their moral character. The face of the Birman is without intelligence; his mouth is large and sensual, the teeth prominent, and the nose flat. Altogether the national cast of countenance is vulgar in the extreme, and so rigid that the passions have scarcely the power of relaxing it. Early taught by experience to study precaution, and practise dissimulation, candour and sincerity are unknown to them, and it is a national boast that the Birmans are without equals in their adroitness in concealing the truth. Happy or sad, their physiognomy announces neither pleasure nor pain; and even when questioned on the simplest topic they return an indirect reply. Artifice and circumvention are resorted to as the legitimate means of attaining their ends, and the man who should employ neither deceit nor stratagem in the pursuit of his object would be looked upon as little removed from a fool. They are, however, a very lively and talkative people; very vain, and proud of their affected superiority over every other nation; obstinate, suspicious, and addicted to many vicious habits, particularly the smoking of opium and gambling. The diversity of talent, the variety of appearance, and disparity of form, so conspicuous in individuals of the civilized countries of Europe, are scarcely to be found in Birmah. Every person conforms to the habits of the mass; and in respect of fortune the whole community are more upon a level with each other than any people who dwell in cities. Each has the same opinion of himself, of his country, and of foreigners in general. The national characteristics are perhaps less strongly marked in the priests, owing to their life of study and devotion; but these are not perpetuated, in consequence of their celibacy. Except in remote villages the people are on a perfect equality in respect of education, a circumstance which is accounted for by the fact that they are all instructed in the same routine, which embraces reading and writing in the vernacular tongue, and a smattering of Pali, collected from elementary books. As the colleges have no direct revenues, the priests are dependent for subsistence and clothing on the freewill offerings of the people; but usage has imposed on parents the duty of feeding the clergy of the college in which their children are educated. A large number of scholars forms, therefore, the best endowment of the brotherhood, a fact which may account for the vehemence with which they exhort their hearers to send their children to school, and denounce the negligent in this respect as the enemies of religion.

With respect to the Birmans it is obvious, says a late writer, to the most casual observer, that the country is gradually falling to decay. While the people of India are pressing forward with rapid strides, in defiance of the trammels of caste, scarcely glancing behind them, and then only to smile at the errors of their ancestors, the Birmese are receding from twilight into darkness, gathering their wisdom from books fourteen hundred years old, turning the fables of their forefathers into truths, pausing in puerile admiration over the knowledge and exploits of their ancestors, and lamenting their own fallen condition; the government, meanwhile, regardless of the value of life, draining an already half-peopled country of its inhabitants, towns dwindling into villages, and villages disappearing altogether; communication becoming less frequent; the people dispirited by oppression, yet passionately attached to the soil, anxiously awaiting the fulfilment of the prediction which promises them the restoration of their lost happiness and power, under a wise and just dynasty. The wars which had prevailed since the twelfth century, at one time between the Shans and the Birmans, at another between the Siamese and the Peguans, and at a later period between the Peguans and the Birmans, had almost stript those regions of their inhabitants, when the warlike propensities of Alongpora and his successors give the final blow to the prosperity of Birmah. They robbed their cities of every able-bodied man, and carried their arms into Siam, Aracan, Assam, and Cassay, exterminating the people wherever they came, till the whole region from the 95° to the 100° of longitude, and from Cape Negrais to the tropic, became almost untenanted by human beings. It is now overrun with jungle covering the ruins of forts and temples, which serve to mark the spots that were crowded in former times with a dense population, whose descendants are now gathered in scanty groups along the banks of their magnificent rivers. But they have lost the enterprise and valour which rendered them the terror of their neighbours, and retain only the vanity, obstinacy, and restlessness by which they have been always characterised. The degenerate Birmans seldom engage in any pursuit which requires much mental application; their books on religion and science are translations from the Pali; their poetry is confined to odes and songs of love and war; their knowledge of music is very limited; they are unacquainted with chemistry, and believe in the transmutation of metals. On the other hand, they are acquainted with vegetable physiology, and the sexes of plants; they can work in gold with considerable taste; they can weave intricate patterns, which even in England it has been found difficult to imitate, and they can carve in wood with tolerable ingenuity; but, on the whole, they do not excel, or even attain mediocrity, in any art which demands elaborate manipulation; and the few manufactures which they still possess, flourished among them in higher perfection at the moment of our first acquaintance with them than they do at present.—(*Jos. Smith, Asiatic Journal, April* 1841.)

Among the Birmans and the Talsins there may be said to exist seven classes of society distinguished by their privileges or employments; namely, the royal family, the public officers, the priesthood, the merchants, or "rich men," as they were called, the cultivators and labourers, slaves, and outcasts. The only class of public officers which can be called hereditary are the Thaubwas or Saubwas, the tributary princes of subjugated countries. The rest of the chief officers are appointed and dismissed at pleasure; and their titles, rank, and offices, and very often even their property, do not descend to their children. Any subject, who is not a slave or outcast, may aspire to the first office in the state, and the highest offices are really often held by persons of very mean origin. The priests called Phungyi or Ra-han, are bound to a rigid celibacy, interdicted from all employment but their own especial calling, and particularly from intermeddling with politics; but they are secured from labour by the voluntary contributions of the people. As a body they are not surpassed by the clergy of many more civilized countries, in the extreme simplicity and virtuous manner of their life. Existing by the voluntary gifts of the people, their best interests are involved in the observance of an irreproachable life; their sermons are generally in praise of charity, while, however, the general doctrines of their religion are not left unexplained. The priests form an important and numerous order; and along

with them may be classed the Thi-la-shau or nuns, who are less numerous, and are generally old women. There are also occasionally some young women among them, who forsake the sisterhood as soon as they can procure husbands; neither priests nor nuns being bound to continue in their profession. The women generally are neither immured nor veiled, nor are they withdrawn from the company and conversation of men; but they are treated as mere slaves, all laborious duties being devolved upon them; they also manage most of the transactions of buying and selling. The habitations throughout the country are made of slight materials but are commodious. Bamboos fixed in the ground, and tied with strips of rattan compose the outline, and serve as the supports of the building; the walls are covered with mats, and the roof thatched with grass. These slight structures are sufficiently comfortable, but they are exposed, by the nature of their materials, to frequent conflagrations. The temples and monasteries are splendid structures, being covered profusely with carvings and paintings, varnished and gilded, but the materials consist principally of brick and mortar. Through the mischievous effects of bad government the population and prosperity of the country have long been and still are rapidly declining; the whole population, it is believed, does not amount nearly to three millions.

The Birman empire consists of two great divisions—PEGU, which comprises all the sea-coast, and the mouths of the rivers; and AVA or Birmah, which comprehends the upper country, and is the seat of the dominant people. For administrative purposes, the empire is divided into provinces or vice-royalties, of very variable extent. The most frequent civil division appears to be that into *myos* or townships, which are reckoned to amount to 4600. The towns, however, properly so called, and some of which are indeed little better than large villages, do not exceed thirty-two. Of the seven principal towns, Mr. Crawford gives the following conjectural estimate of the population;—Ava, Amarapura, and Sagaing, with their suburbs and districts, 354,200; Rangoon, 12,000; Prome, 600; Bassein, 3000; Martaban, 1500. Ava, the capital of the empire, stands on the left bank of the Irawady, in lat. 21° 50′ N., and long. 96° E. The native popular name of the city is *Angwa*, a fish pond, which has been corrupted by the Hindoos and Malays into *Awa*, and by Europeans into *Ava*; its official name is *Ratnapoora* (Jewel town.) Ava is surrounded by a brick wall 15½ feet high, ten feet thick, and 5¼ miles in circumference; the houses are in general mere huts, and are thatched with grass. Some of the dwellings of the chiefs are constructed of planks, and tiled; but there are probably not half-a-dozen of houses built of brick and mortar. The houses are thinly scattered, and large spaces are even wholly destitute of habitations. The town contains many temples, the tall white or gilded spires of which give in the distant view a splendid and imposing appearance. The capital is not confined to Ava, but embraces likewise *Sagaing*, a straggling town of mean houses on the opposite bank of the river, and *Amarapura*, with the large districts attached to the three, making together an area of 288 square miles. Ava was the ancient capital of the country; but Alompra, the founder of the Birman empire, built the new city of Amarapura (town of immortality) a few miles to the eastward, which became and continued the capital till 1822, when Ava was restored to its pre-eminence by the new king, who then ascended the throne. On the 23d March 1839, Ava was visited by one of the most terrible earthquakes ever known in that part of the world. The three cities of Ava, Amarapura, and Sagaing, were reduced to vast piles of ruins; every thing built of bricks, houses, monasteries, temples, and the city walls, were levelled with the ground; and of the immense number of pagodas, not one was left entire. The shock was felt throughout a space of 1000 miles southward from the borders of China, embracing the most populous parts of the empire; not a single pagoda, temple, or other brick building being left standing. But comparatively few people perished, their escape being owing to their living chiefly in wooden houses or bamboo huts.—(*Silliman's Am. Journal*, XXXVIII. 385.)

Rangoon stands on the north or left bank of the eastern branch of the Irawady, 26 miles from the sea. It is a poor and decayed town; but is the chief, and, indeed, almost the only port for foreign trade in the Birman dominions; for which purpose its situation is extremely convenient, from being so near the sea, and having an uninterrupted communication at all seasons, by the river, with the upper provinces. The tide rises 18 feet at neap tides, and at spring tides from 25 to 30. About two miles from the river is the great temple of Shwe-Dagong, of the shape of a speaking trumpet standing on its base, which is built of brick and mortar, and richly gilt all over. Its height is about 270 feet, and it is really a noble object. This temple is the most famous religious edifice in the Birman dominions, a celebrity which it owes to the legend which supposes it to contain eight true hairs of Gautama, brought as a trophy from western India many centuries ago, by two merchants. It is, in fact, what is not common in this country, a place of pilgrimage, and is frequented by many strangers. Nearly 60 miles to the north is *Pegu*, the ancient capital of the country when a separate kingdom, but now almost entirely deserted. It contains the famous temple of Shoemadoo, or the golden supreme, a structure of the same kind as the Shwe-Dagong at Rangoon, and 331 feet high. About 15 miles east of Rangoon is *Syream* or *Syriam*, formerly one of the chief ports of the kingdom of Pegu, and the seat of a great trade, before its harbour was shut up by the Birman conquerors.

Prome, written by the Birmans *Pri*, but pronounced *Pyi*, stands on the east or left bank of the Irawady, about 156 miles N.N.W. from Rangoon, in a narrow plain between the hills and the river: it is a very ancient capital, having been founded, according to the Birmans, about 443 years B.C. It is a thriving place, and fully as populous as Rangoon. About 70 miles E. by N. of Prome is *Tongo* or *Tongoo*, the representative of the Tangoo of the 16th century, the capital of a dynasty which caused memorable revolutions in the western and central parts of this region. It is said to be a place of considerable traffic and population.

Bassein or *Persaim* is a sea-port town, on the left bank of the most westerly branch of the Irawady, about 70 miles from the sea.

Martaban, on the north bank of the Saluen, at the point where the river separates into two branches, is built at the foot of a long steep ridge, and consists of mean houses, which are raised from the ground on posts. It has many old substantially-built monasteries, and several temples, one of which is 150 feet high, and is of a more chaste design than usual.

Bhamo or *Bamoo*, on the Irawady, 180 miles N.N.E. of Ava, near the junction of the Tapan or Pinlang or Bhamo river, which flows from China, contains about 14,000 inhabitants, of whom one-tenth are Chinese. The surrounding country is one of the most prosperous and wealthy portions of the empire; and a great trade is carried on between Bhamo and China. *Mogoung* or *Mong-maorong*, is a large fortified city, on a branch of the Irawady, about lat. 25° 20′ N., inhabited chiefly by Shyans, Chinese, and Singphos. In the vicinity are famous amber mines, which attract merchants from Yunnan, Munipore, and other places.

§ 2. *The Kingdom of Siam*

Is composed of Siam Proper, a portion of the country of the Laos, a part of Cambodia, and the Malay States of Quedah, Patani, and Ligor. It is situate between 5° and 29° N. lat., and 97° and 105° E. long., measuring about 900 miles in length from north to south, and from 50 to 400 in breadth, including an area of 220,000 square English miles, with a population of about 2,790,000. Its boundaries are: north, Laos; south, the Gulf of Siam, and the Malays; east, An-nam; west, Birmah, the British Birman provinces, and the Bay of Bengal. The greater part of the country is mountainous; but it contains

also fine valleys, and, near Bankok, a rich alluvial plain, watered by the Meinam. The soil is fertile, yielding in abundance fruits, dyewoods, medicinal gums, and timber; but it is badly cultivated, and thinly inhabited. Besides the Meinam, it is watered by many small rivers. The eastern coast of the gulf is skirted with innumerable islands, the smaller of which are uninhabited. On the shore of the Bay of Bengal, the Siamese territory extends 260 miles, including a great many islands, some of which are of considerable size, as Junk-ceylon, Panjang, Langkawi, Trutao, and Boutung. This part, however, of the kingdom is a mere wilderness, with only a few places inhabited. Siam Proper consists of the valley of the Meinam, which, at the southern extremity, does not exceed 60 miles broad; but it extends inland about 360 miles, and is bounded on both sides by high mountains. The climate and natural productions are much the same as those of Birmah. The government is a despotism of the most absolute kind. The name of the sovereign is confided only to a few individuals; in public he is mentioned by such epithets as these: the sacred lord of heads; the sacred lord of lives; the owner of all; lord of the white elephants; most exalted lord; infallible and infinitely powerful. Even the members of his body are spoken of in terms of adulation; everything belonging to or attached to his person is styled golden; to visit him is to approach to his magnificent majesty's golden feet, to speak in his golden ear, &c. The country is divided into districts; each of which is governed by a minister appointed by the king, aided by a governor and other officers; and the more distant provinces are placed under viceroys or rajahs. There appears to be no written law. All the people, except the Chinese, European, and American residents, are virtually slaves, or in a state of slavery, being obliged to labour on public works one month out of every three or four, according to royal pleasure, in building temples or junks, making roads, or performing any other work; for all which they receive no compensation but the glorious privilege of living in Siam or Thai, literally the free country. There are, besides, a number of slaves, who consist of captives taken in war, and debtors. The religion of Siam is Buddhism. The talapoins or priests, who are supposed to amount to 100,000 at least, are maintained by daily contributions from the people, by annual presents from the king; and by valuable gifts which they receive at funerals. They assemble daily in the temples to repeat prayers which they do not understand, as they are in the Pali language, with which very few are acquainted; they relieve the people from all devotional exercises and holy acts, except that of daily bestowing upon themselves boiled rice, and other offerings. For three months of his life every Siamese is obliged to serve as a talapoin, and the yellow robe is generally assumed at twenty years of age. They may quit when their term is expired; but if they take up the robe a second time, it must be retained for life. The talapoins are of different ranks or classes, and have one supreme chief, like the pope, who has under him various priests, corresponding to cardinals, archbishops, bishops, and other dignitaries; the whole system bearing a very strong resemblance to that of popery. The *wats* or temples are numerous and costly, many of them are indeed magnificent; they occupy the best situations in the kingdom; and are the residences of the priests, and the places of education for all male Siamese.

The Siamese belong to the Mongolian variety; their average height is five feet two inches. The lower limbs are stout and well formed; but the body is long, and consequently the figure is not graceful; the shoulders are broad, and the muscles of the chest well developed; the neck is short, and the head in fair proportion. The hands are large and the complexion of a dark olive, but not jetty. Among females of the higher classes, who pass their time generally within doors, the skin is of a much lighter hue; in some instances it might be called a very dark brunette. The forehead is narrow at top; the face flat, the cheek-bones broad, and the chin narrow, so that the whole is rather lozenge-shaped than oval. The eyes are remarkable for having the upper lid extended below the under, at the corner next the nose, but it is not elongated like that organ in the Chinese or Tartar races; the eyes are dark or black, and the white is dirty, or of a yellowish tint. The nostrils are broad, but the nose is not flattened like that of an African. The mouth is not well formed, as the lips project slightly; and it is still more disfigured by the habit of chewing areca-nut. The hair is jet black, stiff and coarse, almost bristly, and is worn in a tuft on the top of the head; the rest of the head being shaved or clipped very close. A few scattered hairs grow upon the chin and upper lip, which are usually plucked out. Though active, the Siamese are not a warlike people; they possess an inordinate self-esteem, which places them above all nations, except the Chinese, whom they acknowledge as superiors, and to whom they have sometimes paid tribute, and the Birmans, whom they rank as their equals. All their superfluous wealth they devote to the building of temples, to obtain what they believe the prospective salvation of their souls. They are mean, rapacious, and cruel, suspicious, vacillating, and procrastinating. Cringing and servile in the extreme to their superiors, they are arrogant, haughty, and tyrannical to their inferiors. They have, however, the commendable quality of filial affection, which is maintained through life with punctilious exactness. The son never stands in the presence of his parents, nor takes a seat on a level with his father. Even his magnificent majesty humbles himself once a month, and appears before his mother on his knees and elbows. The Queen dowager (when there is one), and Talapoin Pope, are the only two individuals in Siam who have no superiors. The Siamese call themselves *Tai*; the Shyans denominate them *Tai-yai*, or the great Tai. By the Birmans Siam is called *Yudia*, from the name of its former capital, and the people are designated *Yudia-shan* or *Yudias*. The Assamese, Shyans, and Siamese, are evidently sprung from a common stock.

Though larger than France, Siam does not contain one-tenth of the number of inhabitants. On comparing the births and deaths for a period of ten years, the population appears to decrease at the rate of one-ninth every year; and in less than a century the land would consequently be a desert, did not the constant influx of foreigners, for the purposes of trade, supply the deficiency. Siam already contains nearly as many Chinese as Siamese. Several causes concur in producing this depopulation; as polygamy, the great number of the talapoins, the extreme filthiness of the people, and their habit of living on every sort of unwholesome food. The Siamese have feeble constitutions; the least bodily exertion fatigues them; and a Chinese physician will distinguish a European among a hundred Asiatics, merely by feeling his pulse and without looking at him. The Siamese at present possess that portion of Cambodia which extends along the Maykuang river between 12° and 14° N. lat.

BANKOK, the capital, is situate on the Meinam, about 20 miles in a straight line from the sea, but 40 by the course of the river. It is irregular in plan, and everywhere intersected by canals; the streets are narrow and dirty; the greater part of the houses consist of miserable bamboo huts; but there are several richly gilt temples; and the palaces of the king and his grandees are large buildings, in the Chinese style. Many of the people live in large boats ranged along the sides of the river and canals. Bankok is the principal seat of the commerce of Siam; and the row of junks generally extends for more than two miles, riding at anchor in the middle of the river, where they often remain for months retailing their cargoes. The population, according to the government census in 1828, amounted to 401,300. Mr. Crawford, however, makes it only 50,000; Mr. Malcolm took some pains on the subject, and is of opinion that the city and immediate suburbs contain at the most about 100,000 souls. Within the walls, he says, there cannot be more than 4000 people.—(*Travels*, II. 139.) The climate of Bankok may be called hot, but is as pleasant and salubrious as that of any city of the east. The thermometer ranges about 13°; the highest mean temperature of the hot season, 86° 33'.

Ayuthia, properly *Si-yo-thi-ya*, also named *Siam* by the old European geographers, the ancient capital, stands on an island of the Meinam above Bankok, and is said to be nearly as populous. *Prabat*, 160 miles N. by E. of Bankok, contains an impression of Buddha's foot in a rock, which is the

grand object of pilgrimage among the Siamese. The only other places worthy of notice are :—*Pa nam*, at the mouth of the river, where it is 5 miles wide. *Chantibon*, on a river which falls into the s side of the gulf, 12 hours from the sea; *Ligor*, *Tahung*, and *Sungora*, considerable towns on the e side of the isthmus of the Malay peninsula. The district of Chantibon and of the neighbouring town *Tsiugvai*, are the proper country of the people called *Chong*, and the only part of the kingdom whi produces black pepper.

§ 3. *The Empire of An-nam*

Comprises *Tonquin* or *An-nam* proper, *Cochin-China*, the eastern and southern parts of *Camb* or *Kamboja*, and several islands in the Chinese Sea, along which it extends upwards of 1200 miles. lies between 8° 10′ and 23° 20′ N. lat., and between 105° and 109° E. long. being bounded on the nor by the Chinese provinces of Quangtong, Quangsi, and Yun-nan; on the west by Laos and Siam; a on the south and east by the ocean. It comprises altogether an area of about 120,000 square miles; a a population of 10,000,000. The country is naturally divided into two long narrow stripes by a rance mountains which extend in a direction parallel to the coast, from the borders of China to the mouth the Maykuang; Tonquin and Cochin-China being to the east of the range, and Cambodia, to the we Cambodia occupies the lower part of the valley of the Maykuang, with the alluvial plain or delta at mouth, and a small portion of the coast of the Gulf of Siam. It is said to be a fertile champaign co try; but no geographical details respecting it are known. Cochin-China consists of a long narrow st of land, extending more than 600 miles in length along the Chinese Sea, but nowhere exceeding 15 breadth. It is in fact a series of small transverse valleys divided by so many spurs from the long ran of mountains which forms its western boundary. The coast is beautiful and grand; the shore is dented with numerous bays; and the mountains, which rise several thousand feet in height, are brok into innumerable valleys and ravines. Tonquin expands to a much greater width than Cochin-Chi and consists chiefly of a large alluvial plain, watered by the Sang-kol and other rivers. It is the o part of the empire that is rich in metals; and produces large quantities of gold, silver, copper, and ir The climate is generally fine and healthy, the heat being tempered by the sea breeze; but a mater diversity of climate prevails in the different provinces, arising from difference of physical aspe and geographical situation. In Cambodia the seasons follow the same course as in Malabar, Beng and Siam; the rains commence about the end of May or beginning of June, and continue till Septe ber. In Cochin-China, the seasons are reversed; the dry season prevails during the south-west mo soon, and the wet season during the north-east monsoon; a change which is occasioned by the lo mountain border which intercepts the monsoons; the rains commence in October and continue March. In Tonquin again, the seasons are the same as in Cambodia. In both Tonquin and Cochi China the heat of summer and the cold of winter are excessive; at Hue the greatest heat of summ has been reported to be 103°, and the greatest cold of winter 57° Fahrenheit. The forests of Cochi China produce a variety of scented woods; true cinnamon, teak, ironwood, cedars, walnut, coc areca, betel, bamboo, rattans, ebony, and most of the products of British India. Tea also grows great abundance between 10° and 16° N. lat., which serves for the consumption of the lower order but the chiefs prefer tea from China, to which the native produce is somewhat inferior, owing to t improper manner of cultivating it. Cambodia produces gamboge, cardamums, aniseed, areca, indig the central provinces, pepper and two sorts of sugar-cane; Tonquin yields many kinds of varnish tre areca palms, &c. Cotton, rice, and the mulberry-tree are almost universal. There is also great varie of fine fruit; ginger, and spices of various kinds are also indigenous. The principal animals are t elephant, rhinoceros, tiger, leopard, buffalo, bear, horse, deer, goat, monkey, baboon, dog, cat; p cocks, parrots, and a variety of other birds of the richest plumage, curlews, plovers, and aquatic bir of all kinds. Alligators infest the larger rivers; the hooded snake, and several other noxious reptil infest the land; the seas abound with an inexhaustible supply of fish, and afford subsistence to a lar portion of the population. Mosquitoes and other insects abound in great multitudes.

The people consist of several races. The *Tonquinese* and *Cochin-Chinese* are a short, squat, and i favoured race; in features nearly resembling the Malays, but without any indication of ferocity their expression. On the contrary, says Mr. Crawford, their countenances exhibit an air of cheerfu ness and good humour; the women appear to be fairer and handsomer than the men. Their han arms, and feet are well formed, and the carriage even of the lower orders is graceful. They are mu in the same state of civilization and comfort as their neighbours. Besides these, the empire contai people of several other races:—The Cambodians, who call themselves Kammen or Cummin, speak language distinct from those of all their neighbours; but, in physical form, manners, laws, religio and state of civilization they bear a close resemblance to the Siamese. The people of *Chamra Tsiompa* on the south-east coast, between Cambodia and Cochin-China speak a peculiar dialect, d fering essentially from the languages of both An-nam and Cambodia, and profess a species of Bu dhism widely different from the religion of their neighbours, and more resembling that of the Jai in Hindústan. The coast of their country is now principally occupied by An-namese. The M occupy a strip of mountainous country, between Lao and Cochin-China, extending about 300 miles length by 50 or 60 in breadth; but little more respecting them is known than their name, and th they are an uncivilized but inoffensive people. All these are indigenous races. The strangers settl in the empire consist of Malays, Portuguese Christians, and Chinese. The Malays are confined the east coast of the Gulf of Siam, between the latitudes of 11° and 12°; they retain Mahometanis and speak the Malay tongue, intermixed with a number of Cambodian and Champa words. The Po tuguese are a mixed race who appear to have migrated from Malacca about the middle of the seve teenth century, and are found in different places along the coast. They are hardly distinguishab from natives of the country who have embraced Christianity. These Christians are among the poore and most abject part of the population. The Chinese form the most numerous class of stranger but their total number will not be overrated at 40,000, of whom 25,000 are engaged in working t iron, silver, and gold mines of Tonquin. Politically, the empire contains but two classes—the peopl and the nobility or mandarins. The highest offices are open to candidates of every class, and ve lately, all the great mandarins, the chiefs of the five columns of the empire, had been common soldier The son of a mandarin of the first rank is entitled only to the second rank; if he is in actual emplo ment as a mandarin, his children belong to the third class; but if he has not been employed, h children return after his death to the ranks of the people.

The empire is at present divided into three great civil divisions; Cambodia and Tonquin, which a governed by viceroys; and Cochin-China, which is under the immediate government of the e peror himself. The whole territory is subdivided into twenty-two provinces, of which six are Cambodia, seven in Cochin-China, and the remainder in Tonquin, the last of which is the mo populous and the most valuable division of the empire.

HUE, in Cochin-China, the capital, and the residence of the emperor, is a large and strongly for fied city, situate nine miles from the sea, upon the banks of a wide navigable river which falls into t Gulf of Tonquin. In lat. 16° 45′ N., long. 105° 32′ E. It is of a square form, about six miles in c cumference, surrounded by a rampart 30 feet high, which is cased with brick, kept in excellent orde and protected by bastions all in the European style. One side is washed by the river, and the other thr by a wide and deep canal. The interior is laid out in squares; but the town is rather paltry. T

palace is surrounded by handsome barracks; the citadel is a small quadrangular building, with strong and lofty walls; and the city, it is said, would require a garrison of 40,000 men for its defence. The population is believed to amount to 30,000. *Turon*, 60 miles S.E. of Hue, stands on a river which falls into a magnificent bay safe and most commodious for shipping, measuring five miles by two, and completely land-locked. *Quinhone*, one of the largest towns in the province, 15 miles from the sea, is situate on a navigable river which falls into a bay of the same name, 200 miles S. by E. of Hue; and rather more than 100 miles farther south, are the two magnificent harbours of *Camraigne* and *Nhatrang*, the latter of which is one of the naval arsenals of the empire, and is strongly fortified in the European style. In Tonquin the only place of importance is *Ketsho* or *Kachao*, the capital of the province, and the largest town in the empire, situate 100 miles from the mouth of the river Sangkoi, which is navigable for junks eighty miles up from the sea. The city is said to be at least three times as large as Hue, and probably contains 150,000 inhabitants. In Cambodia: *Saigon*, the capital, stands on a peninsula formed by two branches of the river Don-nai, one of the finest rivers of Asia, but till lately scarcely known to Europeans. The river may be navigated for 60 miles from the sea by vessels of any burden without a pilot; and by native craft, 20 days' voyage above Saigon, which is itself 15 leagues, or about 40 miles from the sea. Saigon is composed of two distinct towns, called Bingeh and Saigon, near the former of which is an immense citadel, almost rivalling in extent the fortifications of Hue. There is likewise a great naval arsenal. The houses are, as usual, built of wood, and thatched, and one storey high. Saigon is the principal commercial city of the empire, and contains at least 100,000 inhabitants. *Kamboja* (Cambodia, Eawek, Laweik or Loech), the ancient capital, is built on an island in the Maykuang, nearly 300 miles from its mouth; but is greatly decayed. Its royal palace and pagodas are in ruins.

About the middle of last century Tonquin, Cochin-China, and Cambodia formed separate kingdoms; Cochin-China being, however, tributary to Tonquin. These countries having been for many years in a state of anarchy, a revolution at length broke out in Cochin-China, in 1774, which led eventually to the present order of things. The great agents in the revolution were three brothers, called Tayons, men of the lowest condition, who defeated and put to death the king, and his son, who had advanced with an army to his father's rescue. But the wife of the prince having escaped with her son Gia-long, the latter, after many adventures, became ultimately king of Cochin-China and Tonquin, and established the present empire of An-nam; a result for which he was indebted principally to the resolution and sagacity of the French Bishop of Adran, and the skill and courage of a few European adventurers who accompanied him. Gia-long got possession of Hue in 1801; Tonquin was subdued in 1802, and Cambodia in 1809. He died in 1819, leaving his empire to an illegitimate son. The government exhibits despotism in its worst form; the only rich man is the king; he has fine palaces, large treasures, excellent fortresses; and vessels far superior to those of the Chinese. His officers are merely his tools, and share but little in his splendour. The nation at large is in the most abject condition; the people are poor, wretched, and filthy in the extreme, and are forced to give more than one-third of their labour, or an equivalent, to the king. The country is disturbed by frequent insurrections and rebellions; and emigration has lately prevailed to a vast extent, though prohibited by a despotic and decidedly anti-commercial prince, who forbids his subjects to carry the produce of their own country to other markets under pain of death.

§ 4. *The Country of the Laos*

Is a mountainous region situate to the north of Cambodia and Siam, occupying the upper vallies of the Meinam and the May-kuang, being bounded by An-nam on the east, Yun-nan on the north, Siam and Cambodia on the south, and Birmah on the west; and measuring about 800 miles in length by 400 in breadth. The climate is warm in the south, and temperate in the north, where it is a common occurrence to see snow and ice in winter. The atmosphere is very unhealthy during the rainy season, which lasts from April till October; during the other six months of the year the dry and fresh north wind purifies the atmosphere, and the forests can then be passed through without danger. The appearance of the country is magnificent, and the scenery beautiful; the soil is generally very fertile, except on the higher mountains, which present an arid appearance, with enormous rocks of strange shapes, concerning whose origin the Laos possess innumerable traditions. The country is rich in gold, silver, copper, and iron; almost every brook rolls down particles of gold; and if the people were acquainted with the art of mining, there is no doubt that they might acquire immense wealth. The vegetation is nearly the same as that of Siam. It is from the mountains of Laos that those enormous trees are obtained which serve the Chinese as masts for their largest junks. The country contains all sorts of wild animals, as elephants, rhinoceroses, bears, tigers, boars, porcupines, wild oxen, and buffaloes, elks, deer, &c. Crocodiles are not rare, and birds of every kind are innumerable. The inhabitants are called *Shyan* by the Burmans, *Lao* or *Low* by the Chinese; but they call themselves *Tai* or *Tie*. They seem to be the parent stock of both the Siamese and the Assamese; they are divided into three distinct races, with many subdivisions of tribes, and their language has a corresponding number of dialects. They are said to be a more civilized people than the Birmans; mild, humane, intelligent, and prosperous; and, though parts of their country are occasionally overrun and subdued by their neighbours, they have yet maintained a virtual independence. Some of the tribes still adhere to the ancient demon-worship; but most of them are Buddhists. *Zemmai*, on the Meinam, 400 miles N. of Bankok, is the residence of the prince of all the southern Laos, and is said to contain 25,000 inhabitants. It is called *Chanymai* or *Changmy* by the Siamese; and by Loubiere, in his history of Siam, *Chamé*, *Jangoma*, and *Shaimai*. Within a circuit of 50 miles are the cities of *Lagong* and *Moungpai*, each with 20,000 inhabitants; *Labong*, with 14,000; and several smaller towns.—(*Notice sur le Laos, par M. Pallegoix; Bulletin de la Societé de Geographie, Paris, Jan.* 1836.)

The *Singphos*, a kindred people, occupy both sides of the upper region of the Irawady, and spread from the Patkoi hills, in Assam, to China. They are divided into fifteen or twenty tribes, some of which are now British subjects, some are subject to the Birmese, and others are independent. They are a wild and somewhat lawless people; worship *nats* or demons; and have a great hatred of Buddhism. *Beesa*, called by the Burmans *Bejanoung*, and by the Shyans *Hukung*, near the head of the valley of the Kyen-duen, is one of the principal Singpho towns, between which and Assam there is constant and free intercourse.

§ 5. *The British Provinces.*

MARTABAN or MOULMEIN, RE or YE, TAVOY, and MERGUI or TENASSERIM, are situate along the eastern coast of the Gulf of Martaban, between 11° and 18° N. lat., and extend about 480 miles in length, by only 44 in breadth, comprising an area of 32,800 square miles; besides a great number of islands along the coast, which together comprehend about 1000 square miles. The whole length of the eastern frontier is formed by a range of mountains rising from 3000 to 5000 feet above the level of the sea, and chiefly composed of granite; the rest of the country consists of a series of hills, valleys, and plains, which extend from the mountains to the sea. Several passes lead through the mountains into Siam. The principal of these is the *Phra-song-chu*, or *Pass of the three pagodas*, in lat. 15° 48′ N., 110

or *Bruse* Island, forms the west side of the estuary of the Saluen, extending 17 miles in length N.-S., by 6 or 7 in breadth, and divided lengthways by a chain of moderately elevated hills. It is inhabited chiefly by Karyens, and produces a considerable quantity of rice.

PENANG, PINANG, or PULO-PENANG (Betelnut island), called in official documents PRINCE OF WALES' ISLAND, is situate near the northern entrance of the strait of Malacca, opposite the coast of Quedah, from which it is separated by a strait two miles wide. It is about 16 miles long, and from 8 to 12 broad, comprising an area of 160 square miles. It is of granitic formation, with a range of hills which extends through its whole length; but on the west and south sides there is a considerable space of level ground of good quality. Penang is considered remarkably healthy. In 1785, Captain Light, the commander of a country ship in India, having married the rajah of Quedah's daughter, received this island as a marriage portion; he transferred it to the East India Company, who agreed to pay for it 6000 dollars annually to the rajah; and they having in 1800 obtained a further grant of a district on the opposite mainland, now pay him 10,000 dollars a-year for both *Georgetown*, the capital of the island, is one of the neatest towns on the Indian seas; it has a capacious harbour, with good anchorage, and is well-defended. The population of the island amounted, in 1833, to 40,322. *Wellesley province*, the continental dependency of Penang, extends 35 miles along the coast, and contained, in 1833, a population of 49,553.

The territory of MALACCA, on the south-west coast of the Malay peninsula, extends about 40 miles along shore, by 30 inland, and contains about 800 square English miles, with a population, in 1833, of 34,000. The coast is rocky and barren, with detached islets of cavernous rocks; the interior is mountainous, with picturesque valleys. The highest peak, called *Lealdang* by the Malays, and *Ophir* by the Portuguese, rises to the height of 4000 feet. The climate is healthy; the temperature is very equal, the thermometer ranging only from 72° to 85° during the whole year. The city of *Malacca* stands on a plain, with numbers of trees interspersed among the houses, near the mouth of a small river, in N. lat. 2° 14′, and E. long. 102° 12′. It is regularly built, and has an excellent anchorage, but a bad harbour. The situation is eminently salubrious. Population about 5000. The Anglo-Chinese college, one of the most valuable institutions in the east, was established here in 1818, by Drs. Morrison and Milne, for the cultivation of European and Chinese literature, and the instruction of native youths in the principles of Christianity; it is supported by voluntary contributions, and has several schools attached to it, at Malacca, Tavoy, Moulmein, and Rangoon. Malacca was founded by the Malays after their migration from Sumatra; it was afterwards in possession successively of the Portuguese, the Dutch, and the English; and was finally ceded by the Dutch to the English, in 1825, in exchange for Bencoolen in Sumatra. Though fallen, the city is still the head-quarters of the British military force on the Straits.

SINCAPORE or SINGAPORE (*Singhapura*, Lion-town) is an eliptical-shaped island, about 50 miles in circumference, 27 long by 15 broad, comprising an area of 270 square miles, and situate at the southern extremity of the Malay peninsula, from which it is separated by a long strait, only a quarter of a mile wide at its narrowest part. Within a circuit of 10 miles, there are about fifty other islands, containing altogether an area of about 60 square miles, all within the limits of the settlement, the total circumference of which, including the interjacent seas, is about 100 miles. The surface of the principal island is beautifully diversified with vallies, plains, and irregular hills; it is well stocked with timber, and the trees are generally of great size. A more delightful climate is probably nowhere to be found; the variation of seasons is scarcely perceptible; there is neither summer nor winter; even the periodical rains are short, and not very well marked. The thermometer ranges from 71° to 89°. The soil is fertile, the scenery beautiful, and the air deliciously balmy. The town is situate on the south side of the island, in N. lat. 1° 17′, and E. long. 103° 51′, on the banks of a salt creek, which is navigable for lighters. The streets are regularly built in the English style, chiefly of brick or freestone, generally two storeys high, finished with taste and neatness, and all painted white, which gives the town a fine and imposing appearance from the offing; its symmetry and beauty, however, are considerably impaired by the uncouth structures of the Chinese, Malays, and Hindoos, who adhere to the styles of their respective countries. The Chinese are the most numerous and most industrious class of the population. The harbour or road is commodious, safe, of easy access, and defended by a fort, which is well garrisoned and occupies a beautiful situation. In the vicinity of the town is a level, fertile, well-cultivated plain, laid out in gardens and plantations, intersected with excellent carriage roads, which are bordered with shrubs and trees of perpetual verdure, and contain the villas of the English merchants. Singhapura was a very ancient Malay settlement, but had been abandoned since the 13th century. In 1818 it was taken possession of by Sir T. S. Raffles; and the sovereignty confirmed to Britain, in 1825, by a convention with the King of the Netherlands, and the Malay princes of Johore, to whom it belonged. It had been previously possessed for a few years by some Malay fishermen and pirates; but so rapidly did the new settlement prosper, that when the first census was taken, in January 1824, the population amounted to 10,683; in 1834, it had increased to 26,349, of whom only 130 were white; the rest being Malays, Chinese, and other orientals. It has become a central emporium for the trade of the Chinese and Javan Seas; native vessels from every part of the Indian Archipelago find here a market for their produce, and a supply of the commodities which they require. A lucrative trade is also carried on with Cochin-China, Cambodia, Siam, Malaya, and Sumatra. There are no export or import duties. The language of general commercial intercourse is Malay. The island is abundantly supplied with all kinds of provisions, in great variety and of excellent quality. It possesses, indeed, so many advantages that it has been called "the paradise of India, the home of plenty, and the abode of health."

Penang, Malacca, and Sincapore, are dependencies of the Government of Bengal, and are under the immediate charge of the Governor of Penang, who has assistants resident at Malacca and Sincapore. By means of these three settlements, the British Government has now the command of the northern passage to China. The jealous and exclusive commercial schemes of the Dutch have been completely frustrated by the bold step of Sir T. S. Raffles, in taking possession of Sincapore; a measure at which the Dutch were highly indignant. But when they found they were left without a remedy, they surrendered Malacca too, as the possession of that city would no longer answer their purpose of closing the straits.

§ 6. *The Malay States.*

The Malayan peninsula is a long narrow tract of about 750 miles, and 170 where broadest, but varying from that to a breadth of only 60. The great mountain range which divides the British Birman provinces from Siam, appears to extend without interruption to the southern extremity of the peninsula, occupying a great part of its breadth. The whole territory is of primitive formation, exhibiting everywhere masses and peaks of granite. It produces a considerable quantity of gold; but the staple production of the whole region, as far north at least as the 15° N. lat., is tin. The districts best known produce pepper, and other aromatics, and several kinds of gum. The forests, which seem to occupy a great part of the interior, contain aloewood, eaglewood, sandalwood, and *cassia adorata*, a kind of cinnamon. Vegetation is, indeed, everywhere rank and luxuriant; the animals are nearly the same as those which are found in the neighbouring countries to the north. The northern districts

belong to the king dom of Siam, and are chiefly inhabited by Siamese; but the southern portion, inhabited by the Malays, is divided into a number of petty states or kingdoms. *Quedah* or *Kedah* extends along the west coast from the Trang river, lat. 7° 20′ N., to the Krian, in 5° 10′, with a population of about 500,000; *Perak*, from the Krian to the Runkup, lat. 3° 59′—population, 35,000; *Salangore*, from the Runkup to the Lingie, in 2° 35′—population, 12,000; *Malacca*, from the Lingie to the Cassang—population, 35,000; *Johore*, from the Cassang on the west coast to the Sedilly on the east coast, in lat. 2° 15′—population, 25,000; *Pahang*, from the Sedilly to the Kemamang, in lat. 4° 15′—population, 40,000; *Kemamang*, a very small inland district, with 1000 inhabitants; *Trengano*, from the Kemamang to the Basut—population, 30,000; *Calantan*, from the Basut to the Baruna—population 50,000; *Pitani*, from the Baruna to the Tara, in lat. 7° 20′—population, 54,000; *Ligor*, from the Tara to about the 9° 20′ N. Of these, Quedah, Patani, and Ligor are subject to Siam; Malacca is a British province; the others are independent, being governed by rajahs. The inland mountains are inhabited by savage tribes, some of them negroes, who are in a state of general anarchy and barbarism.

The *Malays*, who have given their name to the peninsula, migrated in the twelfth century from the territory on the banks of the river Malaya, in Sumatra, to escape subjugation to a king of Java. They seem to be a branch of the indigenous population of that great island, and probably of Java also, but are now settled along the coasts opposite to those islands. They are in general of a ferocious character, and celebrated for their piratical habits; a propensity to war and violence being the ruling passion of the race. The country being unsettled and laid waste by perpetual feuds, the peasant driven from his village and lawful means of subsistence, and tempted by the smooth seas, the safe navigation, and the shelter from pursuit afforded by the numerous islands, creeks, and rivers of the straits, and by the charms of a life so congenial to his free and restless spirit, is induced to scour the ocean for precarious subsistence by fishing, or plunder, or both, as opportunity offers. There is, however, something highly romantic, and even interesting, in the national character of the Malays. They are not wholly illiterate; for they possess letters, and, as Mahometans, are acquainted with the Koran. They shew great ingenuity in several mechanic arts, especially in the fabrication of arms, and in the highly-wrought temper and finish of their form dable creeses. In some of their principal settlements they carry on a considerable trade, and can boast of wealthy merchants; but nowhere is slavery or slave-dealing more common. A bull-dog does not differ more in form and quality from a greyhound than a Malay from a Hindoo. The broad face and course lineaments, the bull neck, short stature, muscular limbs, and glaring yellow hue of the former, are in direct contrast with the symmetrical features, the olive hue, the slender limbs, and the often elegant figure of the latter. Their mental dispositions and other natural qualities are in equal opposition. A Malay will not submit to a insult or an injury, without harbouring the purpose of deadly revenge, which he will carry into effect with all the art and subtlety of a fox; he will smile while he stabs, the better to throw his victim off his guard. Sometimes an infuriate Malay will run *amuck*, that is, strike and stab every person who falls in his way, till he is himself knocked down or captured. The laws and institutions of the Malays are said to exhibit the worst parts of Islam, mixed up with certain superstitions of their own; they practise circumcision, and believe in witchcraft; they buy their wives, often at an enormous price; the poorest seldom giving less than 60 dollars, which frequently reduces them to slavery, for debtors are obliged to work for the creditor till they can pay. They have fines for theft, and even for murder, but in most cases the punishment depends on the power of the injured party to exact it. The government is in the hands of sultans and rajahs, whose power is extremely limited, and is chiefly confined to the precincts of their own residence. Every village has its chieftain; and these dignitaries seldom agree in any common object, but, on the contrary, are often at war with each other. The justice which they administer to their followers depends entirely on their caprice. They are honoured with high-sounding titles; but it is difficult to conceive a greater caricature of royalty than a Malay sovereign in his wooden palace or barn, naked, except round the waist, squatted on a mat, and eagerly bargaining for the sale of cattle and fowls, or vegetables. Their perfidy is such that no treaty with them can be relied on; they have been known to murder at their own table a invited guest. Plunder and bloodshed seems indeed the invariable object of every Malay, and such is their audacity, and so general is the spirit of piracy among them, that should even a large ship-of-war meet with a serious accident in their seas, she will be surrounded with hundreds of praus, waiting for the first favourable opportunity to plunder the wreck, and murder the crew.

Malay towns consist of a group of huts of wood and thatch, heaped together without order or regularity. The *prahus* or *proas*, used by the pirates, are generally about eight or ten tons burden, well manned, and remarkably swift, particularly with the paddles which are commonly used. They are generally armed with swivels on their bows, centre, and stern, of small calibre, but long range. When preparing to attack, strong wood-n bulwarks, called *apilans*, are erected, behind which the crew entrench themselves, fighting with their long guns, until their prey is disabled, or till the gong sounds the signal for boarding. But they mainly depend for safety and success on their skill in paddling, the swiftness of their boats, and their knowledge of the intricate channels among the islands, or over the bars of the rivers, into which they generally contrive to escape, thereby baffling their pursuers; and often leaving them aground on a shoal or a mud bank. They scarcely ever attack except during the lull between the land and the sea-breezes, or in a calm. They make their attacks and move in small fleets of from six to twenty prahus. During October, November, December, and January, they are found cruising up and down along the west coast of the peninsula, and the opposite shore of Sumatra. From June till the end of September, they are often to be seen about the islets to the south of Sincapore, and in the creeks and rivers of the Johore coast. February, March, and April, are spent in fishing, collecting sea-weed, and preparing for future expeditions. The crews are armed with boarding spears, some of which are of very great length, creeses, hatchets, and swords, muskets, blunderbusses, and a variety of missiles. The most noted haunts for pirates on the west coast of the peninsula are the *Bonting*, *Aroa* or *Aroar*, *Coco's*, *Piring*, *Dinding*, and *Sambilang* islets; those on the Salangore coast; and the islets between Cape Rachado, and the Lingie river. The rivers *Muhare*, *Perak*, *Patch*, *Koran*, *Muar*, *Formosa* or the *Battu-pahat* river, and formerly the *Lingie* river; the straits of *Calang* and *Dryon*, *Point* or *Cape Romania*, and its vicinity, and the *Carimon* isles to the south; on the east coast the creeks and small rivers of Johore up to Pahang; the *Kemamang* river; those of *Trengano*, and *Calantan*; also the islands of *Timoang*, *Pulo Tingie*, *Redan*, and *Tor*. Their armed vessels, however, are often ready for war or trade as occasion may offer, and some of them are really traders, who assert the necessity of carrying arms for their own defence; but the British cruisers invariably burn, sink, or otherwise destroy all that are found with arms on board. One of their chief resorts for their slave trading is *Pulo-Nias*, on the west coast of Sumatra.—(*Journal of the Asiatic Society of Bengal*, Nov. 1836.—*United Service Journal*, Apr. 1837.)

For the materials of this Section, the South-eastern Peninsula, we are principally indebted to *Crawfurd's Journal of his Embassies to Ava, Siam, and Cochin-China*; *Capt. Low's History of Penang*; to the *Journal of the Royal Asiatic Society of Great Britain*; *The Rev. Howard Malcolm's Travels in the Birman Empire*; *Klaproth's Travels round the World*; *the Asiatic Journal for August and October 1840*; *Marten's History and Statistics of the British Colonies*; *Captain Benjamin Morrell's Voyages*; *Journal of the Asiatic Society of Bengal*, for 1839 and 1840, &c. &c.

THE CHINESE EMPIRE.

THIS empire extends over a very large portion of eastern and central Asia, comprehending upwards of 3,000,000 of square English miles, of which 1,298,000 are within the limits of China Proper, and the remainder in the subject territories to the west and north.

ASTRONOMICAL POSITION.—China Proper is situate between 20° and 42° N. lat., and 98° and 123° E. longitude.

DIMENSIONS.—The greatest length, from north to south, is 1500 miles; and the greatest breadth, from east to west, about 1100 miles. The superficial area comprehends 1,298,000 square English miles, and the coast line is upwards of 2500 miles in length.

BOUNDARIES.—*Northern* :—Mantchouria and Mongolia, or Chinese Tartary. *Western* :—Thibet. *Southern* :—Birmah, An-nam, and the country of the Laos. *Eastern* :—The Pacific Ocean.

NAME.—The name of *China* is very probably derived from that of the dynasty of *Tsin*. The country is called by the natives *Chung-kwo*, central kingdom; and *Tang-shan*, Hills of Tang, the name of one of their most celebrated dynasties. The present ruling family have given to it the name of *Ta-tsing-kwo*, the Kingdom of Great Purity. In the proclamations issued by government, especially those addressed to foreigners, it is often called *Teen-shan*, Celestial Empire. The natives call themselves *Chung-kwo-teih-jin*, Men of the Middle Kingdom, or *Han-jin* or *Tang-jin*, Men of Han or Tang. The whole empire is often designated *Teen-hea*, Under Heaven.

GENERAL ASPECT. — China consists of a series of river *basins*, and of low lands along the sea-coast, divided by ranges of hills, which rise in some places to a very considerable elevation. Yun-nan, the south-western province, is very mountainous, and sends out two branches eastward; the one of which separates the basin of the Si-kiang river from the coasts of the Gulf of Tonquin; the other separates it from the basin of the Yang-tse-kiang, and its affluents, whose basins are themselves divided by diverging ranges from each other, and from the coasts of the east sea. The basin of the Yang-tse-kiang is divided from that of the Whang-ho by a continuation of high land which diverges eastward from the Peling mountains, on the borders of Tartary, but which, terminating before it reaches the coast, leaves a large alluvial plain between the mouths of these two great rivers. The remaining portion of the country lying between the Whang-ho and the Gulf of Pe-che-lee, consists of the basin of the Pei-ho and the Eu-ho, having the hills of Shantung province on the south, and a cross range on the west, but communicating with the basin of the Whang-ho, by an opening at the angle formed by the two ranges. The geology of China is unknown; the only elevation which has been ascertained by European observers, is that of the mountain over which is the *Pass of Meilan*, between the provinces of Kiang-si and Quang-tong, which rises to the height of 8000 feet above the level of the sea. The appearance of the country is very varied; between Peking and Canton, a distance of 1200 miles, the members of the British embassy observed every variety of surface, but this uniformity was very remarkably disposed in large masses. For many days they saw nothing but one continuous plain, without the smallest variety; for as many days they were hemmed in by precipitous mountains, naked and unvaried as the plains; and, for ten or twelve more, their course lay through lakes, swamps, and morasses. There was a constant succession of large villages, towns, and cities, with large navigable rivers communicating with each other by artificial canals, both of which were crowded with boats of every form. Neither hedges nor trees were to be seen throughout the country.

The southern basin and the adjoining coast compose the provinces of *Yun-nan*, *Quang-si*, and *Quang-tong*. Yun-nan presents a singular variety of mountain and valley; possessing a more alpine character than any other part of China, and yet containing some extensive and finely watered plains. It is also said to be the richest of all the provinces, in metals and minerals, among which are gold and very fine copper. Quang-si and Quang-tong, or the two Quang provinces, lie to the east of Yun-nan,

and consist principally of a large plain bordered by mountains. *Fokien* and *Che-kiang* are maritime provinces to the north of Quang-tong, and consist of ridges of mountains at no great distance from the sea, interspersed by numerous valleys. Fokien is, comparatively speaking, so unproductive, that its numerous population are compelled to devote themselves to maritime affairs, in which they are favoured by the deep bays and fine harbours which the province contains. Its inhabitants are the boldest and most adventurous of the Chinese, and furnish the mariners for the imperial fleet of war-junks, and the greater part of the emigrants to foreign countries. The basin of the Yang-tse-kiang, and its affluents, is occupied by the provinces of *Setchuen*, *Kwei-chew*, *Hou-quang*, *Kiang-nan*, and *Kiang-si*. Setchuen is very imperfectly known. Its mountain border on the west is lofty, but the eastern part of the province slopes into a plain. Kwei-chew consists partly of a plain, but a large portion is composed of the mountains towards Yun-nan and Quang-si. Hou-quang consists principally of an extensive and highly fertile plain, watered by numerous lakes and rivers, and producing in abundance, beyond any other part of the empire, every thing that can minister to the use of man. Kiang-nan consists, with little interruption, of a great alluvial plain, which extends from the sea inland, along both sides of the Yang-tse-kiang and the Whang-ho. Kiang-si occupies the basin of the Kankiang and the Poyang-hou, and is profusely watered by numerous streams which pour down from the mountains that border on its south, east, and west sides. The northern provinces of *Shen-si*, *Shan-si*, *Honan*, *Shan-tung*, and *Pe-che-lee*, occupy the basins of the Whang-ho and Pei-ho and their affluents, with the mountains which divide and encircle them. Shen-si, the north-west province of China, abounds with mountains, everywhere diversified with fertile and well-watered valleys, but is nowhere so rugged as to shelter savage tribes. Shansi is also partly mountainous, and occupies the eastern side, as Shen-si does the western side of the valley of the Whang-ho, in its long southerly course from the great wall, before it turns finally to the east. Honan lies between Shan-si and Kiang-nan, occupying the space between the two great rivers, and from its central situation is called the "flower of the middle." It is described by the missionaries as being so fertile and beautiful as to have merited the appellation of the garden of China; and appears to consist of an extensive champaign country, bordered on the west by high mountains covered with forests. Shan-tung consists of a long mountainous promontory, jutting far out into the Yellow Sea, with the valleys which border it on both sides. Pe-che-lee is the most northerly province, and consists of a wide naked plain rising gradually to the Tartar frontier, where it becomes decidedly mountainous. The new province of *Kan-suh* is composed of hills and deserts, lies to the west of Shen-si, and comprehends a great part of what was formerly included within that province.

GULFS, BAYS, STRAITS.— *Gulf of Tonquin*, between the island of Hainan and the province of Quang-si and Tonquin; *Gulf of Canton*, in Quang-tong; *Strait of Formosa*, between Formosa and Fokien; the *Yellow Sea (Whang-hai)*, between Corea and the northern provinces of China; the *East Sea (Tung-hai)*, between Formosa and Corea; *Gulfs of Pe-che-lee* and *Liaotong*, in the north-western part of the Yellow Sea. The water in these gulfs is generally shallow, with a muddy bottom.

ISLANDS.— *Hainan*, between 18° and 20° N. lat., and 108° and 112° E. long., is separated by a narrow and shallow channel from a long peninsula which juts out from the province of Quang-tong. It is about 190 miles long, by 70 broad; a great part of it, particularly on the northern side, is level, and is inhabited by Chinese; but the interior is rugged, and possessed by very rude tribes. The climate is hot and unhealthy. The capital is *Kiong-cheou-fou*, on the north coast. The *Ladrones* or *Robber's Islands* extend along the coast between Hainan and Canton, so near each other and the mainland, and so irregular in their form and position, as to appear like fragments disjoined from the continent. They have a very bleak and rugged appearance, and have long served as a haunt of pirates. *Tye-pun-shan*, or *the Great Ladrone*, in lat. 21° 57′ 10″ N., long. 113° 44′ E., is steep and bold, and may be seen at the distance of fourteen leagues from the masthead of a large ship, or nine from the deck. This island, with the *Little Ladrone* and *Potow*, to the north-north-west, bounds the eastern side of the great channel which leads to Macao roads. *Heang-shan*, a very large island formed by two branches of the Canton river, forms the western side of its main channel, and terminates seaward, in a small peninsula which contains the Portuguese town of Macao. The *Asses' Ears* and the *Lemas*, are small islands, barren and uncultivated, at the eastern side of the Gulf of Canton. *Lintin*, the station of the opium smugglers, a small island in the Canton river, 21 miles N.E. of Macao, and 23 outside of the Bocca-Tigris. The peak of Lintin, a high mountain in the centre of the island, forms an excellent landmark. *Lantao* or *Tyho*, a large island on the eastern side of the Gulf of Canton. *Hung-kong*, a small rocky island, 15 miles in circumference, recently ceded to the British as the seat of their trade with China, is situate to the east of Lantao. *Hae-tan*, a large island off the coast of Fokien, between which and the mainland there is a labyrinth of islands and rocks, lining the coast for many miles. *Quesan*, a cluster of islands between 29° and 30° N. lat., off the coast of Che-kiang. *Chew-shan*, *Chow-shan*, or *Chusan*, a large and fertile island, between 30° and 31° N. lat., surrounded by a great number of smaller islets off the north-east coast of Che-kiang. Between the Quesan islands and Chusan harbour, a space of about 60 miles by 30, the number of islands exceeds 300, among which there are almost as many valuable harbours, or places of perfect security, for ships of any burden. This circumstance, together with their central situation in reference to the east coast of China, and the vicinity of Corea, Japan, Loo-choo, and Formosa, attract a considerable trade, which centres at Ning-po, a city of Che-kiang, to which all these islands belong. *Ting-hai-heen*, the capital of Chusan, is a large city, 6 miles in circumference, and surrounded by a good wall and ditch. Near Chusan is the island of *Poo-to*, inhabited by about 1000 Bonzes, who attend a number of large temples, which are resorted to by mariners to return

thanks after a perilous voyage. *Tsong-ming* or *Tsung-ming*, a large alluvial island, 5 or 6 leagues long by 2 broad, at the mouth of the Yang-tse-kiang, surrounded by dikes to protect it from the sea, and containing about 2,000,000 of inhabitants, who are industrious and enterprising, and celebrated as excellent fishermen and sailors. One part of the island is used for the cultivation of rice, another for the growth of various grains, and the third, though apparently the most unpromising, and producing not even a blade of grass, is so impregnated with salt, as not only to furnish a sufficient quantity for the consumption of the inhabitants, but also a large surplus for exportation. The banks which bar the entrance of the Yang-tse-kiang are really formidable; they are about twelve in number, visible at low water, and several miles in circumference. *Woo-teaou-sha* are immense banks at the mouth of the Yellow river, stretching about 80 miles out to sea, but gradually sinking, and running out in spits. As the coast is not visible, even at the distance of two miles, many vessels are wrecked upon them; but no measures are ever taken by the Chinese government to point out the dangers. *Yun-tai-shan*, an island with a double range of hills, north of the Yellow river. *Staunton*, *Alceste*, *Miatau*, small islands off the coast of Shan-tung. *Sha-loo-poo-tien*, low sandy islands or shoals, off the mouth of the Pei-ho, in the Yellow sea. *Potocki's Islands*, a group off the southern coast of Liaotong. *Sir James Hall's Group*, *Hutton's Island*, *Amherst Isles*, *Corean Archipelago*, all in the Yellow sea, along the west coast of Corea. *Quelpaert*, a large island in the East sea, 60 miles from the south-west point of Corea.

Ta-wan (called by its first Portuguese visitors *Formosa ilha*, Beautiful island), in the East sea, between 22° and 26° N. lat., and 120° and 121° E. long., is 250 miles in length, by 80 in breadth, and lies about 20 leagues from the coast of Fokien. It is divided throughout its length by a range of mountains, some of which reach the limit of perpetual snow. From this ridge there is a gradual slope to the west coast; and far into the sea, on that side, the water is shallow. This side produces immense quantities of rice and sugar, is in possession of the Chinese, forming part of their province of Fokien, and contains two considerable towns, *Tai-wan*, the capital, and *Ke-lang-ching*, the latter of which possesses the only good harbour in the island, and is situate on the north coast. The eastern side of the island is mountainous and precipitous, and is inhabited by independent tribes of the Malay or Polynesian race, who live chiefly by hunting. Along the coast are the smaller islands of *Steel*, *Soho*, *Samasanna*, *Betel-Tobago-xima*, and *Lamay*; and in the channel, between Tai-wan and Fokien, are the *Pescadores* or *Pang-hoo* or *Pehoe Islands*, a numerous group of various dimensions, all extremely barren; but, having good harbours, they serve as a place of refuge for the junks in the north-east wind, which blows here during the greater part of the year. The Chinese keep a numerous garrison here, as the security of Tai-wan depends on the possession of these islands.

RIVERS.—The Kiang (river), called by Europeans the BLUE RIVER, and named, near its mouth, YANG-TSE-KIANG (river of the son of the ocean), is the largest in the empire. It is formed by the union of three branches, named the *Kin-cha*, the *Yalou*, and *Min*, of which the first is considered by Klaproth to be the principal. The *Kin-cha-kiang* (gold-sand river), called *Mourousi-oussou* and *Bourai-chou*, in Thibet, takes the name of *Ta-kiang* (great river), in Setchuen, and runs through that province, Hou-quang, and Kiang-nan, into the East sea. The length of its course is about 3280 miles. Its principal affluents are the *Yaloung*, *Min*, *Lo*, and *Kan*, on the right; the *Kia-ling*, and *Han*, on the left. Its course is very winding, but the general direction is nearly east, through the middle of China. It appears to be the longest, as well as one of the largest, rivers of Asia, and conveys an immense body of water into the ocean. Where it is crossed by the imperial canal it is two miles wide, and the stream runs with such force, that Lord Amherst's embassy found great difficulty in sailing up to the Poyang lake; and were unable to make way at all against the stream, except with a strong north-easterly breeze. The influence of the tide extends 400 miles up the river.

The *Whang-ho* (*Hoang-ho* of the French), or YELLOW RIVER, has its sources in the Koulkoun mountains, in the country of Hoho-nor. Turning abruptly north, it passes to the outside of the great wall, and, after flowing in an easterly direction, turns south, and flows S. by W. for about 400 miles, at the end of which it turns again very abruptly east, and flows into the East Sea, about 100 miles to the north of the Yang-tse-kiang, after a course about 3000 miles. Its stream is so excessively rapid as to be nearly unnavigable throughout the greater part of its course. It carries along with it an immense mass of yellow mud in a state of solution in its waters, and its frequent floods occasion great damage to the country, and expense to the government, in maintaining artificial embankments. Its principal affluents on the right are the *Wei-ho* or *Ouei-ho* or *Koei-ho*, in Shan-si, and the *Hoei* or *Hoai-ho* in Kiang-nan. The *Fuen-ho*, in Shan-si, is the principal affluent on the left. The tide ascends the stream of the Whang-ho as far as in the Yang-tse.

The *Pei-ho* rises in the Kingkan hills, and falls into the gulf of Pe-che-lee. Its principal affluents are the *Tshao-ho*, the *San-kan-ho*, and the *Hou-thou-ho* or *Eu-ho*, which is crossed by the imperial canal.

The *Si-kiang* (Pearl river) flows through Quang-si and Quang-tong, past the city of Canton, where Europeans give it the Portuguese name of *Tigris*, and call its mouth the *Bocca-tigris*. A little above Canton it is joined by the *Pe-kiang*, and below Canton, by the *Tong-kiang*, both from the north.

LAKES.—The *Tong-ting-hou* is a large lake, 300 miles in circumference, in the province of Hou-quang, which pours its waters into the Yang-tse-kiang. From the borders of this lake to the city of Vootshan, or an area of 140 English square miles, there is a great number of lakes nearly touching each other, from which circumstance the province has received its name of Hou-quang, the country of lakes. The *Poyang-hou*, in Kiang-si, has a circumference of 90 or 100 miles, and receives four large rivers, whose accumulated waters are discharged into the Yang-tse. It lies in the midst of a great extent of swampy land, with rivers flowing into it from most points of the compass. Its waves sometimes rise so high as to render it, in the opinion of the Chinese, as dangerous as the ocean. Its surface is studded with sandy islands just rising above the water, and covered with humble dwellings, the abode of fishermen, who pursue their calling on the lake. The *Tai-hou* to the south-east, the *Kao-yeou-hou* to the north-east, the *Hong-tse-hou* to the north, and the *Tsiao-hou* to the south-west of Nanking.

CLIMATE. — The temperature of China is considerably lower than that of the European countries in the same latitudes; and is more subject to excessive variations. At Peking, in the latitude of central Spain, frost occurs daily in December, January, and February, and very often in March and November; and this cold is often followed by excessive heat. At Peking there are, properly speaking, only two seasons, winter and summer; and, according to the observations of Father Amyot, the mean of the greatest heat is 121°, that of the greatest cold 63° below zero, and the medium heat of the year 55°. At Canton, under the tropic of Cancer, the mercury frequently falls below the freezing point in January, while in summer it sometimes, though not often, rises to 100°. The mean of the monthly range of the thermometer at Canton, for the years from 1829 to 1838 inclusive, stood thus:— January 52½°;

February 55°; March 62½°; April 70°; May 77°; June 81°; July 83°; August 82°; September 80.033°; October 73¼°; November 65¼; December 57.134°. The number of rainy days in each of the ten years averaged 122. — (*Silliman's Am. Jour. of Science, April* 1840.)

The first English embassay, on their arrival in Canton in December 1793, found that a fire was not disagreeable; thirteen years afterwards, Krusenstern saw ice selling in the streets during the same month. In February 1836, Canton was visited by a fall of snow, which continued for several hours, to the great surprise of the natives, few of whom had ever before seen such a phenomenon; and to the great delight of the European residents, who were thus agreeably reminded of home. Notwithstanding, however, these extremes of heat and cold, the climate must be generally characterised as highly salubrious, a circumstance which no doubt arises from the extent of cultivation and drainage. During August and September it is generally hot and sickly, as the wind then blows from the west over the parched deserts of the interior. Hurricanes also are not unfrequent, and are sometimes extremely violent.

VEGETABLE PRODUCTIONS. — The southern provinces possess the usual products of tropical regions, few of which, however, are seen to the north of the Pass of Meilan. Between that mountain range and the Whang-ho, various species of orange, lemon, tea, sugar-cane, rice, pomegranates, black and white mulberries, the vine, the walnut, chesnut, peach, apricot, and fig, are seen growing on the same spot. Camelias, bamboos, and cypresses are also found; the whole zone abounds with coniferæ, and the mountains are adorned with pines. The principal object of cultivation is rice; but in the north-western provinces there are districts too cold and dry for this grain which is therefore replaced by wheat. Yams, potatoes, turnips, onions, beans, and, above all, a kind of white cabbage, called *potsai*, are cultivated. But not the least important of the vegetable products is *cha* or tea, of which the Chinese botanists reckon 200 species. It grows in the most sterile ground on the sunny ridges of hills, chiefly between 25° and 30° N. lat.; though it is also found in various other parts of the country. The cultivation appears to be confined to the temperate zone, extending to the northern provinces. The tea-districts, properly so called, are thus stated by Dr. Abel: That of the green tea is in Kiang-nan, between 29° and 31° N. lat., at the north-western base of a ridge of mountains which divides Che-kiang and Kiang-nan; the black-tea district in Fokien, is contained within lat. 27° and 28° N., and is situate on the south-eastern declivities of a ridge of mountains which separates Fokien from Kiang-si. Green teas are very little used by the Chinese; though an infusion of tea is used universally throughout the country, and is brought forward on all occasions, and at all times of the day. Public tea-houses are also found in every town and village.

ANIMALS. — China contains scarcely any animals which are not common to other countries. The elephant is found in the south-western provinces, and the one-horned rhinoceros lives in the marshes of Yun-nan and Quang-si. The musk deer is sometimes found in the western provinces; deer, boars, foxes, and other wild animals abound in the forests. The Chinese rear, though in small numbers, all the domestic animals of Europe, the horse, the ass, the ox, the buffalo, the dog, the cat, and the pig. They have also two-humped camels of a small size. They eat almost indiscriminately every living creature which comes in their way; dogs, cats, hawks, owls, eagles, and storks are regular market commodities; and, in default of these, a dish of rats or snakes is not objected to; and cockroaches, and other insects and reptiles are used for food or medicine. Some of the native birds are very splendid; the fish are in great variety; and from China we have derived the gold and silver fish of our ponds and vases. The insects are numerous and beautiful. The white-wax insect produces an important necessary of life. Sir George Staunton mentions it as an insect not much exceeding the size of a fly, covered with a white powder, which is imparted to the stems of the plants on which it lives. This powder is collected by the people, who apply to it hot vegetable oil, and the mass, when cold, coagulates and becomes as firm as bees' wax. As a medicinal drug, it is highly esteemed throughout China, and, for making candles, is reckoned superior to bees' wax. The silkworm is said to have come originally from China. The people rear this valuable insect in small houses erected for the purpose in the midst of the mulberry plantations; and even the inhabitants of the towns rear it, and purchase mulberry leaves for the purpose. Destructive ants abound in the southern provinces.

PEOPLE. — The Chinese are considered by physiologists as belonging to the Mongolian variety of the human race. The head is almost square, the nose is short without being flat, the complexion yellow, the beard thin and the eyes oblique. There is

however, a great difference between the southern and the northern Chinese, and between the mountaineers and the inhabitants of the plains and sea-coasts. A Chinese female is vain of her beauty in proportion to the smallness of her eyes, the protuberance of her lips, the lankness and blackness of her hair, and the extreme smallness of her feet. Among the men, corpulence, as the indication of an easy life, commands a certain degree of respect; and men of thin figure are regarded as destitute of talent. People of quality allow the nails of their fingers to grow, and stain the hair of the head and the beard black. The Chinese are generally of a middle size; few tall men are found among them, and still fewer dwarfs or deformed persons. The women can be seen with difficulty, and generally those only of the lower ranks, who are not distinguishable from the men by any delicacy of feature or complexion. Their persons indeed are considered to be the reverse of elegant or beautiful. With respect to character, peace, industry, order, and regularity appear to prevail among them. Flagrant crimes, and open violations of the law, are not common; but petty delinquencies and frauds are very prevalent. The supreme ruler of the country is the bamboo, which is applied, at the discretion of the magistrates, to all ranks of offenders; and on such occasions the delinquent is obliged to return thanks to the magistrate for his paternal care of his morals. The attachment of kindred is very strong, and the support of the aged and infirm is inculcated as a sacred duty, which appears to be very strictly fulfilled. Towards strangers, however, and persons not of their own family, their indifference is extreme; and in cases of accident, they allow their neighbours to perish before their eyes, without offering the smallest assistance. They all marry early, and are very prolific, the consequence of which is a very numerous, and generally redundant population, who, with all their industry and moderation, have often great difficulty in obtaining the means of subsistence. Emigration is prohibited; but great numbers of men notwithstanding contrive to leave the country; numerous colonies have settled in the Indian Archipelago, and some have even gone to Calcutta, Mauritius, and Brazil.

The community of China appears to be divided into four ranks or orders; of which the literati or learned occupy the first place; the husbandmen the second; the manufacturers the third; and the merchants the fourth. But in this country, as everywhere else, wealth raises its possessor above such conventional distinctions. The merchants accordingly, though lowest in rank, can command the services of their superiors; but it is only the *learned* who are yet allowed to occupy places in the government. The only persons possessing hereditary rank are the members of the Imperial family, who are distributed into five classes, all distinguished by wearing a yellow girdle; but they possess no political powers or privileges, and have only very small revenues assigned to them for their subsistence. The consequence is, that some of the more remote of these branches are in very indigent circumstances. Being likewise brought up to a life of idleness, they are in many cases ignorant, dissipated, and worthless; but they are kept under very strict control. Besides the descendants of the emperors, there is another class of imperial kinsmen, descended from the brothers or uncles of the first Tartar emperor, who are distinguished by a red sash and bridle. Every thing connected with their dress and equipage is subject to minute regulation, and they are as strictly watched as the others. It is said there are still some descendants of the Ming dynasty in existence, but they have laid aside the yellow girdle through fear of persecution. Polygamy is not permitted; a man can have only one legal wife, but he may have as many *tsie* or concubines as he pleases, or can afford; and the offspring of the latter possess many of the rights of legitimacy. The wife is espoused with regular marriage ceremonies, is the equal of her husband in rank, and possesses certain legal rights, such as they are; but the tsie is bought for money, and is taken into the house nearly as any other domestic. The women are, however, the slaves of their husbands and masters; they live and die in ignorance, and every effort to raise themselves above the rank assigned to them is regarded as impious arrogance.

Besides the subjects of the Emperor, there are within the limits of China Proper several tribes who have always maintained their independence. The higher districts of Yun-nan are occupied by a hardy highland race called *Lolo*, of a totally different character from the Chinese. Such is their valour, and the strength of their mountain fastnesses, that the Imperial Government has been obliged to rest satisfied with a nominal acknowledgment of homage, leaving the internal government to be administered by the native hereditary chiefs. In the neighbouring province of Kwei-chew are several tribes of rude people called *Miaotsi*, who inhabit the mountain districts, and have hitherto bid defiance to the military force of the empire. The people who

possess the mountainous districts of Hainan and Formosa are likewise nearly, if not altogether independent.

The Ladrones, or Pirates of the islands which stud the southern coasts of China, form a very numerous and organized body, and possess a fleet of at least 500 well-manned vessels, of from 10 to 250 tons, the largest carrying 12 guns, and all of them armed, besides the ordnance, with abundance of small arms, spears, swords, and boarding krises. They are under strict discipline, and often evince great bravery.

POPULATION.—With European statists the population of China has long been an insoluble problem; and their estimates have varied from about 30 to 370 millions. Balbi, by his approximative method, determines it to be 150 millions. In 1793 Sir G. Staunton was informed by a mandarin of high rank that it then amounted to 333 millions; and in 1832 Mr. J. R. Morrison of Canton stated, in the Companion to the Anglo-Chinese Almanack, as the result of a census taken in 1813, and published by imperial authority, the amount as having then been 360,443,000. Mr. Medhurst says that it was, in 1812, 361,221,900, and adds, that after the fullest consideration of all that has been said on the subject, after the most patient investigation of native documents, and after extensive inquiries and observations among the people for more than twenty years, he cannot resist the conviction that the population of China Proper is as above stated; besides the population of Formosa, and the tribes of Chinese Tartary. Mr. Gutzlaff also declares himself to be "fully persuaded that the last imperial census is as near the truth as it can be ascertained." Those parts of the empire which he visited were extremely populous. He took the trouble of examining some parts of the census, and of numbering the houses in small districts, and invariably found that the population was under-rated. And Mr. Morrison, in publishing the statement already referred to, observes that it "will probably serve to set at rest the numerous speculations concerning the real amount of population in China. We know from several authorities that in China the people are in the habit of diminishing rather than increasing their numbers in their reports to government. And it is unreasonable to suppose that in a work published by the government, not for the information of curious inquirers, but for the use of its own officers, the numbers reported by the people should be more than doubled, as the statement of some European speculators would require us to believe." The numbers in our table of the extent and population of the provinces are those published by Mr. Morrison, taken from the *Ta-tsing-hwuy-leen*, or Collection of Statutes of the *Ta-tsing* dynasty, published in 1825, according to a census taken in the 18th year of the reign of Kia-king, under the authority of his imperial Majesty.

EDUCATION, SCIENCE, and LITERATURE.—One of the most curious features of Chinese policy is the encouragement given to the cultivation of literature, which is professedly the only channel of introduction to advancement in the State, and to the acquisition of office, rank, and honours. With the prospect of such rewards the number of students is very great, and a taste for letters is almost universally diffused. Schools abound in every town and village, and the best education which the country affords may be procured on the most moderate terms. Certain magistrates are appointed in every province to take charge of the candidates for employment, to direct them in their studies, and twice a-year to hold public examinations, when small presents are distributed to the most deserving. At Peking is a grand national college named *Han-lin-yen*, which is supported by Government, the members of which are the chief literati of the empire. Nothing, however, but old established principles are taught; the scholar of the present day must not venture to go beyond the sages of ancient times; learning is consequently at a complete stand-still. As a further encouragement to literature, the press is left free, and any one may print what he pleases, taking his risk of the consequences; the Government being very rigid in suppressing "wicked, corrupt, and seditious publications," and in punishing their authors. The antiquity and importance of Chinese literature have only of late years been duly appreciated in Europe, and have but very recently begun to attract the attention of students. "The Chinese literature," says M. Abel-Remusat, "is incontestibly the first in Asia, in respect of the number, the importance, and the authenticity of its monuments. The classic works, named *King*, go back to a very remote epoch. The philosophers of the school of Confucius have made them the basis of their labours upon morals and politics. History has always been the object of attention, and the Chinese annals form the most complete and continuous that exist in any language. The custom of competition has given a powerful stimulus to political and philosophic eloquence. Literary history, criticism, and

biography, are the subjects of a crowd of works remarkable for their order and regularity. The Chinese possess many translations of Sanscrit books upon religion and metaphysics. The literati cultivate poesy, which is subject to the double yoke of metre and rhyme; they have lyric, narrative, and descriptive poems, theatrical pieces, romances of manners, and romances wherein the marvellous prevails. They have, besides, a great number of special and general collections, libraries, and encyclopædias, and in the last century they began the printing of a collection of select works in 180,000 volumes! Notes, glosses, commentaries, catalogues, indices, extracts arranged in the order of subjects, lend their aid to facilitate research. They have excellent dictionaries, in which all the symbols of their writing, and all the words of their language are explained with the greatest care, and in a very regular order. Books are printed upon silk paper, and as this paper is extremely fine, they are obliged to print only upon one side; the parts are classed, numbered, and paged; finally, there is not, even in Europe, a nation that has so many books, books so well made, so commodious for consultation, and at so low a price;" and notwithstanding there is no country where real science and literature are at a lower ebb.

Geography has been cultivated from the most ancient times; a fact which is proved by the descriptions of the empire given in the *Chou-king*, five centuries B. C. The Jesuits constructed a new map of the empire by order of the Emperor Kamhi, between 1707 and 1715, and a new edition of it, with corrections, was published in 104 sheets in 1760, by order of the Emperor Kien-long, under the direction of the missionaries. The imperial geography forms 260 volumes in quarto, with maps and plans. It embraces every topic: topography, hydrography, monuments, antiquities, natural curiosities, industry, productions, commerce, agriculture, government, population, general history, biography, and bibliography. Astronomy has always been held in honour, but its progress has been very limited. Their knowledge of mathematical science appears to be very low; they use the decimal system of arithmetic, and execute with rapidity all its operations by means of a machine, the swanpan, the use of which has passed into Russia and Poland. Their theory of military tactics displays some learning, and has even fixed the attention of some generals of the school of the great Frederick; but their artillery is very defective; their muskets are inferior, and their powder is very inefficient. The Chinese were, nevertheless, acquainted with the art of making gunpowder before it was known in Europe, and they have long been accustomed to make fireworks which produce a surprising effect. Their medical science is mixed with superstitious practices, and founded upon imaginary theories. Their pharmacopœa, however, is rich, and they have good books of medical natural history, accompanied with plates; but their physicians are the only cultivators of natural history. Their arts of design are very imperfect; they are unacquainted with perspective; and the only objects which they paint well are plants, flowers, houses, boats, and other objects of inanimate nature. Their sculpture is distinguished only by its nice finish; but they execute in wood sculptures in relief of remarkable fineness. Their architecture has neither grandeur nor elegance; and yet the order, and the fine colours with which their buildings are adorned, have a seducing effect. Magnificence is reserved for public buildings, such as the emperor's palace, temples, towers, triumphal arches, town walls, and gates. Their bridges, canals, quays, and particularly the embankments of the Yellow river, are as remarkable for the persevering industry which has produced them as for their usefulness. The Chinese music, though founded upon a very complicated system, wants, nevertheless, according to European taste, both harmony and melody.—(*Balbi's Abregé*, p. 787.)

The manners of this numerous people have one striking characteristic, and their religious opinions and practices are precisely similar throughout the empire. When the main features of the Chinese character have been studied in one place and in one person, they have been studied in all, and when one train of argument has been discovered which suffices to silence the objections of one individual, it will be equally effective on all other occasions. The uniformity and invariableness of the Chinese mind is to be traced perhaps to their possessing one set of opinions on philosophy and religion; which being laid down in their ancient books, and transmitted from age to age, constitute the public and universal belief on these topics, and run through the whole mass of society. Hence the missionaries find the Chinese always using the same arguments, and starting the same objections, which having been often answered before, may be easily answered again. In the system of Chinese literature there is no harmony or continuity. The most deplorable ignorance stands in immediate juxtaposition with science of more than ordinary refinement; an astonishing accuracy and minuteness of detail are often combined with a total want of general

principles, or with principles grossly incorrect. Here and there are observable foundations of immense mental strength, on which no superstructure is erected; or, perhaps, some superstructure of so uncouth an appearance, and so useless and fragile, as to prove only the perverted ingenuity of the artist; and on the other hand, surprise is excited by the prospect of some noble and magnificent edifice, which seems to have sprung from the ground, like the palace of Aladdin, without any perceptible agency of sufficient power to call it into being. All the intellectual combinations of China are monstrous; they possess uniformly a mingled character of civilization and barbarism. The people have been from time immemorial separated from the rest of mankind, and no free intercourse has ever shaped their rude inventions into forms calculated to make them suitable to mankind in general. All that they have done is specifically Chinese; all their productions have a national character; they are stiff, contracted, and incapable of being wrought into any foreign composition.

The spoken language of China is composed of monosyllables, of which there are scarcely 350 which a European can distinguish from each other; but the Chinese are able, by various modulations of the voice, to distinguish many more—about 1300. The syntax is also very meagre; declensions and conjugations are wanting, and their place is supplied by circumlocutions. There is also a written language, expressed by about 80,000, or, according to some writers, 40,000 different characters or symbols, each representing a separate object or idea; and as this written language is common to the whole empire, the natives of the various provinces, though speaking different dialects, and mutually unintelligible when speaking their own dialect, can, nevertheless, all read the written language, and have thus a ready means of general communication. Even beyond the limits of Chinese dominion the Chinese written language is understood; and throughout Cochin-China, Corea, and Japan, it is a common object of learning. The multiplicity of characters might seem an insuperable obstacle in acquiring the language; but these are in fact compounded of 214 elementary symbols, which form a clue to their labyrinth; and by the help of which, dictionaries have been formed that enable Europeans to acquire a complete knowledge of it in a comparatively short time. It has been the general opinion among learned men in Europe that the written and the spoken languages of China have no connection or relation to each other; that the visible characters represent *things* or *ideas* directly, without reference to the *sounds*, by which the same objects may sometimes be expressed; that they are real characters, in short, which have no connection with words, and might have been invented by a race of beings destitute of the faculty of speech. But Dr. Ponceau of Philadelphia has succeeded in throwing new light on the subject, by shewing that these so-called real characters represent words only and not ideas, at least directly, and that they are not common to the other nations which surround China in any other way than the words of the French language, for example, are common to the nations of Europe; that is, that they are common to the people of those nations who have studied and learned to write them, and to speak the Chinese language along with them, and to no others. To use the Doctor's own words, "nations whose languages, like the Japanese and the Loo-chooan, are polysyllabic, and have inflections and grammatical forms, cannot possibly understand Chinese books and manuscripts, unless they have learned the Chinese language." Every syllable in Chinese is a word, and as each character represents a syllable, it follows that each character represents a word. The Japanese have a syllabic alphabet of 47 characters; and their historians relate that, in A. D. 284, their sovereign having sent an embassy to the emperor of China to request him to send a person to civilize his kingdom, Vo-nin, a prince of the imperial blood, was sent. He introduced the Chinese civilization, language, and literature; and for a long period Chinese was the only written language in Japan, and the only record of its learning. It was not till A. D. 733 that a selection of 47 characters was made from the Chinese, and applied to the Japanese language by one Kibi, a man of high rank, who modified the characters so as to adapt them to the syllables of which his alphabet was composed. The Chinese language, thus introduced into Japan, still remains there as a learned language, and is taught as such. Many of its words have also been adopted by the Japanese into their language; an event which has also happened in various other countries; but the Japanese who have not learned the Chinese language, cannot make themselves understood by the Chinese in writing any more than in speaking. Chinese books are constantly translated into Japanese and *vice versa;* a labour which certainly could not be necessary if the two nations, as is commonly believed, used the same written characters for

both languages. There are also various native dictionaries in Chinese, with Japanese explanations; and in Japanese, with interpretations in the language of China. Chinese books, with interlineary Japanese translations, are also used in Japan. Dr. Ponceau, in saying that foreigners, and even the Chinese themselves, read the Chinese written language only by translating it, and that the symbols directly represent words, is undoubtedly right; for each of the characters of which it consists has attached to it one of the 1300 monosyllabic words of the spoken language; but as these are too few to afford a distinct sound for each character, it happens, in some cases, that one monosyllabic sound represents 70 or 80 written characters, so that it is scarcely possible to read the written language aloud intelligibly even to those who can read it for themselves. Indeed it frequently happens, that, in reading a paper, the auditors are assisted by the reader making, by a motion with his hand in the air, or with his fan, the shape of the character, or at least of its key, to remove ambiguity. The same ambiguity would prevail in the spoken language itself were it not obviated by the use of expletives, that is, by compounding the monosyllables, of which the language has been said entirely to consist, into polysyllabic words. For instance, when a man is speaking of his father, a term which is expressed by *foo*, a monosyllable which has 70 or 80 different meanings, according to the different written characters which it represents, he employs *foo-chin*; and, instead of *moo* for mother, *moo-chin*. The syllable *chin*, which signifies kindred, not only removes at once all doubt as to the meaning of the speaker, but is one proof at least that the Chinese is as necessarily and inevitably, in some cases, a polysyllabic language as English itself, or any other. But that Dr. Ponceau is wrong in saying that the characters only represent words directly, and not things or ideas, is evident from the fact that each of the 70 or 80 characters represented in speech by the single syllable *foo*, conveys a distinct idea to those who read it, while the same idea could not be communicated to another person distinctly, by merely reading the monosyllabic name. In short, the real difference between the so-called monosyllabic language of China and the languages of other countries is, that in the former the written characters represent syllables with distinct meanings, while in the latter they represent the simple unmeaning sounds of which syllables are composed; but, in both, it is only by compounding syllables into longer words, in Chinese perhaps less than in other languages, that a copious and generally intelligible speech, applicable to any thing beyond the simplest ideas, or to the purposes of any other than those of unthinking savages, is, or can be produced. The educated classes throughout the country communicate with each other in the dialect of Kiang-nan, the seat of the last native dynasty, which is usually called the Mandarin language.

RELIGION.—(See pages 125 and 126.) Besides the religion of Buddha or Fo, of Confucius, and of Tao-sse, nearly all the other forms of mythology which are conspicuous in the page of history now exist in China. To use their own expression, says Dr. Milne, "her gods are in number like the sands of Havy river." There are gods celestial, terrestrial, and subterranean; gods of the hills, of the valleys, of the woods, of districts, of families, of shops, of the kitchen; gods who preside over thunder, fire, rain, grain, births, deaths, and small-pox; and genii of the mountains, rivers, lakes, and seas, birds, beasts, and fishes. Astrology, divination, geomancy, and necromancy, every where prevail; and every one possesses spells and charms. As might be expected, the god of wealth is the most popular deity among merchants and tradesmen; and is represented with a wedge of gold in his hand. Seamen worship as their god *Tung-haï-vaung*, the lord of the east sea; and also pay their vows and burn incense to a goddess who is the exact counterpart of the heavenly patroness of the mariners of Spain, Portugal, and Italy. But all these superstitions are more or less mixed with the worship of Fo, the number of whose temples and priests (bonzes) is incalculable. These shrines are found not only in every city, town, and village, but also in private houses, where the priests are occasionally employed to instruct the children; but no temple can now be built without special permission; and the sacred edifice is used for state purposes by the officers of government, for the reception of foreign ambassadors in travelling through the country. The Chinese have no sabbath, and no division of time by weeks. They labour every day in the year, except the first, which they devote to family visiting, and the last, which they consecrate to the memory of their ancestors. They celebrate the festival of the full moon by keeping up a noise and riot all night; and during the first two days after the first full moon of the year they celebrate the feast of lanterns, on which occasion the whole country is illuminated. Every house, and every village, with all the shipping on the canals and rivers, are then lighted up with painted lanterns. This appears to be a religious festival; but its origin and history are forgotten.

Since the first arrival of the Portuguese on the shores of China, in the 16th century, the catholic church has been earnestly employed in endeavouring to convert the inhabitants to her form of Christianity; but the result of all her efforts, during three centuries, is the existence of only about 200,000 native Christians in the empire, and chiefly in the western and northern provinces. Of late years protestant missionaries have also been labouring zealously to gain proselytes to their doctrines, and have translated the Bible into the Chinese language; but hitherto without much, if with any, real success. There are also some thousands of Jews in China, whose principal residence is at *Khai-fung*, in the province of Honan. A few Mahometans are found in Shen-si and Kan-suh.

Government.—The Chinese Government is a sort of patriarchal despotism; limited, however, by the right of representation which is lodged in certain classes of magistrates, and still more by the obligation under which the emperor is placed, of having to choose all the agents of government, according to fixed rules, from the literary class. The members of this class form a true aristocracy, which is perpetually recruited by promotions from among the numerous students. Young men of all conditions are admitted to trial for the third literary rank; those who obtain this enter themselves as candidates for the second, to attain which is a necessary step for those who are to exercise public functions. From the second rank they may rise in the same way to the first, which qualifies them for the highest offices and employments. This institution is as old as the seventh century; its members are the only nobility of China, but their rank is not hereditary. It dies with the possessors; but, as might be expected, their children form the favoured class of students, and have the best chance of promotion. Hereditary dignities are confined to the princes of the imperial family, and to the descendants of the philosophers Confucius, Mencius, and Laokiun. The supreme power is exercised by the emperor, who takes the title of Son of Heaven, and August Emperor. The succession is hereditary in one family, but the emperor selects his successor according to his own judgment or caprice. For administrative purposes China is divided into eighteen large provinces, which are subdivided into districts arranged in three classes according to their importance, and designated by the terms *foo*, *chew*, and *heen*, usually annexed to the names of their chief towns. Each governor general, or viceroy, has commonly two provinces under his charge. There are besides, in each, an intendant of the province, a superintendent of the literati, a director of finance, a criminal judge, and two intendants, the one of the salt-pits, and the other of the public granaries. Each district has likewise its particular magistrates, who are invested with administrative or judicial functions. The emperor nominates to all employments from a triple list furnished by the personal or privy council. Many reports, decrees, and other official documents are published under the form of instructions addressed to the magistrates or the people; they are published regularly in the Peking gazette, from which they are extracted and again published in the provincial gazettes, which are printed in the principal cities. When the emperor pursues any measure, or promulgates any law to which public opinion is supposed to be unfavourable, he publishes in the gazette his reasons for it. The emperor believes himself responsible to his subjects for all the calamities which they experience, such as famines, epidemics, earthquakes; and, when such occur, publicly accuses himself of having offended heaven by neglecting his duties, and imposes on himself certain penances, such as seclusion, fasting, &c. The public functionaries, both civil and military, are divided into nine ranks, distinguished by buttons of the size of a walnut, formed of different jewels and metals, which are fixed on the top of their conical caps. Their common title is *Quan;* but they are usually called by Europeans *mandarins*, a word derived from the Portuguese verb *mandar*, to command. The first rank includes ministers of state, and presidents of the tribunals, who are distinguised by a red gem; the second, viceroys and governors of provinces, who have an inferior red gem; the third, judges, treasurers, and salt-superintendents, a dark-blue stone; fourth, superintendents of circuits, and governors of counties or provincial districts, a light-blue stone; fifth, rulers of departments, a crystal globe; sixth and seventh, magistrates of districts, a white stone globe; eighth, assistant magistrates, a flowered gilt globe; ninth, village magistrates and inferior officers, a plain gilt globe. There are six supreme tribunals at Peking, to which all the affairs of government are referred, and which make their reports to the emperor for his decision and approval. The first selects, promotes, and superintends, all the civil officers of the empire, and is the centre of all power and patronage; the second has the charge of the revenue, and superintends the census of the population, taxes, coinage, &c.; the

third takes charge of all public ceremonies, and the different forms of religion; the fourth manages the affairs of the army, navy, and ordnance, and appoints the various officers; the fifth, or police department, superintends all matters relative to the detection and punishment of crimes; the sixth, or tribunal of public works, takes charge of all the palaces, public offices, mines, canals, manufactories, bridges, &c. Besides these there are a board of music, the colonial office, and the Too-cha-yuen or censors, whose office it is to watch over the words and conduct of the emperor. There is also another board of censors who preside over the deliberations of the other tribunals, and report to the emperor; who may be said indirectly to govern the empire. Under the Mandchew emperors the Chinese appear to have declined in civilization; and the government is now in a state of deplorable and increasing weakness. The people have ceased to respect laws which are openly contemned by public functionaries. Piracy and smuggling are acknowledged as trades; in some districts robbery is committed openly, and in all these cases the mandarins are quieted by a share of the profits.

Since the conquest of China by the Mandchews, two centuries ago, a large party has existed who are anxious to restore a native dynasty of sovereigns. The members, being closely watched, formed themselves into a secret society, ruled and organized like that of the Jesuits, from one of whom indeed, it is said, the plan of the institution was obtained. The society soon extended its branches into every province, and its members are now supposed to amount to several millions. They are united by the most solemn oaths of secrecy, and by pledges of mutual assistance; they have signs and pass-words known only to themselves; possess a common purse, and are remarkable for their implicit obedience to the commands of their unknown superior. In 1794 they made a vigorous effort to overthrow the reigning dynasty, and their ravages were not suppressed till 1802. Occasional revolts have occurred since, but the society have conducted their operations so cautiously that all the efforts of the imperial ministers have failed to discover their leaders. The connection, real or supposed, of this society with the Jesuits, was the cause of the cruel persecutions of the Chinese Christians at the beginning of the present century. The Society are called *Pe-lien-kiao* (worshippers of the flower of the nymphæa or water lily).

FINANCES.—There are no authentic documents from which any account of the public revenues can be obtained; Mr. Medhurst has given the following account of them:—"The revenue is derived principally from the land-tax, which is paid partly in kind and partly in money; it is generally a very light impost, amounting not, as some suppose, to one tenth, but more usually to one fiftieth or one hundredth of the produce. There are also taxes on pledged articles, and more particularly a heavy impost on salt; while custom-houses are established on the sea-coast, and at the most important passes in hills and junctions of rivers, so as to secure the mercantile as well as the agricultural population. Some of the revenue thus derived is kept in the provinces, to pay the army, navy, and police, and to provide against famines, while a considerable proportion is forwarded to Peking for the immediate service of the emperor and his officers. We cannot, therefore, form a correct estimate of the resources of China, unless we consider all that is sent to the capital and expended in the provinces, as being alike drawn from the labour of the people, and devoted to the service of the state. Thus the revenue of the Chinese empire will appear to be as follows:—

Land-tax, paid in money sent to Peking,	£10,581,755
Ditto, paid in grain, ditto,	4,230,957
Customs, paid in money, and sent to Peking,	493,666
Grain kept in the provinces,	31,596,569
Money, ditto ditto,	9,568,375
	£56,471,322

This revenue, when divided among 361,221,900 persons, amounts to three shillings and three halfpence per head: and if that only which is sent to Peking be reckoned, namely, £15,206,378, it will not amount to much more than tenpence per head. Some persons may doubt, how a government over so great a country can be maintained for so small a sum, and how a people under an arbitrary rule can be let off with such insignificant imposts; particularly when, in a free country like our own, and in a time of profound peace, each individual contributes upwards of two pounds annually, as his share of the public burthens. But it must be remembered that China has few or no resources beyond itself; that her foreign commerce is limited, and, com-

pared with the population, insignificant; that comparatively few subsist by manufactures; and that almost all the inhabitants are dependent on agriculture. In a country, therefore, where the consumers fully equal the capabilities of the soil, and where every production is hastily devoured by a needy population, there is little left for a government to glean, or, to use a Chinese simile, to squeeze, out of the already exhausted pockets of the people. It is not unlikely, also, that the present peaceful state of the country, and the willingness with which the Chinese submit to the Tartar yoke, is to be ascribed mainly to the light and insignificant burthens pressing on the people, who would soon complain, and perhaps revolt, if more heavily taxed. But how can the government manage to maintain an immense establishment of civil and military officers, besides an army and navy of nearly a million of men, upon fifteen or even fifty-six millions of pounds sterling? To this it may be replied that the pay of a Chinese soldier is only fourpence a-day; that the salary of the highest officer under government does not exceed £8000 per annum, of which there are not many; there is no more than one officer to ten thousand people; and that most of these have no more than £50 per annum: thus it is quite possible for the government to manage a country so thinly officered and so poorly paid, upon a comparatively small sum of money. Besides which, there is no national debt in China, so that all that is gathered goes to the actual maintenance of the government, and is not expended in paying the interest on obligations formerly contracted, to be defrayed by future generations.

In the report of the Anglo-Chinese college for 1829, there is an estimate of the amount of land-tax paid in different provinces, extracted from the Ta-tsing-hwuy-teen, or "Collections of statutes of the Tartar dynasty," by which it appears that the average rate of land-tax per *mow* (or Chinese acre, somewhat smaller than an English acre), is from fifteen cash to one hundred, or from one penny to sixpence: this, when calculated at its highest value, and multiplied by the number of acres in China under cultivation, will amount to about £12,000,000 sterling. This statement agrees with the common report of the natives, who affirm that from one to two per cent. of the produce is the utmost of what is exacted by the government in the shape of land-tax."

Army and Navy.—The army is numerous but inefficient; and consists principally of an undisciplined rabble, armed with matchlocks, bows and arrows, and spears The number has been variously estimated by European writers, from about half a million to 1,954,450. The most precise account of the military force of China which we have been able to find is contained in a communication by Father Hyacinth Bitshurin to the Academy of Arts and Sciences at St. Petersburgh, in August 1837. The Mandchews, with the Mongolians and Chinese who accompanied them on their invasion of China, form a distinct military community, which is divided into "standards," and subdivided into sections and companies, each company consisting of 150 men. The Mandchews of Peking consist of 681 companies, amounting to 102,150 men; the Mongolians quartered in that city consist of 204 companies, amounting to 30,600 men; and the Chinese 266, amounting to 39,900. The whole force of the Mandchews on duty in the provinces amounts to 840 companies, or 126,000 men. To these are to be added the "wild hunters," who form 97 companies, consisting of 14,550 men. These troops garrison the principal cities and towns of the empire; but, in addition to them, there is an army of native Chinese, amounting to 660,300 men, who do the ordinary duty of posts, both within and beyond the frontiers of China. The Government maintains 3000 regular troops in Thibet, besides a number of irregulars; and in Turkestan, numerous Chinese garrisons are established in all the towns, which are furnished from the adjacent province of Kan-suh.—(*United Service Journal*, xix. 97.) This, however, is only the peace establishment; in time of war, it is calculated that 10,000,000 of soldiers may be levied; but we are assured that the greater part of these exists only on paper, and that it is very difficult to muster an army when one is required. With the exception of the men stationed on the frontiers, the whole of this mighty host consists of men of peace, who are always in garrison, and are employed in preventing any violation of law. But they suffice, such as they are, to keep the country quiet; and may be considered rather as an armed police force than an army.—(*Canton Register, November* 27, 1838.) But, since these opinions were expressed, the Chinese have come in contact with British troops, and have shown an unexpected degree of efficiency and resolute bravery; though they are ill armed, and not very expert in the use of their artillery.

The imperial navy is said to consist of 1763 vessels; of which 1036 are employed

for police purposes on the great rivers, and the rest are stationed on the sea-coast. They are of all sizes, but none of them carry more than 20 guns. The larger ships carry from 200 to 400 soldiers and seamen; the total amount of the marine force is estimated at 60,000 men, on the peace establishment.

PRODUCTIVE INDUSTRY. — The industry of the Chinese in every thing which relates to the comforts and conveniences of life is wonderful. The origin of several of the arts is lost in the twilight of antiquity, and the invention of them is attributed to personages whose existence is very doubtful. They have from time immemorial, been acquainted with the preparation of silk, and the art of making the cloths which have attracted the merchants of the greater part of Asia. The manufacture of porcelain has been carried to a high degree of perfection, which the Europeans have but lately been able to surpass. The bamboo, besides being the grand instrument of punishment, serves as a material for numerous kinds of works. Their cotton cloths are famous over the world. Their furniture, their vessels, instruments and utensils of every kind are remarkable for great solidity joined to a certain ingenious simplicity, often deserving of imitation. They have always been acquainted with the art of working metals, they make musical instruments, cut and polish precious stones. Wood engraving and block printing are as old as the tenth century. They excel in embroidery, dyeing, varnishing, and cutting ivory. The fans which they make are everywhere admired; their works in filagree are beautiful; their artificial flowers have never been surpassed, and we owe to them the invention of tinted paper. Europeans have very imperfectly imitated some of the productions of their industry, such as their vivid and unalterable colours, their paper, which is at once fine and solid, their ink, and many other things which require patience, care, and dexterity. They take pleasure in reproducing models that reach them from foreign countries, which they copy with scrupulous exactness and slavish fidelity. They even make, expressly for Europeans, objects suited to their taste; and the rate of wages is so low, that it is often found advantageous to employ them upon works which European artists could only execute at a great expense. Nearly the whole arable land is constantly employed in producing human food. Even the steepest mountains are brought into cultivation; and are cut into terraces which resemble at a distance immense pyramids ascending by numerous steps or storeys. The waters which flow at the foot of the mountain are raised from terrace to terrace till they reach the very top by means of a portable chain-pump which may be worked by two men. Reservoirs are also formed on the tops of the mountains, from which the rain-water that is collected is let down for the irrigation of the sides. The houses of the peasantry are dispersed throughout the country, and not collected in villages. The women rear silk-worms; spin cotton, and weave it into cloth, which is in general use among the common people for both sexes; they also manufacture woollen stuffs. The Chinese use no butter nor cheese, and very little milk; their principal animal food is pork; they have few horses for travelling, show, or war; the only cattle which they keep are such as are required in husbandry; even sheep are very rarely to be seen, except in mountainous districts where the plough cannot be used with advantage. Hence there are no grazing farms, no meadows, and very little pasture, while every acre of ground capable of cultivation is turned up by the spade or the plough, and converted into a rice or a corn field. Wheel carriages are rare, particularly in the south, where the roads are few and narrow, and consist generally of raised pathways through the rice fields, or of winding lanes over the mountains. The gardens are very few; a Chinese grandee delights more in artificial landscapes, laid out in a small compass, than in an extensive park, or a flower garden. Utility is every where studied in preference to pleasure.

PUBLIC WORKS. — The Great Wall begins with a large bulwark and fort on the shore of the Yellow Sea, from which it extends westward, along the borders of Peche-lee, Shan-si, and Shen-si, through a space of 1500 miles, and ends amidst nearly impassable rocks and extensive deserts. It consists of an embankment of earth, raised upon a foundation of large square stones, and cased with stones or bricks; it is generally broad enough at top for six horsemen to pass abreast. Its height varies according to its situation; in the valleys and plains it is not less than 30 feet; and in such places it is strengthened by projecting square towers, at the distance of a bow-shot from each other. There are gates at intervals, which are strongly fortified and garrisoned. This great work appears to have been completed in the third century, and was intended as a defence against the Tartars, but a great part of it is now falling to ruins. The *Yun-ho*, *Yu-ho*, or Great Canal, commences near Lin-chin, in

Shan-tung, extends across Shan-tung, and Kiang-nan, and ends at Hang-chou-fou in Che-kiang, after a course of 700 miles. In some places it is raised above the level of the country, where strong dikes prevent its waters from overflowing; in other places it has been dug to the depth of 60 or 70 feet below the surface; and throughout it has a width of 200 feet. There are no locks, but only floodgates, and in hilly tracts inclined planes interrupt and regulate the current of its waters. In every part of its course it passes through alluvial soil, which is intersected by numerous streams; the sluices are of the rudest construction. It is neither carried through any mountain nor over any valley; it is nevertheless a work of high national utility, and forms the great channel of communication between the northern and the southern provinces. By means of the Pei-ho and Eu-ho rivers in Pe-che-lee, the Canal, the Yang-tse-kiang, the Poyang-hou, and the Kan-kiang in Kiang-si, and the Pe-kiang in Quang-tong, there is a navigable communication between Peking and Canton, interrupted only in one place by the high mountains which separate Quang-si and Quang-tong from Kiang-si. Across the mountains the communication is formed by the pass of Meilan, cut through the top of the ridge, a work esteemed so difficult that the Mandarin who accomplished it, was honoured with a statue in one of the neighbouring temples. The Chinese are obliged, by the circumstances of their country, to pay great attention to the draining and irrigating of their lands. Especial care has therefore been taken to prevent inundations; and the labour and expense bestowed on this department is scarcely equalled in any other country. Some of their embankments are strong and well constructed; their bridges over rapid streams and broad estuaries, are constructed of solid granite, and bear testimony to the skill and perseverance of their engineers.

COMMERCE. — The internal commerce of China is much more important than the foreign; it is carried on by means of the rivers and canals, and consists principally in the interchange of the natural and artificial productions of the different provinces. The country is so extensive, and embraces such a variety in its products, that the inland traffic is sufficient to occupy a very numerous portion of the people; and this circumstance has contributed to make the Chinese neglect their maritime commerce, which once extended so far as the Red Sea. Their merchants, however, still visit the principal ports of the Eastern Seas. Their foreign commerce may be distinguished into the maritime and the inland. The former is the more considerable, and its principal mart is at Canton, which is frequented by the maritime nations of Europe and by the Anglo-Americans. The Government, not content with limiting the places where European traders are to be admitted, the place of their abode, and the time during which they may remain at Canton, has also restricted their dealings to certain Chinese merchants, whom the French call *Hanistes*, and the English *Hong*, whose number till 1792 was only twelve, but has since been raised to eighteen. All commercial operations are managed through their intervention; and they are sometimes obliged to act as a sort of political agents in settling the disputes which often happen between the foreigners and the local authorities. The great article of export from Canton is tea, which is brought there by land carriage from the most remote tea-districts. The British part of this commerce was long monopolized by the English East-India Company; but since the abolition of their monopoly, the export of tea has increased immensely. The maritime trading towns next in importance are Hang-chew-foo, Hiamun or Amoy, Chao-ching, and Ning-po. The Spaniards of Manilla have the exclusive right of trading at Hang-chew-foo, in Fokien; Shanghai, in Kiang-nan, is the emporium of the trade with Japan. The land foreign commerce is carried on at five principal stations on the frontiers of Siberia; at Yarkhand and Aksou on the frontiers of Turkestan; at Leh and other places in Thibet; at Young-chang-fou on the frontiers of Birmah; and at Kuei-lin-fou on the frontiers of Annam. The principal articles of export, besides tea, are Nanking cloth, porcelain, rhubarb, squine, musk, ginger, badiane, mercury, zinc, borax, silk, shawls, mother-of-pearl, tortoise-shell, and other articles mentioned in the preceding section. The principal imports are, cloths and other woollen stuffs, furs from Siberia and North America, gold and silver wire, purl, and mats, glass and mirrors from Bohemia, lead, coral, cochineal, Prussian blue, cobalt, champagne wine, clocks and watches, ebony, gunpowder, sandalwood, calambac, ivory, tin, copper, birds' nests, incense, mother-of-pearl, camphor, tobacco, opium, and various other articles. The opium trade is contraband; but forms nevertheless the most valuable article of import. This drug is smoked by all classes to an enormous extent. In 1836 so many as 26,018 chests were imported into the country, valued at 17,106,903 dollars. The value of edible

birds' nests imported from the Indian Islands has been estimated to exceed £300,000 sterling annually.

DIVISIONS. — China is divided into eighteen provinces, which are subdivided into *foo*, *chew*, and *heen*; and it is a remarkable fact, that the Chinese cities have no proper names, but are all distinguished by the names of the *foo*, *chew*, or *heen* of which they are the capitals. Canton, for instance, is named Quang-chou-foo, *i. e.* the capital of Quang-tong; Nan-king is named Kiang-nan-foo, *i. e.* the capital of Kiang-nan; the capital of the empire itself, the residence of the Imperial Court, has no other name than King-szu, *i. e.* the capital, or Chun-thian-foo, the capital of Chun-thian. In consequence of there having been in China, occasionally, several simultaneous kingdoms, or, from the circumstance of the Court having several times changed its residence, the different capitals have received names indicative of their position: *Pe-king*, the north court; *Nan-king*, the south court; *Tung-king*, the east court.

TABLE of the Extent and Population of the Provinces of China, with the Principal Towns.

Provinces.	*Area in sq. miles*	*Population.*	*Relative Population.*	*Towns.*
Pe-che-lee,	58,949	27,990,874	474	PE-KING, Tong-chew-foo, Tien-sing-foo.
Shan-tung,	65 104	28,958,765	445	Tsi-nan-foo, Tong-chew-foo, Hong-chew-foo.
Shan-si,	55,268	14,004,210	253	Tai-yuen-foo.
Kiang-nan, { Kiang-su, / Gan-hwy, }	92,961	{ 37,843,501 / 34,168,059 }	774	Kiang-nan-foo (NAN-KING), Soo-chew-foo. Gan-khing.
Che-kiang,	39,150	26,256,784	671	Hang-chew-foo, Ning-po-foo.
Kiang-si,	72,176	30,426,999	422	Nan-chang-foo, King-te-ching.
Hou-an,	65,104	23,037,171	354	Honan-foo.
Hou-quang, { Houpee, / Hounan. }	144,770	{ 27,370,098 / 18,652,507 }	318	Wou-chang-foo. Chang-cha-foo.
Fokien,	53,480	14,777,410	276	Foo-chew-foo, Amoy, Chin-chew.
Quang-tung,	79,456	19,174,030	242	Quang-chew-foo (CANTON), Macao.
Quang-si,	78,250	7,313,895	93	Kwei-lin-foo.
Yun-nan,	107,969	5,561,320	51	Yun-nan-foo.
Kwei-chew,	60,554	5,288,219	87	Kwei-yang-foo.
Setchuen,	166,800	21,435,678	128	Ching-too-foo.
Shen-si, / Kan-suh,	154,008	{ 10,207,256 / 15,193,125 }	165	Si-ngan-foo. Lan-chew-foo.
Total,	1,297,999	367,659,901	283	PEKING.

These names are spelled in various other ways: it is always difficult, and sometimes impossible to express oriental names by Roman letters, and therefore each European nation spells them differently

§ *Cities, Towns, and Remarkable Places.*

PE-KING (North-Court), the capital of the empire, in the province of Pe-che-lee, about 26 miles only from the great wall, in lat. 39° 42′ 15″ N. long., 116° 30′ E., stands in a sandy plain, destitute of vegetation, and bounded on the west by a chain of high hills from which issue several streams that water the country. It is about 20 miles in circumference, is surrounded with high castellated walls of blue brick, outside of which there is a wet ditch. It is composed of two cities which are quite distinct; the one called King-tshing (Imperial town), called also the Tartar city, because it was built by the Tartars or Mongols during their possession of China in the 13th century, and is now inhabited principally by the Mandchews; the other named Lao-tshing (old town), or Wai-lo-tshing, called also the Chinese town, because it is principally inhabited by Chinese. Some of the gates are lofty and strong, and surmounted with lofty towers, which give them, at a distance, the appearance of grandeur. The streets are generally broad, and in straight lines; the largest is 60 yards wide, and nearly 3 miles in length, from east to west. They are unpaved, but clean and well kept. The houses are low, often one storey, and are built of brick, and tiled. The shops are handsomely ornamented, and the brilliancy and variety of the goods exposed for sale give them a gay appearance. The finest buildings are the temples, which are spacious and magnificent, adorned with columns, and stairs of white marble. The streets and houses of the Chinese town are very inferior in appearance to those of the Tartar city. There are, besides, 12 large suburbs, without the walls, each extending about two miles in length. The population of Peking is variously estimated at between 600,000 and 3,000,000; the city probably contains about 2,000,000. The Tartar city is composed of three towns within each other, each surrounded with its own wall. The innermost is the Tsu-kin-ching, or Imperial palace, about two miles in circumference, of a square form, surrounded with strong walls, 30 feet high, built of brick, and covered with yellow tiles. It is composed of numerous buildings, containing halls, temples, &c., and the imperial garden. The second enclosure, called Whang-ching, contains numerous large gardens, with artificial lakes, and hills, temples, and halls, and is principally inhabited by people in the service of the court. Peking is distinguished from the other capitals and great cities of Asia by a number of public institutions, resembling those of Europe, notwithstanding the great differences interposed by Chinese habits, manners, and customs. It receives its supplies from the southern provinces, by means of the great canal and the rivers of Pe-che-lee, which form the channels of a very active commerce.

In the neighbourhood of the city is the imperial summer palace, called *Yuen-min-yuen*, the round and shining garden. The palace is very large, being composed of a great number of buildings, disposed with beautiful symmetry, and separated by courts, gardens, and parterres. The face of each glitters with gold, varnish, and painting, and the emperor's apartments are adorned with the most valuable productions of China, Japan, and the Indies, and even with masterpieces of several European arts. The gardens contain about 60,000 acres, diversified with artificial hills, lakes, canals, vallies, rocks,

and islands; which are occupied by arbours, forests, pavilions, and everything most agreeable to the sight. A hundred and twenty miles to the N.E. of Peking, and beyond the great wall, is *Zehol*, a hunting-seat of the emperor, where Kien-long received the British embassy in 1793.

NAN-KING or Kiang-nan-foo, stands on a branch of the Yang-tse-kiang, in the province of Kiang-nan, 570 miles S. by E. of Peking. The area enclosed by the walls is much larger than that of Peking, but the greater part of it is now destitute of even the traces of buildings, and the city occupies only a corner of the enclosure. Reduced, however, as it is, it still continues to be one of the principal manufacturing towns of the empire. Its silks, paper, and cotton cloths, are preferred to those made any where else; and even in Europe the cottons were once highly esteemed, and have given their name to a species of imitation cloth called *nankeen*. Learning also continues to flourish, the booksellers' shops are amply furnished, and more physicians are sent from Nanking than from any other city of the empire. Its principal or most celebrated building is a pagoda, or octagonal tower of 9 storeys, ascended by 884 steps. The material is a fine white tile, which, being painted in various colours, has the appearance of porcelain; and all the parts are so neatly joined as to appear to form only one piece. The galleries are filled with images, and set round with bells, which tinkle with the wind; and on the top is a large pine-apple-shaped ornament, consisting, as the Chinese say, of solid gold. About 40 miles E. by N. of Nanking, in the bed of the Yang-tse-kiang, is the island of *Chin-shen* (Golden island), which rises almost perpendicularly from the river, and is covered with gardens and pleasure houses. "Art and nature," says Sir G. Staunton, "seem to have combined to give to this spot the appearance of enchantment." It belongs to the emperor, who has built upon it a large and handsome palace, and on the highest point are several temples and pagodas. It also contains a large monastery of priests, who are its principal inhabitants. In this part of the great river, which is here two miles wide, are numerous islands skirted with shrubbery, and rocks which rise abruptly from the water; the waves roll like those of the ocean, and porpoises are said to be sometimes seen rolling among them. Chin-shan stands nearly in the middle of the stream.

Sou-chew-foo, a very large city, and one of the most flourishing commercial places in the empire, stands on the east bank of the great canal, 104 miles E.S.E. of Nanking, in the province of Kiang-si; and is extolled as a terrestrial paradise. It is traversed by numerous canals, which render it, like Venice, a city on the waters; it contains a multitude of magnificent bridges, temples, and triumphal arches, and it is here that all the classes of people, whose business it is to minister to pleasure, lawful or unlawful, are trained to their respective callings. A few miles west of the city, the Tai-hoo (Great lake), nearly 100 miles in circumference, and bordered by picturesque hills, which are cultivated to their very tops, is a place of great resort and recreation to the citizens, who take their pleasure in numerous boats, rowed chiefly by women. *Ching-kiang-foo*, in the same province, on the south bank of the Yang-tse-kiang, at the place where it is crossed by the canal, is one of the maritime keys of the empire, and is defended by a very strong garrison. *Shang-hai*, *Seang-hae*, or *Shang-hae-heen*, 60 miles E. by S. of Sou-chew-fou, has a fine harbour at the mouth of the Woosung river. The entrance, however, leads over an extensive bar, so that only ships drawing not more than 14 feet water can reach the city, which is in lat. 31° 9′ N., long. 121° 4′ E. This is, perhaps, the largest emporium of the empire, and carries on an extensive trade, equal in amount, at least, if not superior, to that of Canton.

Hang-chew-foo, the capital of Che-kiang, is the emporium of trade between the northern and the southern provinces. It is the famous *Kinsai* of Marco Polo, the capital in his time of southern China; and is 90 miles to the S. of Sou-chew-foo. The whole intervening space is a rich and beautiful country, containing in many places extensive forests of mulberry trees, which afford abundant food for the silkworms. Hang-chew-foo is situate between the basin of the great canal which ends here, and the river Chen-tang-chaung, which falls into the sea, at the distance of 60 miles east. The tide when full increases the width of the river to about four miles opposite the city; and renders it the channel by which great quantities of merchandise are received and exported to and from the southern provinces. But there is no water communication between the river and the canal, so that all goods arriving either way must be landed at the city. The population is very large. *Ning-po-foo*, in lat. 29° 33 12″ N., long. 121° 17′ E., is a very beautiful town, with an extensive trade in raw silks, silk piece-goods, and green teas. It stands upon a creek, and, till the middle of last century, contained an English factory. Large vessels can proceed only so far as *Chin-hae*, at the entrance of the river, but ships of 300 tons may anchor before the city, which is about 12 or 15 miles from the sea. *Sikpo* (Shlp-po), south of Ning-po, has an excellent land-locked harbour; and Cha-po (Cha-poo), about 70 miles N., is the Chinese emporium for Japan.

In the province of Fokien are: *Hok-chew* or *Fou-chew-foo*, the capital, 10 miles from the mouth of the river Si-ho or Min-kiang, which is broad and navigable up to the city. The entrance of the river is in lat. 26° 6′ N., long. 119° 55′ E., and is rather intricate. Numerous villages and hamlets occupy beautiful situations on its banks; while fertile fields, producing wheat, naked rocks, cascades, islands, and plains of sand give a diversified aspect to the scene. The city is one of the largest and most populous in China, and is distinguished for its commerce and the industry of its inhabitants, as well as for the number of literati who make it their residence. It is also remarkable for a great stone bridge, a rude but substantial structure, built quite across the broad river. *Amoy* or *Emoei* (*Hea-mun*), in lat. 24° 27′ 26″ N., long. 118° 10′ 30″ E., is situate on an island, with an excellent harbour which admits ships of the greatest burden. It carries on a very extensive trade with the Indian Archipelago, Formosa, and all the maritime provinces of China. The city is very extensive, and contains at least 200,000 inhabitants. Vessels can sail up close to the houses, load and unload with the greatest facility, have shelter from all winds, and in entering or leaving the port are in no danger of getting on shore. *Chin-chew* (Tseuen-choo), 50 miles N.E. of Amoy, a seaport town on a small river, with a bay obstructed by shoals and banks, so that only small brigs can proceed to the city.

CANTON or *Quang-chou-foo*, called also by the natives *Sang-ching*, is situate in lat. 23° 7′ 10″ N., long. 113° 14′ 30″ E., on the Choo or Si-kiang (Pearl river), 100 miles from the sea, and surrounded by canals, branches of rivers, rice fields, and towering barren hills. It is a very ancient city, but is important now as the sole emporium of the European and American commerce with China. The city is of a square form, surrounded with walls built of stone and brick, with a line of battlements and embrasures, and pierced with sixteen gates. It is divided by a wall into two parts, called the old city and the new city, the whole circumference of which can be walked round at a quick pace within two hours; but the suburbs are fully as large as the city itself. The European factories are outside the walls on the banks of the river, and are thirteen in number. They are, without doubt, says Gutslaff, the most elegant buildings in the empire, though a European might find fault with them, and view the factory comforts with contempt. There are about 600 streets in Canton, most of which are narrow and crooked, and none at all to be compared with the old and new China streets near the factories. Few of the houses are splendid; the dwellings of the poor are exceedingly crowded; and, even in the houses of the wealthy, if we except those of a few Hong merchants, there is no real comfort. The governor's palace, a very spacious building, stands near the Yew-lan gate. The other public buildings and the temples are very numerous. The population has been variously estimated between 75,000 and 1,500,000. Many thousands of the people live continually on the water, in a sort of floating houses ranged in lines like streets. The foreign trade is transacted by means of a certain number of merchants called Hong; and the imperial officers, to whom communications are made through the

Hong, are the Tsung-tuh, governor of the two Quang provinces, who generally resides at Canton, though his proper official seat is at Shaou-king-foo, about 100 miles to the westward; the Foo-yuen, or Lieutenant-governor; the Hae-kwan-keen-tuh or Hoppo, the collector of the customs, who has the entire direction of foreign trade. All matters, however, of importance are communicated to the Tung-tuh, who reports to the Emperor what is worthy of his attention. The European and American ships anchor at *Whampoa* (Hwang-poo), a small and wretched village on an island about 14 miles down the river. Each ship on its arrival engages a Hong merchant, who becomes surety for the good behaviour of the crew, and for the payment of the duties; and with him the greater part of the business is transacted. The custom-house officers are very numerous. All of them live by extortion, and are, without exception, venal. *Macao*, in Chinese *Aou-mun*, "the entrance to the bay," a Portuguese town, is situate on a small peninsula, nine miles in circumference, at the southern extremity of a large island (Heang-shan) formed by two branches of the river of Canton. It is a handsome well-built city; and the population is estimated at between 12,000 and 30,000. The Chinese government interdicts all communication from Macao with the neighbouring country, and a wall is built across the isthmus and closely guarded, which no European is allowed to pass. The peninsula is rocky; the cliffs are of various picturesque forms, presenting fine views of both sea and land. A garden and a cave are still pointed out as the haunt of Camoens, the author of the Lusiad. The foreign merchants leave their families here, while they can proceed to Canton only for the purposes of trade. Macao is near the sea, just within the entrance of the great western channel of the river or gulf of Canton. It had an excellent harbour, but the depth of the entrance has decreased to two fathoms, and large ships are therefore obliged to lie in the roads, which are much exposed. The *Bocca-Tigris*, or proper mouth of the river, lies to the north of Macao road, about 50 miles by the navigable channel of the gulf.

Nan-tchang-foo, the capital of Kiang-si, upon the Kan-kiang, a very large town, is the centre of the porcelain manufactures. It has also a great trade in silks and furs; and produces an immense number of idols. *King-te-tshin*, on the Po, a large town to the east of the Poyang lake, is the largest porcelain manufactory in the world. It contains not fewer than 500 furnaces, and is said by the missionaries to have 1,000,000 of inhabitants. Its site is marked by the clouds of smoke by day, and pillars of fire by night, which give it the appearance at a distance of a great city on fire. No foreigner has ever been admitted within its precincts, lest he should make known the secrets of the processes there carried on. China contains many other large cities and towns, but these, however important to their natives and the imperial government, have never acquired a European fame, nor been visited by any other Europeans than a few Catholic missionaries. The kingdom is said to contain altogether 1572 towns, 2796 temples, 3158 bridges, 10,809 public buildings, 765 lakes, and 14,607 mountains; all specially enumerated and described by Chinese writers. Large and flourishing cities are found only where there is ready water communication with other places. The greatest sameness exists in all the towns. In the larger towns are a few well-paved streets, lined with shops; but most of the streets are very narrow, extremely dirty, and lined with mere hovels. The suburbs of many cities are much larger than the cities themselves, and it is not unusual to see a large walled space without houses, where there was formerly a city. Villages and hamlets have often a fine appearance at a distance; but internally they are only a mass of houses irregularly clustered together, without furniture or comforts, and filthy in the extreme. The grandeur of the natural scenery is often as striking as in many parts of the world. Commanding situations are chosen for temples, which serve likewise for taverns, stages, public halls, and gambling-houses. The building of houses is regulated by law, and none is allowed to exceed a certain size. The public buildings have little to recommend them.—(*Balbi's Abregé*, p. 771; *Sir G. Staunton's Account of Macartney's Embassy*; *Ellis's Account of Lord Amherst's Embassy*; *Gutzlaff's Voyages, China Opened, and History of China*; *Medhurst's China*; *Downing's Fanqui in China*; *Davis's China and the Chinese*; *Rev. Howard Malcom's Travels*; *Voyage of the Amherst*; &c. &c. &c.)

§ *Subject territories beyond China Proper.*

I. The western part of the province of Kan-suh, comprising *Barkol* and *Ouroumtsi*, with the country between these places and the ancient western limits of Shen-si.

II. *Thian-shan-pe-lou*, or the country to the north, and *Thian-shan-nan-lou*, the country to the south of the Celestial mountains, form together what the Chinese call *Tsin-kiang*, or the *New frontier*. They are both dependent on the military governor-general who resides at Ili or Ele, and have been, since 1760, a regular province of the empire. Thian-shan-pe-lou comprises, 1. *Soongaria* or *Zungaria*, subdivided into three military divisions, which bear the names of their chief towns, *Ili* or *Goulja*, *Kour-kara-oussou*, and *Tarbagatai*. 2. The country of the Kirghiz, which comprises a part of the territory of the Kirghiz of the Great Horde, who dwell around lake Balkashi, and a part of the country of the *Bûrût*, in the neighbourhood of Lake Zaisang. 3. The *Torgot* country, which comprises the territory along the upper Ili, assigned by the Emperor of China to the remains of the Torgots or Torguths, who, in 1770, migrated from the banks of the Volga to place themselves under his protection. Thian-shan-nan-lou or *Little Bukharia*, formerly divided into eight principalities, tributary to the empire, is now divided into ten districts which are entirely subject, and bear the names of their chief towns, namely, *Khamil* or *Hami*, *Pijan*, *Karashar*, *Koutshé*, *Sairam*, *Aksou*, *Oushi*, *Kashgar* or *Kashkar* or *Cashgar*, *Yarkhand*, and *Khoten* or *Khotan*. Aksou may be regarded as the capital of the country, as it is the residence of the commander-in-chief of all the troops in this division of the empire. It was in this province, and particularly in Cashgar and Yarkhand, that a few years ago the Turkish princes revolted, and carried on a desultory warfare against the Chinese.

III. The *country of the Mongols of Hoho-nor* or *Khokho-noor*, divided, according to Klaproth, into 30 banners. This race inhabit the very high mountainous country around the lake *Hoho-nor*, and are, properly speaking, Kalmucks. This region contains the sources of the Whang-ho, and its southern slope sends forth the Kin-cha-kiang, one of the principal branches of the Yang-tse-kiang, the Saluen, and the May-kuang or river of Cambodia, three of the largest rivers of Asia.

IV. *Thibet* or *Si-zzang*, subdivided into, 1. *Oui*, which contains *H'lassa* (Lassa), *Botala*, and *Jigagounggar*. 2. *Zzang*, which contains *Jikadze*, a town of 30,000 inhabitants, according to Klaproth; *Jashi-loumbo* (Teeshoo-lomboo,) the residence of the Bantshan-lama; *Ghiandze*; *Phari*, a small fortress not far from Mount Chumulari; *Chakakote*, a commercial town of 1000 houses near Dhwalagiri; *Bhaldi* or *Paltee*. 3. *K'ham*, which comprises *Bathang*, *Triamdo*, *Soumang* or *Sourmam*, *Souk*. It appears that the eastern part of this province has been united to the Chinese province of Setchuen. 4. *Ngari*, which comprises several small states tributary to the Dalai-lama. Their chief towns are *Choumarte*, *Bourang-dakla*, *Deba*, the capital of the *Undes* or *Urnadesa*, and the residence of a lama; *Toling*, the residence of a grand lama; *Ladakh* or Leh, the capital of Little Thibet; *Garlou* or *Gurtope*, a Chinese military post. The eastern part of this province is occupied by Mongol tribes named Khor or Charai-gol; and Ladakh is an independent kingdom or principality.

V. The *country of the Deb-Raja* or Bhotan and Bisni, both already described as being within the natural limits of India. They are dependent upon, but are not properly subject to China.

VI. *Mantchouria*, or the country of the Mandchews, divided into three departments or shires:

1. *Ching-king*, which comprises Ching-yang or Moukden, Foung-thian, the archipelago of Leao-ton
or of John Potocki; 2. *Kirin*, which comprises Kirin, Hedoune, Ningouta, Tondon, a place of exil
for Chinese criminals; 3. *Saghalien-oula*, comprising Saghalien-oula-hotun, Taltsikar, Kallar, an
the northern part of the island of Tarrakai or Tshoka or Seghalien.

VII. *Mongolia*, in which we must distinguish:—1. The *Country of the Mongols*, subdivided int
Kortsin, where are found the ruins of the towns Almatou and Sibe; *Tourbet*; *Jalait*, where are foun
Cholkoto; *Gorlos*, containing the ruined towns of Loung-ngan, *Ao-khoto*, and *Bar-khoto*; *Arou
Kortsin*; *Toumet*, containing the ruined town of Kara-khoto; *Karatsin*, containing the ruins o
several ancient cities, and the Buddhist temple of Kou-youan-ming-szu; *Aokhan*; *Naiman*; *Ouangni
out*, with the ruins of Jao-tsheou; *Khalka* (left wing); *Jarout*, where there is a celebrated temple o
Buddha-Sakyamouni; *Abakhai*; *Abakhanar*; *Khaokut*, where we find Barin-khoto and the tombs o
the Khitan emperors; *Kesikten*; *Sounioud*; *Dourbun-Koelsohn*; *Khalka* (right wing); *Toumet o
Koukou-khoto* (in Chinese, Kwei-wha-Ching), the residence of an incarnate god; *Ourat*, where w
must place the ancient country of Tenduc or Thian-te, mentioned by Marco Polo, and containin
several celebrated temples; *Ordos*; *Chakhar* or the Frontier Mongols, in the neighbourhood of Shan-si
the *Districts of the eight pasturages* belonging to the Chinese Government, where was situate the town
of Chao-naircan-soume, formerly called Kai-phing, which, according to Klaproth, is the Clemenfo
of Marco Polo, the summer residence of the Mongol khans of the dynasty of Tuan. 2. The *Country
of the Khalka*, which comprises the ancient country of the Khalka, a part of the desert of Gobi, th
country of the *Ourianghai*, and a portion of that of the *Eleuths* or *Oelet*. Its principal towns are
Ourga or *Kuren*, *Mai-tmat-tchin*, *Oula-soutai*, the residence of a Mandchew general, commander-in
chief of the troops in this province. Several hordes of Kalmucks wander in this elevated region. I
Ourianghai live the Soyotes, who sometimes indulge in cannibalism. According to Klaproth, it is i
this part of the empire that we must place *Karakhorin* or *Karakorum* or *Caracorum*, the ordinary resi
dence of the first successors of Zenghis Khan, and consequently the capital of the largest empire tha
ever existed. It was there that Kublai and Argoun received the ambassadors of all the princes of Asia
and of several from Europe and America.

VIII. The *Kingdom of Corea*.

These eight provinces comprise an immense extent of country of very diversified surface, an
possessing different climates and natural productions.

MONGOLIA is an elevated valley or table-land inclosed between the Altai mountains and those o
Thibet, and intersected by chains of lofty granite mountains, the summits of which are in many part
clothed with a variety of trees. Numerous rivers, abounding in fish, flow at the foot of these ridges
and pasturages and cultivated fields interrupt, at intervals, the monotony of the sandy and stony so
of which the greater part of the country consists. The desert of Gobi is intersected from east t
west by mountains less elevated than those to the north. Notwithstanding the scarcity of water an
pasture it is almost everywhere covered with flocks of sheep and goats, herds of large camels, vigo
rous though small horses, and oxen, undisturbed by insects or reptiles. The yellow sand, whic
forms the surface of the desert, is generally not loose and moveable; and water is found in wel
from seven to ten feet in depth. To the northward, however, of Hoho-nor it assumes a most terrifi
appearance, being there covered with semi-transparent shingles, which reflect the sun's rays and ren
der the summer heat so intense that not even a blade of grass can grow among them. The arid so
ends at the southern limit of the Gobi. The country of the Tsakhars, of the Ordos, and of severa
Mongolian hordes, who live to the south of the steppe, is adapted for tillage, and sufficiently wel
watered. Nearer to the great wall of China, the districts of the Eastern Mongols form a fertile coun
try. The climate is very different from that of the countries of Europe situate in the same latitud
(between 40 and 50 N.). The great elevation of the country, and an abundance of natron are probably
the most active causes in producing the greater degree of cold which is experienced in Mongolia.
In October and November 1820, the Russian embassy found Reaumur's thermometer to vary between
10° and 18° below zero, = between − 9° and − 9° of Fahrenheit; but cold as the climate is in winter
it is, on the contrary, in summer almost as hot and parching as in Arabia. The pines, fir, birch, ash
elm, and white poplar, grow on the mountains of Northern Mongolia, and in the same region are
found red currants, wild peaches, and various shrubs. Besides the domestic animals already men-
tioned, there are numbers of wild horses, boars, goats, bears, wolves, hares, foxes, sables, and squir-
rels; with cranes, wild geese, ducks, moorfowl, quails, and swans. The Mongols being obliged by
their pastoral habits frequently to change their places of abode, have to content themselves with a
little wheat, millet, and barley, of their own sowing, and to depend for the greater part of their sub-
sistence on the produce of their flocks and herds, and the corn which they receive from China in
exchange for their sheep and other animals. Their improvidence in regard to bread exposes them
sometimes to absolute want in winter, when their flocks like wise suffer from extreme cold, or disease.
They are naturally warlike, and have not lost the remembrance of the victories of their ancestors
over the Chinese; the name of Zenghis Khan is still in high repute among them, and they still point
out his several places of residence. But the long peace which they have enjoyed since they became
subject to China, in the latter half of the 17th century, has rendered them more strikingly remarkable
for simplicity of character, frankness, kindness, and hospitality, than for traits of a martial spirit.
Yet they still are fond of horse-racing, wrestling, and archery. In religion they are Buddhists, and
have among them a great many *lamaes* (spiritual mothers), and no less than ten of that superior order
styled *Kutukhtu*. The Mongolians worship one supreme God, but regard the Kutukhtus as his vice-
gerents, who, they believe, know the past, the present, and the future, have the power to remit sins,
and do not die, their soul only migrating to another body. The Dalai-lama of Thibet is the superior
of the Kutukhtus, and the supreme head of the religion, and used to point out the child into whose
body the soul of the deceased Kutukhtu had migrated; but that privilege is now reserved to the
emperor himself. The lamaic religion contributes to soften their manners; crimes are seldom com-
mitted; and, when they do occur, are always severely punished. Though they have neither artists
nor manufacturers, and depend on China for their supply of manufactured goods, they dress them-
selves carefully and expensively; and their tents usually contain a variety of furniture and conve-
niences, besides altars and idols. They live principally on milk, butter, and cheese, and only in case
of great necessity eat the flesh of the camel or horse. They drink koumiss, a fermented liquor made
from mare's milk. They beguile their idle hours with songs, which are very flattering to their ancestors,
and betray a secret dislike to their Mandchew rulers. Polygamy prevails among them, and divorces
are frequent. Their trade is almost entirely with China, with which country they exchange sheep,
cattle, and silver bars for manufactured goods and tea. The country is divided into several princi-
palities, which are independent of each other, but all recognise the supremacy of China; and though
the Chinese politicians trust to this division of power for the maintenance of their authority, yet, for
greater security, they have placed Mongolia under military rule. All the hordes are divided into
bands, regiments, and squadrons; the officers of which are invested with both military and civil
powers; and over them inspectors are appointed by the emperor. Every three years the chiefs of the
principalities hold a general diet. The dignity of prince is hereditary in the eldest son alone, the
younger sons falling into the class of poor nobility. Each prince pays the emperor a tribute of cattle,
as an acknowledgment of his supremacy, but receives in return presents of much greater value; and
not seldom an imperial princess for a wife. The supreme administration of Mongolia is vested in

the board or tribunal of foreign affairs at Peking.—*(Travels of the Russian Mission through Mongolia to China, &c., in 1820-1, by George Timkowski.* London, 1827.) The *Khalkas*, or black Mongols, are described by Gerbillon as being, next to the Hottentots, the dirtiest and ugliest race he ever saw. They possess the north-eastern deserts to the south and south-east of the Baikal. The *Kalmucks*, who possess the western part of Mongolia, Thian-shan-pe-lou or Soongaria, and the western part of Kan-suh, do not differ materially from the Mongols. They call themselves *Derben Oerot*—the four brothers, or allies; and are divided into four nations, called *Choshotes* or *Eleuths* (called *Sifans* by the Chinese), who live in the vicinity of lake Hoho-nor; *Soongares*, who give their name (Soongaria) to the country they inhabit; the *Torgotes* or *Torguths*, already mentioned; and the *Derbetes*, some of whom have joined the Torgotes, and others have attached themselves to the Soongarians. The Kalmucks live in tents or cabins of hurdles, and are quite nomadic in their habits. The few towns in their country are inhabited principally by Bukharians and Chinese. They have three distinct classes of society; the nobility, or "white bones;" the common people, or "black bones," who are slaves; and the *lamas* or clergy, who are sprung from both, and are freemen. The internal concerns of the tribes are managed independently by their princes, who sometimes used to combine for common objects, and elected a contaysha, or king, to direct the general concerns. In religion they are followers of the Dalai-lama, and are in complete subjection to the dominion of their priests, to whom they commit the direction of all their affairs; and nothing is done without consulting a gylong (or gellong) who pretends to interrogate the gods by sorcery. The priests live in luxury; they are enjoined to celibacy, but the purity of their life is somewhat questionable. *Goulja*, the chief place in Soongaria, is a large town of 10,000 houses; it stands on the river Ili, and is the entrepot of the commerce of central Asia with its western and eastern regions. *Ourga* or *Kusen*, south of Lake Baikal, contains 70,000 inhabitants.

LITTLE BUKHARIA, or THIAN-SHAN-NAN-LOU, forms a wide plain, extending eastward from the Belur-tagh, and is watered by numerous streams, which find their way to the Loknor (lake of Lop), or are lost in the desert. *Cashgar* is the most westerly portion, and appears to be flourishing under Chinese sway; the fields, being carefully cultivated, produce large crops of grain, and the fruits are of peculiar excellence. Its chief town, which bears the same name, was once the capital of a kingdom; and is still a large and flourishing city, with nearly 50,000 inhabitants. *Yarkhand* or *Ierkhand*, not far to the south-east, is a somewhat larger city; and stands in a fertile plain, rich in fruit and grain, bordered by hills on all sides except the east, in which direction its river flows. Its climate is dry and agreeable; snow seldom falls, and even rain is rare. *Eela*, another city, whose situation seems not exactly known, is said to have 75,000 inhabitants. *Khoten*, once the capital of an independent kingdom, of considerable extent and power, lies south-east of Yarkhand, but very little is known of the country. The inhabitants are Mahometan Turks, who are allowed to conduct their own government, while the Chinese collect the revenues and guard the frontiers. People entering the country for the purposes of trade, from Bokhara and Thibet, are not allowed to proceed farther than Yarkhand; and, as they enter the Chinese dominions, are placed under the charge of certain persons who are responsible for their behaviour. The frontier is guarded by a chain of military posts, at which every package brought by the caravans is carefully examined; and permission is then given to proceed to Cashgar and Yarkhand, where duties of no very oppressive amount are exacted. So thoroughly organized is this system of police, that it is said to be impossible to elude its vigilance. A native who was suspected in these countries, and was afterwards in the service of Captain Burnes, remained in confinement for three months, and was at length dismissed by the road he had come, after a likeness of him had been taken. Several copies of the picture were dispatched to the frontier towns, with these instructions:—"If this man enters the country, his head is the emperor's, his property is yours." "I need not add," says Captain Burnes, "that he has never since sought to extend his acquaintance in the Chinese province of Yarkhand."—*(Burnes' Travels*, II. 233.)

MANTCHOURIA, or the country of the Mandchews, and COREA (V. and VI.) form together one geographical region, and occupy the wide extent of country which lies along the eastern coast of Asia, between China and Siberia. Their northern border is a part of the Altai range of mountains; another range called *Seih-hih-tih*, forms the coast extending from the mouth of the Amoor to the southern extremity of Corea, and constitutes the nucleus or skeleton of that peninsula; while a third range, stretching in a direction from north to south-west, divides Mantchouria from Mongolia; and between these two cross ranges there appears to be a mountain ridge, or high land at least, which divides the basin of the Amoor and its affluents from the waters that flow southward to the Yellow Sea. The greater part of Mantchouria is occupied by the basin of the Amoor and its affluents. This great river is formed at Baklanova, on the Russian frontier, by the confluence of the *Anon* or *Onon*, called also *Chilka*, and the *Argun* from the west. It then makes a long circuit through Daouria, and enters the sea in lat 53° N., after receiving from southern Mantchouria the waters of the *Songari-ula*, and the *Usuri* or *Unuli*, with various other streams. Deep and still it presents no impediment to navigation; it has neither rocks nor shallows; its banks are lined with magnificent forests, and it is admirably suited as the outlet of the produce of south-eastern Siberia; but the jealous policy of the Chinese prevents its being used for purposes of commerce. The northern part of Mantchouria is the original seat of the present imperial family, who conquered China in 1640. It appears to be diversified by rugged mountains, covered with thick forests, and separated by valleys of considerable fertility. Wheat is raised only in the most favoured spots; oats being the general object of cultivation. The most valuable product, however, is ginseng, the universal medicine in the estimation of the Chinese, who boast that it would render man immortal were it possible for him to be so. It grows upon the mountain sides. The shores along the ocean are covered with magnificent forests, but are in a state of nature. Its few inhabitants, named *Keyakur* and *Feyak*, do not even hold any intercourse with the interior, but live entirely independent, subsisting by fishing; and, though very poor and uncivilized, they appear to be mild and well disposed. The Mandchews are somewhat civilized; they possess even a spoken and written language essentially different from that of the Chinese, or any other nation of central Asia, and have many radical sounds which bear a close affinity to those of the languages of Europe. They belong to the Tongoose race, and are divided into several tribes, differing slightly in the degree of civilization. They are more robust in their figure, but have less expressive countenances than the Chinese, and their women have not their feet cramped and distorted. The *Daourians* or *Ducheri*, who possess a large portion of the banks of the Amoor (called from them Daouria), consist of Mandchews mixed with Mongols. The Mandchews generally appear to be a rude, half-civilized people; and their conquest of China has greatly injured their native country, as the leading families, and ambitious individuals have naturally followed the court. They have neither temples nor idols, but worship one supreme being, whom they style the emperor of heaven; yet their religion appears to have some affinity with Shamanism. Mantchouria is divided into three provinces:—1. *Chin-king, Moukden* or *Leao-tong*; 2. *Kirin*; and, 3. *Chichikar* or *Tsitsikar*. *Leao-tong* lies round a gulf of the Yellow Sea, and is separated from Corea by considerable ranges of hills, the most celebrated of which is the *Chang-pih-sang*, or long-white mountain. A part of the country produces abundance of wheat, peas, and rhubarb, the staple articles of export to China; but the soil is mostly poor, the harvests frequently fail, and famines are not uncommon. Hemp is the plant which best repays the cultivator; it reaches the height of seven or eight feet, and sometimes more. Potatoes have also been recently introduced from Russia, and thrive very well, yielding a good produce. The climate is very cold; the sum-

Lassa or *Hlassa*, the capital of the Dalai-lama, and the ordinary abode of the *Tsin* or Ch ... dent or viceroy, situate upon an affluent of the Sanpoo, is a large well-built city, with hou ...

or three storeys. It has in the midst of it an immense temple, formed of an assemblage of buildings, with a bazaar around it. The population is large but fluctuating, owing to the constant arrival and departure of pilgrims, who come from all parts of the realms of Buddha, to this sanctuary of Lamaism. About 8 miles N.W. of the city is the vast temple of *Brae-poung-chong-pa*, which is attended by more than 5000 lamas; and in the neighbouring plain are 21 other temples. *Jigagounggar*, near the right bank of the Sanpoo, though neither marked in our maps, nor described in our books of geography, is a large and important city of 20,000 houses. *Jikadze*, also near the right bank of the Sanpoo, is said to have 23,000 families, and a garrison of 5300 men; it is the capital of the territory of the lama styled Bantshan or Bogdo-lama. Near it, to the west, is the magnificent convent of *Jashi-loumbo* or *Teshoo-loomboo*, where this pontiff resides; and which is said to contain more than 3000 chambers or cells. It is adorned with numerous obelisks, covered with gold and silver, with statues of Buddha in gold, silver, and bronze, and is served by more than 3500 lamas. *Bhaldi* or *Baidi*, a small town near the lake Yamtso or Paltee, which contains a convent on an island, the residence of a female divinity called *Dordjepame*, or the holy mother of the sow. The Hindoos, and Nepaulese, as well as the Thibetans, reverence her as an incarnation of the Hindoo goddess Bhavani. She never quits her dwelling, nor leaves the island, but when she goes to Lassa, in great pomp. During the journey censers are carried before her, and she sits upon a throne covered with a large umbrella; everybody runs to receive her blessing, which she bestows by making them kiss her seal. The convents in the islands of this lake, inhabited by monks and priests, are under her direction. The western part of Thibet bears the Chinese name of *Chanthan* (Snow country), but is known to the Bhooteas as *Hiun-des*, and to the Thibetans as *Nari*; including the provinces of *Garo*, *Rodokh*, *Gardokh*, *Sumgiel*, and *Tholing*, the two last of which are immediately contiguous to Piti in Ladakh, and to the British dependencies of Bissaher and Kunawar. Tholing, the chief town is situate on the left bank of the Suttlej, and is a place of considerable note; it is said to contain 108 temples, with a number of gelums attached to each. Chan-than is the chief resort of the shawl-wool goat, and is also pastured by numerous flocks of sheep, whose wool is an article of trade. It likewise produces gold in considerable quantity; but the searching for it is discouraged by local superstition as well as by the Chinese authorities. *Gardokh*, called also *Gartokh*, *Ghertope*, or *Garo*, is little else than an encampment, consisting of a number of small blanket tents, with a few houses of unburnt bricks; it is in fact merely a trading station, or mart, where, in the summer months the natural productions of Thibet and China are exchanged for those of India.—(*Moorcraft's and Trebeck's Travels*, vol. I. part 2, chap. 5.) To the south-east of Gartope are situate the two celebrated lakes *Manasarowara* and *Rawan-rhad*; the former of which is an oval basin about 15 miles by 11, nearly 17,000 feet above the level of the sea, surrounded by tremendous rocks, above which rise the loftiest summits of the Himalayas. The waters are clear and well tasted; but it is yet uncertain whether or not they have an outlet. Once to behold the Manasarowara is considered by the Hindoos as a felicity beyond every other on earth; but the great and almost insurmountable difficulties of the journey prevent all but a select few from accomplishing the pilgrimage. It was visited by Mr. Moorcroft in 1812. The Rawan-rhad, which he only saw at a distance, was said to be four times the size of the other, and to enclose some lofty mountains in the form of an island; but his distant observation did not confirm these statements. It emits its waters by the Suttlej.

LOOCHOO (*Doo-choo*, *Lekayo*, *Low-kow*, *Lieou-kieou*, *Lieu-kieu*, *Lieu-chew*) is an insular kingdom, in the Pacific Ocean, to the eastward of Formosa; the principal island lies between 26° 4′ and 26° 53′ N. lat., and 127° 34′ and 128° 18′ E. long., being nearly 60 miles in length by 10 or 12 in breadth. The climate is very temperate; and such is the excellence of the soil and climate, that vegetable productions, of different natures, and generally found in distant regions, grow here side by side. Not only the orange and the lime, but the Indian banyan tree and the Norwegian fir, the tea-plant, and the sugar-cane, all flourish together. The island abounds in rice, wheat, pease, melons, pine-apples, ginger, pepper, camphor, dye-woods, firewood, tobacco, silk, wax, and salt; and the sea yields coral and pearls. The animals are beeves, sheep, horses, deer, and winged game, goats, pigs, and poultry. The people are of small stature, with a good deal of the Corean physiognomy, but with nothing of the drowsy and elongated eye of the Chinese. They are a polite and cultivated race. Their language differs both from the Chinese and Japanese, though it has many words common to both. Their books of religion, morality, and science are written in the Chinese character; but, for common purposes, the Japanese letters are used. They seem to have made no progress in science and literature; all their acquirements have been derived from China. Their religion seems also to be of the same nature as the Chinese, but the priests are considered an inferior caste. Their government is monarchical. The only town with which Europeans are yet acquainted is the great seaport of *Napa-kiang*, on the south-west coast, about five miles from the capital, *Kien-ching*. The group contains altogether 36 islands, all of which are small; and the only one deserving particular notice is *Sulphur Island*, 80 miles N. of the Great Loo-Choo, which contains a sulphuric volcano, that constantly emits white smoke. The *Madjicosima Islands*, the principal of which is *Typinsan*, and situate midway between Loo-choo and Formosa, are also subject to the king of Loo-choo, who is himself tributary to China.

LADAKH

Is a portion of the mountainous region situate between the Himalayas on the south, and the range of Kara-korum on the north, extending about 250 miles from E. to W. and 200 from N. to S. but with an irregular outline, and comprising altogether a superficial area of only 30,000 square miles. It is bounded on the north-east by the mountains of Kara-korum, which divide it from the Chinese province of Khoten; on the east and south-east by Rodokh and Chan-than, dependencies of Lassa; on the south by the British subject territory of Bissaher, and by the hill states of Kulu and Chamba; Balti, Kartakshe, and Khasalun complete the boundary on the west and north-west. The country consists of a series of narrow valleys, which are sometimes little better than deep ravines or defiles; and even at their greatest expanse, do not exceed a few hundred yards in width at the bottom. They are all situate at the great elevation of from 11,000 to 13,000 feet above the level of the sea, and the mountains which form them rise several thousand feet higher. The passes which lead into Ladakh on its southern frontier exceed 16,000 feet, and there are several mountains within the country of still greater height. The general character of the surface is extreme inequality, consisting of steep and bare mountains capped with snow, and close rocky dells, with rapid torrents or deep rivers rushing through them. There is accordingly little room for the labours of agriculture; and the proportion of available ground does not probably exceed one-fifth of the country; and the soil being formed by the disintegration of primitive rocks, is such as to be only rendered productive by human industry and skill. The general aspect of the country, where not under cultivation, is one of extreme sterility, in which a few willows and poplars are the only trees, and the chief verdure consists of Tartaric furze, with a few tufts of wormwood, hyssop, dogrose, and other plants of the desert and the rock, which expose rather than conceal the barrenness of the soil. Nor is the climate more auspicious to the labours of the husbandman. Frost, snow, and sleet commence early in September, and continue with little intermission till May. In May the days become warm, though even then the rivulets present a coat of ice early in the morning; which may be observed in some spots even in June, while on the loftiest mountains snow falls occasionally in every month. During summer the sun shines with great power,

and for a short time of the day its rays are intensely hot. Even in the depth of winter the sun's heat is very considerable for an hour or two, and the variation of temperature is consequently extreme. The great heat of summer compensates the shortness of its duration, and brings the crops to rapid maturity. The air is generally dry, the moisture being converted into snow in winter, and speedily evaporated in summer; there is consequently very little rain. The harvests however are not unproductive; and they present also the peculiarity of yielding equally abundant crops year after year from the same land, without fallows or rotation of produce. The water is in general clear and pure; but is often discoloured by earth, and impregnated with soda and alum. In general it is unwholesome to strangers, and at some seasons even to the natives. The species of grain cultivated are wheat, barley, and buckwheat, of various kinds. The natural sward is composed of a starveling low grass and dwarf sow thistle; in bogs the surface is covered with a short rush and bent grass, with some varieties of crowfoot and dwarf equisetum. The islands and banks of the rivers are in some places naked, in others fringed or concealed by a kind of thorn. In some places natural springs keep the surface perpetually wet during summer, and are then surrounded by beds of low rush and aquatic grass, affording wholesome pasturage. Lucerne, both wild and cultivated, grows in some places with great luxuriance, and is gathered as winter fodder for the cattle. A species of salnfoin also grows wild in some places; but the most valuable source of fodder is the *prangos*, an umbelliferous plant, which grows only in the western districts of the country. The head of the plant, including leaves, flowers, stems, and seeds, is converted into hay for the goats, sheep, and cows. Horses also will thrive on it; but it is only as hay that it is an acceptable food; whilst growing, no animal will browze upon its leaves, though they will eat its flowers. There is no great variety of culinary vegetables; but onions, carrots, turnips, and cabbages are reared in some places in spring and summer; carraway, mustard, and tobacco are grown in a few gardens. The only fruits cultivated are apricots and apples; rhubarb is produced in great abundance. The domestic animals are horses, asses, yaks, beeves, the zho or yak-mule, sheep, goats, and dogs. The horses are small, but active and hardy; but they are not numerous, nor much used. The sheep are larger than those of India. The common breed of goat is the shawl-wool species; the fleece is cut once a-year; the wool picked out is sent to Cashmere, but the hair is made into ropes, coarse sacks, and blankets, for home consumption. The dogs are large, with a shaggy coat of a dark colour, and are in general fierce, but intelligent. The wild animals are not numerous; they are mostly of the goat kind, are much larger than the domesticated species, and yield a finer wool. The ibex frequents the loftiest and most inaccessible rocks; the wild sheep is also met with; and in the eastern parts of the country a sort of wild horse or ass. Large mice, hares, squirrels, foxes, ounces, bears, lynxes, leopards, and marmots abound; and in the mountains a species of tiger. The birds consist of a large, fierce, and powerful raven, another large ravenous bird called chakor, sparrows, linnets, redbreasts, skylarks, snowlarks, and water birds of various kinds. Fish abound in all the streams, but are not used for food. There are mines of sulphur in some places; soda is found in great plenty along the banks of the Sinh-kha-bab, and in the district of Nobra; lead, iron, and copper are also found; but want of fuel and want of industry prevent them being wrought. The rivers are all affluents of the Indus (see *antè*, p. 682). In the eastern part of the country are two large lakes, which have no outlets, but are kept at their level by evaporation. The lake of *Panzkung* is about three miles broad, but of unknown length, though not less than 50 miles; the water is extremely salt, and contains apparently no fish. The other lake, named *Tsumereri* by Mr. Trebeck, and *Chumomenil* by Mr. Gerard, is situate among steep mountains which rise abruptly from the water; it is about 14 miles in length, and 2 in breadth, and 15,000 feet above the level of the sea. The water is brackish, and seems to contain no fish. In the middle of May Mr. Trebeck found this lake sufficiently frozen to bear the weight of a man across it.

The people of Ladakh are of the Thibetan stock; but a considerable number of Cashmirians have settled at Leh, and have produced a mixed race called *Argands*. The whole population may amount to 150,000 or 180,000. There is not much wealth in the country, but what there is is equally diffused, and the great body of the people are in easy and comfortable circumstances, owing chiefly to the valuable fleeces of their goats. They pay no taxes in money, but are bound to give suit and service, both domestic and military, and to furnish contributions in kind for the support of the Rajah and the provincial governors. The severity of the climate renders warm clothing indispensable, and woollen clothes are therefore worn by all classes. The people are in general mild and timid, frank, honest, and moral, but indolent, dirty, and addicted to intoxication. Their religion is nominally Buddhism, but is a strange mixture of metaphysics, mysticism, fortune-telling, juggling, and idolatry. The doctrine of the metempsychosis is curiously blended with tenets and precepts very similar to those of Christianity, and with the worship of grotesque divinities. The country is infested with idle lamas and gylongs, who live on the industry of the people. The government is a simple despotism; but it is so curiously modified by the circumstances of the people, and the influence of the priests, that the Rajah, unless he is a person of uncommon talent and energy, is possessed of little real power, and may even be deposed, his successor being always a member of his own family. The business of government is administered by the khalun or prime minister, assisted by the nuna-khalun or deputy, the lom-pa or governor of Leh, the chug-zut or treasurer, and the banka or master of the horse. The districts and towns are governed also by inferior khaluns or tan-zins, or rajahs; and the business of the magistracy is discharged by officers called nar-pas, and by the head men of the villages. There is no permanent military force; the peasants giving their service as soldiers when required. The Rajah is nominally independent, but pays a tribute, disguised under the name of a present, to the authorities of Gardokh, on behalf of the government of Lassa. The country is divided into the principal pergunnahs or districts of *Ladakh*, in the centre; *Nobra*, on the north; *Zanskar*, on the south, and *Spiti* or *Piti*, on the south-east. *Le* or *Leh*, the capital of Ladakh, situate at the foot of some hills, stands in a narrow valley, about two miles from the banks of the Sinh-kha-bab, from which it is separated by a sandy plain. It is inclosed by a wall, with projecting towers; but the streets are disposed without order, and the town forms a confused assemblage of houses. These are partly of stone and partly of brick, generally of two or three storeys; some are loftier, and their total number is estimated at 1000, though Mr. Moorcroft thinks 500 nearer the truth. The palace of the Rajah is a large and lofty building, forming a conspicuous object, standing within the view of the city; the whole town, at a distance has much the appearance of a cluster of cards.—(*Moorcroft's and Trebeck's Travels*, vol. I. Lond. 1841.)

CHITRAL, GILGIT, KAFFIRISTAN, and LITTLE THIBET, are situate to the westward of Ladakh, and occupy the remainder of the elevated mountainous region which extends from the Himalayas on the south to the Hindoo-Koh, Belur-tagh, and Tsung-ling or Kara-korum mountains on the north. They are exact counterparts of Ladakh, and the same description will equally apply to all; their valleys are all drained by the affluents of the Indus. The inhabitants of Chitral, Gilgit, and Little Thibet are Shiah Mahometans; and their princes boast of their descent from the celebrated Secunder Zoolkurneenee (Alexander the Great.) Chitral is subject to Kunduz; Gilgit is a strong country and independent; but very little is known about either of them. *Iskardo* or *Skardo*, the capital of Balti, in Little Thibet, is a large fortified town of irregular construction, on the left bank of the Indus, nearly due north of Cashmere, and 140 miles N.W. by W. of Leh. The chief of Iskardo boasts that his capital was built in the days of Alexander. *Kaffiristan* is the most westerly portion of this region, and situate immediately to the north of the Kohistan, or hill country of Cabul. It contains many

elevated table-lands, on which there are always villages. The winter is severe, but in summer grapes ripen in great abundance. It is the abode of a singular people, called by their Moslem neighbours the Siahposh Kaffirs, or Black-vested Infidels, from their wearing black goatskin dresses; they are entirely confined to the mountains, and are persecuted by all the surrounding nations, who make them slaves. They appear to be a rude uncivilized race, with very little religion; and, possessing a country strongly fortified by nature, they wage interminable war with the Moslems, and have repaid on them with tenfold vengeance the injuries which they have themselves suffered. Yet at times they are peaceable, and allow their country to be visited by commercial traders, and even make short periodical truces with some of their immediate neighbours. Gold is found among their mountains, and formed into vessels and ornaments; and various circumstances, taken in connection with their personal appearance and fair complexion, in which they differ from other Asiatics, have given rise to an opinion that they are of Grecian descent; probably the remains of settlers from Alexander's army, or of those who formed the Grecian kingdom of Bactria, and were driven by the fanatic followers of Mahomet into the wilds which they now occupy. They possess great agility and activity.

TURKESTAN.

THIS country is situate between 36° and 51° N. lat., and 45° and 78° E. long. From east to west, between the sources of the Syrdaria and the Caspian Sea, it extends about 1350 miles; and in breadth, from the northern frontier of Persia to the frontier of Russia, including the steppes of the Kirghiz, about 1260. It is bounded on the north by the Russian provinces of Orenburg and Tobolsk; on the south by Affghanistan and Khorassan; on the east by the mountains of Pamer, part of the Belur-tagh, which divide it from Chinese Turkestan; and on the west by the Caspian Sea and the river Ural. The greater part of the country is composed of sandy plains, intersected by a few rivers, and studded with small lakes, the banks of which, with the grounds within reach of irrigation by their waters, are the only cultivated parts of the country. It rises gradually from the shores of the Caspian and the Aral towards the south and the east, on both of which sides it is inclosed by high mountains, which give rise to its principal rivers. The south-eastern region is a hilly country, formed by the diverging ranges of the Hindoo-koh; and the eastern is formed, in like manner, by the divergent and subordinate ranges of the Belur-tagh. The great plain at the foot of the mountains has an elevation of about 2000 feet; but it gradually declines westward to the Caspian, where it is as low as the level of the ocean. From the Sir northward to the Moughojar hills, through a space of more than 270 miles, not a single river crosses the desert, which, however, contains a number of shallow saltwater lakes, and has exactly the appearance of land from which the sea has retired. These lakes are in some places dried up, and have left a cake of salt, of dazzling whiteness, covering an area sometimes of 6 or 7 square miles. Immediately along the east side of the Aral are the two great deserts of *Kara-koom* and *Kizil-koom*, or the Black and the Red Wastes; the former of which is in some parts 175 miles broad, extending from the north-east corner of that sea to the mouth of the Sir, and the other from the Sir to the Amoo, forming an ocean of sand, without a drop of fresh water, and covered with moveable hillocks, which rise between 12 and 60 feet above its surface. To the north of the Aral is a wild hilly region, thinly inhabited by nomadic tribes; and the highest part of the country in that direction is occupied by the Moughojar hills, which are a continuation of one of the groups into which the Urals are divided at their southern extremity; the same red sandstone which composes the Urals at Orenburg extending into the steppes. In the northern and westerly part of the region there are extensive hills; but, towards the south and the east, this hilly region gradually sinks into plains composed of clay, marl, and calcareous tufa, covered with loose sand, which is blown by every storm of wind into hillocks, and forming altogether a depressed tract of immense extent, interspersed with innumerable lakes and morasses, the general direction of which, from the shores of the Aral north-eastward, favours the opinion that the whole region was at no remote period under water. These deserts, however, are partially interrupted by two ranges of low hills, called the *Great* and the *Little Bourzouk*, the latter of which terminates in a promontory at the north-eastern corner of the Aral, while the other extends considerably to the westward. North-eastward, again, from the Little Bourzouk are some hills of hardened marl, full of marine shells, a formation which extends to the shores of the lake, of which these hills appear to have recently been the shore, though they are now 40 miles distant from it. Between the Caspian Sea and the Aral the country is occupied by an elevated region called the *Ust-urt* or High Plain, which extends north and south from the 41° to the 47° N. lat., or about 400 miles. It is bordered all round by a small chain of calcareous hills, called the *Chink*, which forms the western and north-western shores of the Aral, and touches the Caspian at the Mertvoi-Kuttock or Dead Gulf, where it forms also the shore of the *Tiouk-kara-su*, a deep indentation of that gulf. When approached either from the north or from the south, the Chink presents a precipitous face or cliff, in which the openings are so few, so narrow, and so difficult, that it may almost be considered inaccessible; it is so steep towards both seas that it rises at once 639 feet above them. The Ust-urt rises in some places to 727 feet above the Caspian, and its lowest elevation is 550 feet above the same level. On its north-eastern side it is connected with the Moughojar hills, and thus forms a complete bar to any communication between the two seas. The climate of the Ust-urt is perceptibly more unequal and severe than that of the low country; on which account it is considered advisable to make the circuit of the sea of Aral, rather than pass between the seas, in travelling between Khiva and the Russian frontier. The Ust-urt does not possess a single river; the bushes and herbage which grow upon it are fit only for camels, but not for horses, and still less for sheep. Springs are rare, and the water is far below the surface. In the middle there are some salines and sandy tracts. The general sterility and the violent winds and storms to which the Ust-urt is exposed, render it quite uninhabitable; and no Kirghiz are ever known to encamp there in winter. It presents the same appearance to the eye as the lower steppes; both consisting of sandy clayey ground, sand, and saltpits, and containing the same vegetation, with the exception of a bushy plant called balalysh, which is not met with in the lower steppes. Near the Ust-urt, at different distances, are distributed hills of unequal elevation, but extending in the same direction as the Chink; and to the south of the Emba there is a chain of hills, or rather a small plateau, called Jildi-tagh; all of which appear to have been formerly connected with the Ust-urt, and to have been afterwards separated from it by the action of the waters which covered the lower plains, at a time when the Ust-urt formed a large peninsula, connected with the northern mainland by the Great and the Little Bourzouk, which may even be considered as its north-eastern prolongation.

The steppes of the Kirghiz have not every where a uniform surface, nor do they constitute a vast plain, as the name might be thought to imply; they are, on the contrary, intersected by many chains of hills, and no where exhibit those boundless expanses which are met with elsewhere. The surface is for the most part unequal, and covered with small round-topped hills; but, as these hills are neither high nor clothed with trees, the name of *steppe* is sufficiently applicable to the country. There is also a great want of water, which causes an excessive dryness, an inconvenience which may be attributed to the rarity of rain, the extreme summer heat, the clayey soil, and the winds which pass over it. The verdure is consequently poor, and the general appearance is unvaried and fatiguing to the eye. It may, however, be divided into several regions of various degrees of fertility. The most fertile and least

sandy part is the northern region, between the 51° and 55° N. lat.; the meadows there are rich in pasturage and in every kind of flowers; there are forests which produce timber fit for building, as well as fire-wood; many plains of a strong soil, fit for agricultural purposes; lakes abounding in fish; and rivers of fine, palatable, and wholesome water. The second region, bounded on the north and west by the river Ural, and to the south and east by lines extending from the Moughojar mountains to the fortress of Orsk and fort Boudarinsky, consists of a clay soil, watered by a great number of rivers, and consequently abounding in herbage; it contains also several places fit for cultivation, but, with the exception of some bushes and trees on the banks of the river Ilek, no wood appears anywhere. Notwithstanding its distance from the sea, it contains many shells, pebbles of divers colours, petrifactions, mollusks, and other marine remains. The third region extends to the south of the second, terminating at the Caspian sea on the south-west, at the Ust-urt on the south-east, and at the Steppe of Mouss-bil, between the Moughojar hills and the Ust-urt, on the east. It is evidently less fertile than the second region, contains large spaces of sand, vast marshes, and lakes of water unfit for drinking. The small streams which water it are almost all saltish, even to bitterness, and become dry in summer. It affords in summer ample food for camels, but it is only in autumn that the herbage becomes fit for horses, after the cold has modified its dryness; watering places are rare; and cultivable ground is only to be found in the north, along the water courses, and even there in small quantity; the southern part, almost entirely occupied by salt lakes and marshes, and beds of reeds, is completely sterile. The fourth region is the Ust-urt already described; the remainder of the country, extending to the east and the south, is generally sterile; but towards the north-east, being watered by streams from the northern hills, it becomes more fertile and pleasant, and contains many valleys fit for cultivation. The most southerly region presents scarcely anything but general sterility, as in the sandy wastes of the Great and the Little Bourzouk, the Kara-koom, the Kizil-koom, the Arch-Koudouk-koom, the desert Biptak, the lake Balkask, the reed-beds which surround it, and the almost unknown steppes which are traversed by the rivers Chou and Talash. Several places, however, in the northern and western regions are remarkable for their fertility.—*(Description des Hordes et des Steppes des Kirghis-Kazaks, ou Kirghiz-Kaussaks, par Alexis de Levchine.* French edition, Paris, 1840.)

RIVERS.—The JIHOON or AMOO[a] (ancient OXUS) has its source in the *Siri-kol*, a lake in Khunduz, N. lat. 37° 27′, E. long. 73° 40′, 15,600 feet above the level of the sea, and encircled with mountains, except on the west side, where the river finds a channel. After leaving the mountains, it passes through the sandy plains in a north-westerly direction, fertilizing a narrow tract of about a mile in breadth on each side, till it reaches the territories of Khiva, where it is divided into a great number of branches, and forms at last a swampy delta, overgrown with reeds and aquatic plants, and terminating in the sea of Aral. Its channel throughout is remarkably straight and free from rocks, rapids, and whirlpools, nor is it much obstructed by sandbanks; and were it not for the marshes which obstruct its mouth, it might be navigated from the Aral to near Khunduz, a distance of 600 miles. Being the only drain of an extensive hill country, it pours down a great body of water, and is never fordable below the junction of the Ak-Sural, 40 miles N.W. of Khunduz. The melting of the snow causes a periodical swell in May, which continues till October and the river is also subject to a second but smaller flood during the rains of spring. It fluctuates also in its rise and fall with the state of the weather; in the upper part of its course it is frozen every year, so that, above Khunduz, passengers and beasts of burden cross it on the ice, on their route to Yarkhand. Below Khiva it freezes yearly, and throughout the desert it is also frozen over in severe winters. Its advantages, however, both in a commercial and in a political point of view, are very great. According to tradition, a branch of the Amoo, if not the whole stream, once flowed westward to the Caspian Sea; and the deserted bed of the river can still be traced in that direction, terminating in the Gulf of Balkan; but when the change took place, and whether suddenly or gradually, is uncertain. Its principal affluents are the *Soorkh-ab*, or river of Karategin; *Koksah*, or river of Badakhshan; *Kafernihan*, or river of Hisar; the *Tupalak*, and the *Zurhab*, on the right bank; the Ak-surrai, *Bunghee*, *Surkhab*, or river of Goree; the *Khooloom*, and *Adirsiah* or *Dehas*, on the left.

The SIR-DARIA or SIHOUN, called, in the upper part of its course, NARYM, rises among the Teeanshan or Sky Mountains, to the south of the south-west corner of Temourtou or Issek, in the country of the Highland Kirghiz, who are subjects of China. The Narym has considerable affluents. About 250 miles above its mouth in the Sea of Aral, a branch called *Kouvan* separates from the main stream of the river, and is afterwards subdivided into five branches, which again unite, and a little lower down form a great number of lakes of different sizes. According to Meyendorf, the Sir is rejoined near its mouth by the Kouvan through a little brook. It washes Khojend, Tounkat, and Otrar, passes a little to the north of Khokand, and some miles to the west of Taskkend. It is much smaller than the Amoo, but is said to be more rapid. In summer it is fordable; and in winter it is covered with ice, sometimes two yards thick, over which the caravans pass.

Next in importance to the Sir is the *Kohik* or *Zurufshan* or *Zerafchan*, which rises in the high lands east of Samarcand, and passing north of that city and Bokhara forms a lake (Kara-kool, Black Lake), in which it terminates, not far from the right bank of the Amoo. In the upper part of its course it waters the rich province of Samarcand; below that city its waters are diverted, for the purpose of rice cultivation; for three or four months of the year its bed is perfectly dry at Bokhara; and in consequence that city and the country below it suffer great inconvenience, as they depend on the river for a supply of water. The lake into which it flows is familiarly called *Denghis* or the *Sea*, and is about 25 miles long, and surrounded by sand hills. It is very deep, and does not appear ever to decrease in size at any season. When the snow melts in summer, the water flows as steadily into it as it does in winter; its water is salt. The river of *Khurshee* rises in the same high lands as the Kohik, and passes through Shuhr-Subz and Kurshee, below which it is lost in the desert. The fields of Shuhr-Subz yield rich crops of rice; and Kurshee is a sheet of gardens and orchyards. For six miles on the one side and sixteen on the other, the waters of the river are distributed by canals; and where these cease there is again a barren desert to contrast with the beautiful herbage of the watered district. The *river of Balkh*, already mentioned as a branch of the Amoo, rises south of the Hindoo-koh, about 20 miles from Bamean, near the *Band-i-Burbur*, a celebrated dam, ascribed to a miracle of Ali, and appears to be a mass of earth that has fallen in upon a ravine. The river then flows north among the mountains, and enters the plains of Turkestan, about six miles south of Balkh, where it is divided into innumerable channels which intersect the whole country, and so completely absorb the waters that none of them reach the Amoo. The *Sara-sou* flows through the country of the Kirghiz of the great horde into Lake *Jeka-Kool*. The *Chou* or *Shou*, which comes from Soungaria, out of Lake Issi-koul, flows through the Kirghiz country of the middle and the great hordes into the lake *Kaban-Koulak* or *Bei-le-Koul*. The *Emba* rises from the western flank of the Moughojar hills and flows in a south-westerly direction into the north-eastern corner of the Caspian sea. The *Ulkhiak* and *Ulu-Irghis* flow from the eastern flanks of the Moughojar hills in a south-easterly direction into the Salt Lake or marsh *Ak-sakal-barbi*. The *Noura* rises from the hills to the north-west of Lake Balkash, and flows north-westerly into the lake Khurkaljine.

---

[a] *Jihoon* means a flood, and is the name used in all the Turkish and Persian works which treat of these countries; but the people on its banks now speak of the river under the name of *Amoo*, calling it *Darya-i-Amoo*, the *river*, or literally the *sea of Amoo*.—*(Burnes' Travels*, II. 186.)

LAKES.—The lake commonly called the SEA of ARAL, is situate in the western part of Turkestan, between 43° 35′ and 46° 48′ N. lat., and 52° and 68° E. long. It is very nearly of a square form, but with a considerable extension to the north-east, and measures from south-west to north-east 370 versts, or 245 English miles; its greatest breadth, along the 45° parallel, is about 190 versts, or 124 English miles; and it contains a superficial area of about 21,000 square miles. The Arabian and Persian geographers called it the lake of Khwarism, Kharasm, and Urghunge; but the Kirghiz-Kazaks and their neighbours call it Aral-denghis or Sea of Islands. In the Russian annals it is called *Cinoe* or Blue Lake. The water is not so salt as that of other seas, and even near the mouths of the Amoo and the Sir, at some distance from the shore, it is almost fresh; the eastern and southern shores are low, for the most part sandy, but in some places covered with reeds. The western and northern shores are high and precipitous, being formed by the Chink or border of the Ust-urt. In the eastern, or rather south-eastern part, are a multitude of small islands named Barça-Kaltmass, and, to the northward of the middle, is a large island named Barça-Kilmess, covered with wood. The lake freezes in winter, and from the mouth of the Sir to the town of Kourgrat it is passed on the ice. The fish are of the same species as those of the Caspian. Many of the Kirghiz allege that in the middle of the lake there is a whirlpool, which no vessel dare approach. Its surface, as ascertained barometrically in 1826, is 18 toises, or 115 feet higher than that of the Caspian.—(*Levchine*, 47.) The depth is not great, and there are so many sand-banks near the shores that the fishermen are obliged to use flat-bottomed boats. Its waters are said to be rapidly diminishing.

In the steppes of the Kirghiz there are a great many lakes, which differ in their properties as well as in extent. Some are fresh, some bitter, but the most of them are salt. The principal of them are: the *Balkashinoor*, about 130 miles in length from north to south, bordered on the west and south by sands, and on the north-east by very extensive beds of reeds. It receives the river Ili (Eelee) from the Tarbagatai; the Alaguz from the north-east, and a number of smaller streams. The *Issyk*, *Issek*, or *Tous* (Warm or Salt Lake), called by the Mongols *Temourtou*, and by the Chinese *Ie-Gai*, among the hills to the south of the Balkash, is about 100 miles in length by 34 in breadth. The water is almost fresh, and abounds with fish; its outlet is the river Choui. To the north-east of the Balkash are two lakes, the *Sacyk* or *Aluk-tou-koul*, and the *Ala-koul*, only divided by an isthmus composed of saltish substances, which seems to be of recent formation. None of the other lakes are of the least importance.—(*Levchine*, 47, &c.)

CLIMATE, AND NATURAL PRODUCTIONS.—The climate of the plains and the steppes of Turkestan is subject to extremes of heat and cold; the sandy surface of the country producing an intense heat in summer, while, on the contrary, in winter the same deserts are sometimes covered with snow, and are always very cold during the night. In the steppes of the Kirghiz the extremes are remarkable; the thermometer often falls below 30° of Reaumur, or 36° of Fahrenheit below zero; and, even at the mouth of the Sir, 45° N. lat., it falls to 20° or —13° of Fahrenheit. In such a temperature the rivers, mountains, and plains of the steppes, are necessarily covered with snow, which is very deep, and lies long. At the mouth of the Sir snow does not always fall in winter, but almost every year the lower part of the river, and the northern part of the Aral, are coated with ice. Nor is the extreme cold the only evil; severe storms, hurricanes, and whirlwinds, blow over the steppes, carrying every thing which is moveable before them. These colds are succeeded in summer by excessive heat, which is nearly insupportable by either man or beast. In the region adjoining the river Ural the temperature sometimes rises to 50° Reaumur, or 145° Fahrenheit, in the sun, and to 34° (109° Fahrenheit) in the shade. The hand cannot then be applied to iron, and the sand is so hot as to roast eggs. The climate, however, is generally healthy. Rain is very rare in the steppes; the ground is consequently very dry, and, in summer, breaks into cracks or crevices. In general the seasons in this country may be represented as follows: — spring, sudden and fleeting; summer, dry and burning; autumn, rainy, gloomy, and short; winter, long, dry, and constantly cold.—(*Levchine*, Part I. ch. 2.)

Among the mammiferous animals in the steppes the rodentia are the most numerous; wolves inhabit caverns of the gypsum mountains, and the sandy districts; the canis corsac roams among herds of the antelope saiga. Horses are the most valuable domestic animals in almost all the grassy steppes of Persia, Turkestan, and Siberia. Among these the beautiful race of Argamats supply the cavalry of Khiva. Camels, of both species, and sheep, frequently of a good breed for wool, and some of them fat-tailed, beeves, and goats, constitute the wealth of the wandering tribes. Fine wool goats are bred in Bokhara. The tiger has been found in the vicinity of the Aral, on the banks of the Sir and the Kouvan. The wild boar is found in great numbers in the vicinity of all the rivers; the mouse in the Kirghiz steppes; and the dog geese, so called from their burrowing in the ground. The falco chrysætos builds its nest in the Kirghiz steppes. But, generally speaking, the natural productions peculiar to the country are comparatively few in number, and of little consequence.—(*Zimmerman's Memoir on the countries about the Caspian and Aral, &c.* London, 1840.)

PEOPLE.—The most numerous race who occupy the low country are the *Usbecks*, who distinguish themselves by 32 tribes, into which they are said to have been divided in their pastoral seats, before they conquered this country. The first tribe crossed the Sir about the beginning of the 16th century, and possessed themselves of Bokhara, Kharism, and Khokand. They are also to be found beyond the Belur-tagh, as far east as Khoten, and probably further. They are of the Turkee or Turkish race, and are generally short and stout made, with broad flat foreheads, high cheek-bones, thin beards, small eyes, clear and ruddy complexions, and generally black hair. Their dress consists of a shirt and trowsers of cotton, with a coat of silk or woollen cloth, which is bound with a girdle; and above this a gown of woollen cloth, pasteen, or felt. The head is covered with a white turban, worn in general over a kalpack. Both men and women wear boots, and bandages round their legs instead of stockings; and every man has a knife suspended from his girdle, with a flint and steel for striking fire. The women have a dress similar to that of the men, but longer, with a silk handkerchief tied over the head, and the hair plaited into a long tail, which hangs down from the middle of the head in the fashion of the Chinese. They wear gold and silver ornaments, and over all throw a sheet of silk or of cotton. The aborigines of the country are the *Taujiks* or *Tats*, sometimes, but erroneously, called *Sart*, which is merely a nickname given them by the nomadic tribes. The Taujiks are devoted to commerce; their language is Persian, which has long been that of the country; and it is most probable that they are themselves of Persian or Arabian origin, descended from the first Moslem conquerors. There is besides a great number of Persians in Turkestan; and many Jews, Hindoos, Armenians, and Russian slaves. The northern parts of the country, towards the Russian frontier, are occupied by nomadic races formed by an intermixture of *Kalmucks*, *Kazaks*, and *Kirghiz*. The Kalmucks and the Usbecks are said to have sprung from one tribe; and the Kirghiz and the Kazaks appear to be much the same people, differing only in location. The Kazaks pass the summer in the southern parts of Russia; but repair in winter to the neighbourhood of Bokhara, where they sell their sheep. The Kirghiz occupy the wide plains or steppes which extend along the southern frontier of Siberia to the east of the Aral, and the north of the Sir. They are divided into three branches or hordes, called the Great, the Middle, and the Little horde. The great horde ranges to the east and south on the borders of Cashgar and Khokand, and many of its tribes have adopted the habits of these more improved districts, and acquired a peaceable character, with fixed dwellings; those of them, however, which occupy the higher parts of the hilly regions still merit the name of the wild Kirghizes. The

middle and the little horde occupy the shores of the Aral, extending also towards the Caspian, and retain the nomadic pastoral character in its ancient purity. They own the supremacy of Russia, which pensions their chiefs; and for greater security against their inroads a line of strong posts is kept up between the Ural and the Irtish. The Usbecks and Tanjiks of Bokhara, Khiva, Balkh, and Kokand, are Soonee Mahometans, very strict in their profession, and even fanatical. Several tribes on the eastern borders are Shiahs, and some are idolaters. There are also Jews and Hindoos, who profess, of course, their paternal faith.

Among the numerous states of Turkestan the government is more or less despotic; but each nation or body politic is generally composed of an aggregation of clans or ûrûghs, of which the chief are in many instances elected by the people. The chief administers the internal affairs of the clan, and arranges the quota of tribute, and military service exacted by the general government. But these heads of clans do not unite in any assembly, nor claim the right of exercising any control over the measures of the sovereign.

It may be stated, in general, that in all the great towns the people are industrious; most of them being devoted to agriculture. But the Bokharians are distinguished above all their neighbours for their manufacturing industry, and for the fine cotton and silk stuffs, hats, paper, and other articles which they produce. Bokhara has always been a great mart for the trade of central Asia: and for the last 80 or 90 years it has been visited annually by caravans from the southern provinces of Russia; till within these 20 years the trade in European fabrics was principally confined to the Russians, who brought them from Orenburg and Troitskai; but is now carried on more extensively through India and Cabul. The late attempts of the Russians to open a direct communication with Bokhara have been frustrated by the chief of Khiva, who took offence at measures which threatened to turn the traffic from his own territories; but numerous fairs are now held annually on the southern frontiers of the empire, the chief of which is at Nishnei-Novgorod, on the Volga, which commences in August, and lasts 40 days. It is at this market that the merchants who carry on the trade of central Asia make the most part of their sales and purchases; and even Hindoos are found among the traders. The imports from Russia consist of white cloths, muslins, chintzes, broad-cloth, both of English and Russian manufacture, of imitation brocade (kincob), velvet, with nankeen and and gold thread, all of home manufacture; also furs, cochineal (kermis), locks, iron-pots, iron, brass, and copper; wires, leather, paper, needles, cutlery, and jewellery, hardware, refined white sugar, honey, and a variety of other small articles. The annual caravan which arrives at Bokhara consists of about 1300 camels, and leaves Russia in January. The imports from India by way of Cabul, are indigo, cotton, sugar, white cloths of all kinds, calicoes, and muslins; chintzes of European manufacture, shawls, brocades, muslins, spices, &c.; and Captain Burnes was informed that three-fourths of the articles which are imported from both countries are of British manufacture; many of which can be transported through Russia at less expense, even as far as the borders of India, than through India itself. Besides the Russian and British trade, Bokhara carries on an extensive and direct commercial intercourse with the Chinese garrison-towns of Cashgar and Yarkhand, importing chinaware, musk, and bullion, but chiefly *tea*, of which beverage the people of Turkestan are extravagantly fond. With Persia their trade is inconsiderable, owing to the unsettled state of the roads, which are infested by wandering Turcoman robbers, and the hatred which subsists between the two people, who differ in their religious tenets. The shawls of Kerman form the principal article of import. Opium has also found its way from Persia into Bokhara, and is again exported to Yarkhand and Cashgar, where the same demand exists for it as on the sea-coast of China. The exports of Bokhara are far from inconsiderable, since it possesses silk, cotton, and wool. The silk is chiefly produced on the banks of the Amoo, where the mulberry thrives luxuriantly; and nearly all the Turcomans are engaged in rearing silkworms in summer. It is exported in considerable quantities to Cabul, and even finds its way to India. The silk is manufactured at Bokhara into a stuff called *udrus*, of a mottled colour, red, white, green, and yellow, which is the fashionable and most expensive kind of dress in Turkestan, and is not exported. There are likewise extensive cotton manufactures; their cotton thread is much in demand, and is exported in considerable quantities to Russia, while much of the raw material is sent to Balkh, Khooloom, and Kunduz. The wool of Turkestan is sent across the mountains to Cabul, and the Punjab, where it is made into a coarse kind of shawl. It is procured from the Kazaks and wandering tribes about Bokhara, who were long ignorant of its value, and still use it for the common ropes for their horses and cattle. The lambskins of Bokhara are celebrated in the East: they are procured only in Karakool, and are exported to Persia, Turkey, and China; but chiefly to the first country. The Persian merchants purchase them for ready money, being afraid to risk a commercial investment across the desert. It is not possible to negotiate a bill between Meshid and Bokhara.

DIVISIONS.—Turkestan has never been all subjected to the same sovereign. It may be considered as divided naturally into, 1. *The Steppes of the Kirghiz*, which occupy the northern part; 2. *Mawer-ul-nahar*, i. e. between the rivers Amoo and Sir, the *Transoxiana* of the Latin geographers; 3. *The hill countries* along the southern and the eastern borders. It is divided politically into a great number of states, which differ greatly in extent and amount of population; but the dominant, or at least preponderating native powers are the Khanats of Bokhara, Khiva, and Khokand or Ferghanah. The following are the principal states or Khanats:—

BOKHARA, which is the richest, most populous, and most powerful, is an isolated kingdom of small extent in the midst of a desert. It is an open champaign country of unequal fertility. In the vicinity of its few rivers the soil is rich; but beyond them, it is barren and unproductive. It lies chiefly to the north of the Amoo; but towards the south-east, it crosses the river and holds a supremacy over Balkh, and the Khanats of Andkho and Maimuna. On the banks of the Amoo, the Kohik, and the river of Kurshee lies the whole cultivable soil of the kingdom. Its length along the Amoo is 240 miles. From Balkh to Bokhara the distance is 260 miles of nearly an entire waste; the desert commences about 15 miles beyond the capital. The strip of cultivable ground on the banks of the Amoo is narrow, and much of it lies neglected; the most fertile part of the kingdom is the valley of the Kohik, the ancient *Sogdiana*, which is considered a paradise by the Arabs. Another small portion is watered and fertilized by the river of Kurshee; while Balkh and other places south of the Amoo owe their fertility to the waters which descend from the mountains. The climate of Bokhara is salubrious and pleasant; being dry, and in winter very cold, as is usual in sandy countries. There is constant serenity in the atmosphere, and the sky is of a bright azure blue, generally without a cloud. At night the stars have an unusual lustre, and the milky way shines conspicuously. Even in moonlight, stars are visible on the verge of the horizon, and there is also a never-ceasing display of the most brilliant meteors. In winter, the snow lies three or four months at Bokhara; and the spring rains are often heavy. In Balkh, the heat is oppressive; and the climate is very unhealthy. The harvest is about fifty days later than at Peshawer; the wheat is cut in the middle of June, and at Bokhara it is about a fortnight later. *Bokhara*, the capital, which stands in lat. 39° 43′ N., long. 64° 55′ E., about 1200 feet above the level of the sea, is a place of great antiquity, tradition assigning its foundation to the age of Alexander the Great. It lies embosomed among gardens and trees, and cannot be seen from a distance; the situation is delightful, and the climate salubrious. Its shape is triangular, exceeding eight miles in circumference, surrounded by a wall of earth, about twenty feet high, and

pierced with twelve gates. Few great buildings are to be seen from the outside; but when the traveller passes the gates, he winds his way among lofty arched bazaars of brick, and finds each trade occupying its separate quarter. Everywhere he meets with ponderous and massy buildings, colleges, mosques, and lofty minarets. The city contains about 20 caravansaries and 100 ponds and wells, is intersected by canals shaded by mulberry trees; but is, nevertheless, indifferently supplied with water, the river being six miles distant, and the canal opened only once in fifteen days. In summer the people are often deprived of water for several months. It contains several large mosques, and not less than 366 madreses or colleges, a third part of which are large buildings which contain upwards of seventy or eighty students. Many, however, have but twenty, and some only ten. The students are supported by a public allowance, and are entirely occupied with theology, which has here superseded all other subjects. They are quite ignorant even of the history of their country; and a more perfect set of drones, says Burnes, were never assembled together. Population, 150,000. *Samarcand*, the *Maricanda* of the Greeks, 120 miles E. of Bokhara, is as ancient as the time of Alexander. It was the capital of Timour, and the princes of his family passed their winters there. It has now declined from its grandeur to a provincial town of 8000, or at most 10,000, inhabitants; gardens and fields occupy the place of its streets and mosques; but it is still regarded with high veneration by the people. Some, however, of its buildings still remain to attest its former glory. Three of its colleges are perfect, and one of them, which formed the observatory of Ulugh Beg, is particularly handsome. The tombs of Timour and his family still remain; and the ashes of the conqueror rest beneath a lofty dome, the walls of which are beautifully ornamented with agate. *Kurshee* is a straggling town of a mile in length, with a considerable bazaar, and about 10,000 inhabitants, 140 miles S.E. of Bokhara. To the N.E. of Kurshee, about 50 miles, is *Shuhr-Subz* (the Shehri-Subz of Arrowsmith, and Cher-Sebz of Balbi), the birth-place of Timour, and the seat of a khan. *Balkh*, lat. 36° 48′ N., long. 67° 18′ E., 260 miles S.S.E. of Bokhara, is one of the most ancient cities in the world, and is called by the Persians Am-ool-belud, mother of cities. It is supposed to have been the ancient *Bactra*, said to have been built by Kyamoors, or Cyrus, the founder of the Persian monarchy; and was in later times the capital of a Grecian kingdom, which was founded by the successors of Alexander. It was also the birth-place of Zoroaster, and the seat of the patriarch, primate, or archbishop of the Magian hierarchy. Its present population does not amount to 2000. The ruins extend for a circuit of twenty miles, but present no signs of magnificence; they consist of fallen mosques, and decayed tombs, which have been built of sun-dried bricks; nor are any of these ruins of an age prior to Mahometanism. The city stands in a plain about six miles from the hills, and affords an abundant supply of bricks to the inhabitants of the surrounding country. A stone of white marble is still shown in the citadel, which is said to have been the throne of Kyamoors. These are the only towns in the country; there are some large villages, but none which contain more than 2500 inhabitants. The villages are also few, and widely separated from each other; they amount to about 400, and the whole population of the kingdom is estimated by Burnes not to exceed 1,000,000, one half of which are nomadic tribes. The villages are fortified with mud walls; and in the cultivated parts of the country, single habitations, called *robats*, are scattered here and there, and invariably surrounded by walls.

KHUNDUZ or KOONDOOZ occupies a valley to the south of the Amoo, lying among low hills which extend about 30 miles from east to west, and about 40 from north to south; the climate is most insalubrious, the heat is excessive, and yet the snow lies for three months during winter. It produces rice, wheat, and barley, apricots, plums, cherries, and mulberries. The town, of the same name, cannot boast of a population of more than 1500. The neighbouring districts do not partake of this unhealthiness, but have in general a pleasant climate, and a rich and prolific soil. BUDUKHSHAN or BADAKHSHAN, called also FYZABAD, is situate to the east of Kunduz, to whose meer or chief it is now subject. It lies higher up the Amoo, and is celebrated by both natives and foreigners for its vales, its rivulets, romantic scenes and glens, fruits, flowers, and nightingales. This celebrated country is now almost without inhabitants; it was lately overrun by the chief of Kunduz; its ruler was dethroned, the peasantry driven out of the country, and a rabble of lawless soldiery quartered in its provinces. The natives are Taujiks, very fond of society, and so hospitable that it is said bread is never sold in the country. Their language is Persian, which they speak with the broad pronunciation of a native of Iran. Budukhshan has acquired great celebrity for its ruby mines, which are still worked, but are not very productive. There are also mines of lapis lazuli near the head of the valley of the Koktcha river, about 120 miles E. by S. of Kunduz. Of its capital, *Fyzabad*, once so celebrated throughout the East, scarcely a vestige is left, except the withered trees which once ornamented its gardens.

To the north of Kunduz and Budukhshan, and beyond the Amoo, are the small hill states of *Hisar Koolab*, *Durwaz*, *Shoognan*, and *Wukhan*; the whole of which are mountainous. Hisar is finely watered, and is a rice country, independent of Bokhara and Kunduz; and its capital, of the same name, stands on a rising ground, 260 miles E.S.E. of Bokhara. The whole population of these states is Mahometan.

Between Budukhshan and Yarkhand or Iarkhend, in the Chinese territory, lies the high plain of *Pamir* or *Pamer*, inhabited by the Kirghiz. In the centre of the table-land is the lake *Sir-i-kol*, from which the Amoo flows. The plain extends all round the lake for six days' journey; and all the mountains are described as being reflected in its waters. Pamir is a flat tract, intersected by shallow ravines, and covered with short, but rich pasture. The climate is very cold, and in summer the snow remains in the hollows. The Taujiks call it *Bam-i-duniah*, roof of the world. It is about 15,600 feet above the level of the sea, bordered and intersected by mountains 2000 to 3000 feet higher. This elevated tract is common to India, China, and Turkestan; and from it, as a central point, their principal rivers flow; it is also the centre from which their mountains radiate. From Pamir the ground sinks in every direction, except to the south-east, where similar plateaus extend along the northern face of the Himalayas into Thibet.—(*Wood's Journey to the source of the Oxus*. Lond. 1841.) The inhabitants are nomadic Kirghiz, who cover their whole bodies, even their hands and faces, with sheepskins, to protect them from the severity of the cold. There is no grain in the country, and the people live entirely on flesh and milk. They do not even know the use of flour; and when it is given them they mix it with their soup, but never bake it into bread. Captain Burnes heard of an animal called *rass* by the Kirghiz, and *kooshgar* by the low country people, which was said to be peculiar to Pamir. It is larger than a cow, but smaller than a horse, of a white colour, with hair hanging under its chin, and its head is crowned with very large horns; which are indeed said to be so large that a man cannot lift a pair of them; and when left on the ground, the small foxes bring forth their young in the inside of them! The flesh of this wonderful animal is much prized by the Kirghiz, who kill it with arrows. A common-sized rass requires two horses to carry home its carcase; it is said to delight in the coldest climate. The two-humped camel is also indigenous to Pamir, and the *yak* enjoys the snows of all the neighbouring mountains.

KHOKAND, KOKAN, or FERGHANAH, the country of the celebrated Sultan Baber, the founder of the Mogul empire in India, lies north-east of Bokhara, from which it appears to be separated by the Aktagh, or Asferah mountains. It occupies the upper valleys of the Sir and its affluents, and is a much smaller territory than Bokhara. It is ruled by an Usbeck khan, who claims to be of the same lineage with Baber, but his power is on the decline. The country is celebrated for its silk; and its other produce

is much the same as that of Bokhara. The capital is *Kokan*, an open town on the Sir, about half
size of Bokhara; the ancient capital is *Marghilan*, still a large and fine city, some miles to the so
east of Kokan. *Indejan*, on the Sir, is likewise a town of considerable note; and the Chines
Yarkand call all the people who visit them from the westward Indejanees. *Tashkend*, an anc
and flourishing city 86 miles N.N.W. of Kokan, is described by the Siberian merchants who visit t
a large town of 80,000 inhabitants. Unaccustomed as they are to extremes of climate, these travel
complain vehemently of the oppressive heat of Tashkend. Its whole wealth consists in the produc
the soil; yet that soil would soon be annexed to the desert, were it not for the industry of the inh
tants. Every vegetable substance grown in Tashkend, the mulberry-trees to feed the silk-worms
fruit-trees, even the trees reared for fuel, are with the humbler vegetables, all planted in gard
watered by canals from the little river Cherchik, which flows at 12 miles distance. The staple art
of produce is cotton, in the manufacture of which more than half the population are employed; t
owing to the rudeness of their processes, the Russians, notwithstanding the long land carriage,
supply them with manufactured goods at a cheaper rate than they can make them. *Turkestan*, a t
of 1000 mud houses, defended by a fort, and ditch 15 feet deep. *Och*, at the foot of the Tukht-i-Sulei
mountain, is a town frequented by numerous pilgrims, who come to pay their devotions at a sm
square building on the top of the mountain. Tradition states that Solomon sacrificed a camel on
spot, where the blood is still shewn on a stone which is quite red. It is, however, much frequented
people suffering from rheumatism and other acute diseases, who are said to be cured by stretch
themselves on a flat stone near the building. *Khojend*, on the bank of the Sir, is a fortress surroun
with fields and gardens, like Bokhara. The Kokanese wear skull-caps instead of turbans. The k
keeps up an intercourse with Russia and Constantinople; but there is no friendly feeling towards
rulers of Yarkhand.

The Khanat of KHIVA (sometimes spelled CHIVA) and more generally called ORGUNJE by its
habitants, lies about 200 miles W.N.W. of Bokhara. It is a small but fertile territory, occupying
delta of the Amoo, and surrounded by deserts. The inhabited part is about 200 miles from north
south, and about half as much from east to west; it claims the dominion of the deserts which bor
the Caspian, has of late years established its supremacy over the Turcoman hordes south of
Amoo, and holds Merve, which lies on the high road between Khorassan and Bokhara. It is the
cient Kharism or Charism, and is mentioned by Arrian under the name of the country of the C
rasmii. It contains only two places of note, *New Orgunje* and *Khiva*; the former of which is
commercial capital, the latter the residence of the khan. *New Orgunje* (*Urghendj* or *Ourghen*
stands on a canal derived from the Amoo, about six miles from the river, and has a population of ab
12,000. It is distant from Bokhara about 300 miles W.N.W. *Khiva* is a modern town, about half
size, situate also on a canal, about 60 miles S.W. of New Orgunje; and is the greatest slave mar
of Turkestan. The country of the *Kara-kalpaks*, lying along the Sir, whose inhabitants are nomad
in summer, and stationary in winter, is subject to Khiva, but contains no place of any importan
The people of Khiva carry on the slave trade to a great extent; they make forays into Persia,
seize the subjects of Russia on the Caspian; they supply Bokhara and the whole of Turkestan w
slaves, and are said to possess about 2000 Russian slaves. But while the Khivans are thus robbing
every direction, they grant protections to caravans on payment of fixed duties. The Russian cabi
has long attempted, but without success, to form a connexion with Khiva, not only for commerc
purposes, but for the suppression of the practice of enslaving its subjects. There is great hosti
to Russia in the minds of the Khivans, and it would be most dangerous to appear in the charac
of a Russian in their country. The Russians recently attempted, in the winter of 1839-40, to ma
an army of 20,000 men to Khiva, through the Ust-urt; but, after losing all their camels and ma
men, through the extreme severity of the cold, the wreck of the armament was obliged to return
Orenburg; and, instead of repeating the attempt, the Russian government has been content to en
into a treaty, one condition of which is, that the Kivans shall no more enslave Russian subjects.

Turkmania is the country lying south of the Amoo, or Turkestan Proper, stretching from Kh
to the Caspian, and occupying the space between that sea and the Aral. On the south it is boun
by hills, which are a continuation of the Hindoo-koh, and the Paropanisan Mountains. On the sou
eastern shore of the Caspian, where Turkmania adjoins Persia, the country is mountainous,
watered by the rivers *Gurgan* and *Attruk*, which fall into that sea. In all other places it is a flat
sandy desert, scantily supplied with water. The streams which flow from the mountains are spee
absorbed by the sand, and never reach the Amoo. The largest of these is the *Murghab* or river
Merve, and the *Tejend*, which passes Shurukhs. The country contains no towns or villages, for
Turcomans are an erratic tribe, who wander from one well to another with their herds and flocks, tak
their conical khirgahs or huts along with them. The desert is a vast ocean of sand, flat in some pla
and rising in others into mounds, which, in the neighbourhood of the Caspian, reach the height o
or 80 feet. There is little difficulty in crossing them, and the wells, though few and distant, offer th
supply of water at no great depth from the surface, seldom more than 40 feet. The Turcomans ho
that they rest under the shade of neither king nor tree. They acknowledge the patriarchal sway
their Aksakals (Whitebeards) or elders, and now and then, in some places, fall under the power of
neighbouring nations. The life of a Turcoman is passed in the most reckless plunder of property a
human beings; and a proverb among them boasts that a Turcoman on horseback knows neith
father nor mother. They have fortunately no supreme ruler to guide or direct their united efforts
circumstance which lessens their power and the effects of their barbarity. They belong to the gr
family of the Turkee or Tartar race, and differ from the Usbeeks in being exclusively a nomad
people. They all claim a common lineage, though they are divided into different tribes, to some
which they concede a greater degree of honour than to others. Their total number is reckoned
about 140,000 families. They have neither science nor literature; they are even without mosqu
though not altogether without religion; they are a warlike people, and their domestic habits fit th
for battle. Their food is simple, consisting of the milk and the flesh of their herds and flocks. Th
bestow great care on their horses, which attain a noble perfection in this country, and in the countr
north of the Hindoo-koh. The climate is favourable to the constitution of the animal, and the peo
exhibit the most patient solicitude in its breeding and food; so that its best qualities are fully
veloped. The Turcoman horse is, however, a large and bony animal, more remarkable for strengt
and power than for symmetry and beauty.

In the midst of Turkmania, between Bokhara and Persia, lies the once fertile land of *Merve*,
capital of which is said to have been built by Alexander. It is yet styled *Merve* or *Merú-shah-i-jehá*
king of the world. It long continued a dependancy of the Persian empire, and rose to be a great
opulent country, producing a hundred fold, while its wheat fields furnished three successive cr
from the same seed. Such was its condition, when it was conquered in 1787 by Shah Murad
Bokhara, who destroyed its castle and canals, and forcibly marched the greater part of its people
Bokhara, where they still form a separate community. At a later period the remnant of the populat
was driven into Persia; and this beautiful district, which once presented so striking a contrast to
rest of the country, now partakes of the general sterility, while the Turcomans have usurped
place of its once fixed population. The fields on the verge of the Murghab alone are cultivated, a
here the Turcomans still rear the finest wheat, jewaree, and excellent melons.

RUSSIAN ASIA.

The Russian empire in Asia comprehends several countries and provinces of vast extent, which may be arranged in two distinct portions, the *Caucasian Provinces*, and *Siberia*.

§ 1. *Caucasian Provinces.*

Though the Caucasus has been assumed by modern geographers as the boundary between Europe and Asia, yet, since the countries on both sides of the range form one natural region, and are included in one political government, we have found it necessary, in this particular, to pass the limits of Asia, and intrude on those of Europe. The country we are about to describe has a very irregular outline, and forms a sort of isthmus between the Black Sea and the Caspian. Its northern boundaries are the rivers Kouma, Manytsh, and Kougol-Ieia; the western the Sea of Azov, the Strait of Yenikaleh, and the Black Sea; the southern, Turkish Armenia, the river Aras, and Persian Azerbijan; the eastern, the Caspian Sea; comprising an area of more than 200,000 English square miles. The principal feature of the country is the celebrated mountain chain of Caucasus, which extends across it from near Anapa on the Black Sea to the peninsula of Abcheron on the Caspian, a distance of more than 700 miles, with a breadth varying from about 60 miles to about 120. The highest part of the chain lies to the east of Mount Elbûrz, 43° E., and contains numerous summits which rise above the snow-line (see *ante*, p. 628, 629, and 633); but, in the peninsula of Abcheron, the chain sinks down to the appearance of moderate hills. The culminating point is usually named by European naturalists Elbûrz or Elborus; that, however, is not the distinctive name of any of the summits, but is only the common Circassian appellation of all snow-capt mountains. The proper Circassian name of that lofty peak is *Osha-makhua* (mountain of happiness); the Abbassians call it *Orfeif-Gubô* (heavenly mountain, or mountain of the Great Spirit); and the Tartars, *Ildis-Thagtar* (mountain of stars). All the neighbouring tribes consider it as the residence of the Chin-Padishah, or emperor of the Jins.—(*Spencer's Western Caucasus*, I. 111.) Westward from Elbûrz the chain extends to the north-west, parallel to the shores of the Black Sea, at a distance of 20 or 30 miles, presenting in its eastern portion a series of granitic and porphyritic summits, flanked by shapeless masses of black schist, over which rises a wall of jurassic limestone, to the height of 7000 or 8000 feet (French), cleft by deep ravines, through which the collected waters flow. Advancing from Colchis it is still separated from the sea by a uniform plain 7 or 8 leagues wide, which runs along its base for a space of 30 leagues, becoming gradually narrower, as far as the height of Gagra, where the jurassic wall approaches the sea with its full elevation, leaving only a pass nearly as narrow as the Grecian Thermopylæ, which is a sandy flat, in some parts only fifty feet wide. Farther west the summits decline in elevation, and change their geological character; the black schists and the jurassic limestone are gradually concealed beneath the waves of the Black Sea, or under vast beds of a chalk formation, which here terminates the Caucasus. There are no longer peaks white with snow; but, in their stead, low, round, wooded hills are found ranging along a deep sea coast, cut into a multitude of narrow lateral valleys, which are watered by unnavigable streams. The sea itself is bordered by a long series of white or grey shelving rocks, which are lashed by its waves.—(*M. Dubois; Bulletin de la Société de Geographique, Paris, Avril* 1837, p. 240.) The Western Caucasus is named by the Circassians *Kuschkaa*, and by the Russians *Chernigori* (black mountains), from their being densely covered with forests; and to distinguish them from the lofty snow-capt range, of which Elbûrz forms the principal peak. Towards the banks of the Kouban the mountain valleys open into a plain, a considerable part of which is covered with forests, while the acclivities, glens, plains, and river banks are embellished with cypresses of the growth of centuries, palm-trees, plantains, maples, elms, firs, alders, and poplars. The right or northern bank of the Kouban presents a very different scene, and contains a tract as wild, desolate, and woodless, as the mind can conceive. The soil of the mountain valleys is rich and well-watered, and wants only human industry to render it highly productive. At present, however, a great portion of it is overgrown with wild herbs, and is used only for pasturage. The same description, indeed, will apply, with little variation, to the country farther east, along the whole range of the mountains. To the north of the Kouban and the Terek extends a wide plain, containing scarcely any elevation which deserves the name of hill; and the watershed of the country between the two seas rises probably no higher in its northern part than 120 feet above the level of the Black Sea. The western part of this plain is intersected by ravines, in which flow small streams; it contains not a single tree, but is covered with excellent grass, interspersed with beautiful flowers. The eastern portion, from the Terek to the Volga, is a saline, sandy, and barren steppe, occupied by a few wandering Tartars, and exhibits every appearance of having formerly been a part of the bed of the Caspian Sea. Along the Caspian, southward from the mouth of the Terek to the point of Abcheron, lies the *Daghestan* (hill country), which consists of a numerous succession of hills and valleys, formed by the offsets of the Caucasus. Its south-western border is the main range itself; but the northern part of its western border consists of a long offset, which divides the bed of the river Koisou, which flows north, from the smaller streams that flow directly east to the Caspian.

The southern slopes of the Central and Eastern Caucasus subside into two great valleys or river basins; the one, extending 330 miles north-west from the Caspian sea, with a mean breadth of about 75 miles, is drained by the river Kûr and its numerous affluents; the other extending only about 120 miles from the watershed, westward to the Black Sea, is drained by the river Rioni and its affluents. The mountains of Karalini, which form the watershed between these great valleys, are of comparatively small elevation, and rise only to 6000 feet; but, as the range extends westward, along the southern side of the basin of the Rioni, towards the mouth of the Choruk, under the name of the mountains of Akhaltsike, the summits reach in some places an elevation of 10,000 feet. The southern side of the basin of the Kûr is formed by a high mountainous country, which contains in its bosom the great lake Gûkcha or Sivan; and one of the summits, Ali-Ghuz, rises to the height of 12,000 feet. To the south of these mountains we find the long narrow valley of the river Aras, which forms, throughout the greater part of its course, the boundary between the Russian and the Persian territories. Towards the mouth of the river the boundary line diverges from it, crossing the desert of Mogam or Mogan, and extending southwards along a ridge of heights, which form the watershed of the small streams that flow to the Caspian, and ending on the shore near Astarah or Fort St. Nikolaia, 60 miles S. from the mouth of the Kûr.

The Caucasus forms an immense wall between the northern and the southern portions of the country. There are, however, several passes across the range, the most celebrated of which are the *Pass of Dariel*, in 45° E. long., believed to be the Caucasian pass of the ancients; and the *Albanian Pass* of antiquity, which is generally supposed to be the road that now goes along the shores of the Caspian Sea, by Derbent and Bakû, though Malte Brun affirms it to be that which now proceeds along the

banks of the Koisou, crossing the mountains to the eastward of Mounts Tersh and Kara-kia, in 45° 20′ E. long. From the fortress of Vladikaukas, on the Terek, the Pass of Dariel extends southward along the banks of that river, reaching the height of 9000 feet, from which it again descends to the fort of Passanaour, erected for the protection of travellers, and thence proceeds along the valley of the Aragbor river to Teflis. Between Passanaour and the fort of Kasibeg, on the northern side of the summit, the mountains rise several thousand feet above the pass, and in some places the road runs along the edge of an abyss, which seems to be as deep as the mountains above it are high; while the difficulties of the traveller are often increased by the fall of avalanches, or the sudden swelling of the mountain torrents. The other passes are comparatively unimportant; that by Derbent is little frequented, for, though it does lie over high mountains, it is everywhere interrupted by numerous torrents which often overflow their banks, and render travelling dangerous. The rivers are few, and comparatively unimportant. The *Kouban* (ancient Greek *Hupanis*, Latin *Hypanis*), rises in a valley between Mount Elbûrz and the main chain of the Caucasus, and flows first north-west, and then west to the Black Sea, which it enters a little to the east of the Strait of Yenikaleh. It receives all the waters that pour down from the northern valleys of the Caucasus, between Mount Elbûrz and the Black Sea; the length of its course is about 480 miles. The *Terek* rises from the foot of Mount Kazbek, flows first north through the lower northern part of the pass of Dariel, then north-west till it join the Malka, where the united stream turns nearly due east, and enters the Caspian Sea by a number of mouths. It receives all the waters between Elbûrz and the valley of the Koisou, and has a course of more than 300 miles. The *Kouma* rises from the northern side of Elbûrz, flows first northerly, and then east towards the Caspian, which it formerly reached after a course of 320 miles; but it is now absorbed by the sands before it reach the sea, its empty channel being still visible for about 100 versts. The *Manytsh* has its origin in a number of small lakes or marshes to the north of the Kouma, flows north-west, forms the large lake *Bolchoilmen*, and falls into the Don near Tscherkask, in the country of the Don Cossacks. The *Kûr* (*Kurus* of the Greek, and *Cyrus* of the Latin geographers) rises in the Turkish eyalet of Kars to the north-west of the city of the same name. It flows first in a north-easterly direction, till it reaches the slopes of Caucasus, which turn it to the south-east, a course which it continues till it enters the Caspian. Its course is 550 miles. The *Aras* (*Araxes* of the Greeks and Latins), a larger river than the Kûr, rises from the Bingoldagh, 35 miles S. of Erzroum, and flows easterly, south-easterly, and then north-east, into the Kûr. These two rivers receive considerable affluents from both sides of their respective valleys, and, in the lower part of their courses, form or communicate with a long string of lakes and swamps, which appear to have formed, at one time, a part of their bed. The *Rioni* (*Phasis*) rises to the south-east of Elbûrz, and flows to the Black Sea, collecting the waters of the southern slopes of Caucasus between the 42d and the 44th meridians. Its principal affluent is the *Ziroula*, from the eastern part of the valley.

This region, except the portion to the north of the Kouban, which is part of the Government of Taurida, forms one general government of the Russian empire; the governor-general of which has his residence at Teflis, the capital of Georgia. It includes several ancient kingdoms, states, and provinces, whose names and people have acquired historical celebrity; and these it is necessary to consider as still the proper geographical divisions of the country, though the arrangements of the Russian Government may be different. The ancient divisions are, 1. *Georgia*. 2. *Shirvan*, *Shirvan* or *Guirvan*. 3. The Russian portions of *Armenia* and *Azerbijan*. 4. *Imeritia*, *Mingrelia*, and part of *Gûriel*. 5. *Abassia*. 6. *Circassia*. 7. *Daghestan* and *Leghistan*. 8. The old Russian province of *Caucasia*, comprehending the country between the Kouma on the north, and the Upper Kouban and the Terek on the south and west.

1. GEORGIA (the Persian *Gurgistan*, the Russian *Grusia*, and the Turkish *Gurthi*) though formerly of greater extent, may now be considered as comprising the north-western or upper portion of the basin of the Kûr, and is about 240 miles in length, by 120 in breadth. The Kûr flows nearly through the middle of it, carrying all its surplus waters to the Caspian. The country presents an agreeable variety of mountains, forests, and plains, enjoys a very mild temperature, and is in general very healthy. The people cultivate wheat and millet; peaches, apricots, almonds, quinces, cherries, figs, and pomegranates, flourish with very little care. The vines are abundant, and of good quality; but the wine is not well made. Apples, madder, and cotton are also cultivated. The people boast of their management of bees; their horses and beeves equal the best European breeds in size and beauty; and their long-tailed sheep afford excellent wool. The finest oaks and firs are suffered to rot without being applied to any use. The Georgians speak a language radically different from every other known tongue; but they believe themselves to be descended from the same stock with the Armenians. They are generally handsome, well made, and active; and possess good natural abilities, but are selfish, and addicted to drinking. The beauty of their women is not less celebrated than that of the Circassians, though their skins are not so white, nor their figure so graceful; and many of them are, or used to be exported to Persia and Turkey, for the supply of the harems. Many of the Georgians live in huts half concealed in the ground; but in the more civilized parts of the country are found houses formed of a slight wooden frame, walls made of bundles of osiers, covered with a mixture of clay and cow dung, and surmounted by a roof of rushes. In almost all the villages there are towers, built to serve as asylums for the women and children against the attacks of the Lesghis. About two-thirds of the people are proper Georgians, attached to the ritual of the Greek Church; Armenians and Jews are also numerous. Georgia was formerly a feudal monarchy, subdivided among princes and nobles, the former of whom paid no contributions, but were obliged during war to follow the king with their vassals. Their lawsuits were also decided by the king. The nobles paid certain taxes to both the king and the princes; and although they dwelt in thatched cottages, their pride was equal to their poverty and their ignorance. Under these rulers the people lived in the most abject slavery; they were sold, given away, or pledged, like domestic animals. All who were capable of bearing arms were soldiers; each noble commanded his own vassals, but the king named the commander-in-chief. The king's revenues consisted of the fifth part of the produce of the vineyards, fields, and gardens; with duties on all exports and imports, as well as the produce of the mines, which were but slightly worked. Georgia being protected by mountains, escaped the great Tartar devastations; but for the last three centuries, it has been the scene of almost continual warfare; and, though now under the regular government of Russia, it has experienced so little improvement that its public revenues are not sufficient to defray the necessary expenses.

Teflis, *Tiflis*, or *Tibilisi*, the capital, stands nearly in the centre of the country, on the right bank of the Kûr. It was destroyed in 1796 by Aga Mahommed Khan, the King of Persia, but has been gradually rebuilt, with considerable taste; the remaining portions of the old town are ill built, and contain narrow and irregular streets. The houses of the richer classes alone have glass windows; the poorer people are content with oiled paper. In the new town, however, there are wide streets, fine squares, large barracks, well-managed hospitals, vast caravansaries, and large and fine buildings for the accommodation of the governor and his assistants and deputies. Among the older buildings the cathedral is remarkable for its antiquity, its extent, and its architecture; and the ancient citadel, which is built on a high rock, presents an imposing mass of ruins. Teflis is the residence of the governor-general of Caucasus, and of a Georgian and an Armenian archbishop; it possesses a gymnasium, a seminary, several schools, and a botanic garden; it has also four newspapers, which are published in the languages of Russia, Georgia, Persia, and Armenia respectively. There are also eccle-

brated warm baths, for which water is collected from springs in the neighbouring hills, and is said to possess considerable medicinal virtue. The inhabitants are somewhat industrious, and carry on a considerable trade; but their number, even including the large Russian garrison, does not amount to 30,000. Lat. 41° 41′ N., long. 44° 50′ E. The other principal towns are *Doucheti*, 27 miles N. by W. from Tefils; *Gori*, 45 miles N.W.; *Ganjah* or *Elizavetpol*, 90 miles S.E.; *Telavi*, 35 N.E. by E.; *Signakh*, 56 miles E. by S.; *Akhaltsike* or *Akiska*, 110 miles W. of Tefils, which was formerly the capital of a Turkish pashalic, and contained 40,000 inhabitants, but now contains only about 13,000, mostly Armenian emigrants from Turkey, who have not yet fairly established themselves. It contains several fine churches, and ruins. At *Hertwis* or *Khartous*, 50 versts (33 miles) S.E. of Akhaltsike, where the Trapovanie and the Kûr form a junction, the country is completely volcanic. For a distance of five miles up the Kûr, every rock is composed of a series of volcanic blocks, with layers of solid lava, from 20 to 100 feet in height, resting upon them. The traveller next reaches a circular valley, five or six versts in diameter, through a narrow rent in which, 50 or 60 feet deep, the river flows. In this quarter small balls of volcanic ashes are incessantly thrown up in every direction; which issue from the side of an oval lake from 400 to 600 feet in length, and of fathomless depth, situate in the midst of wild sterile blocks of lava; the surface of its water is 50 feet above the Kûr, which runs close past it. Beyond this lake the Kûr continues to flow among volcanic rocks; at the top of which, 1000 feet above the river, stands the large fortress of the Armenian Queen Thamar; and at the distance of four or five versts from the entrance of the crater, is her favourite place of residence *Warzich*, a most extraordinary spot. It is a complete city, hewn out of volcanic stone; and contains, among other works, three large churches, entirely cut out of the rock, subterraneous passages several versts in length, innumerable chambers, some of them finely sculptured, and Queen Thamar's summer and winter palaces.

2. SHIRVAN was formerly a province of Persia, but of very uncertain limits; its northern boundary was sometimes fixed at Bakû, and sometimes considered to extend as far as Derbent. In its restricted acceptation, it comprises the lower part of the basin of the Kûr, between that river and the mountains; its climate and natural productions are very much the same as those of Georgia. It consists chiefly of a fertile well-watered plain, which produces plentifully cotton, rice, wine, and fruits of various kinds; but along the shore of the Caspian there is a flat tract which is nearly desert. The inhabitants are chiefly Mahometan Persians. The peninsula of Abcheron, though hilly, contains no summit exceeding 1000 feet. The soil is rocky and barren, and its only water is brackish, and is obtained from wells. There is not a tree in the peninsula; but portions of the territory have a layer of mould, on which wheat, barley, and maize, melons, and other fruit, rice and cotton, and, on the higher ground, saffron, are raised. The soil is saturated with naphtha, from which gas is profusely exhaled. It not only streams spontaneously through the surface, but rises wherever a hole is bored. It is of two kinds, black and white, and its principal sources are about six miles from Bakû. The black oil shines with a reddish tint in the rays of the sun, and is used for burning, and for coating roofs. Not far from the same spot a stream of white oil gushes from the foot of a hill; it readily ignites, and burns on the surface of water; and in calm weather people amuse themselves with pouring it in quantities into the sea, where they set fire to it, and it floats away, giving the waters the appearance of a sea of fire. The poor people of the neighbourhood obtain a cheap light, and fire for cooking, by driving a clay pipe or a hollow reed into the ground, and burning the gas which rises through it. The Persian ghebers, likewise, send the gas in bottles to their friends at a distance. The burning field, near Bakû, is a hollow expanse, full of clefts coated with white sand and grey dust, and abounding with particles of sulphur. Some of the clefts are seen burning, some smoking, and others emitting only vapour. There is also, not far from the town, a boiling lake which is in constant motion, and emits a flame without heat. Occasionally the whole region seems to be on fire, as it rolls along the hills in enormous masses, and with incredible velocity; but this fire does not burn, and it is impossible to detect in it the smallest heat. In ancient times this burning field was one of the most celebrated ateshyahs or shrines of grace among the ghebers or fire-worshippers of Persia; a spot to which thousands of pilgrims resorted to purify themselves from sin. A few of them still find their way to it, and spend such a portion of time, five, seven, or ten years, as they think necessary to acquire for themselves the character of sanctity among their countrymen. Pilgrims come even from India to visit this sacred spot. The peninsula is likewise celebrated for numerous volcanoes which discharge immense quantities of mud.

Bakû, the capital, is situate at the south-west corner of the peninsula of Abcheron, where the sea is land-locked by two islands, which render the roadstead a safe anchorage, even close to the shore. The town is walled, and built on a declivity, the top of which is occupied by an old palace of the kings of Persia. The streets are narrow and winding, and the population amounts only to about 3500 or 4000. The exports consist of naphtha, saffron, cotton, silk, opium, rice, and salt. The district of the town contains 35 villages, with 19,000 inhabitants, of whom 1000 are Turcomans.

To the south of Shirvan, and divided from it by the Kûr, the Russian territory includes a portion of the Persian province of Ghilan, called *Talish*; but there are no towns, or other places, of the least importance.

3. The Russian portions of ARMENIA and AZERBIJAN lie between Georgia on the north, and Mount Ararat with the river Aras on the south; being together about 200 miles in length from N.W. to S.E., and 130 in breadth. The country consists of a mass of mountains which form a congeries of volcanic amphitheatres, and here, as well as to the south of the Aras, crowding upon each other, fill up the whole space between the Black Sea and the Caspian. One of the largest of these amphitheatres is occupied by the most remarkable feature of Russian Armenia, the great freshwater lake *Gûkcha* or *Kûkcha* (properly *Gokcheh-derya*, the blue lake) called also *Sivan* or *Sevan*, the surface of which is 5300 feet above the level of the sea. Its greatest length, according to Colonel Monteith, who travelled round it, is 47 English miles, while its breadth varies from 6 to 21; but according to the late Russian trigonometrical survey, as reported by M. Dubois, its length is only 15 French leagues (41½ English miles), and its breadth 8 leagues (21½ miles). In the north-western portion of the lake is an island called *Sevan*, with a monastery, 1200 yards from the shore. In his passage across this strait, Colonel Monteith lost soundings with 400 feet of line soon after pushing off, and the lake had the dark blue appearance of deep water.—(*Journal R. Geog. Soc. Lond.* III. 40.) A branch of the river Zengue, which passes Erivan, carries the surplus waters of the lake to the Aras. The lake is entirely surrounded by extinct volcanoes, and by jets of various trap rocks and porphyries which yield small streamlets of water during the spring months. Immediately to the north-west, but politically within the limits of Georgia, lies another great volcanic amphitheatre, that of *Somkheti*, which has no lake, but contains immense beds of lava and obsidian. The western border of this region, and of the Russian territory, is formed by the *Arpa-Chai* (barley river), which, according to Colonel Monteith, invariably presents the same feature of flowing in the deep bed of a basaltic ravine, with numerous ruined castles, perched on abrupt rocks, till near its junction with the Aras; but according to Smith and Dwight (*Missionary Researches in Armenia, &c.* London, 1834, pp. 102, 269), it presents at the place where they crossed it, at Gûmri, not the shadow of a barrier to the advance of an army. In their journey eastward they had entered a different empire almost before they were aware of it; as both banks of the river presented the same features of plain and gentle undulation, and the river itself was easily forded. Gûmri, however, has since been fixed on as the site of a Russian fortress. Waving fields of barley on its eastern bank, interspersed with meadows, attracted their attention before they knew they had crossed the boundary. The beautifully limpid water, scattered widely in artificial

canals, gives extreme fertility to a broad tract of land, which is well peopled, and presents an animated scene of villages, some of which appear to be large. The north-eastern part of this region, occupying the angle formed by the Kür and the Aras, above their confluence, is called *Karabaugh* (black garden), from the extreme fertility of the black alluvial soil of the valley of the Kür which it embraces. The rest of it is mountainous, and, in general, well wooded with a variety of forest trees; but in the heart of the mountains which form the walls, as we may call them, of the two river valleys, is an extensive table-land entirely destitute of timber.—(*Smith and Dwight*, 223-225.) Its waving surface, however, is arable, and cultivated with grain throughout in long narrow fields without fences; but, as there is no means of irrigating the soil artificially, the produce is scanty, varying from one to five fold, and four fold being the average crop. The table-land is intersected by numerous ravines of great depth, whose precipitous sides bristle with numerous slender cones, each capped with a rock occasionally several tons in weight, judging from their size, and forming the beds of streamlets of the purest water. The southern border of this table-land is formed by a high mountain ridge which sinks abruptly on the opposite side down to the Aras, which forms, as already mentioned, throughout the greater part of its course, the limit of Russian Armenia. Its valley is much narrower than that of the Kür; and the low grounds along its banks are in many places swampy for miles in succession. The lower part of its course is through a succession of defiles; and below Ouradabad the stream forces its way through a great chain of mountains, where a road has been made which even now scarcely admits of a loaded mule passing on either bank. Basaltic and volcanic rocks form everywhere the prevalent mineralogical features of its channel; but in a valley four miles below its junction with the Arpa-chai, are situate the salt mines of *Kulpi*, which have for many ages supplied Georgia and even the Caucasus with that necessary article. The salt is so abundant that hitherto it has not been necessary to sink deep. A range of hills bordering the valley on the east side appears to be entirely composed of salt, in the sides of which numerous excavations have been made. The soil of the valleys of the Aras appears to be extremely fertile, but, except in the lowest plains, nothing is produced without continual irrigation; and wherever a canal cannot be made to reach, not only is there no crop cultivated, but even grass seems scarcely to grow, and unsightly saline weeds, covered with thorns, increase the appearance of general barrenness. If it be true, as some have imagined, that we are here to look for the site of Eden, certainly on no part of the earth is the primeval curse more palpably inflicted than on the original paradise. No where is it more true that man eats bread in the sweat of his brow, and nowhere are thorns and thistles more spontaneously produced. The mountains around, instead of being covered with trees, as in the Karabaugh, or clothed with verdant pastures, as at Erzroum, present only forbidding precipices of rock or of earth, apparently without even a blade of grass. The whole scene of valley and mountain affords not a tree, except in the immediate vicinity of the villages.—(*Smith and Dwight*, 270.) Directly south of Erivan a small portion of the Russian territory extends to the south-westward of the Aras, and in the south-west corner of this portion stands the famous mountain *Macis* or *Agri-Dagh* or *Ararat*. Its peak rises to the height of 17,265 English feet (2700 toises, by Parrot's measurement); M. Dubois makes it 16,254 French feet; and the smaller peak he makes 12,162. Sixty miles N. by W. of Ararat the mountain Ali-Ghux rises to the height of 12,000 French feet, capped with perpetual snow, and forms the northern termination of a superb garland, as M. Dubois calls it, of extinct volcanoes which enclose the basin of *Ararat* or central Armenia, over the whole circumference of which nothing is to be seen but black and grey lava currents, with pumice or obsidian, along with scoriæ and basalt, or trass, intermixed with porphyries and melaphyres. In July 1840 Ararat, after long quiescence, again burst forth as a volcano, and did immense damage to the neighbouring country.

Erivan, lat 40° 9′ 30″ N., long. 44° 33′ E., the capital of the province of Russian Armenia, is situate in a rugged valley, on the east bank of the Zengue or Zenghi or Zengy river, the outlet of lake Gökcha. It is a small city without walls, but has good houses, and contains about 1800 Moslem, and 700 Armenian families, or about 12,000 inhabitants. The citadel is at the distance of about a quarter of a mile to the south, and is almost a distinct town. Surrounded on the north by arid mountains, which concentrate the sun's rays, the climate of Erivan is extremely hot in summer, and proverbial for intermittent fevers and liver complaints. The soil, however, is extremely fertile, and Erivan is not less famous for its fruits than for its diseases. All the sunny hills which border the valley are covered with vines. Some places are so warm as to allow them to remain exposed to the air all the winter, but generally they are slightly covered with leaves or straw during that season. The melons and apples are also uncommonly fine. The trade of the place seems to be in a languishing condition; and the population is said to be declining since the Russian conquest. About 12 miles west from the city is the convent of *Etchmiadzin*, the ecclesiastical capital of the Armenians, and the residence of their catholicos or spiritual primate. It is surrounded by a high wall, flanked with circular towers, which give it externally the appearance of a fortress; within, it is a city in miniature, containing an ancient church, rebuilt A.D. 618, and other buildings. *Nakhcheran* or *Nakhchiva*, 80 miles S.E. by E. from Erivan, claims the honour of being the oldest city in the world. Armenian etymology shows that the name signifies "first place of descent;" and tradition affirms that Noah fixed his residence here after descending from Ararat. The city was almost entirely ruined during the last war, and is not yet recovering. Around it are numerous gardens of extreme luxuriance, which produce abundance of quinces, pears, apples, melons, pomegranates, grapes, and almonds; but, like Erivan, Nakhchevan is as noted for its sickliness as for its fertility, though it is situated about two fursukhs, or 8 miles, from the Aras, on a higher level than the alluvial and marshy plain which borders the river. Twenty miles, in a straight line, farther down the Aras, and at the south end of a strong defile, is *Julfa*, an ancient city, destroyed by Shah Abbas the great, who carried its inhabitants to Ispahan, where the suburb which they occupied still bears the same name. About 20 miles north-west of Nakhchevan, is the supposed site of *Artaxata*, an ancient capital of Armenia, destroyed by the Roman general Corbulo, in the reign of Nero. *Valarsapat* or *Vagharshabad*, another ancient capital, now a village of about 500 mud cabins, stands close by the walls of Etchmiadzin. There are several other ruined cities in different parts of the province. *Shousha* or *Chouchi* (in Armenian *Shoushi*), the capital of Karabaugh, 124 miles E. by S. of Erivan, is a mountain fortress into a natural castle, surrounded by very deep precipitous ravines. The town contains about 200 houses, built of stone, frequently two stories high, and open to the street.

4. IMERITIA, MINGRELIA, and that part of GURIEL within the Russian territory, occupy the whole basin of the Rioni; the northern border being formed by the Caucasus, the eastern by the mountains of Kartalini, the southern, by those of Akhaltsike, and the western, by the Black Sea. The mean length is above 120 miles from east to west, and the greatest breadth, at the 42° meridian, above 90. The soil is extremely fertile, but little cultivated, and the country is covered throughout with thick forests. Owing to this last circumstance, as is supposed, the climate is so humid that it rains from 120 to 150 days in the year. The lower part of the country, near the sea, is a dead unvaried flat, full of swamps and marshes, producing a constant miasma, the fertile source of pestilential fevers. The people are of the Georgian race, and amount only to about 150,000. Imeritia is directly under the Russ an government, but Mingrelia and Guriel still have their respective princes, who acknowledge the emperor's supremacy, but even their countries are filled with Cossack police stations; and the insecurity to person and property, so vividly described by Chardin, who passed through the

country in 1672, has given way to perfect quiet and security. Decided measures have been adopted, with success, to restrain the sale of slaves, and the condition of the peasantry has been greatly improved. Still, with the exception of a few merchants, the population is divided into only two classes, the nobility and the slaves, the former being the owners of the land, and the latter performing all the work. But as the noble can no longer deprive his serf of his life or limbs, nor sell him to a foreign master, slavery has assumed a somewhat milder form; and the master and slave live together on almost equal terms. Some of the nobles can read a little Russian, but they are unacquainted with their own language. Drunkenness prevails to an incredible extent; and scarcely any limits are set to unchastity in its most offensive and sinful forms. The sacredness and validity of an oath are unknown.

K'houthaissi, Kotais, Kotatis, Coutais, or *Koutais*, the capital, stands on the Rioni, in an unhealthy situation, where the river first reaches the plain, nearly in the centre of the province. It is a small town with about 1600 inhabitants, nearly one-half of whom are Jews. The split and naked rocks which rise above the town are covered with ruins of every description, temples, churches, bridges, aqueducts, towers, &c. overgrown with ivy, brambles, and pomegranate bushes, being all that remains of the ancient city *Cyta* or *Cutaisium*, the birth-place of Medea, so celebrated in classic mythology for her share in the success of the Argonautic expedition. *Poti*, a fort near the mouth of the Phasis, on the Black Sea. *Redout-Kaleh*, a small fortified town, about 10 miles north from the Phasis, on the coast. The roads are unsafe, and there is no harbour. It occupies an unhealthy situation, and owes its existence to the commercial privileges granted in 1821, for ten years, to the Transcaucasian provinces. While these privileges existed, the merchants of Teflis, who visit the German fairs, used to send their purchases, generally by way of Odessa or Trieste, to this port; but in consequence of the restrictions and prohibitive duties since imposed by the Russian government, the trade has been transferred to Trebizond, and Redout-Kaleh is now almost deserted.

5. ABASSIA or ABKHAZ lies along the north-east coast of the Black Sea, between the shore and the summits of Caucasus, being about 260 miles in length and less than 30 of average breadth. It is also called the *Great Abassia*, to distinguish it from another region named the *Little Abassia*, on the northern side of the mountains, towards the sources of the Kouban. The country is fertile though very mountainous; very moderate labour produces rich crops, and the herds of cattle are numerous and productive. It is possessed by wild independent tribes, who have set the Russian power at defiance; and though the Russians mark on their maps nearly half the country as subject, yet their authority is in reality acknowledged no farther than their arms can reach. The Abassians were formerly well known as pirates on the Black Sea. Many of them used to prosecute their fortunes in Egypt, where they rose by their bravery to eminent military rank: the greater number of the Mamelukes were natives of this country. Their women are beautiful, and much sought after in Turkey, where they generally pass for Circassians. The chief towns and forts are: *Anapa*, a small town and fortress 45 miles S.E. by E. of the Strait of Yenikaleh, which is in possession of the Russians. It was formerly the chief emporium of the Turkish trade with the Caucasian tribes, and from it the Georgian and Circassian slave girls were supplied. *Soujouk-kaleh*, a ruined fortress occupying an important position on a splendid bay which affords safe anchorage, 25 miles S. by E. of Anapa. *Ghelenjik*, 16 miles farther S.E., is a Russian fort formed of intrenchments and palisadoes mounted with heavy guns, and contains a garrison of 2000 men. It has one of the best harbours in the Black Sea. About 15 miles farther S.E. is the bay of *Pshad* or *Pshiate* (French *Pchad* or *Pchiate*), where the Russians are said to have lately (1837) erected a fort. *Vadran*, 50 miles S.E. of Ghelenjik, is also occupied by a fort. *Pitzounda*, 80 miles S.E. of Vadran, where the Russians have a fort, two miles from the coast, to which, says Spencer, the road leads through a forest of splendid trees of oak, beech, and chestnut; with wild olives, figs, and pomegranates in full bloom, and vines of enormous growth wreathed from tree to tree. *Soukgoum-kaleh* or *Souchom-Kaleh*, 30 miles S.E. of Pitzounda, and in the south-west angle formed by the intersection of the meridian 41° E. with the 43° N. lat., is a miserable spot, more fatal than any other to the Russian garrison. When in possession of the Turks it is said to have contained a population of 3000; but it has now decreased to little more than a dozen of wretched huts, inhabited by a few Greeks and Armenians. There is also a square fort in a very dilapidated state, but fully mounted with cannon.

6. CIRCASSIA extends along the north side of the Caucasus, from the sea of Azof to the Upper Terek; but, by the gradual progress of Russian encroachment, the independent Circassians are now restricted to the comparatively small region which lies between the Kouban and the mountain tops, forming something like a triangle of 220 miles in length from east to west, and 120 in its greatest breadth. It comprises the northern declivities of Caucasus, and sinks into a flat towards the banks of the Kouban. It is possessed by a wild people who call themselves *Adeches* or *Adekhes*, a name denoting a mountain ravine on the sea; but their neighbours, the Nogai Tartars, call them *Tcherkesses*, a name which well expresses the ferocity of their disposition, being derived from *tsherk*, to cut off, and *kes*, the head. From this Nogai word is derived their European name of Circassians. They are divided into ten tribes, whose habitat cannot be specified, as they often change their residence; their character even, and condition are continually fluctuating according to the character and circumstances of the settlers who come among them. These tribes bear the names of certain rivers or districts, or of individual founders, and number altogether, it is said, about 272,400 males. The only class of society is the military; every head of a family being obliged to protect, as well as to cultivate, his own property. Among some of the tribes, however, there is a sort of nobility, destitute of privilege or influence. Some have slaves, who are not natives, but captives in war, or purchased strangers. In former times the Circassians were governed by despotic princes; but, since 1769, the government has been vested in a sort of senate, or council of elders. Of these assemblies, there is one in every subdivision of a tribe, but their deliberations must be confirmed by the general assembly of the people, which often overrules the decisions of the council. This state of things gives rise to continual bickerings, animosity, and deadly hatred among the tribes. In religion the Circassians are Mahometans; in respect of moral character, they are a set of lawless plunderers, who respect only those of their own tribe or lineage. The adjoining provinces can never prosper, while they have such neighbours as these, who are ever ready to harass, and rob, and murder the peacefully disposed citizens; and it is therefore the interest, if not the duty of the Russian government to extirpate or subdue them. In external appearance, however, the Circassians are a remarkably fine race, and their women are reputed the most beautiful of the Caucasians. Their houses are formed of hurdles covered with clay, and thatched with straw. Forty or fifty of such huts, arranged in a circle, form a village, in the centre of which the cattle are placed for safety during the night. Their horses, which are considered inferior only to those of Arabia, roam freely in the fields, without ever entering a stable. Their agriculture is in a state of primitive simplicity; but the great fertility of the soil makes up for their want of skill or industry. The management of bees is an important part of their rural economy. The Circassian language differs much from those of the other Caucasian tribes. It is never written; and when a Circassian has occasion to send a letter, he applies to his mollah, who writes it for him in the Turkish tongue. The original country of the Circassians is also called *Kabardah*, which is divided into two portions, the Great and the Little; the former comprising the basin of the Kouban; the other, the upper and the middle parts of the basin of the Terek.

7. DAGHESTAN and LESGHISTAN, comprise the mountainous country which lies between the west coast of the Caspian Sea, and the summits of the eastern Caucasus, as far west as the Koisou; and

extends into Georgia as far as the Alazan, an affluent of the Kur. Along the coast Daghestan extends from the Terek to Alty-agatch, a distance of 250 miles, while its greatest breadth, between the sea and Mount Terek, is about 70. The north-eastern part of Lesghistan is included in this measurement; but its southern portion extends beyond it down the southern slopes of the mountains. As the name implies, Daghestan is the country of mountains; but the soil is extremely fertile, and the climate is mild. The territory of *Kouba*, in the southern part of the province, has been called by the Persians, the paradise of roses; and in some parts of it, the vine may be seen shooting from every cleft of the rock. But these fine regions are subjected to excessive humidity; and are in several places infested with reptiles and pernicious insects. Daghestan abounds with rivers, which, as their courses are very short, are scarcely worth naming. The largest of them is the *Kasoui*, which flows into the *Gulf of Agrakhan*, after a course of 150 miles. The *Samour* has a course nearly as long, and discharges its abundant waters by ten or twelve mouths, between lat. 41° 50' and 42°. The inhabitants of the lowlands of Daghestan are a mixed race descended from Persian, Arabian, Syrian, Turkish, and Tartar colonists, mixed with the aboriginal Caucasians. The mountains are inhabited by the Lesghis, the most predatory and ferocious of all the Caucasian nations; who appear to have been established in this region from time immemorial, and are mentioned, not only in the ancient chronicles of Georgia, but even by Strabo and Plutarch. They are considered as among the bravest of the Caucasians, and are always ready to serve as mercenaries in the wars of their neighbours; their fidelity may be relied on as long as they are regularly paid. The majority of them are now Soonee Mahometans, but a few faint vestiges of Christianity may also be traced among them. The weak bonds of society are held together only by hospitality and the law of retaliation. They used to be the terror of all the surrounding provinces; and they so perseveringly and successfully resisted the power of Persia, as to give rise to the proverb, "If a king of Persia is a fool, let him march against the Lesghis." They were, however, at last driven, in A.D. 1742, by the arms of Nadir Shah, to seek protection from Russia, and swear allegiance to the Czar; they now pay a small tribute of silk or money, and the influence of Russia is effectively felt in the election of their rulers. But they are still even worse than the Circassians for their predatory habits and blood-thirstiness. The Russians for a long time, instead of residing and having military posts among them, stationed troops along their frontiers, to prevent them from pillaging the adjacent districts; and the country used to be a sort of asylum for refugees from Russian justice or oppression; but Marshal Paskewitsch is said to have lately reduced some of the tribes to absolute subjection. The Lesghis are divided into numerous tribes, whom the nature of their country keeps so isolated, that no such thing as a general confederacy or national union seems ever to have been known among them. Their language has no analogy with any known tongue except that of the Samoiedes, to which it has a distant resemblance. It is divided into numerous dialects, which Guldenstædt has endeavoured to arrange into eight classes, each comprising the speech of several tribes. The first of these is the *Avar*, which comprises the *Avars*, and fourteen other tribes resembling them, who all dwell in the north-western parts of Daghestan. The Avars themselves occupy the upper valleys of the Koisou, and their khan, the most powerful prince of the eastern Caucasus, resides at Koun-dzakh, a large village, where he has a spacious mansion, with glazed windows. The king of Georgia used to pay the predecessors of this khan about £1000 sterling a-year, as black mail, to save his subjects from Lesghian ravages; the Russians now pay him a pension of about £1600, in consideration of which he always acts in subservience to their wishes and directions. The Avars are believed to be the remains of the Avars or Huns who took refuge in this part of Caucasus. The only other tribes worthy of notice are the *Akushas* and the *Kubashas*, both comprised in the fifth of Guldenstædt's classes, and the *Kasi-Coumyks* (or *Koumooks*), who form the seventh. The *Akushas* dwell on the Koisou, and form a republic, composed of about thirty villages. They have neither princes nor nobles; but are divided into twelve tribes, each of which has a chief, who possesses, however, no power to command, but only that of advising. They sell their services to the highest bidder, and will fight against any other tribe except the Shumkhal of Terki, whose supremacy they formerly acknowledged, and who permit them, without remuneration, to graze their flocks on the rich meadows along their frontier. The *Kubashas* also live near the Koisou, in a large town of the same name, with eight dependent villages. They call themselves Franki, on which account they have been supposed to be of Venetian or Genoese origin; but they resemble in every respect the other Lesghis, and their language is a dialect related to the Akushan. They are known throughout the East as the Zer-kherans, or makers of coats-of-mail; they manufacture splendid arms, and fine cloth or shawls, which are highly prized, not only in the Caucasus, but even in Persia, and the countries beyond the Caspian. They neither cultivate the ground, nor rear cattle, but exchange the produce of their manufacturing industry for the necessaries of life. They always live on good terms with their neighbours, and court their friendship; but are nevertheless ever on their guard against attack, and the only two passes leading to their country are defended by fortifications, mounted with small copper cannons, cast by themselves. They never make war, nor pay taxes; they are governed by a council of twelve elders, chosen by the people; and their disputes are settled by arbitrators, to whose decisions they submit without a murmur. The Kasi-Coumyks live also on a branch of the Koisou, under a khan, whose authority extends over 100 villages, and who is fiercely opposed to the Russians. He resides at a place called Chahar or the town, and can raise on an emergency 6000 men. The Kasi-Coumyks are zealous Mahometans; they practise agriculture as well as the rearing of flocks, and are notorious marauders. Besides these seven classes, there are several other Lesghian tribes not enumerated by Guldenstædt, whose dialects he could not ascertain.

Towns in Daghestan.—Derbent, an ancient but decayed city, on the Caspian, in lat. 42° N. long. 48° E., in a very pleasant situation, which rises gradually from the sea to the top of a hill, and commands a very extensive prospect, especially towards the south-east. It is surrounded by an ancient wall, built of large square stones, and formed, during many centuries, the key of the Persian empire in this quarter. It is still supposed to contain so many as 4000 families. In the neighbourhood is a tomb said to be that of forty Arab heroes, who were killed in battle against the infidels, when Derbent was taken by the Khalifs. The Mahometan Lesghis still make pilgrimages to it. Near Derbent are the remains of a great wall, which formerly extended to the Alazan, and was built by Khosru Noushirvan, king of Persia, to prevent the incursions of the Khasars; but which the people of Derbent ascribe to Alexander the Great, the wonder-worker of Western Asia. The upper castle of Derbent is built on an abrupt rock three miles from the shore; the lower stands close upon the water. These are connected by a double rampart, but to what era it is impossible to decide. *Kouba*, 50 miles S. of Derbent, was formerly the capital of a khanat, one of the most powerful in Daghestan, and is now the chief town of the province or district of Kouba. Its situation being unwholesome, a new town of the same name has been founded at a short distance to the westward. *Barchly* or *Kevrikh*, 20 miles N.W. of Derbent, is the residence of the khan of the Kaitak, who bears the title of *Ouzmei*, and exercises a sort of sovereignty over the Akushas and Kubashas. *Turkou*, *Terki* or *Tarki*, 75 miles N.N.W. of Derbent, the residence of a khan, with the title of *Shamkhal*, is built in terraces upon three peaked hills, about three miles from the Caspian sea, and has a population of 10,000.

8. The old province of Caucasus includes all the country to the north of the Terek and the Kouban, lying between the Caspian sea, and the eastern border of the government of Taurida, and bounded on the north by the rivers Kouma and Manytsh. It is almost entirely a sandy steppe; but the province may now be considered as including also the hill country between the Upper Kouban and Lesghistan.

to the summits of the Caucasus, called Kabardah and Little Abassia, and inhabited by the *Ossetes*, the *Mistdjeghis* or *Kistes*, and several of the subjected Circassian and Abassian tribes. The eastern portion of the mountains, bordering on Lesghistan, and extending westward and northward to the upper Terek and its affluent the *Souja*, is occupied by the Mistdjeghis, some of whom are nearly as great robbers as the Lesghis. The Russians have not yet been able entirely to subdue them, and it is even necessary to send an escort of 150 men with official dispatches from Mozdok to Vladikaukas. The *Chechenzies* are the most powerful tribe; the *Karaboolaks* are as wild and troublesome; but the *Ingooshes* have been subdued, and are more inclined to agriculture and peaceful occupations than any other of the Caucasian highlanders; though in religion and moral feelings they are not superior to their neighbours. The *Ossetes* live to the west of the Mistdjeghis, and are a people of precisely the same character. Their language and other circumstances have induced some writers to believe that they are a Median colony transplanted into the Caucasus at some remote epoch; and Klaproth supposes them to be the Sarmato-Medians of the ancient, and the Alani or Ases, of the middle ages. The Russians have, as yet, succeeded in establishing their authority over only a few villages in the valleys of the Terek, through which the military road to Georgia passes. The low country, to the north of the Terek and the Kouban, is inhabited by *Nogai-Tartars* and *Coumyks*; the latter of whom possess the lower parts of the rivers Sundsha, Koisou, and Axai; the former the country farther west.

The Russians first got possession of this country in the time of Peter the Great, who even extended his dominion along the Caspian Sea into Ghilan; but, in the reign of the Empress Anne, the military establishments were withdrawn to Kislar, and a line of forts carried along the Terek, for the defence of the frontier. Mozdok was built in 1763, and from that point the line was extended gradually westward to the Sea of Azov, along the northern bank of the Kouban. The wars in which the Russians have been engaged with Persia and Turkey having led them again to the south side of the Caucasus, they have been anxious to establish their authority over the intervening mountain tribes, who, if not reduced to subjection, are likely to prove the most troublesome and dangerous neighbours. In the course of time they will probably succeed in effecting their subjugation; but as yet their progress has been very slow; and, as the policy of the government is not to adopt the only means of civilizing them, by introducing a rational system of moral and intellectual education, the contest will most probably end in the extirpation of the mountain tribes.

Stavropol, the capital of the province, is a neat fortified town, near the Kouban, lat. 44° 49′. N. long. 41° 50′ E. *Georghievsk*, the capital of the province till 1825, and still the residence of the military governor-general of Caucasus, is a well-built fortified town, on the left bank of the Pod-Kouma, 90 miles S.E. of Stavropol. *Konstantinogorsk*, a small town, 20 miles S.W. of Georghievsk, is celebrated for sulphureous warm baths, which are resorted to by people from the farthest parts of the empire. *Petigorsky*, another much frequented watering place, 40 miles W. of Georghievsk; the water is hot, and strongly sulphureous. At *Kislavodsky*, S.W. of Georghievsk, there is acid water. *Karass*, a neat town, between the two last named places, at the foot of the *Bech-tau* (the five mountains, 4320 feet high), is remarkable for a colony of Germans and Scotch. *Mozdok*, a commercial town, and one of the principal military stations on the line of the Terek, 80 miles E. by S. of Georghievsk. *Kislar*, an important fortress and a large town, on a branch of the Terek, near its mouths. Besides the garrison its population is reckoned at 9000, the greater part of which are Armenians. Some of them are very wealthy, and have built for themselves the finest church in the region of Caucasus, at the expense of £24,000 sterling. *Vladikaukas*, on the right bank of the Terek, nearly under the 43d parallel N. lat. and 45° E. long., is a small fortress, with earthen ramparts and a ditch, which are well protected by palisadoes. Though comparatively insignificant, it has fully answered its purpose of keeping the neighbouring mountaineers in check, and preserving the communication through the pass of Dariel, of which it may be called the key. A suburb extends between the fortress and the Terek, which is partly inhabited by Russian dealers, traders, and soldiers, and partly by peaceful Ossetes. There are also some large gardens, where every kind of vegetable, but more particularly cabbages and potatoes, thrive admirably. There is also a celebrated orchard planted by General Del Pozzo, a late commandant.

§ 2. *Siberia.*

Siberia is the general name of the vast region which extends in length from the Ural mountains, on the borders of Europe, to Behring's Straits and the northern Pacific Ocean, which separate it from America; and in breadth from the Artic Ocean to the Altai mountains, which form the border between the Russian and the Chinese empires. Its extreme length, measured from the southern extremity of the Urals to Behring's Straits, exceeds 4000 miles; and its greatest breadth, from the parallel of 50° N. lat. to Cape Severo-Vostochni, about 1870. The original Siberia was a small khanat founded by the Tartars in the year 1242, on the banks of the Irtish and the Obi, which took the name of *Sibir*, from its capital. This khanat was invaded by the Russians in the sixteenth century, and after considerable resistance, was added to the dominions of the Grand Duke. As the Russian discoveries and conquests extended to the eastward, the name was vaguely applied to all the newly acquired country, till at length it reached the farthest limits of Asia on the Arctic and the Pacific Oceans; and it was even, for a time, extended to the kingdoms of Astrakhan and Kazan, on the west of the Urals. The name is now definitively restricted to the country east of those mountains.

Siberia may be described generally as an immense plain, sloping upwards from the Arctic Ocean to the Altai mountains and the Urals; but with an ascent so gradual as to be scarcely perceptible. The Urals extend along its western border from near the gulf of Karskala, in lat. 68° N., to the river Ural in lat. 51°; but in few places exceed the elevation of 5000 feet, their higher summits being to the north of the Polar circle; and immediately to the east of them lies the basin of the great river Irtish. This tract is so low, that at Tobolsk, 550 miles, in a straight line, from the gulf or sea of Obi, the lower portion of the town is only 128 feet above the level of the Arctic Ocean. And even the basin of the upper Irtish, on the south side of the mountains, 1750 miles from the ocean in a straight line, or 1000 miles more by the course of the river, has been found not much to exceed 1900 feet. At Irkutsk, on the Angara, 1400 miles from the ocean, in a straight line, measured along the 105th meridian, the elevation is 1246 feet; but at Kiakhta, 150 miles farther south, it rises to 2228. At Yakutsk, on the Lena, 560 miles from the sea, on the 130th meridian, the elevation is only 287 feet; and even at Katshuga, near Irkutsk, where the rivulets which form the upper branch of the Lena have their sources, it is only 1509 feet. The country which forms the watershed, in this direction, between the basins of the Lena and the Angara, though extremely uneven, is not mountainous; but a considerable rising is perceptible from Irkutsk to Katshuga, and the highest point of the road between them is 1771 feet. From Yakutsk to the river Aldan, the ground rises continuously, but gradually, as it proceeds eastward, till at Nokhinsk, on the western bank of the Aidan, it reaches 751 feet. On the eastern banks of that river, the mountain range, which has derived its name from the stream, rises with a steep ascent. The mountain pass on the road to Okhotsk is 2619 feet high; and Mount Kapitan, the highest point of the Aldan mountains in this direction, rises to 4055 feet. On the east of Mount Kapitan, the country continues to be from 2400 to 2600 feet above the level of the sea; and only to the east of Ketanda, in 60° 40′ N. lat., and 141° 38′ E. long., it descends with a rather steep declivity to Okhotsk, which is only 13 feet above the level of the sea. The mountains of Aldan form

the eastern boundary of the great plain of Siberia, and leave between them and the sea of Okhotsk, only a very narrow strip of land covered with marshy forests, which produces scarcely any plant subservient to human subsistence.

The plain of Siberia seems to consist almost entirely of steppes and marshes, intersected by large sluggish rivers, which roll down an immense mass of water to the Arctic Ocean. The steppes are extensive plains, somewhat different from each other in nature and aspect. In some places they are, like the American savannahs, covered with abundance of tall grass; in others the soil is saline, the salt appearing in the form of an efflorescence mixed with the earth, or in ponds or lakes of salt water: in general, they consist of very loose soil, and contain many lakes, because the waters, finding no declivity, remain stagnant. The steppe of *Ischim* occupies the greater part of the country to the south-west, between the Tobol and the Irtish, an extent of 700 miles from east to west; and the country between the Irtish and the Obi is occupied by the steppe of *Barabinsk*, of hardly less extent than the other, which comprises the whole space between the Irtish and the Obi. It is by no means dry and parched, as the word steppe is sometimes thought to imply, but abounds, on the contrary, with water to a remarkable degree, being full of lakes, morasses, and rivers, which flow either into the Om, the chief river of the steppe, or into the Obi or the Irtish. In some places the plain is a bog as level as the sea: here and there it is covered with grass or weeds, and with poplars and birches. Many of the little lakes are salt. The two largest are the *Uba* and the *Itkul*. The steppe of Ischim, sometimes, though rarely, presents the same aspect; and in both many tumuli or barrows are found, containing the remains of Tartar or Mongolian chieftains. Between the upper Obi and the Yenisei is a hilly ridge, which, however, disappears in the neighbourhood of Yeniseisk; and though there are some groups of hills in the south-western part of the district of Mangaseisk, which send a few small streams to the ocean, these are mere specks in the vast marshy plain which extends between the lower parts of the Obi and the Yenisei, presenting a dismal region, where the ground is continually frozen to a great depth, only superficially thawed in summer two or three feet, and covered here and there with some stunted plants, and a carpeting of moss. Beyond Beresov, in 63° 20′ N. lat., the face of the country along the Obi consists of an uninterrupted swamp, which is constantly frozen over, and unvaried by tree, hill, or mountain, except that the dwarf pine and the sand willow are occasionally seen. Such is the only prospect which meets the eye of the traveller for 400 miles along the Obi to Obdorsk, near its mouth. Farther to the east, in the country of the Tongooses and the Yakûts, lofty and well-grown larches veil the barrenness of nature, for 400 miles inland, but their number decreases as the traveller proceeds northward, and they gradually become dwarfish and stunted. Both the tree itself and the moss which covers it become coarser, but nothing can save them from the destructive blast of the north wind. A few stunted birches are the last to contend with this dread enemy, and the 70th degree of latitude may be assigned as the limit to the growth of trees. Between that line and the Arctic Ocean, extends an apparently interminable waste, called the *tundra*, consisting of land, lakes, and sloughs. It contains few rivers or streams, but some of the lakes are large, and of considerable depth, and all of them abound in fish. A death-like silence reigns throughout, only interrupted by the summer birds of passage. Still further north than this dreary region, there is a chain of large islands, separated from the mainland of Siberia by a strait of the Arctic Ocean, which is free from ice only for a few weeks in August. The general depth of this strait is small, although a strong current sets through it in the direction of Behring's Straits. In many places the former limit of the sea may be traced several miles inland; it is, in general, high and steep, whereas the present shore is low and flat; and on the intervening space is found a quantity of dry and half-decayed wood, apparently left there by the receding waters. Icebergs sometimes rest on the bottom of the strait. The islands extend 400 miles in a direct line from east to west, from the Lena to the Kolima, between the 74° and 77° N. lat. The largest is named Kotelnoi; which is hilly, and watered by a small river. Ammonites with a pearly lustre are found in its sands. Another of them is named *Noraia-Sibir* or New Siberia, discovered in 1809 by M. Hedenstrom, who explored 140 miles of its coast. The Arctic Ocean may be said to commence only to the north of these islands in the 76° of latitude. It never freezes, but in March every year a few detached blocks of ice may be seen floating upon it. The regions along the southern borders of Siberia are, as might be expected, considerably different from those we have now been describing. Though hilly in many places, they contain large tracts of excellent pasture ground, and some which are even very fertile in grain; so much so, that in the district of Krasnoyarsk on the Yenisei, the soil is so rich that it requires very slight labour, and may be cropped for five or six years, or even more, in succession, without manure. In the neighbourhood of Irkutsk the country is agreeable, the soil fertile, and agriculture flourishing. Kirensk, on the Lena, has also a fertile territory, producing plants of extraordinary size. As the Baikal is approached the country becomes more and more mountainous; and the district of lower Udinsk, to the south of the lake, is almost entirely covered with dark and marshy forests, where the soil produces nothing but moss and marsh plants, similar to those of the northern regions; and Upper Udinsk appears to be composed of sand and rocks, with a soil ill fitted for the culture of vegetables. It possesses, however, an astonishing variety of soil and climate; containing in one place narrow, gloomy, and cold valleys; and in another, hot sandy plains, and, a little way off, a surface of neutral salts. The province of Nertshinsk, south-east from the Baikal, along the Amoor, is covered with mountains. The plains are only wide valleys containing every where precipitous and perpendicular rocks, which have the appearance of being suspended in the air.

RIVERS AND LAKES.—The OBI issues from Lake Teletskoi or Altyn Nor, in the territory of the Kalmucks, near the frontier, under the 52° N. lat. Insignificant at its origin, it goes at first by the name of By or Biya, and only takes that of Ob or Obi after its union with the *Katunia* or *Katunya*, a large river, which joins it from the west. It passes through the governments of Tomsk and Tobolsk, becoming larger and more rapid by the accession of many powerful streams, and enters the Arctic Ocean at the head of the deep gulf or sea of Obi, to which it gives its name. Its affluents on the right are the *Tom*, which waters Tomsk, the *Chodim*, the *Ket*, the *Tim*, and the *Vakh*. The principal affluent to the left is the IRTISH (Irtyche or Irtuish, Ertshish of the Mongols), as large as itself, or, as some say, rather larger, which, rising in the great Altai mountains under the 46° N. lat., forms the lake *Zaisang* in the Chinese territory, and thence flows north through the mountain border of the two empires. It receives in its progress the *Narym*, *Bukhtarma*, and *Uba*, before it enters Siberia, and afterwards the *Ishim*, *Tobol*, *Sosva*, and several other streams from the left, and joins the Obi in lat. 61° N. The Teletskoi lake, from which the Biya issues, is inclosed by high mountains, but receives a considerable river, the *Chulyshman*, from the Chinese territory.

The YENISEI has its sources in the country of the Ouriangkai, in the Chinese territory, where it is formed by the union of the Oulou-kem, and the Beikem. After entering Siberia it flows almost due north to the ocean, with a very large and rapid stream, which, even at Yeniseisk, is already 3600 feet wide. Its principal affluents on the right are, the *Upper Tongouska*, the *Podkamenaia Tongouska* (Tongouska beyond the rocks), and the *Lower Tongouska*, which is the largest of the three. The Upper Tongouska issues from the Lake Baikal, under the name of *Angara*; and if we consider the *Selinga*, the principal feeder of the Baikal, as a continuation of the Angara, then the remote sources are to be traced to the south side of the Altai, nearly 500 miles south-west of Irkutsk.

The *Piasina*, the *Taimoura*, the *Khatonga*, the *Anabara*, and the *Olenik*, are comparatively small rivers which enter the ocean between the Yenisei and the Lena.

The LENA, one of the largest rivers of Asia, rises at Katshuga near Irkutsk, 2000 feet above the level of the sea, flows north-east and nearly due east to Yakutsk, where it turns north, and flows in that direction to the ocean, which it enters by several mouths. Its principal affluents on the right are, the *Aldan* and the *Vitim;* on the left, the *Viloui*. The *Iana*, the *Indigirka*, and the *Kolima* or *Kolyma*, are considerable rivers which enter the Arctic Ocean to the eastward of the Lena. The *Anadir* flows eastward to the Gulf of Anadir, to the south of Behring's Straits.

The URAL, which forms the boundary between Europe and Asia, rises on the east side of the Ural mountains, from the foot of Mount Kolgan, in lat. 54° 50′ N., and flows nearly due south for upwards of 250 miles, when it turns westward and leaves Siberia.

The great Lake BAIKAL, in the south-eastern part of Siberia, embosomed among high mountains, between 51° and 56° N. lat., and 104° and 111° E. long., is about 360 miles in length, and from 20 to 52 wide, about 1200 in circumference, and contains a surface of 14,800 square miles. Its depth varies from 20 fathoms to 100, and in some places exceeds even 200. It contains many islands along the eastern and some on the western shores; but most of them are of small extent, and only masses of rock. The largest island, named Olkon, is 32 miles in length, by 10 in breadth, is rocky and mountainous, and is separated from the shore by a strait two miles wide and very deep. The water of the lake is fresh, and extremely clear. It freezes in November, and thaws in May, and during winter is crossed in sledges. It is subject to remarkable agitations, being sometimes raised into high waves by a moderate wind, and at other times scarcely put in motion by a violent storm. It also is said to be liable to a kind of intestine commotion or boiling, by means of which vessels receive rough shocks, even when the surface is perfectly smooth. The lake contains seals, though none of these animals are ever known to ascend the river Ienisei, and its affluent the Angara, which issues from the lake. It also contains a particular kind of fish, which the Russians call Sollamanka, and which, according to Pallas, consists entirely of bones, and an oily grease. The waves sometimes throw on shore a kind of bitumen. The principal feeders of the lake are the *Selinga*, on its south-east side, which has a course of 700 miles; the *Upper Angara*, at the north-east end, which has a course of 450 miles; and the *Barguzin*, on the east side, which has a course of 300 miles. The surplus waters are discharged by the *Lower Angara*, which issues through a deep crevice near the south-west point of the lake. The Russians speak of the Baikal with a respectful awe; and give it the name of the Holy Sea; even the surrounding mountains are held sacred. Its name is derived from the language of the Yakûts, who call it *Bayakhal*, the rich water. Its surface is 1793 feet above the level of the sea. In summer it is navigated by the Russians, and in winter it is crossed in sledges.

The other lakes are of little importance. Lake *Tshamy*, 80 miles in length by 50 broad, lies in a part of the steppe of Baraba which is filled with lakes almost touching one another. The province of Kolhyvan and the steppe of Ischim also contain a great number of lakes of which *Karg-Algydim* is the largest. In the districts of Iset and Iekaterinburg the number of small lakes is very great. Salt lakes are almost equally numerous, and are found in all parts of the country. The lake *Bielai* or *Ebelai*, in the steppe of Ischim, is one of the most abundant in producing salt; and in the middle of the steppe of Baraba is the famous lake *Yamish*, 7 or 8 miles in circumference, the salt of which is extremely white, and crystallizes in cubes.

CLIMATE.—The climate of Siberia is, in every sense of the word, excessive. Exposed without shelter throughout its whole length to the winds which blow from the Polar ice, and excluded by the high mountains of Central Asia, from the more genial breezes which would otherwise reach it from the equatorial regions, the cold in the northern part is keener and more constant than that of Lapland, and the same intensity is sometimes experienced among the southern mountains between the parallels of 50° and 55°. The winter lasts for nine or even ten months. Snow begins to fall in September, and is not rare even in May. The corn crops, when not ripe in August, are considered as lost; and they are often covered with snow before they can be cut down. The consequence of this almost continual cold is, that in all the northern parts of the country the ground is constantly frozen to a great depth; and it is only the surface that is thawed by the summer heat to a depth of from one foot to three feet and a half. Even so far south as the latitude corresponding to Scotland, between 56½° and 58°, Humboldt found some springs of no great depth, the temperature of which was 34° 7′ and 36° 5′. Some degrees to the north of Irkutsk, where the mean temperature of the year is between two and three degrees below the freezing point, the soil always remains frozen to the depth of 12 or 15 feet. At Bogoslovsk, in the middle of summer, a bed of frozen earth, nine feet and a half thick, was found at the depth of six feet below the surface; and, at Yakutsk, 62° N. lat., notwithstanding the high temperature of the atmosphere, in July and August, the subterranean ice is perpetual. At Yakutsk, in lat. 62° 1½′ N., a well has been lately sunk to the depth of 382 feet, by which the temperature has been ascertained; and this immense thickness proves that Siberia must have been in the same physical condition for a long period of years as it is at present. The mean temperature of the atmosphere at Yakutsk is 6° Reaumur; in 1828, the mean temperature of January at two P.M., was 35° 7′ Reaumur, and the mercury did not thaw for three months in succession; in ordinary years it is solid only for two months. It is impossible to determine accurately, in the present state of our information, the boundary of this layer of ground ice; we know only enough to say, that it extends over an immense tract of country. Humboldt found the soil frozen at a depth of six feet at Bogoslovsk, 59° 44′ N., near the Urals. Near Beresov, Erman found the temperature of the soil at a depth of 23 English feet to be + 1°; but in 1821, a dead body, which had been buried upwards of 9½ years, was found in a bed of ground ice showing no signs of decomposition. It has long been known that the soil at Obdorsk is always frozen. At Tobolsk there is no ice, but the farther we proceed eastward the more the direction of the ice is to the south. Georgi found it on the shores of Lake Baikal, and it is said also to be found at Nertshinsk. No ice is found at Okhotsk, and the soil is in general warmer on the shores of the Pacific. The summer heats are short, but are sudden and powerful. In the neighbourhood of Yakutsk the Tongooses often go naked in summer. The growth of vegetables is almost perceptible. But in the neighbourhood of the Arctic Ocean, in the middle of the long day of the polar circle, a north wind is sufficient to cover the waters with a thin crust of ice, and to give a yellow and red tinge to the leaves of plants. Vegetation is often limited to a few days; but in that short interval the plants flower and form seed; they sometimes even grow in the morasses, where at all times ice is found on raising the moss. At Kolyma, the vegetation of summer is little more than a struggle for existence. In the latter end of May the stunted willow bushes put out small wrinkled leaves, and those banks that have a southern exposure, become clothed with a greenish hue. In June, the temperature at noon attains 72°; the flowers appear, and the berry-bearing plants blossom, when sometimes an icy blast from the sea gives the verdure a yellow blight, and destroys the bloom. The air is clearest in July, and the temperature is then usually mild, when millions of musquitoes darken the air, and force the rein-deer to leave the forests, and take refuge in the cold open plains near the sea, where they are pursued and killed without difficulty by the hunters. Winter prevails for nine months. In October the cold is somewhat mitigated by thick fogs, and by the vapour which rises from the freezing sea; but in November the great cold begins, and in January increases to 65°. Breathing then becomes difficult; the wild rein-deer withdraw to the deepest recesses of the forest, and stand there motionless as if deprived of life. As the sun returns the cold becomes even more piercing; and the intensity of frost which accompanies the rising of the sun in February and March is especially penetrating. Perfectly clear days are extremely rare in winter, because the sea-winds,

which always prevail, bring with them vapours and fogs, which are sometimes so thick as wholly to conceal the stars. But, though the climate is so severe and unkindly, it is not injurious to health; and the inhabitants are not subject to scurvy nor other infectious diseases. Storms are frequent in the southern regions; but near the ocean thunder is scarcely ever heard, though distinct flashes of lightning are sometimes seen. In the low countries on the Lenisei, the aurora borealis is seen from the beginning of October till Christmas; and in no country does this phenomenon exhibit greater magnificence. The climate of Siberia is, on the whole, favourable to man. Fogs prevail not only over the northern and eastern regions, but also in the steppe of Baraba, the inhabitants of which have a cachectic look. In Daouria, and round Nertshinsk, the confined narrow vallies give rise to fevers, epilepsy, and scurvy.

NATURAL PRODUCTIONS.—In so rigorous a climate only the most hardy plants can thrive: the oak, the hazel, the alder, the plane, and the wild apple, cannot withstand the rigours of the Siberian winter. They disappear in the neighbourhood of the Urals and the banks of the Tobol; but the oak and the hazel appear again, though feeble and languid, on the banks of the Amoor. The lime and the ash cease at the Irtish; the pine, which in Norway reaches the parallel of 70°, does not in Siberia pass beyond 60°; the silver fir reaches no farther than 58°. The common gooseberry, which grows in Greenland, does not succeed farther north than Türükhansk on the Lenisei, in lat 68°. Potatoes diminish in size, till, at the latitude of 60°, they are no larger than pease, and here the cabbage ceases to expand. But we are not to conclude from these facts that the great Siberian rivers pass through barren wastes; for they are skirted with thick forests of alders, willows, elms, Tartarian maples, white and black poplars, and aspens, besides an immense quantity of different kinds of pines, among which the Siberian cedar (*pinus sibirica*) sometimes reaches a height of 120 feet, while its rings of branches sometimes indicate an age of 150 or 200 years. It is only as far as the Lenisei that this tree displays its magnificence; to the east it diminishes in size, and, beyond the Lena, towards the eastern sea, it becomes quite dwarfish, though still preserving its proportions. The balsam poplar perfumes the air, and exudes its odoriferous resin. Siberia produces neither apples nor pears. The wild pear of Daouria only yields a tasteless fruit, of the size of a cherry. The fruit of the Siberian crab is also small; but the berry-bearing undershrubs, the *rubus chamæmorus*, the *rubus arcticus*, and different kinds of *vaccinium*, abound, and agreeable drinks are made from them. The steppes are covered with a kind of cherry tree, the fruit of which is abundant, and is used for making a species of wine. The Siberian apricot, which grows only in Daouria, produces a sourish fruit; the wild cherry grows in every part of the country, but the garden cherry tree becomes languid even in the neighbourhood of Ischim. During their short summer these wild countries are adorned with a considerable number of beautiful flowers, each region possessing some peculiar to itself. The true rhubarb has been sought for in vain. In western Siberia, cultivated grains generally disappear about the 58th parallel, though even there, on the banks of the Obi, Mr. Erman learned that wheat and barley produce forty fold on the fertile soil which is inundated by the river; and still farther north, at Beresov, 63½° N. lat., the cultivation of barley and rye has been tried with success. In eastern Siberia grain has been found not to ripen at 55°, nor in Kamtschatka at 51°. The mountains on the southern frontier are too cold and too dry; so that three-fifths of Siberia are scarcely susceptible of any sort of culture; but the south-western parts possess remarkable fertility. In the north of Kolhyvan barley gives a return of twelve, and oats of twenty fold. Buck wheat is apt to shoot in this black and light soil; but when sown in thinner soil it gives a return of from twelve to twenty fold. The greater part of the cerealia known in Europe grow also in the south of Siberia; but only the winter rye, barley, and oats, are cultivated. The Tartars, who are fond of white bread, have great difficulty in rearing a little wheat. In short, beyond the 60th parallel of latitude, with the exception already mentioned, and the 112th meridian, the cerealia do not succeed. In the north they are destroyed by the cold; and on the east the fogs prevent them from ripening. The culture of potatoes now supplies their place to a considerable extent. Common flax grows in several parts of the Urals. The *linum perenne* reaches to 66°; hemp only to 55°. At the foot of the Altai mountains some Tartars make thread and cloth from two species of nettles, the *urtica dioica*, and *cannabina*. Hops are produced in great abundance.

ANIMALS.—Siberia scarcely exhibits a single genus of birds or quadrupeds which is not common to it with Europe. Wild rein-deer roam in herds near the shores of the Arctic Ocean, and, when domesticated, form the wealth of the desert tribes; but they come down to a lower latitude than in Europe. Herds of them have been seen on the mountain border of Mongolia, near the sources of the Onon, between lat. 49° and 50°; and thus the countries of the rein-deer and the camel, which in the western parts of the old world are separated by an interval of 20 or 30°, here touch each other, or perhaps are intermixed. A Samoiede is reckoned rich who possesses 150 rein-deer; some Tongooses have as many as a thousand; a Koriak, several thousands; and we are told that among the Tshuctshes there are men who own as many as 50,000! The Siberian dog, resembling the wolf, is in some measure the companion of the rein-deer. He serves as an animal of draught, not only among the Kamtschatdales, but also among the Tungooses, the Samoiedes, and the Ostiaks. He is swift and agile, but wild and difficult to guide. The Tartars of western Siberia have carried along with them in their migration the favourite animal of their nation, the horse. The greater part of the Siberian horses are white. The sheep of the nomadic tribes are of the broad-tailed kind. The black cattle of Russia, when transported to Siberia, diminish in size, but improve in strength. In general the animals of central Asia extend more or less into the southern parts of Siberia. The camel not only comes to the country with caravans, but he lives in Daouria among the Russian Mongols. Next to North America and South Africa, Siberia is the most extensive hunting ground in the world; but, owing to the eagerness with which they have been pursued, the animals of the chase are now very much diminished in number, and are only to be found in the most remote districts. Sables, ermines, marmots, martins, and squirrels, are the principal animals hunted for their skins. The rock or ice fox (*canis lagopus*, or *Isatis*), whose colour in general is white, but sometimes bluish, inhabits the icy zone, Kamtschatka, and the eastern islands. The elk is diffused over great part of the country, but does not pass the latitude of 65°. It is hunted in March when the snow begins to melt. The tahia or wild horse is found in the steppe of Ischim, and in various parts of the mountain border; the koolan or wild ass, the jighetai, a sort of mule, the stag, the roebuck, the antelope, the argali or wild sheep, which extends from the Caucasus to Kamtschatka, some wild boars on the banks of the Irtish, the musk animal, though rare, and beavers in Kamtschatka. There are also various small animals worthy of notice, as the hare of Daouria (*Lepus tolai*), the hare of Mongolia, the mountain hare, which makes a regular provision of hay; moles, weasels, and several animals of the rat and mouse kind, among which we may mention the lamming, and the species called the *mus œconomicus*, and the *mus socialis*, which store up in their holes considerable quantities of onions and other esculent roots, which the Siberian diligently searches out, to apply them to his own use. Among the wild beasts the white bear is the most formidable; the brown bear is also common; the ounce, and a species of panther with long white hair, have been found in the south; the lynx and the glutton are natives of every part of the country, and even the tiger has appeared on the banks of the Lena, to the north of lake Baikal. Both natives and travellers are annoyed by insects; in summer the air is darkened with mosquitoes, and even the rein-deer are forced to take refuge from these tormentors in the wilds of the tundra. The houses are infested with bugs. The country abounds with winged game, as wild-ducks, geese,

swans, water-hens, woodcocks, and partridges; and in summer innumerable flocks of ducks and geese cover all the lakes and marshes of the tundra. The Greenland and other seals, and the morse abound in the Arctic ocean; and a particular kind of seal is also found in the Baikal. Herrings are caught in the rivers in vast quantities; and it is worthy of remark, the farther to the east this fish is caught, the larger is the individual, although they are all of the same species. The herrings are followed up the rivers by a species of smelt called the muksun. The Lena is visited by shoals of sturgeon, and the salmo omul is occasionally found in the rivers of the tundra. The *salmo nasus*, and the *salmo autumnalis*, ascend all the rivers which have stony beds, as the Ienisei, the Lena, and others to the east, but do not enter the Obi, which has a slimy and earthy bottom. But to compensate this deficiency, the Obi produces very large sparlings, numberless sturgeons, white salmon, pikes, eels, and eel-pouts. The fisheries on the east coast, and among the adjoining islands, are very rich, and remarkable. In the seas which wash these regions are numberless shoals or herds of whales, sea-bears, sea-wolves, manatis, and sea-otters. Besides these living animals, numerous remains of elephants, rhinoceroses, and other animals of the torrid zone, have been found along the banks of the Irtish, the Obi, the Ienisei, the Lena, and even on the very shores of the Arctic Ocean. Bodies of these quadrupeds are found mixed with sea-shells, and bones which appear to be the skulls of the largest inhabitants of the ocean; they are met with along the river sides, and in beds of earth or ice, and seldom, if ever, in a pebbly stratum. The *Liakhof* or *Lachow* islands are composed entirely of sand and the bones of elephants, rhinoceroses, and mammoths or Siberian elephants, which are quite entire, even sometimes with the flesh and skin in good preservation. Naturalists are quite at a loss to account for the occurrence of these remains in so high latitudes.

MINES AND MINERALS.—Siberia is rich in mines of gold, silver, platina, copper, and iron. Red lead, or the chromate of lead is found in the mines of Beresov. Chrysolites, opals, beryls, lazulites, feltspar, jasper, talc, black porphyry, and other minerals occur in various places; and, there can be no doubt, that much mineral treasure yet remains to be discovered. The grand mining districts are in the northern part of the Urals, on both sides of the range, in the government of Perm. It is, however, on the Asiatic side of the mountains that the auriferous sands are found, which contain pieces of gold, platina, and chromate of iron united with platina. These metals are often found only a foot below the surface. The principal gold mines are those of Beresov, in the district of Iekaterinburg (56° 54′ N. lat.) They were first worked for gold in 1754, but they did not rise to any importance till the time of Catherine II. The number of workmen employed is upwards of 3000. The ore is an iron pyrites, mixed with quartz, which contains gold; 3¼ or 5 lbs. English are obtained from 1250 stone weight of the crude ore. About 45 miles N. by W. of Iekaterinburg are the gold mines of *Neviansk*, belonging to the Yakoklef family, which are managed and wrought by their serfs, who compose the great bulk of the population of the district, about 10,000 in number. Though the proprietors rarely visit their estates, they have a castle at Neviansk, which is richly furnished in the antique Dutch fashion of the days of Peter the Great; where they allow a liberal sum to their steward expressly for the entertainment of respectable travellers. The earliest mining works at Neviansk were constructed by a body of the unfortunate Swedes who were taken prisoners at the battle of Pultova, in 1709. The mines of *Tagilisk*, 70 miles N. by E. of Iekaterinburg, with seven others within a circuit of 30 miles, all belonging to the Demidoff family, are, like those of Neviansk, wholly managed by serfs, without any immediate or personal superintendance of the owners. The principal produce is iron, but the district yields also copper, gold, and platina. The magnitude of the works at Tagilisk corresponds with the boundless mineral treasures of the surrounding country; the roasting furnaces being large enough to contain at once 14,000 tons of ore. The value of the mineral veins possessed by the Demidoffs is much enhanced by the immense extent of forest included in their estates, and which are adequate to feed the blazing fires of their colossal furnaces for ages to come. On the territory belonging to their mines are 5000 square miles of fine forest, in which the trees stand so close together that the woodman has scarcely room to wield his axe! In quantity, as well as in financial importance, the iron undoubtedly far surpasses the other metallic produce of the country. There is annually produced the enormous quantity of 132,000 tons of metal, of which four-sevenths are consumed in European Russia, two-sevenths in Asiatic Russia, and one-seventh is exported to the south and the south-west. The iron ore near the surface is spread over so wide an extent, that it is calculated many ages must roll over before it be exhausted: the hill of Blagodat alone, which rises from the plain near Kuschiva or Koushva (38° 17′ 30″ N. lat., 60° 18′ E. long.) to the height of 1534 feet above the level of the sea, is entirely composed of magnetic iron ore, forming a mass much larger than would be consumed in a century at the present rate of production. The Uralian copper mines yield about 3500 tons of metal yearly. The gross value of the platina and gold found in the Urals nearly equals that of the iron; and the total annual production of that celebrated region may be valued at £1,500,000 sterling. Silver is rarely found in a native state, but is often mixed with gold, and in one of the Daourian mountains with lead. Corneous silver ore *(argentum muriatum)* is found at *Schlangenberg* (called by the Russians *Zmeiawetkaia-gord*, in the Little Altai mountains, and in the district of *Semipulatnoi*), where sulphuret of antimony and silver, and arsenical ore, and copper pyrites, also abound. In Daouria, south-east of Lake Baikal, are the numerous silver mines of Nertshinsk, opened in 1704. The ore is rich in lead, and contains a little silver, which is easily extracted. Besides the copper mines in the Urals, there are some in the Altai. The richest mines are on the Siberian side, at Turia-Wasilewskoi, Trolewskoi, and Ologowskoi; and are found at the limit which separates the schistous rocks from the pure limestone. The copper of Siberia is exceedingly ductile. The prevailing ores in the mines last mentioned are the red oxide and the blue carbonate. Malachite or stalagmite copper is also found here in the greatest perfection. The iron mines diffused over Siberia (besides those of the Urals) are little worked. The peasantry smelt iron in the neighbourhood of Krasnoyarsk and Ieniseisk; but at Nertshinsk and Kolyvan the other more valued metals are so productive that iron is despised. In 1749 a mass of native iron was found, between Abakansk and Karaoolnoi Ostrog, near the upper Ienisei, weighing 1680 lbs., which, according to a tradition of the natives, had fallen from the atmosphere. Asbestos is also produced abundantly in the Urals and in other places; and on the eastern coasts there is found a soft and almost fluid clay, called lithomarge or rock marrow, which the Tongooses eat by itself, or with milk, without inconvenience. Throughout Siberia there is found on the aluminous schistous an efflorescence called "rock butter," which is used by the people as a remedy for diarrhœa and the venereal disease. Diamonds have lately been found, but in small quantities.

PEOPLE.—The Russians are of course the dominant people; but they, with the Cossacks, and other colonists from Europe, inhabit chiefly the towns and the military stations. Some of them are descendants of the soldiers employed in the conquest, or in keeping the country in subjection; others are criminals sent thither for banishment, with their descendants. To these two classes must be added adventurers, peasant deserters, and ruined merchants, who seek here the means of repairing their fortunes. The higher officers of government are a very fleeting class of the community: all of them, whether civil or military, who volunteer to serve in Siberia, are entitled to promotion by three years' service beyond the Irtish; many seek professional advancement by this voluntary exile, but few prolong their stay beyond the time required. The advancement, however, of civilization in Siberia of late years, and the greater advantages which it now holds out to settlers, have induced many people of a better description than those who used formerly to visit it, to take up their permanent abode in

the principal towns, and in the more fertile and agreeable districts of the country. Little more than a century ago the Siberians were considered so savage a race, that Peter the Great believed he could not inflict a severer punishment on his enemies the Swedes, than to send them to Siberia. The consequence was, that these honourable exiles introduced into the country some of the customs and manufactures of Europe, and while employed in ameliorating their own situation, civilised the people among whom they had been forced to settle. More lately, the governors, with civil and military officers, have introduced into the principal towns the manners of St. Petersburg, accompanied with all the Russian vanity and ostentation. But this refinement has scarcely yet extended to the small towns and villages scattered over the vast wilderness; though even there, in the most remote stations, respectable travellers are received with the greatest hospitality, and treated with the most cordial kindness. Some of the settlers, though rich in flocks and herds, scarcely know the use of money, and lead a life purely patriarchal. The hunters, however, that roam over the deserts, are not much removed from savages. They sleep on the frozen ground; quench their thirst with wild berries; and even drink the blood of their victims. The Cossack who, at Tobolsk, or Irkutsk, finds himself confounded with the populace, becomes a sort of monarch when sent among the Samoiedes or the Yookaghirs, to collect their tribute and maintain order. Some Cossack families have obtained the rank of dvorianin, or patrician nobles. The garrisons of the posts and stations along the frontiers are mostly composed of Cossacks, who are everywhere the most active and useful servants of the government. The merchants of Siberia used to be chiefly itinerant, going from town to town, and from market to market. Of the exiles, those condemned for political offences, and who belong to the upper classes of society, are usually sent to towns far to the north or the east, where, from their strong nationality and constant habits, they are unable to accommodate themselves to the rude and simple manners of the country, and consequently lead a miserable existence. The difficulty of keeping horses, or of using them in a country of snows and morasses, is a frequent ground of complaint. The exiles or unfortunates, as they are compassionately styled residing in Tobolsk, are chiefly persons convicted of embezzlement, or other acts of dishonesty. They are in general free from all kind of restraint, but some of them are bound to perform certain religious penances in the churches; and many submit to the same punishment voluntarily. Offenders of the worst class are often condemned to hard labour in the mines of Nertchinsk for one year or more, and after having completed the period of their severe punishment, are allowed to reside in Tobolsk; but, generally speaking, the Siberian exiles of the labouring classes are in the situation of settlers enjoying full liberty to make the most of their industry. Their exile puts an end to their vassalage for the greater part of them are originally serfs, and raises them to the rank of independent men. To this grand change in their condition, and the moral sense to which it gives birth, must be chiefly ascribed the revolution which takes place in their character. In this, their new country, the unfortunates of this class turn out for the most part exemplary men, and rarely fail to procure by their exertions a comfortable independence. To most of the settlers the long winter proves a period of relaxation from labour. The Russian works for one-half of the year with matchless energy, to make himself comfortable during the other: and when the time of rest arrives, he sits down with a keen appetite to feast on his hoarded stores. The exiles are to be found everywhere comfortably lodged, and in the midst of abundance, which they always feel a pleasure in sharing with the stranger.

Numerous Tartar colonies occupy the southern part of the government of Tobolsk. Those farthest east are the Biriusses, the Kat-chini or Katchinians, and the Beltires; three tribes which, more or less mixed with Mongolian blood, live in the neighbourhood of the Abakan, an affluent of the Yenisei. The Katchinians are rich in cattle; and their beardless visages shew them to be of Mongol lineage. In the south the Sayanians, who have some resemblance to the Mandchews, occupy the Sayanian mountains. A tribe of Teleoctes or Telengutes, live in the neighbourhood of Kutsznesk; but the greater part of them are found in the Kalmuck country. The Russians call them white Kalmucks; their language is half Mongolian. The Tomsk and the Tchulim Tartars inhabit a part of the banks of these rivers. In the Baraba steppe are the Barabinitsi, a nomadic people, some of whom are Mahometans, and the rest Pagans. The Tartars of the Obi live along the left bank of that river as far as Narym. The Tartars of the Tobol are found on both banks of that river, from the frontier to its mouth. The Tarahans, in the district of Tara, speak the same language as the last. The Turalinzi or Turalinians, the most civilized of all the Tartars of Siberia, inhabit the towns and villages on the banks of the Tara, from the mountains to the Tobol. They were forcibly baptized in the river by Philoppei, a nobleman or ecclesiastical dignitary, assisted by a body of Cossacks. The Tartars are generally of a robust and vigorous constitution. Their simple mode of life, their frugality and cleanliness, protect them from most of the malignant and contagious diseases, with the exception of the small-pox, which has at times made terrible ravages among them; and the precepts of the Koran protect the Moslem portion of them from the consequences of the drunkenness to which their Russian neighbours are too much addicted.

Tribes of true Mongol descent occupy the country about Kiakhta and Selinginsk, but are few in number. The Booriates or Barga-Buratt, a great Mongolian race, have peopled almost the whole provinces of Irkutsk and Nertchinsk. In external appearance they resemble the Kalmucks; but there is a greater proportion of fat people among them; they have still less hair; and many of them have no beard whatever. Their complexion is pale and yellow; they are very deficient in bodily strength: a Russian of the same age and size as a Booriate is a match for several of them in wrestling. They enjoy, however, good health, though they seldom reach an advanced age. The small-pox, once very destructive to this tribe, has been arrested in its ravages by the establishment of an institution for inoculation at Irkutsk. The itch is very prevalent, being greatly promoted by their manner of living and clothing. Those to the east of the Baikal make use of warm baths in chronic diseases. Their physicians are shamans, or sorcerers, who attempt to cure them by sacrifices, talismans, and incantations, rather than by natural remedies. They speak a very rude dialect of Mongolian, which is rendered unintelligible to strangers by frequent transpositions and changes of consonants. Those Booriates who live north-west of the Baikal are Shamanists, those to the south-east are Buddhists. Some of them cultivate the ground; but the far greater number live on the produce of their cattle; they have numerous herds of horses, bullocks, and sheep; also a few camels, which in winter are covered with blankets. Their chief wealth consists in horses. The number able to bear arms is 73,000. They are governed by native chiefs, called taishas.

Tongooses.—This people call themselves *Ewen*; the Chinese call them *Solon*, and the Yookaghirs *Erpegh*. They have a common origin with the Mandchews; and are distinguished by their regular conformation. They are usually of middle size, slender, and well made. Their face is less flattened than that of the Kalmucks; they have small and lively eyes, a well proportioned nose, a thin beard, black hair, and an agreeable expression. They are subject to few diseases, yet they seldom attain old age, a circumstance which is owing to the rigorous and unwholesome climate, and their laborious and dangerous mode of life. The priests or shamans are their physicians. Their sight and hearing are incredibly acute; they are not only well acquainted with every tree and rock within their district, but can point out with certainty a road of a hundred miles, by describing the stones and trees which occur in it; and they follow their game by the slightest tracks left on the grass or the moss. Their other senses, however, are less acute. Their religion is a branch of Shamanism; their chief god is called Bea. They practise polygamy. Their princes are called *taisha*, a word which appears to be

of Mongolian origin. Their language is a dialect of the Mandchew, with a mixture of Mongolian words, chiefly such as relate to objects of civilised life; and has eight or ten dialects. The Tongooses occupy no less than a third part of Siberia, extending from the Ienisei to the sea of Okhotsk, on the south-east, and to the Lena on the north-east. Those on the Lena, who are called *Olenians*, live by the produce of their rein-deer, and by fishing and hunting; those who occupy the coast of the eastern sea are called *Lamutes* or shoremen (from *lama*, the sea), and border with the Koriaks.

Finns.—Tribes of this race are found along the base of the northern Urals, and on the lower Obi. The *Woguls*, who live between the Tobol, the Beresov, the Obi, and the Urals, are under the middling stature; with generally black hair, and little beard. Their principal occupation is the chase, in which they display singular agility and address, managing with equal dexterity the musket and the dart. They also excel in laying all sorts of toils for deer. They call themselves *Mansi*, and have a very mixed language. They are nomadic; but, apparently with a view to spare the game, they change their dwellings less often than many tribes of Eastern Siberia. They never join more than five yurts or huts, in one station; and to prevent the wild animals from being frightened away by the smoke, these stations are not allowed to be fixed nearer each other than ten miles. Rein-deer constitute their whole stock; and even in summer these animals are yoked in sledges to cross the level country; but the winter is almost exclusively their season of labour, of travelling, and of collecting their booty. It is then that they are busily occupied in the chase of the fur-animals, and in the trade arising out of it with the Samoiedes, the Ostiaks, and the Russians. Their annual migrations, or trading excursions eastward, are very remarkable; for the European Samoiedes travel in winter across the Ural, and while their eastern neighbours and the Woguls, who dwell to the south of their route, all move in the same direction, they often drive 400 miles, as far as Obdorsk, to barter, in February, the produce of the chase for Russian bread. The Woguls, during summer, give themselves up to lazy repose, and, as the smoke protects them from the flies, they scarcely ever leave their tents at that season; in short, they seem to fall into a summer sleep, retaining just sufficient life to enable them to digest their winter feasts. The *Ostiaks* of the Obi, who are likewise of Finnish extraction, hold the whole extent of country from the Togurian district of the circle of Tomsky (in 59° north lat. and 83° 20′ east long.) to Obdorsk, and from about 100 miles north of that fort to about 660 miles south of it. In summer and at the beginning of spring they inhabit temporary dwellings, which they call jurtes, on the banks of the large rivers; but in winter they retire to the forests, where they have permanent jurtes in the neighbourhood of water. Their settlements are met with at intervals of from 6 to 24 miles, and contain from four to twenty jurtes, placed within 320 feet of each other, and built wholly of cedar-wood, although many other kinds of trees, as the birch, pine, fir, spruce-fir, and larch, are to be had in abundance. They are a small and feeble race, of mild manners, and unmeaning physiognomy; and have hair generally of a reddish, or light yellow cast. They wear a tight dress made of fish skins or furs. Nothing is more disgusting than their appearance and manner of living; and yet they enjoy good health. They generally die of scorbutic, nervous, or other chronic diseases. Their property consists wholly of rein-deer, and the possession of from 200 to 500 of those animals is considered as indicating affluence. Their name is said to be a Russian corruption of the Tartar word Ustiak, signifying wild or ignorant men. The northern Ostiaks call themselves *Kondicho*, from the name of the river Konda, and the word *cho*, a man. The Ostiaks of the south call themselves *Asjakes* after their river Jake. Historians have traced the descent of this people to the Finns, but there is a broad distinction between the two nations in their physical and moral conditions, and particularly in their languages. The Ostiak tongue is said to have no affinity with any European or Asiatic language (which can hardly be the case unless they be autochthones), and is so poor in words, that those who hold much intercourse with the Russians, borrow from them, and adopt new expressions for such ideas as they cannot render into their own dialect. The Russo-Greek form of Christianity was introduced among the southern Ostiaks about the year 1632, but their mode of life makes them very remiss in the observance of religious ordinances; and, what is worse, they have become addicted to the vice of inordinate drinking. The northern Ostiaks are still pagans, though they practise baptism, as well as their more enlightened brethren, and give their children Russian names; the women veil themselves in the presence of strangers. Their general employments are hunting and fishing, and many of them live in a kind of simple affluence. The Ostiak yokes but two dogs to his sledge, unlike the natives farther east, who drive five or six pairs in a train. The bear enjoys among them a kind of religious veneration. They offer sacrifices before setting out to hunt this formidable animal; and, after having killed one, they celebrate his memory by an expiatory fete, and by songs addressed to his manes.

The *Samoiedes* occupy an immense extent of moss-covered marshy territory, which stretches along the coast of the Arctic Ocean from the river Mesen near Arkhangel, to the Khatunes, upwards of 2000 miles in length, and from 270 to 550 in breadth. Their ordinary stature is from four to five feet; they are generally broad, with very short legs, a large and flat head, a flat nose, the lower part of the face projecting, a wide mouth, large ears, a very scanty beard, and small, black, angular eyes. To these attractions they add an olive coloured skin, shining with grease, and black and bristly hair, which, though it is small in quantity, they arrange with great care. The women have an agreeable shape and mild features, and arrive very early at puberty. The girls are generally marriageable at eleven or twelve, but they have few children, and cease bearing before thirty. The women are considered as impure beings, and are obliged to perfume themselves before passing the threshold of the cabin. The Samoiedes are nomadic, and move frequently from place to place. They have much in common with the Ostiaks, but maintain a better character, and are less addicted to drinking. Their wants are very limited; hunting is their chief employment; and their wealth consists in rein-deer, the poorest Samoiede possesses a hundred, while the rich man's herd often amounts to 10,000. They all quit the seashore in winter, when the ice sets in, and wander with their herds to the mossy hills of the interior. They are gross idolaters, their only worship being a species of fetichism. Their magicians are adroit jugglers; but, in supporting their assumed character of inspired persons, many of them become really frantic. Their amusements consist in dances, in which they keep time to a nasal sort of song. They are divided into different tribes, of which the *Obdorians* and the *Joorahs* are the most remarkable. They have a peculiar language, apparently unmixed with any other. It is believed that the whole Samoiede race have moved down the course of the Ienisei; for there are still found in the country which stretches from the upper Ienisei and the Abakan, to the west end of lake Baikal, some small tribes which use dialects containing a great mixture of Samoiede words, or even belonging entirely to that language. Such are the *Soyetes*, who are said to be numerous in Chinese Mongolia; the *Kaibales*, who leave the dead bodies of their children exposed on the trees, and who dispute with the mountain hare the heaps of hay provided by that intelligent animal; the *Matores*, the *Karagasses*, the *Kamachinzes*, and the *Ostiaks* of Narym. It might appear natural to consider the Ostiaks of the Ienisei or of Pumpokol as a link of the chain; but it appears that this tribe of hunters has formed for themselves a peculiar jargon which defies the researches of historians.

The *Yakûts* inhabit the lower basin of the Lena from the neighbourhood of Yakutsk to the ocean, and appear to be degenerated Tartars, who have fled before the conquering Mongols. They call themselves *Socha*, in the plural *Sochalar*; and there is still among the Tartars of Krasnoyarsk a tribe which bears the same name. The Yakûts wear long hair, and short and open dresses. In want of attention to cleanliness they yield to none of their neighbours; and in their general habits of life they very much resemble the Tongooses, though they are considered to be less daring and active. They

are exceedingly superstitious; they reckon thirteen kinds of evil spirits, with the dread of which they are perpetually haunted; and the influence of their magicians is therefore unbounded. They have made considerable progress in cultivating the ground; and have introduced the rearing of cattle and horses, and have attained, not merely a scanty subsistence, but even some degree of comfort. They are now all baptised. But though they are properly a pastoral people, whose chief riches consist in the number of their horses and beeves; yet the abundance of fur-clad animals in their vast forests, and the profit which they make by selling them to the Russians, have induced them to turn much of their attention to the chase, of which many of them are passionately fond, and which they follow with unwearied ardour and admirable skill. The *Yookaghirs* inhabit the country between the Lena and the Kolyma; but geographers are in doubt whether to number them among the Samoiedes or the Yakûta, or among the tribes still to be enumerated. They live by the chase and the produce of their rein-deer, and are all baptised. They were formerly a warlike and formidable people; and the Russians found great difficulty in subjugating them. They are now all but extinct as a pure race, those who now bear the name being much mixed with Russian blood.

The *Chuckchee* or *Tschuktschi* possess the north-eastern extremity of Siberia, from the river Tshaun to Behring's Straits. They generally live in small camps near the rivers; their dwellings are dirty and their food disgusting. The dress of the women consists of a deer's skin hung from the neck, so that by untying a single knot, they are made completely naked. The Chuckchee have large features, but have not the flat nose and small eyes of the Kamtschatdales. They are expert slingers, and display much courage and address in whale fishing, which they conduct in the European manner, without having received instructions from that quarter. They still preserve their independence, but live on good terms with the Russians, and meet them for purposes of traffic at the annual fair of Ostrosya in February, where they exhibit a great degree of adroit management. The staple article which they purchase seems to be tobacco, in return for which they give morse-teeth, and various skins and furs. They are a bold and fearless race, extremely jealous of Russian traders and emissaries, and far from unintelligent. The *Shelagi*, near Skelatskoi-nosa, the *Ankuchalat*, and the *Peyerskoi*, on the islands of the Frozen Sea, who are little known, belong to the Chuckchee family. The Chuckchee are, however, in many respects a peculiar race, and are very little known. A great number of them have been baptized, but they remain as completely heathen as before, without the slightest notion of the doctrines or the spirit of Christianity. Their inducement to present themselves for baptism is solely to obtain the presents which are made to them on the occasion. They formerly all lived on the produce of their rein-deer; but those among them who happened to lose their herds by sickness or other causes, settled by degrees on the coast, and employed themselves in killing whales, seals, and walruses. They are now divided into two classes, the settled Chuckchee, who live on the coast, and the nomadic Chuckchee, who inhabit the hills. The latter, who form the bulk of the people, call themselves *Tenaygrik*. The two classes live on good terms with each other, and exchange their different commodities. The inhabitants of the coast furnish the nomadics with whale flesh and bones, walrus skin, and train oil, which is a favourite article of food, and receive in return rein-deer skins, both raw and made up into clothing. The coast of the bay of Anadir is inhabited by a people very distinct from the Chuckchees in figure, features, clothing, and language. They are called *Oukilou* (sea people), and are said to have formerly occupied the whole coast from Cape Schestakoi to Behring's Straits; and every where along this tract are the remains of huts, constructed of earth and whale bones, quite different from those of the Chuckchee. Captain Billings thinks that their language has a close affinity to that of the Aleutians of Kodiak, who are of the same stock as the Greenlanders or Esquimaux. They pass Behring's Straits in baidours or boats formed of skins; but the thick fogs and frequent storms render the passage dangerous in such frail vessels, and they therefore usually stop at the Gwoosdew islands.

The *Koriaks* live near the rivers Anadir and Oloutoria, between Kamtschatka and the country of the Chuckchee; who live by hunting, and the produce of the rein-deer. The Oloutorai speak a smooth language; but, in general, the idiom of the Koriaks approaches to both the Chuckchee and the Kamtschatdale.

The *Bashkirs* or *Bashkurs* are found in the provinces of Orenburg, of which the greater part belongs to them, and Perm, on the south-western borders of Siberia, speak a Tartar dialect, and are Soonee Mahometans; but it is difficult to trace their origin. They seem to form an intermediate link between the Finns and the Turks; their customs and habits are of Tartar origin, except the dress of the women, which is evidently Finnish. They have no longer any military chieftains; and have, for nearly a century, been good subjects of Russia. In disposition they are faithful, docile, and ready to oblige; and the traveller may pass through their country as safely as through any part of Europe. By an imperial ukase issued in 1832, they have been declared the owners of the gold mines on the east side of the Urals, on payment of one-tenth of the produce to the crown. Most of them subsist by rearing cattle, and a few by agriculture. They pass the winter in villages, living in clean wooden cabins; but in summer they are all abroad in the open country, and live under tents of felt. They may almost be said to live on horseback; but unwearied and skilful in all that pertains to horsemanship, they are dull and lazy in everything else; yet they are very expert falconers; they teach their small falcons to pounce on hares, while a larger kind, called berkuti, are trained to kill foxes, and even wolves. These birds they rear and train in considerable numbers, not only for their own use, but for the purpose of selling them to the Kirghis, and other wandering tribes of the steppes. They are divided into 12 cantons, subdivided into tribes or clans, jurtes, and villages. They pay no taxes, but are bound to provide post-horses, supply men for the frontier cordons, and hold themselves ready for any foreign service. They are, however, but indifferent soldiers. They cherish an inveterate hatred against the Cossacks, whom they excel both in courage and muscular power. Their principal weapon is the bow, in the use of which they are very expert, but fire-arms are rarely found among them.

INDUSTRY AND COMMERCE.—Besides the agricultural labours which are carried on in places suitable for the produce of grain, with the hunting and fishing, and rearing of horses and cattle, that form the chief occupations of the native tribes, the industry of the Russian settlers is principally directed to the working of the mines of the Urals, Kolyvan, and Nertshinsk, and the manufacturing of iron, copper, utensils of these metals, leather, shagreen, and carpets; arms, glass, salt, saltpetre, pitch, isinglass, and felts. The art of lackering has been brought to great perfection at Tagilisk, on the Urals, and the lackered wares are generally ornamented with paintings, the execution of which was for a long time wholly intrusted to such of the uninstructed workmen as seemed to manifest a taste for drawing; but of late years the proprietors of the mines and iron works have sent serfs into Europe to study the art of drawing and colouring. Some of these have even spent years in Italy, and afterwards returning to Tagilisk, have established schools of design for the benefit of their brethren. Among other branches of industry carried on at Iekaterinburg, is the cutting and engraving of precious stones. Amethysts, topazes, tourmalines, with quartz crystals of large size, are cut and polished with great skill; and are then inelegantly, though ponderously, set in the gold of the country. Besides the great abundance of gems found in the neighbourhood, many are brought from all parts of Siberia; and the trade of the lapidary is here carried on in the most extensive manner possible.

Tobolsk is the centre of Siberian commerce. The produce of the mines, fisheries, and hunting expeditions, and the rude articles supplied by the native tribes, as furs, peltry, mammoth bones, morse teeth, dried and salt fish, are here met with and exchanged for European and Chinese goods

and manufactured articles, woollen and cotton cloths, silk stuffs and the like; most of which, however, are drawn from China, the preference being partly due to their cheapness, and partly to the skill with which the vigilant Chinese merchant adapts his commodities to the wants of the country. Tea, likewise porcelain, silk, musk, and rhubarb, are imported by them to a considerable extent. A great trade is also carried on at the annual fair of Irbit, 100 miles N.E. of Iekaterinburg, which is the best frequented and the most important of all Siberia. The commerce eastward of Tobolsk is carried on through Kiakhta, Irkutsk, and several other intervening towns; the whole distance between Tobolsk and Kiakhta, with the exception of about 60 miles, being navigable by the branches of the Angara, the Ienisei, and the Obi; and although the route is exceedingly circuitous and tedious, amounting to no less than 8000 miles, the profits of the trade carried on with the Siberian tribes on the banks of the streams are considered a sufficient compensation for the time and trouble spent on the journey. From the south the merchants of Turkestan bring silk and cotton stuffs, precious stones, and other articles. Formerly caravans of some thousands of camels used to arrive annually at Omsk, Petropaulovski, Orenburg, and other frontier towns of western Siberia. But at present the dried fruits of Bokhara, the rich shawls, raw cotton, and other produce of the southern countries, are carried direct to Nishnei-Novgorod, in European Russia. Still, however, small caravans occasionally travel southwards from the Siberian frontier, taking with them otter and seal skins, linen, and bar-iron. The merchants, who are chiefly Tartars, though a Russian sometimes ventures to accompany them, assemble at Semiyarsk on the Irtish, about 600 miles S.E. of Tobolsk, and usually start in May, while the pools and streams in the desert are not yet completely dried up. The place to which they direct their journey is Tashkend in Turkestan, at a distance of two months travelling from Semiyarsk; the first 200 miles being over a wild and hilly country, across the Karakaralul mountains, which are thickly covered with forests of firs, willows, and black poplars, and infested by bears and wild boars; after leaving which they pass through a woodless country till they reach Tashkend. To the north, again, Obdorsk, 50 miles from the mouth of the Obi, is a point of the greatest importance to the Russian fur traders, and is the centre of the commerce carried on with all the tribes who possess the country from Arkhangel to the Ienisei. The traders begin to assemble in December, but the active traffic, or the fair, does not take place till February, when the yasak, or tribute of skins, is paid by the Ostiaks of Beresov. Besides other useful articles, great quantities of meal and baked bread are sent northward by private traders from Tomsk and Tobolsk, besides what is despatched on account of government, all of which serves as money in the traffic with the Ostiaks and Samoiedes, who are very fond of such luxuries. Petropaulovski, in Kamtschatka, is the principal port on the Pacific Ocean, but its trade is monopolised by the Russian American Company, who have also factories, or counting houses, at Moscow, Irkutsk, Yakutsk, Okhotsk, Kazan, Tomsk, and other places. Peltry forms the principal article of the trade.

DIVISIONS.—Siberia is divided into two great regions, called Eastern and Western Siberia, which are placed under the charge of governors-general, who reside respectively at Irkutsk and Tobolsk. Western Siberia includes the subordinate governments of Tobolsk and Tomsk, and the province of Omsk; Eastern Siberia includes the governments of Irkutsk and Ieniseisk, the province of Yakutsk, and the districts of Okhotsk and Kamtschatka. To these we must add those parts of the governments of Perm and Orenburg which lie to the east of the Urals, and also the country of the Chuckchee, who are independent. These divisions, with their principal towns, are exhibited in the following table:—

Provinces.	*Towns.*
I. WESTERN SIBERIA.	
TOBOLSK, .	TOBOLSK, Tumen, Tûrinsk, Ialûtorûsk, Tara, Kûrgan, Ishim, Sûrgût, Beresov, Pelym, Obdorsk.
TOMSK, . .	Tomsk, Kainsk, Smeinogorsk or Schlangenberg, Barnoul, Kolhyvan, Tomskoi-Savod, Riddersk, Sousûnsk, Bisk, Narym, Kûznetsk.
OMSK, . . .	Omsk; Petropaulosk, the principal fortress of the line of Ischim, and containing an important custom-house; Semipolatinsk, Ustkamenogorsk, Semiyarsk.
II. EASTERN SIBERIA.	
IRKUTSK, .	Irkutsk, Selinginsk, Kiakhta, Nijnei-Udinsk, Wertshinsk, Nertshinskoi-Savod, Troitskosarsk, Karensk, Balagansk, Bargousin, Vershnei-Udinsk.
IENISEISK, .	Krasnoyarsk, Kansk, Abakansk, Atshinsk, Ieniseisk, Tûrûkhansk, Minûssinsk, Khantanskoi.
YAKUTSK, .	Yakutsk, Vilûisk, Olekminsk, Olensk, Oustie-Olenskoie, Verakholansk, Vitimskoi, Sredne-Kolymsk, Nishnei-Kolymsk, Zachiverak, Jigansk, Oudskoi.
OKHOTSK, .	Okhotsk, Ijikhinsk, Kamenoi-ostrog.
KAMTSCHATKA,	Petropaulovski, Versné-Kamtschatsk, Nijné-Kamtschatsk, Aklansk, Bolshertetskoi, Tigilsk.
PERM, . . .	Iekaterinburg, Neviansk, Verkhoturia, Irbit, Tagilisk, Bogoslovsk, Kûshva.
ORENBURG, .	Troitsk, Taheliabinsk, Verkho-uralsk.

TOBOLSK, formerly the capital of all Siberia, is situate on the right bank of the Irtish, near its confluence with the Tobol, in N. lat. 58° 12′, and E. long. 68° 15′. It is divided into the lower and the upper town, the former of which stands on the banks of the river, and is much exposed to floods; the latter occupies the top of a steep ridge which rises considerably above the plains, and consequently the white houses and the church towers are visible at a great distance. The lower town is only 128, the upper 357 feet above the level of the Arctic Ocean. Except the government buildings and two churches, the town is built wholly of wood, and even the streets are paved with that material. Its population in 1833 amounted to 17,558, of whom a considerable number are exiles, who live here not uncomfortably. The variety and abundance of wild fowls in its markets are no where else to be equalled; while the fisheries of the Obi on the one side and the herds and flocks of the pastoral tribes on the other, yield their respective supplies at the cheapest rate. It is also well supplied with manufactured goods of every kind, and with tea, and colonial produce from Europe and China. Literature, science, and the polite amusements of Europe, have also made considerable progress among the citizens, and contribute greatly to their amusement as well as instruction. The inhabitants endeavour also to heighten the graces of the West by a mixture of Siberian merriment, the quadrille and the gallopade being accompanied by singing, while the ladies display at once their figures and their voices. Every pretext, religious or social, is seized on for a feast, a ceremony, or a public show. Marriage gives occasion to four ceremonies; first comes "the meeting;" then "the near inspection;" afterwards "the shaking of hands;" and lastly, "the maiden's feast," which completes the nuptial rites. *Tumen*, 130 miles W.S.W. of Tobolsk, is a town of 8000 inhabitants, which enjoys a considerable trade. *Beresov*, 420 miles N. of Tobolsk in a direct line, or 600 by route, is a fur trading settlement of great importance, inhabited by several respectable merchants and exiles. It stands at a little distance from the left bank of the Obi, on its affluent the Sosva; and no other place can vie with it in the active, enterprising, and kindly spirit of its people. Its situation is very pleasant, and it contains a population of 1500, most of whom subsist by trade. It is historically important, as being the place where the three favourites of Peter the Great, Osterman, Dolgorukof, and Menzikoff, ended their

days in exile. In 1921, the remains of Menzikoff were found buried deep in the frozen earth, in a state of perfect preservation. *Obdorsk*, a paltry wooden town, 50 miles from the mouth of the Obi is, nevertheless, the centre of all the trade carried on with the Samoiedes and the Ostiaks of Beresov. From Tobolsk to Beresov the river is easily navigated downwards in eight days by the current alone: upwards, the navigation is favoured by the prevalent north winds, and by the counter currents near the banks.

Tomsk, 630 miles E. by S. of Tobolsk, a city with 10,577 inhabitants, and the capital of a province, though it contains several churches and many handsome buildings, both public and private, is, nevertheless, a miserable place. It stands on the right bank of the Tom, near its mouth, has a military school with 400 students, a provincial college with a considerable revenue, but without either masters or scholars, and also a very neat public garden. *Barnoul*, 260 miles S. by W. of Tomsk, contains 1200 houses, with 9000 inhabitants, and is the seat of administration for the whole of the mines of the Kolyvan line, the governor being solely dependent upon the imperial Cabinet. It is also the chief smelting place, and enjoys the civilization of a European city. The mining district subject to the authorities at Barnoul extends southwards about 300 miles towards the Irtish and the frontiers of Chinese Tartary. The silver mines of the *Schlangenberg* (Snakehill) are situate 190 miles to the south of Barnoul. As the country rises to the south its climate does not grow milder in that direction, but the winters are at least as severe, and the summers as short as they are some hundred miles farther north. The hills are in general but thinly wooded; and, on that account, notwithstanding the difficulties arising from great distance and inadequate water conveyance, the ores have to be carried down to the smelting houses in the lowlands, chiefly to Barnoul. The wealth and population of this mining district increase rapidly to the south. The farmers and miners of the southern valleys, who have the opportunity of trading with the Chinese, wear silks and fine cloth with gold ornaments and jewellery; and in their houses and their mode of living, manifest a degree of opulence unknown to those of equal rank in Russia. *Kainsk*, nearly midway between Tomsk and Omsk, is a neat town in the centre of a low brushwood forest, and contains 600 houses and 2500 people.

Omsk, the capital of a province, is situate at the confluence of the Om with the Irtish, 290 miles S.E. of Tobolsk, and 490 W. by S. of Tomsk. It is composed of a fortress, and a town with its suburbs, and has a garrison of 4000 men, with a flying artillery of forty pieces. The fortress is the largest of the three divisions, is a neat place, with buildings of brick, and surrounded by a mud wall and ditch. It contains an Imperial military college for the children of the military who form the army of Siberia, also a school for the children of Cossacks. The town and suburbs contain some neat buildings, but are not otherwise remarkable. The total population in 1833, amounted to 11,428. *Semipolatinsk* is a fortress on the right bank of the Irtish, 400 miles S.E. by S. of Omsk. The town stands on a pleasant eminence, commanding a view of the lofty mountains to the south, but the surrounding country is uncultivated and infested by robbers. It contains 1000 soldiers and 2000 civil inhabitants.

Irkutsk, the capital of Eastern Siberia, is situate on the left bank of the Angara, 1246 feet above the level of the sea, 24 miles N. from the lake Baikal, and 1500 E. by S. of Tobolsk, in lat. 52° 16′, and long. 103° 30′. It is the handsomest in external appearance, and the most elegant as to society of any place in Siberia. The houses are chiefly of wood; but the streets are wide and spacious; some of the public buildings are very fine, and among these there are twelve handsome churches. The population, by the census of 1833, amounted to 13,522. The principal inhabitants are merchants, and the civil and military officers of Government. Both classes being in constant communication with Europe, have introduced into this remote quarter, whatever is most recent in literature, as well as in music and the drama. A small library has been formed, and a collection or museum of natural history. The shops are filled with nankeens, porcelain, lackered ware, and other articles of Chinese workmanship. The Russian-American Company have a counting-house here and large magazines; and the town may even be regarded as the grand mart of the Russian commerce with China. It is also a bishop's see. The Angara is here deep and rapid, and the approach along its stream to the Baikal may be considered, says Captain Cochrane, one of the grandest sights in the world. The river gradually widens as it draws nearer the lake, till at length it forms a pretty inlet where vessels are laid up. *Selinginsk*, once an important place on the Selinga, is now much decayed, and contained, in 1821, only 200 houses and 1000 people, besides the garrison. *Vershnei-Udinsk*, a large, populous, and flourishing town on the right bank of the Selinga, 200 miles E. of Irkutsk, and 70 N.N.E. of Selinginsk, contains many handsome brick houses, churches, and public buildings, and has risen on the ruins of Selinginsk as the grand mart between Irkutsk and Kiakhta. It contains a strong garrison, 400 houses, and about 2600 inhabitants. *Kiakhta*, a neat and regularly built town of 450 houses and 4000 inhabitants, on the right bank of a little brook of its own name, an affluent of the Selinga which forms the border of the Russian and the Chinese empires, about 200 miles S.E. of Irkutsk. It is the only place on this frontier, where the Chinese Government allows its subjects to trade with Russia; and the Chinese town of Maimatshin, 200 fathoms from the old town of Kiakhta, is their frontier station. *Werchinsk*, 500 miles E. of Vershnei-Udinsk, is called a city, but is ill-built, widely scattered, badly situate, and worse inhabited, containing about 200 houses and 1000 people. It is the head-quarters of the great penal settlement of Siberia, all the worst criminals being sent to work in the mines of this district. The majority of them are kept at the Bolshoy-zavod, a great fabric, 180 miles E. from the city, situate in a deep hollow, and surrounded by high and barren rocks, as bleak, dreary, and inhospitable as can be imagined.

Krassoyarsk, the capital of the province of Yeniseisk, is situate on the left bank of the Yenisei 300 miles N.W. of Irkutsk. *Atshinsk*, 90 miles west, is a thriving trading town.

Yakutsk or Iakutsk, is situate on the left bank of the Lena, 1200 miles N.E. of Irkutsk, in a bleak and dreary region, with a very cold climate. It is an irregularly-built town, but being the seat of the fur trade, and of a great commerce with the natives, it contains so many as 4000 inhabitants. Iakutsk has all the character of the cold and gloomy north. It is situate on a barren flat near the river; the streets are wide, but the houses and cottages are poor. There is not a tree or a bush to be seen, and nothing to indicate summer but the absence of snow. It contains about 500 houses, 5 churches, and a convent. Yakutsk is the centre of the inland trade of Eastern Siberia; furs, walrus and mammoth teeth, are brought to it for barter, during the ten weeks of summer, from the most distant places to the east and north; and as soon as the Lena is clear of ice, merchants begin to arrive from Irkutsk, bringing with them tobacco, tea, sugar, brandy, rum, Chinese cotton and silk stuffs, yarn, coarse cloth, hardware, glass, &c. The Russians live entirely by trade, and have abandoned all sorts of handicraft to the Yakuts, among whom there are now excellent carpenters, cabinetmakers, carvers in wood, and even painters.

Nishnei-Kolymsk stands on the eastern side of an island in the Kolyma, about 150 miles from the mouth of the river. It is a large town for this part of the world, containing nearly 50 houses and 400 people, most of whom are Cossacks, with a few pedlars and three priests.

Okhotsk, a small town with a harbour on the western side of the sea of Okhotsk, maintains a considerable trade with Kamtschatka and the Russian settlements in North America, the produce of which all passes through it, as the only sea-port of Siberia on the Pacific Ocean. *Petropaulorski* (pronounced Petropaulskh), the capital of Kamtschatka, and the residence of the government and commercial agents, is a town of thatched log-houses, of very poor appearance. Its harbour is a safe land-locked bason, on the eastern side of Awatska Bay, capable of containing six or eight ships of the line in per-

fect security. Awatska Bay is 30 miles in circumference, with a general depth of water of 12 or 14 fathoms on a level bottom of soft mud; and abounds with fish of the finest quality. Its entrance is four miles long and a mile and a half wide at the narrowest part, with a lighthouse on the south-east point, in lat. 52° 52′ N. lat., and 158° 47′ E. long.

Iekaterinburg or *Katherinenburg*, is situate on the eastern slope of the Urals, 25 miles east of the Bilimbayevski pass, and 976 feet above the level of the sea, in the government of Perm. It contains about 2000 houses, chiefly built of wood, though some are of stone, and the great manufactories are of brick, roofed with thin iron plates. It contains the college of mines, which superintends all the foundries maintained by it on both sides of the Urals. The town presents, in a remarkable degree, the appearance of comfort and thriving industry. Many of its houses would be deemed ornamental in the most handsome towns of Europe; yet the greater number of its inhabitants are serfs, whose annual remittances of tribute to their owners amount to princely revenues. It is 320 miles W. by S. of Tobolsk. *Tyumen*, on the banks of the Tara, 180 miles from Iekaterinburg, is a larger town than the latter, and is situate in a fertile country.

Seas, Bays, and Gulfs.—*Sea of Kara*, on the east side of Nova Zembla. *Sea of Obi*, forming the firth or estuary of that river, is about 400 miles long by 80 or 90 wide. *Behring's Straits* form the communication between the Arctic and the Pacific Oceans, separate Asia from America, and are about 50 miles wide, with a small island in the middle. A constant current sets through the straits from the Arctic into the Pacific Ocean. *Gulf of Anadir*, to the south-west of Behring's Straits. *Awatska Bay*, already described. *Sea of Okhotsk*, a large inland sea, between Kamtschatka and Okhotsk, is unnavigable in winter.

Capes.—*Severo-Vostochni*, the most northerly point of the continent of Asia. *Stekatskoi-noss*, in the country of the Chuckchee, in long. 175° E. *Tschuktschi-noss* or *East Cape*, forming the western side of Behring's Straits, and being the most easterly point of Asia. *Cape Lopatka*, the most southerly point of Kamtschatka.

Islands.—*Kotelnoi* or Kettle Island, *Fadei*, *Novaia-Sibir*, *Stolbovoi*, *Iterchankvoy*, *Bear Islands*, and *Burney's Isle*, in the Arctic Ocean; *Diomedes*, in the middle of Behring's Straits; *Evoogisona* or *Clerk's Island*, to the south of the strait; *Matwi*, *St. Matthew* or *Gore's Isle*, south-east of the Gulf of Anadir; *Karagui* and *Behring's Isles* (with 110 inhabitants in 1827) on the east side of Kamtschatka; and the *Kurile Islands*, which extend in a long line of 900 miles across the mouth of the sea of Okhotsk, from Cape Lopatka to Ieso. Their number is not accurately known; but they contain eight known volcanic mountains, some of which are in a state of activity. Some of the islands are uninhabited from want of water, while others rival Kamtschatka in the abundance of game and fish. The few inhabitants are peaceable and well disposed; they live very much in the same manner as the Kamschatdales. The northern portion of them are subject to Russia, and pay a small tribute in furs and sea-calves; the southern islands are claimed by Japan.

Kamtschatka is a large peninsula attached to the north-eastern extremity of Siberia, between 51° and 62° N. lat., and 166° and 167° E. long., about 800 miles long, from 100 to 250 broad, and containing about 80,000 square miles. It is traversed lengthways by a chain of volcanic mountains of great elevation (see *ante*, 629), many of whose summits are in constant activity. The climate is very severe; but not insalubrious; for the inhabitants are robust and long-lived, and have few diseases. Rye, barley, potatoes, cabbage, turnips, hemp, and flax may be raised successfully; but most of the people are devoted to hunting and fishing. The forests contain birch, fir, larch, poplar, cedar, willow, and juniper. The animals usually hunted are bears, lynxes, otters, rein-deer, foxes, sables, beavers, &c., and the number of skins annually exported is about 30,000, chiefly those of foxes and sables. There is also other game of several varieties, and water fowl, whose eggs, saturated with oil, constitute the principal part of the food of the inhabitants. The fish comprise salmon, cod, herrings, besides seals, walruses, and whales. The trade is very limited; labour is confined to the supply of temporary necessities; domestic comforts are little known or cared for, and affluence is seldom attained even by the most provident and most industrious. Taxes are paid in skins; furs and dried fish are exported from Petropaulovski, chiefly by Russians and Dutch, who bring in exchange rice, flour, coffee, sugar, brandy, and whisky. The Kamtschatdales, the indigenous natives of the peninsula, are a people of short stature, with firm shoulders, large heads, long and flat faces, small eyes, small lips, and but little hair. Their women have fine skins, very small hands and feet, and a tolerably well proportioned figure. In their independent state they were very warlike and ferocious; but now, under the Russian sway, they have become a peaceable and honest, but lazy, drunken, servile race, careless of futurity, and addicted to coarse sensuality. The southern Kamtschatdales have both their winter and summer cabins raised on stages, twelve or thirteen feet high, for the purpose of drying their fish. The chief occupation of the men is fishing. In the northern part of the country the cabins are subterranean holes which retain the heat; but the closeness and the filth are insupportable by those who are not accustomed to them. The people are subject to few diseases; their most common complaints are scorbutic and venereal; and the glare of the snow occasions frequent inflammation of the eyes. In 1831 there were in the whole territory of Kamtschatka only 2700 natives and Aleutians.

EMPIRE OF JAPAN.

THIS empire consists of a group of large islands in the Pacific Ocean, to the north-e
between 30° and 42° N. lat., and 128° and 143° E. long. The principal islands are name
kute, *Kiu-siu*, *Awadsi*, *Sado*, and *Ieso*; besides which, the Japanese have also colonised
portion of the island of Saghalien, and claim dominion over the southern half of the I
Niphon is upwards of 800 miles in length, but of irregular form, and of various breadt
islands are very considerably smaller; and the whole superficial area of the empire is
about 260,000 English square miles. The principal islands have a very uneven surface,
with rocky hills. Niphon is traversed throughout its whole length by a regular chain of m
highest peak of which, named Fusi, exceeds 12,080 feet; but the elevation of the chain is
low, as to admit of cultivation up to the watershed of its streams. Several of the summ
volcanoes; Wunsondaki, east of Nangasaki, is the most formidable at present known;
phon, was formerly an active and very much dreaded volcano, but has been quiescent for
century. Earthquakes are frequent and destructive; thermal and mineral springs ar
occurrence. The metallic wealth of the country is said to be very great, comprising cop
lead, tin, iron, gold, and silver. The streams have very short courses, and are for t
rather torrents than rivers. The climate varies extremely from north to south, being i
in the north, while in the south it is nearly as warm as in the south of France, though m
In Kiu-siu, and the southern parts of Niphon, the thermometer ranges between 29° and
heit, 80° being the average in the middle of summer, and 35° in the coldest months of
cold, however, is much increased in winter by the prevalence of north and north-east win
summer heats are modified by breezes from the south and south-east. Rain is very freq
canes also and storms are of frequent occurrence, and are sometimes very violent.

Few plants, except on the hills, are found in a natural state; and the face of the cou
the sides of the mountains, is most diligently cultivated. In the southern districts ric
very large quantities, and forms the principal article of food among the inhabitants. W
partially cultivated, and is held in little estimation. Barley, buckwheat, beans, potat
pumpkins, and cucumbers, are raised in great abundance; and the fruit trees of southern
orange, lemon, vine, peach, and mulberry, are common and very productive. Ginger an
the principal spice plants; cotton is grown in considerable quantity, and tobacco, in the s
to rice, however, tea is the grand object of cultivation; and not only are there large planta
shrub, but the hedges on the farms of Kiu-siu consist of it, and supply the drink of th
Oaks, firs, and cypresses, are common, but not in large masses; timber is supplied fr
Saghalien. There are also the gum varnish tree, the camphor laurel, and others; many
are extremely beautiful. Among the wild animals may be enumerated bears, boars, foxe
monkeys, hares, rats, mice, and two small animals of the weasel tribe peculiar to the
called *itutz* and *tin*. The people eat very little animal food; they live chiefly on fish, and
pally in cotton and silk; the pasturing of cattle is consequently not much attended to. B
beeves are not numerous, and are used only for draught labour; the sheep are but few,
progeny of a stock introduced by the Dutch. The horses are small, and used only by the no
are neither asses nor mules; and pigs are found only in the vicinity of Nangasaki. Dogs a
and held sacred; cats are even more esteemed by the Japanese ladies than by those of Gr
Birds are numerous, and of many species; falcons are highly valued; and pelicans, cranes,
are considered useful in destroying vermin. The pheasants, ducks, geese, teal, storks, pig
larks, and other small birds are numerous; but the common crow and the parrot have neve
Snakes are not unfrequent, and one variety, the *aurabami*, is of enormous size; there are a
and lizards, scorpions, centipedes, and white ants. The seas contain large quantities of
afford a principal article of food to the inhabitants, and give employment to numerou
fishermen. The salmon, herring, cuttle-fish, eel, perch, and many others, are caught in
tities; oysters also, of a peculiar and delicious kind, are extremely abundant, and are use
clusively as food by many of the poor people about Iedo, where the fisheries are situate.
narwhals often visit the coasts, and are caught by the harpoon; the flesh is eaten, the balei
various purposes, and ambergris is extracted from the entrails.

The people seem to be a mixed race of Mongolian and Malay blood, though they boast o
rigines. They are in general well made, active and nimble, with yellow complexions, s
set eyes, short flat noses, broad heads, and thick black hair. They are divided into ei
princes, nobles, priests, soldiers, civil officers, merchants, artizans, and labourers; whi
distinct, with all the strictness of caste, each person following invariably the profession of
Polygamy is not practised even by the nobles, and much more freedom is permitted to the
in China; nor do the women compress their feet, though they bandage their hips so tightl
their feet inwards, and give themselves a very awkward gait. Concubines are commo
hold a lower rank than wives. Prostitutes are found in every town in greater numbers
other country of Asia, except India; and so little discredit is attached to the character, t
visited by married women, and are received without remark into respectable society. T
are said to be intelligent, and desirous of knowledge; they study medicine and astronomy
astronomical observations are as correctly made as their rude instruments will allow.
are compiled at Miyako, the great centre of the national science and literature. History h
ten with great care by some of their learned men; their works on botany and zoology
descriptions, and tolerable engravings; poetry is cultivated; and there is a prevalent taste
The Japanese language has no relation to the Chinese, nor indeed to any known Asiatic
except that of the Ainos, who inhabit Ieso and Saghalien. It is polysyllabic, and has an
47 letters, which are written in four different forms, one of which is used exclusively b
another by women. Some of the inhabitants are also acquainted with Chinese. The est
state religion is that of Buddha; but it has many varieties, and much superstition prev
its votaries. There are monks of various orders, some leading a secluded and ascetic
infesting the towns and highways while on their way to visit different temples. The
large numbers of religious beggars and singing girls, who go about in the habit of num
considerable sums. The sect of Sinto, which professes the doctrines of Confucius, has
imported from China; but its followers are very few. An older form of religion than eith
has maintained itself from the most remote antiquity to the present day, not only in the
peasant, but in the palace of the Mikado; which is called the *Sinto* or *Sin-sio* (faith in
according to Siebold, *Kami-no-mitsi* (way to the gods.)—(*See ante*, p. 126.) This ancien
sider the founders of the empire as the immediate descendants of the Supreme God, who c
from heaven into Japan; and have continued without interruption to exercise sovereign

the race being continued by adoption, when progeny fails the reigning emperor. They believe the spirit of their ruler to be immortal; a doctrine which confirms the faith of the people in the immortality of the soul; in connection with which they also believe in future rewards and punishments. The Supreme Being is too great to be addressed in prayer, except through the mediation of the Mikado, the son of heaven, or of inferior spirits called *Kami*, to whom temples are specially erected. Various kinds of food are offered to the Kami, and anciently even human victims were immolated to appease the wrath or secure the favour of spirits. They pay great reverence to the fox, as the abode of a spirit, and consult him in difficult affairs. The priests of this sect are allowed to marry. The amount of the population has been variously estimated; but is positively unknown to any European. Balbi, on the assumption that Japan is equally populous with China, rates the population at 25,000,000; but if China really contains more than double the number which this geographer assigns to it, the population of Japan should, on his principle, amount to fifty or sixty millions.

The government is a hereditary absolute monarchy. The sovereignty was formerly vested in an emperor called the *Mikado* or *Dairi-sama*; but in A. D. 1593, the emperor's Seogun, or military commander, called also the *Kubo*, usurped the chief civil power; and the Mikado has been ever since a mere tool in respect of the civil government, though he has been left the entire superintendence of religion and education. All public enactments, however, must have his sanction before they become laws; to him alone belongs the power of conferring honorary distinctions. He lives at Miyako, secluded in a large palace called the *Dairi* or Imperial Court, surrounded by numerous officers, who treat him with almost divine honours. His income, however, is small, being now restricted to the taxes levied in Miyako and its district, a certain allowance from the Kubo, and fees paid for dignities and offices. His income, indeed, is so small in proportion to the number of his dependents, that he may be said to live in splendid poverty. The Kubo keeps a guard and a governor over him, but acknowledges himself to be the Mikado's first subject, and sends every year an embassy to acknowledge his inferiority with rich presents. The Kubo holds his court at Iedo; exercises full sovereignty over the lives and properties of his fellow subjects; and directly administers the local government of the five great towns of Iedo, Miyako, Osaka, Sakai, and Nangasaki. The rest of the empire is divided into provinces, and smaller districts which are governed by daimios and siomios, appointed by the Kubo; some of whom are so dependent on him as to be obliged to leave their families in the capital as hostages for their good conduct, and even to reside there themselves during half the year. But they receive the revenues of their territory, with which, besides maintaining their state and dignity, they keep an armed force for the preservation of order, make and repair roads, and erect other public works. They usually reside in the large towns, and occupy castles defended by strong gates and lofty towers, which are the marks or symbols of their dignity. Even the least dependent of the daimios are obliged, once a-year, to repair to Iedo, attended by numerous and splendid retinues, bearing valuable presents, which form a main portion of the Kubo's revenues. The general executive government is confided to seven ministers; the supreme judicial council is composed of five daimios, who assist the Kubo in deciding on political offences; and a senate of fifteen daimios forms the ordinary court of civil and criminal law. The laws are severe, and even sanguinary; fines are seldom imposed; exile to the penal settlement of Fatsisio, banishment, imprisonment, torture, and death by decapitation or impaling on a cross, are the ordinary punishments; and it often happens that the courts visit with punishment, not only the delinquents themselves, but also their relatives and dependents, and even strangers who may have been spectators of the crime. In order to avert these evils from his friends, an offender sometimes anticipates his expected punishment by ripping up his belly; and every Japanese is instructed in the art of performing this operation. The prisons are gloomy and frightful dungeons; and the police is extremely strict. The public revenues are derived from taxes on land and houses; the land is assumed to be the property of the State, and the tax, as in all Asiatic governments, consists in part of the rents, which are said to exceed the half, or even two-thirds, of the produce. The army in time of peace is rated at 100,000 infantry, and 20,000 cavalry. The arms of the former are muskets, pikes, bows, sabres, and daggers; of the latter, lances, sabres, and pistols. The artillery is confined to a few brass cannon and light guns. Discipline and the art of fortification are little understood. There is no armed navy.

The industry of the Japanese will bear a comparison with that of the Hindoos or the Chinese. Their works in copper, iron, and steel, bear a high character; telescopes, thermometers, watches and clocks of good quality, are made at Nangasaki; glass is made, but the manufacturers are not acquainted with the art of glass-blowing. Printing was introduced from China in the 13th century, and is conducted in the Chinese manner by means of wooden blocks. Silk and cotton cloths are manufactured in quantities nearly sufficient for the supply of the country; and porcelain which is even more esteemed than that of China. The art of lackering is practised with great success; good paper is made from the bark of the mulberry and other trees, and the fibres are made into cordage. The art of building houses is very little advanced; they are almost universally constructed of timber, plastered on the outside, and consist of two storeys, divided into rooms by slight paper partitions. Of ship-building and navigation their knowledge is very limited; and they are compelled by law to build their vessels in a particular fashion, very like that of the Chinese junks. Great numbers of ships are employed in the coasting trade of the empire; but they are quite unfit for the navigation of the open sea. The internal trade is very extensive, and native industry is protected and encouraged by a variety of regulations, while, on the other hand, there are no customs or excise duties, and communication is facilitated by numerous coasting vessels, and by excellent roads. The shops and markets are always well provided, and the great fairs are attended by crowds of people from all quarters. Foreign commerce, however, so far from being encouraged, is rigorously opposed by the government, in consequence of the attempts made by the Jesuits to Christianize the people. Nangasaki is the only port for foreign trade, and the Dutch are the only Europeans allowed to engage in it; while the number of vessels, and the kinds and quantities of goods, are strictly defined; and the number of residents in the factory is restricted to eleven. The ships, on arrival, are minutely searched; and the crews are confined to the small island of Desima, which is close to the harbour. All the business is transacted by Japanese, who even unload and reload the vessels. The superintendent of the factory is likewise obliged to send valuable presents to the Kubo; and once in four years he is required to make an official visit to Iedo, with great pomp, and gifts of more than usual value, costing, with the journey, about £3000. The imports comprise raw silk, woollen, cotton, and linen cloths, sugar, dyewoods, seal-skins, pepper and other spices, mercury, tin, iron, cinnabar, glassware, &c., from the Dutch; and silk, tea, sugar, dried fish, and whale oil, from the Chinese. The exports consist chiefly of copper in bars, and, to a small amount, of camphor, silk fabrics, lackered ware, porcelain, &c.

Miyako (i. e. the capital) or *Kio* (the residence) the metropolis of the empire, is a very large city situate in a plain surrounded by hills, in the south-western part of Niphon, about 40 miles from the sea. It is regularly built, with straight streets crossing each other at right angles; but here, as everywhere else, the houses are only of timber and plaster, and two storeys high. Among the great number of public buildings the principal is the palace of the Mikado, an inclosure of vast extent, surrounded with walls and ditches, and overlooked by a fine square tower. Next to it are the palace of the Kubo, a building of hewn stone, surrounded by a wet ditch, and also overlooked by a tower; the temple of Fokozi, celebrated for a colossal image of Daibouts or the Great Buddha; and the temple

of Kwannon, also with a large image of that god, and numerous lamps of the extraordinary shape, Miyako is the centre of Japanese trade and industry; and contains the chief shops of the empire in consequence. Most of the books are also printed in this city, whence they derive (imperial court). Hence a cost of carrying for the subscribers of Hiogo, Osaka, and the three ports; the city also possesses a library of about 100,000 volumes, and one of the six universities of the empire. At the end of the seventeenth century, as supposed by Kempfer, Miyako contained about half a million of inhabitants, among whom were 30,000 priests.

Jedo or Yedo, the residence of the Kubo, and the seat of the chief and military government of the empire, is situated on a large plain, opening to the shore of a deep gulf, on the south-eastern coast of Niphon, about 200 miles E.N.E. of Miyako. It is about 20 miles in circumference, contains about 1,500,000 inhabitants, and carries on a great trade. The principal building is the palace of the Emperor or Kubo, situate near the middle of the city, and consisting of the castle of Siro, and the castle of Nisi-no-maru. It is surrounded with ramparts and wet ditches, which are crossed by drawn bridges. It contains the great imperial library of about 100,000 volumes; and it was here that the Encyclopædia of Japan was published, a very valuable work, in 47 volumes, with a great number of plates. Owing to the nature of its construction, the city is very subject to fires; recently a day passed without several; and whole quarters of the city are sometimes burned down.

Kioto, the ancient residence of the emperors, and, consequently, much venerated, is situate near Miyako, and is a very flourishing place, in consequence of the great number of the temples, which attract crowds of devotees. Osaka, at the mouth of the river Yodo, which runs through the plain of Miyako, is a large city, the richest and most commercial in the empire, and the great resort of all the vessels of pleasure. According to the Japanese no population might furnish an army of 60,000 men; but M. Balbi, with more than his usual moderation, thinks the total number of inhabitants may be reckoned at 200,000. Nangasaki, on the west coast of the island of Kiu-siu, an open town with two more winding streets, is the only place where foreigners are allowed to trade. The commerce and manufactures render it very flourishing and populous; and it is commanded by hills crowned with numerous temples, which render the view very picturesque. Simbasi, a large town, with 20,000 inhabitants, stands on a bay at the south-west point of the island of Iezo. Its harbours is commodiously filled with merchant vessels, and it has a flourishing trade. Among the remarkable places of Japan we must not omit the island of Kosima, the most extraordinary place of exile in the world. It is a small island in the open sea, 300 miles S. by E. of Yedo, and its coasts are so precipitous that there is only one landing place. The prisoners, who have fallen under the Kubo's displeasure, are sent hither, where they are employed in different kinds of handiwork, and manufacture stuffs so precious for their beauty, that his majesty reserves them for his own use.

The large island of Iezo, called also Ma-ma, and Ae-no, to the northward of Niphon, and separated from it by the Strait of Sangar, though possessed and colonised by the Japanese, is also inhabited by an aboriginal people, who call themselves Ainos, but are called by the Japanese Ma-mo (hairy bodies). They are distinguished from the Japanese by a somewhat taller stature and more robust frame; have very large, thick, black beards, and black and somewhat frizzled hair. They live chiefly by hunting and fishing, and pay their tribute to the governor of Matmai, in skins or other natural productions of their country. Their principal arms are bows and arrows. They live without cultivated land, and almost without religion; have no alphabet, and no code, and trade entirely by barter. They live in tribes, which are just so many family associations, though they sometimes form mutual alliances. Their language seems to be entirely foreign to the Japanese, the Mantchoos, and the Kamtschadals. The island presents on all sides lofty mountains, covered with beautiful verdure and magnificent forests, which abound with wild animals.—(Malte Brun, II. 303, 314.)

AFRICA.

GENERAL DESCRIPTION.

PHYSICAL GEOGRAPHY.

ASTRONOMICAL POSITION. — Between 37° 20′ N. and 34° 50′ S. latitude; and 51° 30′ E. and 17° 33′ W. longitude.

DIMENSIONS. — The greatest length from N. to S. is about 4988 miles; and the greatest breadth, from E. to W. about 4618. The superficial area is estimated at 11,870,000 square English miles.

BOUNDARIES. — *Northern:* — The Atlantic Ocean, the Strait of Gibraltar, and the Mediterranean Sea. *Eastern:* — The Isthmus of Suez, the Red Sea, and the Indian Ocean. *Southern:* — The Southern or Antarctic Ocean. *Western:* — The Atlantic Ocean. Africa is a vast peninsula, joined to Asia by the Isthmus of Suez, which is only about 75 miles broad; and, at the Strait of Bab-el-Mandeb, the southern extremity of the Red Sea, it approaches within 16 miles of the same continent. It is separated from Europe by the Mediterranean Sea, and the Strait of Gibraltar, at the latter of which the two continents approach within about 10 miles of each other.

NAME. — The meaning of the name of this great continent has been a fertile subject of conjecture among philologists and antiquaries. By the Greeks it was called *Libya*, and by the Romans, *Africa;* the learned Varro believed that he had found the etymology of the former in *Libs*, the Greek name of the south wind; and Servius, the scholiast on Virgil, proposes to derive the other from the Latin *aprica* (sunny), or the Greek *a-phriké* (without cold). It is more probable that the name Libya was formed by the Greeks from the name of the people whom they found in possession of the country west of Egypt, and who are called in the Hebrew Scriptures *Lehabim* or *Lubim*. With respect to *Africa*, Suidas tells us that it was the proper name of that great city which the Romans called *Carthago*, and the Greeks *Karchedon*. It is certain at least that it was applied originally to the country immediately around Carthage, that part of Africa with which the Romans became first acquainted, and was subsequently extended with their increasing knowledge, till it came at last to include the whole continent. Of the meaning of the name the language of Carthage itself supplies a simple and natural explanation; the word *Afryqah* signifies a separate establishment, or in other words a colony, as Carthage was, of Tyre. The Arabs of the present day give the name of *Afrikiyah* or *Afryqah*, to the countries which formerly depended on this original Afryqah; and it may be remarked, that the name was not used by the Romans till after the time of the first Punic war. (*Esquisse Generale de l'Afrique, par M. D'Avezac.* Paris, 1837; pp. 5, 6, 7.)

GENERAL ASPECT. — Unlike the other great continents, Africa presents a solid mass of land with a very regular coast, unbroken by large peninsulas, islands, bays or gulfs, except only on the south-western side, where the Gulf of Guinea makes a deep and wide indentation. The length of its coast-line is calculated to exceed 16,000 miles. Throughout the whole of that space there are only two navigable openings yet known by which access can be obtained to any considerable distance into the interior of the continent; and though the one of these, the river Nile, has been known to the civilized world since the earliest dawn of history, its remote sources have not yet been reached by Europeans; while the mouth of the other, the Kawara, is a discovery of very recent date; the certainty of its existence, and the direction of its course, were proved so lately as the time of Mungo Park. In addition to this want of water communication, the access of travellers has been barred by the all but insuperable difficulties of passing the deserts, which occupy so large a portion of its surface, and serve as a wall of separation between its sable natives and their lighter

coloured brethren of the northern and eastern continents. The general characteristic of the surface is, that in most parts of its outline, the countries immediately on the coast are low plains, above which the land rises by successive terraces, forming at their summit level an immense table-land, or a series of table-lands, which seem to occupy the greater part of the unexplored interior.

MOUNTAINS.—The north-western portion of Africa, known on the Mediterranean Sea and the Sahara, contains a range of mountains which has been known from the most remote antiquity under the general name of ATLAS. The principal chain begins on the shores of the Atlantic Ocean, with Cape Geer, in 30° N. lat., and proceeds almost directly from the sea to a great height, and extends nearly due east to the meridian of Mequinez, when it turns to the east-north-east, and continues in that direction to the meridian of Algiers, where the ridges unite in an extensive nucleus which contains the highest summits of the chain. From this point a chain appears to extend along the western side of the basin of the river Mulwah nearly to its mouth in lat. 35° N., while another branch, under the name of *Jebel Tedla*, proceeds in a north-easterly direction along the eastern side of the river basin of lat. 34°, and then stretches in an easterly direction through the territory of Algiers, where the highest part bears the name of *Wantersa*. Various ridges, and terminating at the river Shellif, which probably interrupts the continuity of the chain. Little to the west of the meridian of London. To the east of that river, the range of mountains, south-east of Algiers, the *Jebel Gerrerah*, lat. 36° 20′ N., from which it declines to the south-east. Farther east several ridges appear to extend in different directions into the territory of Tunis, terminating on the one side in Cape Blanco and Bon, and on the other at the basin of the Lake of Marks, and the Gulf of Khabz. The chain or range whose general course we have thus endeavoured to trace, has been sometimes distinguished by the *Lesser Atlas*, in consequence of its being supposed that a higher chain ran behind, and the country farther inland, between Barbary and the Great Desert. It has now been ascertained that no such chain exists, the country between the coast chain and the desert being occupied by the natives as more or less elevated table-land, with slopes of greater or smaller rapidity, but without any range of mountains. From *Jebel Tenan*, west of the Mulwah, a minor chain extends westward, nearly parallel to the coast of the Mediterranean, and terminates with *Jebel Zaarat* or *Apes's Hill* at the Straits of Gibraltar. From the southern part of the great mountains another minor chain, named *Jebel Hadrar*, extends first south, and then westward towards the shores of the Atlantic, near Cape Nun; while spurs diverge on both sides, forming the watersheds of the various wadies or river valleys, that pour their waters towards the sea or the desert. To the east of Lake Loudeah, a chain of hills, lower than the Atlas, but which may be considered as a continuation of the same system, extends in a direction nearly parallel to the shores of the Mediterranean, under the names of *Jebel Fissel*, *Jebel Gharian*, and the mountains of *Larhouath*, terminating in a chain of low hills which skirt the coasts of the greater Syrtis. The only summit of the Atlas which has been measured with any degree of accuracy is *Miltsin*, 27 miles S. 20° E. of Morocco, which has been found to be 11,400 feet above the level of the sea, a height below the limit of perpetual snow assigned by Humboldt; and yet this summit but once in twenty years has been seen free from snow. It is more than probable that Miltsin and the neighbouring summits are not the highest of the range, which will probably be found in the province of Tedla, near the sources of the two great rivers Om-er-begh and Mulwah, where a considerable part of the chain is permanently covered with snow, and where the summits have been estimated to reach the height of 13,200, and even 15,400 feet. Wantersis and Gergerah are covered with snow during a considerable part of the year, and have been estimated to reach the height of 7000 feet (1200 toises.)

Mountains of Abyssinia.—These form a chain remarkable for its elevation and extent, which proceeds in a direction from south to north, across the provinces of Shoa, Amhara, and Tigre, and is prolonged towards the south-west across the table-land of Gingiro and Narea, beyond which it is supposed to join or form a part of the celebrated *Mountains of the Moon*, of which nothing is known but the Arab name. This name is either *Qumr* or *Qemr*, according to the diacritical marks employed. *Qumr* signifies an object of a white colour; *Qemr* signifies the moon. If the former be the correct form, it may imply that these mountains are covered with snow; but as the name *Mountains of the Moon* is as old as the time of Ptolemy the geographer, the latter is more probably correct.—*Journal Asiatique, Paris, December 1837.* Another chain appears to extend to the south-west from that which overtops Lake Dembea, across the Bahr-el-Azrek, and to join the mountains of *Dyre* and *Tegla*, to the south of Kordofan and Dar-Fur. Another very high chain extends through the eastern part of Haire, and, stretching in a direction from south to north, forms the famous citadel of *Taranta*. Proceeding northward, this chain follows the direction of the west coast of the Red Sea, and, on Nubia, forms the mountains of *Langap*, the height of which must be great, since, according to Burckhardt, they form the limit of the seasons in that part of Africa. The hills which form the basin of the Nile in Nubia and Egypt, and the west coast of the Red Sea, may be considered as an extension of the Abyssinian mountains, but are too inconsiderable to require further attention here.

The *Mountains of Kong*. This name has been given to a range which separates the low country of Guinea from the basin of the Kawara, and has been supposed to extend eastward across the continent, to join the Mountains of the Moon. It appears to terminate westward in a very hilly country, which contains the sources of the Kawara, the Senegal, and the Gambia; in long. 10° 30′ W. it is crossed through by the stream and valley of the Kawara, but beyond that eastward their name, the *Mountains of Mandara* with others in the interior, and *Cameroons*, on the sea coast, which appear to be connected with the Kong. The Cameroon mountains rise to an elevation of 13,000 feet, close to the sea, and in the adjoining island of Fernando Po, Clarence Peak rises to 10,655 feet. These mountains appear to be of volcanic formation, and to be connected with those of Mandara by a chain of the same description. But beyond these scanty particulars, hardly nothing is known about this range or system of mountains.

In southern Africa the *Mountains of Lupata* or the *Back Bone of the World*, have been long celebrated. They are supposed to extend in a line parallel to the south-east coast, from Cape Guardafui to the Cape of Good Hope, or nearly so; but nothing positive is known respecting them. The same may be said of the corresponding chain which extends along the eastern regions of Congo Angola, and Benguela, supporting the western side of the great table-land which is supposed to occupy the interior. But the mountains which occupy the extremity of the great peninsula are somewhat better known; as they form several chains of great height within the territory of the Cape of Good Hope. Of these the *Nieuwveldt* rises to 10,000 feet; the *Compassberg*, in the snowy range, to 7400; and the *Table Mountain*, near the Cape, to 3582 feet above the level of the sea.

PLAINS and DESERTS.—Of the smaller plains and alluvial river-basins and deltas common to Africa with every other continent, there are none so extensive as to require particular notice in this place. But in its grand characteristic of *deserts*, Africa is pre-eminent. The great desert, to which the Arabs give the name of *La Sahara* or *Sah'ra* (the Desert), by way of eminence, occupies a space of more than 46° of longitude and 15° of latitude, or about 3000 miles in length, and 1000 in breadth, the tropic of Cancer running through the middle of its breadth. A great part of the surface is a dead level, stretching on every side like the ocean, and presenting a view only limited by the horizon. In some

places it is a naked burning plain of sand; other parts consist of hard clay; and in some places the surface is covered with small sharp stones. Elsewhere it is diversified with ravines, rocks, and eminences, all alike barren and unfruitful; while the soft finely pulverised sand is driven to and fro by every breath of wind, and piled up into hillocks which constantly change their forms and places, and too often bury whole caravans in their bosoms. This vast tract, however, is not entirely desert. It is sprinkled here and there with fertile spots, like islands in the sea, which render its dreariness only the more awful from the contrast. In these spots, called *oases* or *wahs*, the supply of water admits of a certain degree of verdure and cultivation, affording support to a scanty population. In the eastern part of the desert some of these oases are of considerable extent, and form a sort of little kingdom. In other parts they are only large enough to contain one or two villages, which serve as halting-places for the caravans; others of them afford merely springs or wells for the refreshment of travellers, but too small a portion of cultivable soil to admit of settled habitation. The Sahara contains, likewise, many salt lakes, which afford an abundant supply of natron and common salt, important articles of traffic between the desert tribes and the people of Soudan, where salt is wanting. But under the impulse of the predominating thirst for gain, man has overleapt the barriers which nature might seem to have destined to remain for ever insurmountable, had she not provided an instrument every way calculated to carry her favoured children over these her dreariest regions. The camel has been emphatically called the ship of the desert, and, by the assistance of this invaluable animal, the recesses of the Sahara have been explored, and regular tracts for commerce established across its wastes. Caravans, or companies of traders cross the desert in every direction, amounting sometimes to the number of 2000 individuals. They are generally men inured from their infancy to the hardships and difficulties of these formidable journies; their food consists of camel's milk, with barley meal or Indian corn, and a few dates. Water is conveyed in goat-skins, covered with tar, and these are replenished at the wells which occur in the route. Sometimes, however, in dry seasons, the springs fail, and great numbers of the travellers and their camels perish from thirst; only about thirty years ago, a caravan proceeding from Tafilelt to Timbuctoo, across the western part of the Sahara, wholly perished, to the number of about 2000 men and 1800 camels. Difficult, dangerous, and disagreeable as the journey is to the regular traders, it may well be imagined how much more so it must be to the poor negroes whom they bring with them in large numbers from Soudan, to supply the slave markets of Barbary and Turkey. Quite unaccustomed to such travelling, and too often ill supplied with food and water, these poor wretches speedily fall victims to the avarice of their masters. When wearied out they lie down and die, and the desert paths are strewed with their bones. Denham and Clapperton, in one part of their journey to Bornou, passed from sixty to ninety human skeletons every day; but at a place called El Hammam, the numbers were countless; and the greater part of these, our travellers were told, were the spoils brought by the sultan of Fezzan from Soudan, only the year before.

The *Desert of Angad* occupies the western part of the territory of Algiers; other deserts of great extent appear to occupy Ajan and the country of the Cimbebas on the south-east; another large desert extends from the southern borders of Benguela to the river Gariep; and to the south of that river, elevated districts called *Karoo*, of several hundred miles in extent, occur between the high mountain ranges which constitute the Cape territory.

RIVERS and LAKES.—Almost the only rivers worthy of notice in a general description of the continent are, the *Nile*; the *Senegal*; the *Gambia*; the *Kawara*, *Quorra*, *Joliba*, or *Niger*; the *Zaire* or *river of Congo*; the *Gariep*; and the *Zambezé* or *Zambizi*.

The *Tchad*, *Tjad*, *Schad*, or *Chad* is the largest lake yet discovered in Africa. Its centre lies in 15° E. long., and 13° 30′ N. lat.; its length being about 200 miles, and its breadth 150. Its water is fresh, and it is said to have no outlet. The other principal lakes are:—*Fittre*, a large lake east of the Tchad, of which nothing is known; *Dibbie*, *Debo*, or *Djebou*, formed by the Joliba, between 15° and 16° N. lat.; the *Dembea* or *Tzana*, formed by the Bahr-el Azrek, in Abyssinia; the *Birket-el-Keroun*, formed by the Nile in Egypt; the salt lakes or marshes of *Melgig*, *Shott*, and *Loudeah*, in Barbary; and *Maraci*, a large lake said to exist in the interior, north-west of Mozambique; but of which nothing whatever is known.

ISLANDS.—*Madagascar*, *Comoro Islands*, *Bourbon*, *Mauritius*, *Amirante isles*, *Seychelles*, *Zanzibar*, *Pemba*, *Mozambique*, *Querimba*, and others off the south-east coast; *Socotra*, east of Cape Guardafui; *Madeira*, *Desertas*, and *Porto Santo*; *Canary Islands*, and *Cape Verde Islands*, off the north-west coast; *Fernando Po*, *Principe*, *San Thomé* and *Annobon*, in the Gulf of Guinea; *St. Helena*, *Ascension*, and *Tristan da Cunha*, in the Atlantic Ocean; *Jerbah*, and *Karkineh*, off the coast of Tunis, in the Mediterranean; *Dhalak* and others in the Red Sea.

CAPES.—*Bon* and *Blanco*, on the north-east coast of Tunis; *Ceuta* and *Spartel*, at the Strait of Gibraltar; *Blanco*, *Cantin*, *Geer*, *Nun*, in Marocco; *Bojador*, *Das Barbas*, *Branco*, on the coast of the Sahara; *Cape Verde*, the most westerly point of the continent; *St. Mary*, at the mouth of the Gambia; *Mount Palmas*, *Three Points*, *St. Paul's*, on the coast of Guinea; *Formosa*, the south-west point of the delta of the Kawara; *Lopez-Gonsalvo*, *St. Catherine*, in Lower Guinea; *Padron*, at the mouth of the Zaire; *Negro*, in lat. 16° south. *Voltas*, at the mouth of the river Gariep; *Good Hope* or THE CAPE, the south-west point of Africa; *L'Agulhas*, the most southerly point of the continent east of the Cape; *Corrientes*, *St. Sebastian*, *Santa Maria*, *Delgado*, *Orfui* or *Hejaun*, on the south-east coast; *Guardafui* or *Ras Assere*, the most easterly point of the continent, at the entrance of the Gulf of Aden.

CLIMATE.—With the exception of the Barbary States, Egypt, a part of the Sahara, the country of the Hottentots, and Caffraria, this vast continent lies between the tropics, and its climate, generally speaking, is that of the torrid zone. It may even be said that the influence of this tropical climate is felt over a great part even of those countries which their northern situation should exempt from it, for it is really only that strip of Barbary which the Atlas protects from the hot winds of the desert, and that part of Hottentot-land protected by the Nieuveldt and other mountains near the Cape, that enjoy the advantages of countries situate within the temperate zones. With the exception, therefore, of these small and narrow tracts, of those regions in the interior to which their elevation imparts the coolness of higher latitudes, and the borders of the great lakes and rivers, every part of Africa is burnt up by continual heat, and the continent generally may be regarded as the warmest part of the globe. Nothing moderates the heat and the dryness, but the annual rains, the sea-winds, and the elevation of the soil; while in the well-watered regions, the moisture, combined with the heat, though productive of the most luxuriant vegetation, are extremely unwholesome to man.

MINERALS.—The mineralogy of Africa is as imperfect as any other part of its geography. We have, nevertheless, says M. Balbi, endeavoured to arrange in the following table, the principal countries according to the respective abundance of the minerals which they produce.

Mineralogical Table of Africa.

DIAMONDS.—*Region of Moghreb*, Algiers.

OTHER PRECIOUS STONES.—*Negroland*, Angola, Bihe, Cassanga, Muchingi, Country of the Maloinas; *Egypt*, in the Arabian chain of its mountains.

GOLD.—*Negroland*, Boure, Kamalia, Mandingo, Wassaw, Dankara, Haoussa, Wangara, Bambouk, Akim, &c.; *Western Africa*, Abuta; *Region of the Nile*, Kamamil, the country along the Bahr-el-Abiad, Abyssinia, &c.

SILVER.—*Eastern Africa*, Chicova. *Negroland*, the plateau of Timbo, Baghermeh.

COPPER.—*Negroland*, Country of the Moloua, Borgo or Dar-Saleh, Dar-Fur, &c. *Eastern Africa*, Country of the Cazembes, the Movizas, the Maquainas, Butuo, Zumbo, Inhambane. *South Africa*, Country of the Hottentots. *Region of the Nile*, Fertit, Kordofan, &c. *Region of Moghreb*, Marocco, &c.

LEAD.—*Region of Moghreb*, Algiers, &c.

IRON.—*Negroland*, Bambouk, Timbo, Kalle, Dentilia, Argola, Loanzo, Benguela, Moloua, Sala, Wassoulo, Bere, Madara, Cassanna, &c. *South Africa*, Country of the Maquainas; *East Africa*, Country of the Cazembes. *Algiers, Abyssinia.*

SALT.—*Moghreb*, Marocco, Tagazza, Aroan, Bilma, &c *Region of the Nile*, Baylur, Kordofan, Sennaar, &c. *Negroland*, Quissama, Angola, Benguela, Saley or Vadai, Dar-Fur, &c.

VEGETABLE PRODUCTIONS.—Our knowledge of the botanical geography of Africa is limited in this respect, that we are acquainted with little more than its sea-coasts, while the interior is almost entirely unknown. The vegetable productions of the coasts of Barbary are closely related to those of the Spanish peninsula, from which they are separated only by the narrow interval of the Strait of Gibraltar, so that there is a singular analogy between the flora of Algiers and that of Andalusia and Valencia, in Spain. Olives, oranges, *chamærops humilis*, the arborescent *ricinus*, and the date-tree grow in both countries equally well. A somewhat higher degree of heat in this part of Africa favours the development of several vegetable forms unknown to the south of Europe, but they are, nevertheless, only different in species, without being so distinct as to constitute new *genera*. The plants of Barca have likewise a great similarity to those of Europe; they form the transition between the Atlantic species and those of Egypt; and even some of them are of a kind which seems peculiar to the torrid zone. The *zizyphus lotus* or jujub, is so abundant in this country that some ancient tribes were fed exclusively with its fruit, and received, on that account, from the Greeks, the name of *Lotophagi* or Lotus-eaters. Egypt presents a great number of particular plants, which are so characteristic, that the mere sight of them, meagre and stunted as they are, is sufficient to indicate their country. Upper Egypt produces in abundance numerous kinds of *cassia*, the leaves of some of which form, under the name of *senna*, a considerable branch of commerce. Besides the date-tree and the chamærops there is also a remarkable kind of palm called the doum palm or *cucifera thebaica*. Several aquatic plants cover the surface of the Nile with their large leaves, and their flowers, which float gracefully upon the water; as the *nymphæa lotus* and *cærulea*, which are seen on the ancient monuments; but the *nelumbium speciosum*, which is also figured among the hieroglyphics, has disappeared from the waters of the river The fruit described by the ancients under the name of *perea* is produced by a plant supposed to be the *balanites Egyptiaca*, a small thorny tree which covers the sandy tracks not only of Egypt, but also of a great part of central Africa, and is found in abundance at Senegal. In Abyssinia, the vegetation has not yet acquired a tropical character; it is, nevertheless, connected with the plants of Mozambique and the Cape of Good Hope. In this country Bruce found a species of *protea*, and Salt, a *pelargonium*, genera which were believed to be peculiar to the Cape of Good Hope and New Holland. Coffee grows naturally on the African coast of the Red Sea, near Bab-el Mandeb, and in the interior, to the southward of Abyssinia, and from it the province of *Kaphа* takes its name. The plants of Upper Egypt, on the contrary, and of the country farther inland, have a great resemblance to those of the west coast of Africa; but no country offers in its plants such a singular physiognomy as the Cape of Good Hope. It is there that we find numerous *ericæ*, *proteæ*, *pelargonia*, *mesembrynthema*, *ixiæ*, *stapeliæ*, &c. These genera are formed by a number of species all collected together near the south point of the continent, with the exception of one or two which are found upon the more northern coasts The plants of the equinoxial regions have a strong resemblance to those of the west coasts; so much so that there is a great uniformity of vegetation from the Senegal to the Zaire. Among the trees are found the *adansonia digitata* or baobob, that colossus of the vegetable kingdom, which grows also in Nubia, the *bombax pentandrum*, the *elais guineensis*, and others. These remarkable plants are found along a very considerable extent of the coast. The *sterculia acuminata*, a tree whose seeds, known among the natives by the name of *cola*, have, it is said, the property of rendering the most unwholesome water drinkable, grows in Guinea and at Sierra-Leone. The *anona senegalensis* and the *chrysobalanus icaco* are also useful trees found on the banks of the rivers from the Senegal to the Zaire In Senegambia, indeed, there are plants not only of species which grow in the regions of Africa of analogous climate, such as upper Egypt, and in Arabia, &c., but also of species which have been considered peculiar to the Indian Archipelago, Madagascar, and South America It must, however, be remarked that these vegetable relations are only found in regions characterised by excessive heat accompanied by humidity, as the banks of the Gambia and the Casamanca. With respect to the sandy and arid localities of Senegal properly so called, they furnish vegetable productions which resemble those of Egypt and Arabia. The alimentary plants cultivated by the natives of the west coasts are maize, cassava, two kinds of pulse, of which the one is the *cytisus cajan*, L., the other a kind of haricot (*dolichos*) and the *arachis hypogea*. The best fruit trees of the same country are the banana (*musa sapientum*), the papaw (*carica papaya*), lemons, oranges, tamarinds, the *elais guineensis* which furnishes the palm-oil, and the *raphia vinifera*, which, as well as the *elais* and a species of *corypha*, produces the famous palm-wine. Some botanists think that the greater part of these plants are of an origin foreign to Africa. Thus Mr. Robert Brown assigns an American origin to the maize, the cassava, the ananas, the papaw, and tobacco, while he thinks that the banana, the lemon, the orange, the tamarind, and the sugar-cane have been imported from Asia. The interior of equinoxial Africa is unknown to botanists; but if we compare the productions of Senegal, Benin, Congo, and Upper Egypt we find among them such striking relations, as early to prove, in our opinion, that the same climatoric causes originate the same vegetable productions, without perceiving any necessity for supposing their transmigration from one country to another.—(*Balbi's Abregé.*)

ANIMALS.—With the exception only of a few animals common to Africa with the adjacent peninsula of Arabia, this continent presents a zoological physiognomy as distinct from that of Asia as if the countries were separated by the distance of half the globe. In the whole of central and northern Africa are found lions, panthers, ostriches, jackals, gazelles, and antelopes, of kinds that are not found to the south of the tropic of Capricorn, where so many other species are assembled. Everywhere the antelopes are the prey of the lions and other feline animals, and of the jackals, hyænas, and pythons. The one-humped or Arabian camel, now abundant in northern Africa, was introduced to the west of the Nile only since the third century. Beyond the Sahara, under the influence of the humidity produced by the great rivers of Senegambia and Soudan, appears a creation, of which no species have ever crossed the desert. There we find the African elephant, the two horned rhinoceros, the tall giraffe, and the clumsy hippopotamus, which extend their ravages, or have their haunts, in every suitable locality between the Sahara and the Cape of Good Hope. Between the tropics are found various species of the dog-headed monkeys (*cynocephali*), none of which ever inhabited Egypt, but of which, nevertheless, three kinds were worshipped in that country, a practice which could only have originated in the native region of these animals. Monkeys with painted faces are found only in Guinea; some are found

at the southern extremity of the continent; and others again from Sennaar to Cafferland. In the basins of the upper Nile and its affluents are two kinds of the *fennec*, described and delineated by Bruce, which has been thought to be a *galago*. Its immense ears, exceeding two-thirds of the length of its dog-like body, form a wide distinction between it and the other *quadrumana*. Figured on the monuments of Lower Egypt, with the dog-heads, the sacred beetle, and the antelopes of the same region, the fennec establishes the Ethiopic origin of the people who raised those monuments. Along the coasts of Zanzibar the Cape buffalo lives in the same forests with the elephant; to the south of the tropic of Capricorn are found the numerous species of antelope, which seem to have been assembled at the southern extremity of the continent as a compensation for the want of even a single species of deer. There also are found the zebra and the quagga; the engallo or phacochere, with the body of a boar, the grinders of an elephant, and whose face, bristling with four protuberances, has given it its name of the masked boar; and the Ethiopic wild boar, figures of which are seen in the mosaics of Palestrina, which has two pairs of ribs more than the European boar, and to which the ancients gave the name of *hoyropotamus*. Among the reptiles are crocodiles, succhos, khamses, monitors, tupinambis, and chamæleons; which last three animals are found nowhere else but in Spain and the Moluccas. The birds peculiar to Africa along the confines of Europe and Asia, have a strong analogy with those of the other two continents. The region of the Nile and the shores of the Mediterranean contain species analogous to those of Arabia, Persia, and Spain. In the sandy deserts of Central Africa are species fitted for these solitudes; while the southern extremity contains birds which are new and peculiar. The ostrich is found in the equatorial zone and the deserts; the messenger or secretary, a singular bird of prey that feeds upon reptiles, is found near the Cape; few regions, indeed, are more prolific of rapacious birds than Africa, and the animals that serve for their prey are abundant and easily procured. Large carrion vultures, griffons, the hideous chincow, and the oricow are always on the watch for the fall of some animal, upon whose carcase they pounce, and devour it in an instant: and in this work they are joined by a smaller species, the percnopters. Eagles are found in every region of Africa, along the banks of its lakes and rivers, and its sea-coasts. The other rapacious birds are kites, sparrow-hawks, vultures, bats, buzzards, and falcons. Crows are abundant; Guinea fowl, bustards of enormous size, grouse, partridges, and quails are much more so. The Numidian, the virgin, the Balearic cranes, the rose-coloured flamingo, the pelican, and a great variety of water-fowl, frequent the lakes and rivers of every part of Africa except the desert. In the equinoctial regions are parrots and parroquets innumerable, and birds of the most beautiful plumage.

Noxious insects and reptiles of almost every species abound; scorpions, scolopendras, enormous spiders, and other venomous creatures; but the Africans suffer less from these than from two other enemies, which, though individually powerless, are, when collected in swarms, the greatest scourge which can be inflicted on a country. These are the *termites* or white ants, and the locusts. The ants abound in all the tropical regions, and even for some distance beyond them; they build clay houses of enormous size, some of which Clapperton met with in his last journey, rising to the height of twelve feet, and resembling so many Gothic cathedrals in miniature. These ants devour every sort of animal or vegetable substance that falls in their way; and they march together in incredible swarms, making up by their numbers for their individual insignificance. Locusts are still more destructive; they are gregarious like the ants, and the region over which they have passed has the appearance of being clean swept. When on the wing they form so dense a body as to hide the sun like a black cloud.

PEOPLE. — There is a greater variety in the physical characteristics of the native Africans than is found among the inhabitants of any of the other continents. As the interior regions are almost entirely unknown, it is impossible to say what varieties may be found there; but along the maritime countries, throughout the Sahara, and the greater part of the basins of the Kawara, the Tchad, and the Nile, the varieties already known are so numerous and so perfectly distinct, that it is not easy to say what characteristics they have in common, except those that distinguish man from the animal creation. The central or equinoctial regions, extending along both Oceans, from the southern limits of the Sahara and Abyssinia to about the 16° or 20° S. lat., are possessed by numerous races and varieties of the black-coloured, woolly-headed people, which are classed by naturalists as the Ethiopic or Black race, or Negroes properly so called. According to M. Flourens, they are an essentially distinct race from the whites. They have under their skin a particular apparatus, which is entirely wanting in the white man, and which is the seat of the pigment or colouring matter. — (*Annales des Sciences Nat. December* 1838. *Edin. New Phil. Jour.* XXVII. 353.) The Sahara and Moghreb are possessed by people of many varieties, all referable to the Caucasian or white class; differing in complexion according to the climate or other physical circumstances, but having nothing in common with the proper Negroes, except their colour, which in some of them is almost or even quite black in those parts of the body which are exposed. Among these the most remarkable are the *Berebers* or *Amazighs*, who possess the Atlas mountains, and are supposed to be the remains of the aboriginal natives of that region; the *Shellukhs*, *Tibbous*, and *Tuaricks*, the principal tribes of the desert, who are likewise, probably, of the same lineage. The uncultivated low country of Moghreb is occupied by numerous tribes of *Arabs*, while the cultivated districts and the towns, along with a narrow strip of country on the southern skirts of the Sahara, between the desert and the Kawara, are possessed by the *Moors*, a swarthy race, apparently sprung from an intermixture of the aborigines with Phenician, Roman, Gothic, Vandalic, Arabic, and Turkish blood. Turks of pure lineage are found in Barbary, and also a great many Jews. In the region of the Nile there are likewise many varieties, chiefly Caucasian, though some are apparently Ethiopic. The great body of the inhabitants of Egypt are of Arabic origin, while their rulers are Turks; the deserts on both sides of the Nile are possessed by roving Arabs; and the ancient Egyptians are represented by a few thousand scattered *Copts*. The Abyssinians, or at least the lately dominant race in that country, are apparently the remains of a colony from the eastern shores of the Red Sea; but they are now pressed upon and hemmed in by African races of unknown origin and lineage. Nubia is occupied by several very mixed races, Negro as well as Caucasian, and varieties of the latter are found along the coasts of the Red Sea, and the Gulf of Aden, as far at least as Cape Guardafui. We find in South Africa, beyond the country of the proper Negroes, two distinct races at least, the Caffers and the Hottentots, who cannot very well be referred to either the Caucasian or the Ethiopic class. The Caffers are a tall, well-proportioned, handsome people, nearly approaching Caucasians in figure, features, and expression, but they have thick lips, and curly though not woolly hair, and their complexion is a blackish grey, or, in some cases, even jet black. The Hottentots, on the contrary, are rather an ugly race; their hair is black, sometimes brownish, very short and woolly; but their skin is dark brown or yellow, and not black. They are the original possessors of the country which extends east and north of the Cape of Good Hope; having for their eastern neighbours the Caffers, varieties of whom extend along the coast from about Algoa Bay to Soffala, but how far inland to the north-east is unknown. Of the languages of these various races very little is known; M. Balbi has, nevertheless, contrived to arrange them all into great ethnographical divisions, and has presented us with the following

Table of the Classification of the People of Africa according to their Languages.

The REGION OF THE NILE contains the following Families or Stocks:—

The EGYPTIAN FAMILY: the *Copts*, who are the descendants of the ancient Egyptians. After the introduction of Islam, their language was gradually replaced by the Arabic, and became entirely

extinct towards the middle of the seventeenth century. With respect to language, the Copts should be regarded as Arabs, and as a branch of the Semitic family. It appears, nevertheless, that in the mountains of Mathmatha, near the Gulf of Khabs, and in a district of Soudan, dialects of their language are still spoken.

The NUBIAN FAMILY: the *Nobah* and the *Kenous* in Nubia. Several thousand Kenous are found in the principal towns of Egypt, where they are improperly called *Barbarins*, *Berberins*, or *Barabra*. It is to the natives of this family that are seen on the monuments as those of the ancient Egyptians.

The TIBBOU-DAZA FAMILY: the *Bouleemas*, the *Haddemas*, the *Hammamas*, the *Amarar*, &c; the *Adas*, one of whom the *Bel Fara* appear to be the least civilized, but, at the same time, the most powerful tribe; the *Zaghawa*, who have mixed and united with the Bedouin Arabs. This family occupies that part of Nubia which lies east of the Nile.

The SHIHO-DANKALI FAMILY: the *Shiho*, properly so called, who are found near the pass of Assaleh; the *Hazorta* near the pass of Taranta; the *Ismaleil*, a nomadic race on the coast from Bab el-Mandeb to Aden, the most powerful tribe of which are the *Dumhoeta*; the *Adaal* possess the country between Babel-Mandeb and Zeyla.

The SHILLOOKS, known also by the names of *Nuehs* or *Fenge*, live along the Bahr el-Abiad and in Sennaar, of which they were the dominant people till the recent conquest by the Egyptians.

The TCHERET-AMOW, occupy the centre of Abyssinia.

The FURIANS, who form the mass of the people of Dar-Fur.

The division of MOGHREB presents but a single family, to which belong all those of its inhabitants who can be regarded as aboriginal: it is

The ATLANTIC FAMILY: the *Amazirgh*, called improperly *Berbers* or *Berebers*, and also *Shelloks*, *Kabyles*, &c; who occupy the high valleys of the Atlas, and a portion of the plains in Marocco, Algeria, and Tunis, and are divided into many tribes, some of which are quite independent: the *Tuaricks*, a numerous and warlike people, spread over the middle part of the Sahara; the *Tibbous*, who possess nearly the whole of the eastern Sahara, the principal *Saoch* and *Augela*; the *Sheilahs*, in the southern part of Marocco, where most of them live under the rule of independent chiefs.

SOUDAN or NEGROLAND presents the following families:—

The VOLOFS or IOLOFS, who are represented as the finest and the blackest of all the negroes: they possess the kingdoms of Bourit-Iolof, Cayor, and Baob, and form the majority of the people of Bondou, Lower Yani, and Salum.

The MANDINGO FAMILY: the *Mandingues*, a powerful, somewhat polished, and industrious genuine negro race, in whose hands is found almost all the ivory and gold trade. Their original country is the elevated territory of Manding, but they are now widely diffused over all the region between the rivers Gambia and Gouba on the west coast, and possess the kingdoms of Bambouk, Kasson, Kaarta, Barra, Kolar, Badibou, Upper Yani, Woodi, Dondila, and Kaboo. They are also the most numerous, and were the predominant people of Bambara before the division of that kingdom. They possess likewise Kankan, Sambatamilla, Thiae, and other districts. To this family also belong the *Soninkes* or *Sarakoles*, who occupy the coast between the Rio Nunez and the Kissi, and other parts of this region.

The FOULAHS or FELLATAHS, called also *Foulahs*, *Fellans*, *Poules*, &c., a very numerous and powerful people, who possess Fouta-Toro, Bondou, Fouladou, Brouko, Wasselah, Sangara, and other countries, besides the large empire of the Fellano or Fellatahs in central Soudan. They have not the extreme negro character; they want the deep jet hue, the flat nose, and the thick lips: their features, on the contrary, are high, with an olive tint, and an agreeable expression; they are probably sprung from the intermixture of the African family with the proper negroes.

The JALONKES, who form a considerable part of the population of Fouta-Jalo, Kouronia, Bale, Firia, Sangara, Soumahana, and Boure.

The KISSIENS in the kingdom of Barbessin.

The KALANNAS, the people of the kingdom of Kalanna.

The HAOUSSA FAMILY: the *Haoussa*, the principal people of Kachna, Goubeo or Ghoober, Kano, Doury, and other parts of the wide region of Haoussa, which forms the centre of the Fellatah empire.

The YARRIBAS, the dominant people of Yarriba.

The MANDARAS, who occupy the country to the west of Bornou.

The BAGHERMEH IS and the MONBAS, the dominant people of Bagharmeh and Mobba, in central Soudan.

The BORNOUAN FAMILY; the *Bornouans*, who form the principal mass of the people of Bornou, and some other districts now separated from the empire of Bornou.

The TIMMANEES, who live between the rivers Sherbro and Cape Shilling, in the neighbourhood of Sierra-Leone.

The BOULLAM, to the south-east of the Timmanees, along the coast and in the adjacent islands.

The ASHANTEE FAMILY: the *Ashantees*, the dominant people of the empire of Ashantee, and the occupants of most of their tributary or vassal kingdoms.

The DAGOOMBA FAMILY: the people of Dagoomba, vassals of the Ashantees.

The AKRAS or INKRANS, in the kingdom of the same name, tributary to the Ashantees.

The KERRAPEES, a numerous people, divided into several petty states, almost all tributary to the Ashantees.

The ARDRAH FAMILY: the *Dahomeys*, the dominant people in the kingdom of Dahomey; the *Judahs*, tributaries of Dahomey, the *Ardrahs*, tributaries to Yarriba; the *Benins*, the dominant people in the great kingdom of Benin.

The KAYLI FAMILY: the *Kaylis* and the *Gengoumas*, in the kingdoms of Kayli and Gungounne, inland from the coast of Gabon.

The CONGO FAMILY: the people of *Congo*, *Sonho*, *Cacongo*, *Loango*, *Matyacka*, *Ondo*, &c., who speak different dialects of the same tongue; the people of *Ilo*, *Concabella*, and *Siti*, whose language is a mixture of Abounda and Congo. The *Mokocs*; the people of *Mocoangoma*, *Muchingi*, *Homa*, *Cassanga*, *Cutta*, *Ginga*, *Haboho*, *Balundo*, *Bihe*, and Portugues, Angola, all speak dialects of the Abounda language.

The BENGUELA FAMILY: the people of *Benguela*, subjects of Portugal; the people of *Quissama*, *Libolo*, *Quiqa*, *Nano*, *Hanha*, *Mongoyaguba*, &c.

SOUTH AFRICA contains the following families: —

The CAFFER or KAUFIR FAMILY: the *Kousas*, the *Tambookies* and the *Mambookies*, on the coast, the *Betchuanas*, subdivided into *Briquas*, *Tammahas*, *Farrabonas*, *Maquanas*, *Mowlongs*, and *Gokas*, inland.

The HOTTENTOT FAMILY: the *Koranna*, the *Gonaquas*, the *Namaquas*, the *Damaras*, and others, who are the Hottentots properly so called; the *Saabs*, commonly called *Bosjesmans* or *Bushmen*, the least civilized of all the known tribes of Africa. They occupy the wildest parts of the country beyond the frontiers of the Cape Colony.

EASTERN AFRICA exhibits the following families, several of which extend into Soudan and the region of the Nile:—

The MONOMATAPA FAMILY: the *Mongas*, on the lower Zambeze; the *Barwa*, on the middle Zam-

beze; the *Movizas;* the *Maravi*, who are now the most powerful people of the late empire of Monemataps. The *Macouas*, a very powerful negro race, who occupy the country to the westward of Mozambique, along the coast from the Zambeze to Melinda. The *Monjous*, one of the ugliest of the negro races, live in the interior, contiguous to the southern Macouas. The *Souahel* or *Sawaeli*, a very powerful negro race who are found along the coast from Magadoxo to opposite Mombaza.

THE GALLA FAMILY: the *Gallas*, a numerous and powerful race, celebrated for their incursions and conquests, which made them masters of a great part of the late empire of Abyssinia. They appear likewise to occupy all the country between Abyssinia and the western frontiers of the states which lie along the coast between Melinda and Magadoxo. The *Mousimbes* or *Zimbes*, a nomadic race who traverse the vast country watered by the supposed course of the river Zebee, and have acquired notoriety by the terrible incursions which they made towards the end of the sixteenth century as far as Melinda and Quiloa.

The SOMAULIS inhabit the coasts of Adel and Ajan, along the sides of the great triangle of which Cape Guardafui may be considered as the apex.

The GINGIROS, who inhabit the kingdom of Gingiro, and whom old accounts place to the south of the mountains of Abyssinia, along the banks of the Zebee.

The NINEANAI, who occupy Bomba, of whom nothing certain is known.

Besides these families, who may be regarded as the aborigines of Africa, there are several other races who have at various periods settled in different parts of the continent, and some of which have become numerous and powerful. The people of Abyssinia, who speak the Gheez or the Tigré languages, belong incontestibly to the Semitic stock; but appear to have been established in that region before the period of history. The *Arabs*, at a very early period, and, more lately, during the great conquests of the first Khalifs, invaded the region of the Nile and Moghreb, and spread even into Soudan, where they are found in great numbers. In the course of time they have introduced exclusively their language into Egypt, a great part of Nubia, along the Nile in Shendy, Damer, Sheygya, &c., in all the towns and great part of the country of Barbary, and part of the Western Sahara. They have also established themselves in several states of Soudan, as Dar-Fur, Mobba, Baghermeh, Bornou, and even within the Fellatah empire. They are also found in districts on the west coast and in the adjacent isles. The *Osmanlee* or *Ottoman Turks* have become the dominant people in Egypt, Tripoli, Tunis, and Algiers; and various European nations have also formed settlements along the coasts, and mixed with the natives. The Portuguese settlements are in Lower Guinea and along the east coast. A large territory, near the Cape of Good Hope, is occupied by Dutch and British settlers. The English, Danes, and Anglo-Americans have settlements at various points on the coasts of Guinea; the Spaniards possess Ceuta; and the French have conquered, and will probably colonise the coasts of Algiers.

RELIGION.—Fetichism, or the worship of idols, is the religion of the greater part of the Africans, and is professed by almost all the negroes, and by some branches of the Atlantic family. These people, who see in the most common things which surround them objects of adoration, appear, in general, to admit of a good and a bad principle; they have lucky and unlucky days; their priests are dexterous jugglers, and profess to secure both men and beasts from the influence of evil spirits. Islam is predominant in all the great states of Moghreb, in Egypt, the greater part of Nubia, and among the Troglodytic family, although the Ababdes are not very strict in their observances; and the Danakil have neither priests nor mosques. It seems also to be professed throughout the north-eastern and central parts of Soudan; and the Mandingoes and other tribes have carried it even to the shores of the western ocean. Christianity is professed by the Copts in Egypt, and also in Abyssinia, where, however, it is mixed with many superstitious and idolatrous rites and notions. The European colonists profess, of course, the religion of their native country, and are protestant or popish, according to their descent. Judaism is maintained by a great number of Israelites throughout Barbary, Egypt, and Abyssinia; and there are a few Guebres, or votaries of Magism, in Mozambique.

GOVERNMENT.—All the various forms of government are found in Africa. The little Arab state of Damer, in Nubia, is a monarchical theocracy; Fouta-Toro and Fouta-Jalo, in Senegambia, are oligarchical theocracies; and the new kingdom of Sus, in Moghreb, is a feudal oligarchy. The governments of Marocco, Benin, Yarriba, and many others, are despotic, and the kingdom of Dahomey groans under a species of despotism of which there are few examples in the world. All the first-born males belong to the king, who causes them to be brought up publicly; he has even the monopoly of all the women of his kingdom, and every man who wishes to marry is obliged to pay him 20,000 cowries for a wife. The king of Moropua is perhaps the most absolute of all potentates, for he even prescribes to his subjects the time for their amusements. Several of the kings and chiefs of Guinea and Eastern Africa also exercise the most absolute power; they send their emissaries to steal men from whatever country they choose, and afterwards dispose of them to strangers in exchange for goods. It would, however, be a tedious task to mention in detail the governments of the numerous petty nations which people this continent. The governments of the great states are all despotic; and, of the smaller communities, many are patriarchal, and vary in different degrees between despotism and anarchy.

INDUSTRY AND COMMERCE.—Though the more civilised people of Africa are very far from equalling those of Asia in respect of industry, they are nevertheless not so degraded as is commonly believed. The people of the principal towns of Egypt, Barbary, Ardrah, Dagoumba, Ashantee, Bornou, and others, carry on various trades, and excel in the manufacture of different kinds of cloth, and in the dressing of skins. The district of Tafilelt and several towns in Marocco, and Kashna in Soudan,

are celebrated for the beauty of their leather (Morocco) and the preparation of skins. For sev years past the spun cotton of Damietta, Mansurah, Mehallet-el-Kebir, Foush, &c. in Lower Eg has acquired great importance. At the Isle of Zerbi, in Tunis, linen cloth and shawl- are manuf tured, which are in demand throughout Northern Africa. The negroes are in general bad bar men; but they are excellent fishers, good forgers, and expert goldsmiths; they can give steel a g temper, and reduce gold wire to an extreme fineness. The Foulahs and the Sousous work iron a silver; are dexterous workmen in wood, leather, and dye stuffs; and indeed among many of t negroes the art of dyeing is carried to a certain degree of perfection. The people of Loggun in B nou make cotton cloth of the finest and closest texture; and the goldsmith-work of Asiantee, D goumba, Sheeky, Jenneh, Timbuctoo, and other countries and towns of the interior enjoys a gr celebrity over all the continent; the work being of admirable finish and resembling filagree. T Bushmen of South Africa are good forgers, armourers, potters, and carvers; the Maquainas are s farther advanced, and work in iron, copper, and ivory. It is said the people of Haoussa make th own fire-arms. Several tribes of South Africa work copper mines; and others of them excel in t manufacture of *pagnes*, mats, and baskets, which are exported for the supply of the interior countri Some of the Moors of the Sahara are good dyers, armourers, and goldsmiths. The people of Whyd in Guinea and the Moonas in Congo, even cut precious stones and make of them pendants for th ears, bracelets, &c; and in Bornou it is said that there are people who cut precious stones a engrave seals. In spite of the obstacles presented by mountains and deserts, and the want of na gable streams, Africa has exhibited, from the remotest antiquity, a vast inland commercial moveme which still forms one of the most characteristic features of the continent. Timbuctoo, Jenneh, a other central towns of Soudan, are visited by caravans which set out every year from the extremit of Africa to exchange the produce of their own countries or of Europe and Asia, for that of cent Africa. Mourzouk, in Fezzan, and Cobbe, in Dar-Fur, are, as it were, the northern and the east gates of Soudan; and for several years the people of Angela have become the carriers of a great p of the trade of Soudan with Egypt and Tripoli. Since the Moroccans lost their influence in Tom buctoo, the Arabs of Suz have possessed themselves of all the trade which that city carried on w Morocco, and are become, like the Fezzaners and Furians, the immediate agents of the commu cial enterprise of Soudan with Moghreb. The Foulahs and the Sousous, and particularly the Ma dingoes, carry on its trade with the coast of Senegambia, and the Dagoumbas and Ashantees w the coast of Guinea. In the region of the Nile, Cairo is the great mart for the trade between Afri and Asia; and this great city, by means of the people of Angela, Fezzan, and Dar-Fur, and t merchants of Khartum and Berber, has commercial relations with the cities of Tunis, Algiers, F and Morocco, and the great towns of Soudan, Nubia, and Abyssinia. The town of Berber, likewi has become the great mart between Soudan, Abyssinia, Nubia, Egypt, and Arabia; and Commas has likewise become the mart of the trade between Soudan and the coast of Guinea. Speaking ge rally, we may say that commerce is to a certain extent the principal occupation of several Afric nations. Omitting the Jews, the Mandingoes, the Fezzaners, the Furians, and others already mention the following are the principal trading people: the Serrawoolis in Senegambia, who have long be famous for their address and intelligence; the Somaulis, who possess several ships, and exchange t produce of southern Abyssinia and the eastern corner of Africa for that of Arabia; the Ghibberti tribe of Arabs among the Dankali, who are the agents of almost all the trade of Abyssinia with Asi the Movizas, who manage nearly all the commercial business of the interior of Monomotapa. It curious also to see the *Lot-aber*, a people among the Iolo's, whose manners and customs resemble the of the gipseys; and the *Aromon* of the Grain coast and some other negroes, living between Cape S Ann and Cape Palmas, who leave their country for certain periods to carry on trade, or hire the selves as seamen on board of European ships; and also, to find a great number of the Foulahs a Kenouz performing the same active and laborious duties which are performed in Europe by the Sav yard-, Auvergnats, Tyrolese, Galleons, Friulese, Irish, and others. The most important commerci towns in Africa are: Fez, Marocco, Mogadore, and Tangier in Morocco; Algiers; Tunis; Tripoli Mourzouk and Ghadames in Fezzan; Cairo, Alexandria, Khartum, Berber, Suakim, Cosseir, a Massouah in Egypt and Nubia; Adowa in Abyssinia; Angornou and Bornou, Kano, Saccatoo, a Kashna in Central Soudan, Koulla in Nyffe, Commassie, Grand-Bassan, Cape Lahou, Yanci, & in Ashantee; Timbuctoo, Jenneh, Sego, Sansanding, Kankan in Western Soudan, Cape Coast, E mina, Bouny, Calabar, &c. in Guinea; St. Louis, at the mouth of the Senegal; Freetown, at Sier Leone; Cassanga, Yanvo, Bilé, Bailundo, Missol, Holondo, &c. inland, Cabenda, Ambriz, &c. on t coast of Congo; St. Paul de Loanda, Benguela, Mozambique, &c. in Portuguese Africa; Berbe in the colonies of the Seychelles. The articles most in demand in the interior of Africa are: pistol muskets, sabres, Venice glassware, of which incredible quantities are still imported, coarse woo and silk stuffs, pottery, brass-mounted cottons, muslins, writing paper, coral, razors, salt, perfum and spices. The principal articles of export are: goodelust, ivory, rice, wheat, gum, pepper, ostri feathers, raw hides, dressed hides, morocco leather, cotton, indigo, dates, senna, wax, aloes, copp natron, salt, teakwood, &c.; to which we must still add SLAVES. These formerly, not many years ag the staple article of African trade, and, in spite of all the laws and regulations made to the contrar the trade is still carried on with the greatest activity on both the eastern and the western coasts, a even across the desert by way of Tripoli and Egypt. The internal slave-trade, always great, appea even to have increased in consequence of the difficulties attending exportation by sea. The rulers Bornou, Baghermeh, Dar-Fur, and other Mahometan states, make frequent incursions upon the idolatrous neighbours, for the purpose of procuring slaves for sale; and even the pseudo christia Abyssinians seize the Shangallas for the same unhallowed purpose; and we may add, to their sham that the Anglo-Americans, and Brazilian-Portuguese, are now the grand encouragers of the traffic Among the different kinds of African money, salt, tibbar, and cowries deserve attention. Tibb or gold-dust, of which the great part is gathered in Central Soudan, is current throughout near the whole of Africa, where, in places the most abundant in gold, at Sansanding, for example, th value of this metal in proportion to that of silver is as 11 to 1, while in Europe it is as 15 to 1. The want of salt in several parts of the interior, and the difficulty of transporting so bulky an articl have considerably enhanced its value, that pieces of salt are used for money in many places. In the country of the Mandingoes, for instance, a piece of salt 2½ feet long, 11 inches broad, and 2 inches thic is worth from one to two pounds sterling; in Dar-Fur 12 pounds weight of salt are equivalent to a slave of 14 years of age, and in the market of Antalow in Tigre two or three pounds of salt are worth the thirtieth part of a dollar; at a greater distance from the place where it is produced, th value augments in proportion to the distance, till, according to Alvarez, a pound of salt is worth i weight in gold! Cowries, of no intrinsic value, are nevertheless the most common money in Souda and Guinea, and the trade-land of Senegambia. These pretty little shells, which are fished up in im mense quantities at the Maldives, have, in the interior of Africa, a value nearly ten times their wort in Bengal, where 2560 cowries are only equivalent to one shilling. The principal current money Abyssinia consists of pieces of cotton worth a dollar; and, when a smaller sum is required, the pie is cut into proportionate lengths.

SOCIAL STATE.—The preceding details exhibit in a great measure the social state of the people Africa, but the following additional particulars will serve to give a more complete, though neces

sarily a very imperfect view of this important subject. Africa presents several great indigenous centres of civilization, while for others it is indebted to Europe and Asia. The first and the most ancient, as well as the most important, is found in the region of the Nile, where, before the dawn of history, the Egyptians and the people of Meroë appear to have cultivated the arts and sciences, and where they have left the most imposing monuments of their industry and skill, along the banks of the Nile and the Azrek, and in the neighbouring oases. The ancient civilization of Axum and Gondar appears to have emanated from Meroë, while the social state of middle and lower Nubia, and the oases adjoining Egypt, appears to have originated from Egyptian colonies. This, at least, is the opinion of M. Balbi; but other antiquaries maintain that Egypt itself derived all its art and science from Ethiopia, or the upper region of the Nile. How civilization originated in Ethiopia, or in Egypt, if it took its rise there, it is impossible to discover. The other centres of civilization which are found in Soudan, deserve, no less than the first, the attention of philosophers. The particular character of the social system among the Foulahs and the Sousous in Senegambia; the progress made by the Ardrahs and their neighbours, before they were invaded by the Dahomeys, a progress which had carried them even to the invention of a kind of writing which may be compared with the quipuos of Peru; the imperfect civilization of the Dahomeys, Beninese, Dagoumbas, and other nations of Guinea and Congo, of the Movizas, Bushmen, Macquinis, and others in south Africa, afford some reason to believe that these people, free from every foreign influence, have followed a particular direction in the developement of their intellectual faculties, and have advanced but very slowly towards civilization. Among the Ashantees, the most powerful and most polished people of Guinea, there are several traditions, customs, and laws, which, as Bowdich thinks, may be attributed to their ancient connection with Carthage and Egypt: and this remark may be applied to several other nations of inland Africa. The people of Tombuctoo, Bornou, Kashna, Haoussa, and other countries of Soudan, appear to have been indebted to the Arabs, if not entirely, at least in a great measure, for the state of civilization, imperfect as it is, in which modern travellers have found them. As to the ancient and modern tribes of the great Berber or Atlantic family, which has successively come in contact with the Phenicians, Carthaginians, Greeks, and Romans, and afterwards with the Arabs, it is natural to believe that it is to these polished nations that they owe their small degree of civilization. To these two kinds of indigenous civilization we have to add two others foreign to Africa, into which, since the dawn of history, at four successive epochs, they have been imported by two European and two Asiatic nations, namely, the Carthaginians and the Arabs, of the Semitic family, and the Greeks and Romans of the Græco-latin family. But the influence of the Carthaginians, Greeks, and Romans, never extended beyond the Sahara. Towards the fourth century, Christianity was established in north Africa, along the slopes of the Atlas, in Nubia and Abyssinia, in the latter of which it still nominally prevails. Three centuries later the Arabs overran all northern Africa, crossed the Sahara, and passed along the east coast as far as Soffala, everywhere introducing Islam and its imperfect civilization: and even yet, in those countries, the Arabic language is almost the sole vehicle of civilization and science. But, beyond the pale of Islam, the whole of Africa is barbarous; most of the people are in the lowest state of savage life; and the modern Europeans have, for a period of three centuries, instead of endeavouring to introduce among them the civilization and the religion which themselves possessed, rather treated them as beasts, carrying them away in millions, as slaves; fostering all their evil propensities, and spreading desolation and misery over every region within the reach of their nefarious traffic.

DIVISIONS.—Our imperfect knowledge of the geography of Africa does not enable us to divide the continent into very distinct geographic regions; and the great number and the uncertainty of its political divisions prevent us from taking them as the basis of our descriptions. We shall therefore consider Africa under the following arbitrary heads of division: the *Region of the Nile*, including Abyssinia, Nubia, and Egypt; *Moghreb*, including Barbary and the Sahara; *Soudan* or *Negroland*, including Senegambia, Guinea, and the basins of the Kawara and the Tchad; or, in other words, all the region between the Sahara and the ocean, eastward to Abyssinia, and southward to the central mountains of the Moon; *Southern Africa*, including that portion of the continent which lies to the south of Abyssinia and the mountains of the Moon; and, lastly, *the Islands*.

REGION OF THE NILE.

THIS wide region comprises that portion of Africa which forms the western shore of the Red Sea, extending from 7° to 32° N. lat., for about 1750 miles, and between 30° and 43° E. long., with a breadth varying from about 1000 miles at the south, to 130 miles or less at its northern extremity. It is usually considered as divided into three large countries, named *Egypt*, *Nubia*, and *Abyssinia*; each of which will form the subject of a separate section, though the greater part of the region is now under the dominion of the Pasha of Egypt.

The grand characteristic of the region is the river NILE, which traverses its whole extent from south to north. According to the most recent information, the remotest sources of this famous river appear to lie in the mountains of the Moon, about 7° north lat. These unite to form a stream which, under the name of *Bahr-el-Abiad* (White river), flows north-eastward, through Dongo or Denka, and the country of the Shelluks, to 15° 34′ north lat., where it receives, on its right bank, the *Abawi* or *Bahr-el-Azrek* (Blue river), from Abyssinia. The White river appears to have been the true Nile of the ancient geographers, but, in modern times, it is only after its confluence with the Azrek that the united stream is known as the Nile, under which name it flows, in a general direction, though with various windings, almost due north, through Nubia and Egypt, into the Mediterranean Sea by two principal mouths. Its principal affluents, besides the Azrek, are the *Maleg* and the *Tacazze* or *Atbarah*, both on the right, from Abyssinia; but from the left no important affluent is known. In one respect the Nile is distinguished from every other river; for, between the junction of the Tacazze and the sea, a distance of 1500 miles, it does not receive a single affluent, but proceeds in solitary grandeur through the desert, fertilizing only a narrow strip along its banks of a few miles in breadth, which constitutes the cultivated portion of Nubia and Egypt. The Bahr-el-Abiad has been explored by M. Linant, to the extent of 132 geographical miles above its confluence with the Azrek. As he sailed along he sounded occasionally, and found always from three to four fathoms; the river was, in many places, a mile and a half wide, and even then was far within its banks, which sometimes seemed four miles distant from each other; but even this is not the full width at its greatest height. There are several islands in the stream, and these as well as the banks are covered with large trees of a splendid green, in the higher parts no longer obscured with brushwood, but standing in groves amidst a rich herbage of the finest hue, as in an English park. But, a few miles above Aleis, where Linant stopped, the river, he was informed, is only knee-deep, in consequence of its great width. Of its higher course very little certain information has yet been received. Ibrahim Kashef, an officer of the Pasha, travelled for 35 days along its banks, partly on both sides; and at the highest point he reached, probably 10° N. lat., 29° E. long., the river was shallow, full of islands, six hours in breadth, but with no mountains in sight. The great breadth, though perhaps exaggerated, and not very intelligibly described, leaves little doubt that the river, even at this extreme point, was much broader than at its junction with the Azrek, and seems to indicate that its conformation is of an extraordinary kind, its origin being perhaps in a lake or lakes, supplied by streams from a distant range of mountains. The existence, moreover, of lakes having a communication with the river only during floods, is rendered highly probable by a passage in Linant's Journal, which states that at the time of the inundation of the Abiad, an incredible quantity of fish is brought down by the current. M. Russegger, however, writing from Rosserres in the country of Fassoglo, in December 1837, says that with respect to the White river, he had reason to be convinced that it flows in a direction precisely contrary to that assigned it on the maps, for it rises in the country of the Galla and Shangalla, and flows parallel to the Blue river.—(*Ath naeum*, 5th *May* 1838.) Be that as it may, the Bahr-el-Abiad is undoubtedly the principal branch of the Nile. It discharges a greater quantity of water than the Azrek; and, though somewhat narrower at the confluence than it is higher up, it is even in this respect equal to the other. The colour also of its water is that which characterizes the united stream in the dry season, the Azrek being then of a greenish hue, while the Abiad is always white, and has a soapy appearance, even during the inundations. But, at the confluence, the Abiad is only 180 feet across, and, further down, the general aspect of the river has much more of the character of the Azrek than of the Abiad: in every respect resembling the former as to the nature of its banks and adjoining scenery, width, sinuous course, sand-banks, and the want of large shells, such as are only to be found on the banks of the Abiad. Below, also, as along the banks of the Azrek, there are comparatively few waterfowl, while near the Abiad these are innumerable.—(*Jour. R. Geog. Soc.* vol. II.) The Bahr-el-Azrek, however, has by many been considered to be the Nile. It rises from a small marshy plain, in the country of the Agows, 125 miles S.S.W. of Gondar, and takes a circuitous course through the lake of Dembea to the south-east, south, west, and north-west, in which last direction nearly it continues through almost 6° of lat. till it meet the Abiad. It was the source of this river that was visited by Bruce, as the source of the Nile; and it is indeed well entitled, from its size, and the length of its course, to dispute the honour with its rival; at the confluence, it is at least as wide though it discharges a smaller quantity of water. In the dry season its water has a greenish hue; but during the annual flood, it becomes reddish, from the nature of the mud brought down by the *Bahr Toumat*, which falls into the Azrek in the province of Fazuolo. The Azrek is the *Astapus* of the ancient geographers; and its principal affluents are: the *Dender*, and the *Rehat*, on the right; the *Roma*, *Yabous*, and *Toumat*, on the left. The only affluent of the Nile, below the great confluence, is the *Tacazze* or *Atbarah*, on the right, in lat. 17° 40′ N. This stream has its source in the high mountains of Lasta, and forms with the Nile the famous peninsula of Meroë. Near its confluence with the Nile it receives on the right the *Bahr Mogren*, which brings down such a quantity of black earth that it affects the general colour of the river. After the junction of the Abiad and the Azrek, the Nile makes a remarkable bend, like a great S, flowing 200 miles south, and then turning again to the north, its width varying exceedingly from more than a mile to less than a quarter of a mile, and its channel being studded with innumerable islands, clothed with the richest vegetation. In its progress through Nubia it forms six cataracts. The first occurs about midway between Hallfaiah and Shendi; the second, below Berber; the third, above Meraweh; the fourth, at Hannek; the fifth, at Wady Halfa, is formed by a multitude of rocky islands, among which the river dashes amidst clouds of foam, and is tossed in perpetual eddies; the sixth, and lowest, between Philæ and Elephantine, 24° N lat., where there is a considerable fall, the greatest height, however, being only five feet perpendicular; but the bed of the river is for several miles thickly strewed with granite rocks, and narrowed to half a mile. These cataracts, however, are usually numbered upwards, the sixth being reckoned

the first, and the first the sixth. The Nile consists of too large a body of water to be lost in the immense desert through which it flows, but it diminishes gradually as it proceeds northward. It is narrower at Cairo than at Siout; and narrower at Siout than at Thebes; but from Wady Halfa to Thebes, its volume continues apparently the same. An immense quantity of the water is diverted from the river, and exhausted in artificial irrigation; and, when the great canals of Egypt were kept in good repair, the river must have been still more diminished towards its mouth. At Assouan its width is about 3900 feet; at Hajar Silsili, only 1700; at Oudi, 36 miles above Cairo, 2900; at Rosetta, 1800, and at Damietta, only 800.

§ 1. *EGYPT.*

SITUATION AND EXTENT.—This ancient and celebrated kingdom, is situate in the north-east corner of Africa, between 24° 3′ and 31° 37′ N. lat., and 29° and 35° 25′ E. long.; but of this large space of 150,000 square miles, little more than a tenth part is occupied by cultivable soil, the remainder consists of salt marshes, sandy plains, or rocky and barren mountains. The cultivated land of Egypt consists of the long narrow valley of the Nile, which measures above 500 miles along the course of the river, with an average breadth of only eight or ten miles; and a large triangular plain, measuring about 150 miles along the sea, from which it extends about 100 miles inland to the point where it joins the valley. Besides these, there is likewise the province of Faioum or Fyoum, which is watered by a branch of the Nile, and comprises about 340 square miles.

The average breadth of the valley of the Nile between Cairo and Edfou is only about 7 miles; and that of the cultivated land, whose limits depend on the inundation, scarcely exceeds 5½, being in the widest part 10¾, and in the narrowest, 2 miles, including the river. The extent of the Delta may be estimated at 1976 square miles, and the whole northern district, capable of being irrigated, including the Delta, at 4500 square miles, or double the whole arable land of the valley, which may be computed at 2255 square miles. That the irrigated part of the valley was formerly much less extensive than it is at present, at least wherever the plain stretches to any distance east and west, or to the right and left of the river, is evident from the fact of the alluvial deposit constantly encroaching in a horizontal direction upon the gradual slope of the desert; and, as a very perceptible elevation of the bed of the river, as well as of the land of Egypt, has been constantly going on, it requires no argument to prove that a perpendicular rise of the water must cause it to flow to a considerable distance over an open space to the east and west. Thus the plain of Thebes, in the time of Amunof III., or about 1430 B. C., was not more than two-thirds of its present breadth; and the statues of that monarch, round which the alluvial mud has accumulated to the height of nearly 7 feet, are founded on the sand which once extended to some distance in front of them. How erroneous, then, is it to suppose that the drifting sands of the encroaching desert threaten the welfare of this country, or have in any way tended to its downfal; and how much more reasonable is it to ascribe the degraded condition to which Egypt is reduced, to causes of a much more baneful nature, foreign despotism, the insecurity of property, and the effects of that old age which it is the fate of every country, as well as of every individual, to undergo. It is true that the sand has accumulated about Bahnasa, and on the irrigated land in its vicinity, as well as about Kerdasseh, and a few other places, owing to the form of the valleys, which open in these spots from the Libyan desert, but this effect is not general throughout the valley of the Nile, even on this side of the river; and the progress of the sand can never be very great in any part of Egypt, however it may extend itself in Nubia over the exposed and narrow strip of land which the western bank presents above the cataracts of Assouan.—(*Wilkinson*, I. 218, 219.) For the satisfaction of those who will be content with simple facts it may be sufficient to state, that the breadth of the irrigated portion of the valley is much more extensive now than it was at any former period, and that this increase will continue in spite of the very few local impediments which the drifted sand may accidentally offer; and it is not irrelevant to observe, that no soil is better suited for many kinds of produce than the irrigated edge of the desert (which generally consists of a clay mixed with sand) even before it is covered with the fertilizing deposit of the inundation.—(*Ib.* 222.) From the first cataract of the Nile to the mouth of the river at Rosetta, the perpendicular stratum of soil decreases in thickness as it approaches the sea; and thus at Elephantiné the land has been raised about 9 feet in 1700 years, at Thebes about 7, and so on, gradually diminishing to the mouth. There, indeed, the deposit is lessened in a very remarkable degree, much more than the regular decreasing ratio, in consequence of the greater extent of the land, east and west, over which the inundation spreads; so that in a section representing the accumulated soil and the level of the low Nile, the angle of inclination would be

much smaller from the head of the Delta to the sea, than from the Thebaid to the Delta. The formation of Egypt and its extensive Delta are beyond the reach of inquiry, and of a date long anterior to the period at which that country or Ethiopia was inhabited. In the times of the earliest Pharaohs, of whom any record now remains, the whole of Lower Egypt seems to have been densely inhabited (*Ib.* 9, 11); and hence we have evidence that the mountain chain the Delta has been protruded into the sea, to an great extent, within the age of history. If it had ancient cities, which were built two thousand B.C. or 4000 years ago, and still are so, they ought now to have been far inland. — *Wilkinson, Journ. R. Geog. Soc.* IX. 432.)

GENERAL ASPECT. — The valley of the Nile is bounded on both sides by ranges of mountains, which follow the course of the river from the cataracts to near Cairo, where they diverge, the western range extending from that point north-westward to the neighbourhood of Alexandria, while the eastern range stretches eastward to the head of the Red Sea. The general character of the western range is that of a limestone formation, containing numerous fossil shells; but from Luxor to Assouan the formation is sandstone alternating with limestone, and containing also slate and quartz of various colours. Above Assouan the formation is granite, mixed with syenite and some other crystalline primitive rocks. The eastern range differs somewhat in character, as it rises more abruptly, and often approaches close to the margin of the river. The limestone extends as far south as on the western side; but the granite formation commences earlier. Near Assouan the granite alternates with decomposed sandstone, and in the same neighbourhood are found the granite quarries which furnished the materials of the ancient temples, obelisks, and statues. The elevation of these mountain ridges is only a few hundred feet, and the northern branch, which extends from Cairo to Suez, the Jebel Mokattam, and Attaka, does not exceed 400 feet. In both ranges there are numerous ravines which afford passages from the banks of the Nile into the eastern and the western deserts. The great valley itself has the same inclination as the waters of the river, which is about two inches in the mile; so that Assouan, being about 640 miles from the sea, should be only about 107 feet above its level. The slope, however, is not gradual through all this distance. It is greatest immediately north of Assouan, where the fall of the water is seven inches and a half in the mile, and diminishes almost to nothing as it approaches the Delta. The bed of the river, however, does not lie along the *bottom* of the valley, but along the top of a narrow ridge formed by the continual deposit of mud during the inundations: and the same is the case with the Bahr Jousef, whose channel likewise forms a narrow ridge, with a hollow between it and the Nile. The banks consist of a succession of rich plains of unequal width, studded with little groves of palm trees, each of which hides a village. These groves, animated by innumerable flocks of turtle-doves, pigeons, and other birds, are surrounded with cultivated land, which is sometimes covered by the inundations, and on the returning of the waters, or at other seasons, by means of irrigation, is clothed with the richest verdure and the most luxuriant crops. — *Hoskins' Visit to the Great Oasis, &c.* Lond. 1837.)

At the northern end of the long valley, below the point where the mountains diverge, and between them and the sea, lies the alluvial plain of Lower Egypt, which is almost a dead level, intersected by the two great branches of the Nile. These branches form between them the celebrated *Delta*, a triangular island, measuring eighty miles at its base, and about ninety in a straight line, along each of its other sides, which, however, follow the windings of the river; and are therefore very irregular. On each side of the Delta is a level plain of the same character, the greater part of which appears to have been formerly included within it, when the Nile reached the sea by seven branches. The whole of this plain, beyond as well as within the Delta, is intersected in every direction by numerous canals, which convey the waters of the river to all parts of it, thereby producing a continual verdure; and, during the period of the inundation, a great part of its surface is covered with water. Eastward of the Delta is a singular valley, thirty-nine miles in length by two in width, and containing about 20,000 acres, formed by two parallel mountain ranges which screen it from the sands of the desert. The soil is rich and productive, and is covered with an exuberant growth of shrubs and copsewood. It is crossed by the ancient canal, between the Nile and the Red Sea; and is supposed, with great probability, to have been the land *of Goshen*, where the Israelites were settled. The western part of it is now called *Wady Tomylat*, and the eastern, *Wady Sababyar*. About sixty miles above Cairo, a gap in the western mountains affords a passage for a branch of the Nile into a large district called *Fyoum* or *Faioum*, through which the water flows in numerous streams to the Birket-el-Keroun, or ancient Lake Moeris, converting a large portion

of desert into the most fertile and the most beautiful province of the kingdom. Here the eye is never weary with contemplating the smiling fields, which are covered with a luxuriant and almost tropical magnificence of vegetation, and form a splendid contrast to the barren desert that everywhere surrounds them, and of which they seem to have been once a part. The Faioum is densely peopled, and is never visited by the plague. The aspect of the cultivated parts of Egypt undergoes periodical changes with the seasons. In our winter months, the verdure of Egypt is rich and beautiful. The air is perfumed with the odours of the orange and citron trees, and of innumerable shrubs; and the flocks overspreading the plain add animation to the landscape. The country now forms one delightful garden, though somewhat monotonous in its appearance; for, on every side, it presents nothing but a plain, bounded by whitish mountains, and diversified with clumps of palm trees. In summer, however, it exhibits merely a brown soil, either miry, or dry, hard, and dusty; immense fields under water; vast spaces unoccupied and uncultivated; plains, in which the only objects to be seen are date trees; camels and buffaloes led by miserable peasants, naked and sunburnt, wrinkled and lean; a scorching sun, a cloudless sky, and constant winds which vary only in force. It is not therefore surprising that travellers have differed very much in their descriptions of this interesting country.

Beyond the limits of the cultivated regions are several portions of the deserts which are worthy of notice. In the desert, south-east of Alexandria, are two parallel valleys, called the *Basin of the Natron Lakes*, and the *Bahr-bela-maie*, or waterless river. The former contains a series of six lakes lying in the direction of the valley, the banks and waters of which are covered with crystals of chloride of sodium or sea-salt, and carbonate of soda or natron. The Bahr-bela-maie lies to the south-west of the valley of Natron, from which it is separated by a small ridge; it is about eight miles wide, and is everywhere covered with sand. It is said to join Faioum on the south, and the Mediterranean Sea on the north-west, and is supposed to have once formed the bed of the Nile, or at least of one of its branches; and, to strengthen this conjecture, petrified trunks of trees and fish-bones have been found beneath the surface. The vegetation in both valleys has a wild and dreary aspect; the palms are mere bushes, and bear no fruit. The Natron valley is inhabited by Greek monks, who have there four convents, which serve at once as their fortresses and their prisons. Farther south are several *oases* or *wahs* scattered over the desert, within the nominal limits of Egypt. Their physical character is pretty much the same, consisting of small tracts or valleys irrigated by springs of water, and producing dates; the larger ones yield wheat, rice, barley, clover, liquorice, olives, apricots, vines, pomegranates, and other fruits. The first which occurs, in advancing southward, is the *Little Oasis* or *Wah-el-Bahryeh*, or *Wah-el-Behnesa* or *Behnasa*, three days' journey south-west of Faioum. It pays a yearly tribute of about £643 sterling, and has an armed force of several hundred men to preserve the peace. A short day's journey south of it is the small oasis of *Wah-el-Hayz*; and three days further south is that of *Farafreh*. Westward of Esneh on the Nile, between 29° and 30° E. long. is the *Great Oasis*, called by way of eminence *El Wah*, which extends in length between 24° 30′ and 26° N. lat., about 100 miles. It contains many springs and villages, with the ruins of Egyptian, Roman, Christian, and Saracenic buildings. Its chief town is El-Khargeh. Three days' journey westward is the *Wah-el-Dakhleh*, *Dakkel*, or *el Gharbe*, which contains eleven villages or towns, and 6000 male inhabitants. Its principal village, is *El Kasr Dakkel* or Dakhleh, in 25° 35′ N. lat. and 28° 55′ E. long. *Wah-Zerzoora*, *Wah Gebabo*, and some others, lie still farther west. But the most interesting of all these *wahs* is that of *Siwah*, 310 miles due west of Benisouef on the Nile, which contains the remains of the celebrated Temple of Ammon, visited by Alexander the Great, and other antiquities; a large and strongly fortified town, with a population of 2000, and several villages. It was conquered by the Pasha of Egypt in 1820. About 25 leagues N.W. of the capital is the salt lake of *Arachieh*, about six or seven leagues in circumference, with a rocky islet, which the Siwahians say contains the sabre and seal of the Great Prophet, or, according to others, the ring, sword, and crown of King Solomon-ben-Daoud, the great magician of the East.— (*Hoskins' Visit to the Great Oasis, &c. &c.*)

The general character of the eastern desert is that of a mountainous region, which, though generally barren and rocky, contains a number of wadies or ravines, fertilized by springs, and clothed with vegetation. Mines of various metals, and quarries of porphyry and other valuable stones are scattered among the mountains. A range of hills, called Jebel Mokattam and Jebel Attaka, extends from Cairo to Suez; to the south of these are other ridges stretching nearly in the same direction, with inter-

Z

Lower Canals.—The

Upper Egypt, they are defended only by fences of earth and reeds, which easily give way before the strong pressure of the superabundant water. There are great disparities in the statements of different writers respecting the height which the inundation ought to reach to be beneficial. According to Wilkinson, who is probably the best informed, the lowest rise is 18 cubits; the canals are then cut; 19 cubits he calls tolerable; 20, good; 21, sufficient; a rise of 22 feet fills every canal; a rise of 24 feet would overwhelm and ruin the villages. A cubit exceeds 21 inches; hence, in order fully to fertilize Egypt, a perpendicular rise of 38 feet is required. Besides the prodigious quantity of earth brought down by the flood from the countries in the interior, the banks of the river itself, in Egypt, are also undermined to a great extent, and the material is carried down to be deposited at the base of the Delta, where new accessions are constantly making to the alluvial formation of the coast, while the direction of the channel of the river is perpetually changing. The salubrity of the water of the Nile was highly extolled by the ancients, and is acknowledged by most modern travellers. If Mahomet had tasted it, the Egyptians say, he would have supplicated heaven for a terrestrial immortality, to be enabled to enjoy it for ever. It is said to be laxative, owing to certain neutral salts which it contains; but, during the three summer months, before the inundation commences, it requires to be filtered before it can be safely used. During the flood it first acquires a green colour, sometimes pretty deep; after thirty or forty days the colour becomes brownish red; and, again, during the low season it becomes quite clear. In many circumstances the Nile differs from all other rivers: for 1500 miles it pursues its course alone, without receiving a single affluent; the country through which it flows is not liable to falls of snow or hail, seldom even of rain; its waters, consequently, receive no taint from the noxious qualities of earths or minerals, except those in its immediate channel; the air, pure and serene, generates no unwholesome fogs; and its banks are unpolluted by the filth of any great cities, as it flows for the most part through rocky deserts or vast expanses of sand. In this long course, it exposes generally to the sun and air a broad surface, and is gradually purified as it advances towards Egypt. During the rainy season, and towards autumn, when it is filled with torrents from the mountains, its waters are muddy and unwholesome; and this is accordingly the principal unhealthy season in Lower Egypt; but at other times there is scarcely a river in the world whose water can be compared in quality with that of the Nile. The average current of the river is about 2900 yards per hour, but it is considerably increased during the period of the inundation. The prevalence of northerly winds more than compensates to vessels bound upwards the rapidity of the stream. The general depth at low water is about six feet (1.830 metre). There is much danger, however, in the river, occasioned by sudden squalls.

At Farshout, in lat 26° 12′ N., a canal, named *Bahr Joussef*, *Moye Souhaj*, &c., issues from the west bank of the river, and runs parallel with it for 250 miles to Benisouef, where one branch diverges towards Faioum, while another flows onward as far as the Delta. It is in some places several miles distant from the river, flowing, like its parent stream, along the top of a ridge formed by the mud of its inundations, leaving a space of low ground between them. Its breadth varies from 50 feet to 300; and it has all the appearance of a natural river, though it is undoubtedly artificial. The branch which flows into Faioum divides into numerous streams, which fertilize the district, and ultimately find their way to the *Birket-el-Keroun*, a large lake of brackish water, about 30 miles in length, with a breadth varying from eight miles to less than one. This lake was believed by the ancients to have been entirely artificial, and to have been dug by king Mœris, for the double purpose of preventing the low country from being damaged by the superabundant overflowing of the Nile, and of serving as a reservoir to supply water during the low season. Herodotus accordingly reports that during one half of the year the Nile flowed into the lake, while, during the other six months, a stream flowed out of it. Of the latter, however, there is no remaining trace; and the great works contrived by Mœris to regulate the water have disappeared. The lake has at present every appearance of occupying a natural basin, though, certainly, its only apparent feeders are derived from the Nile. Mr. Wilkinson, moreover, insists that Herodotus's account of the water returning from the lake to the Nile is totally inapplicable to the lake Mœris, the level of its surface being about 100 or 120 feet lower than the bank of the Nile at Benisouef; which, making every allowance for the rise of the bed of the river, and the proportionate elevation of its banks, could never have been on a level, even in the time of Herodotus, with the lake Mœris. It is the canal of Joussef to which, he says, the account of Herodotus is alone applicable, as being the work of human hands, and returning

ns water to the river — *Topography of Thebes, &c.* 354.] The view of the la
Kernak is remarkably grand. It is equal in breadth to the lake of Geneva, bet
Zurich and Thun, and though differing in its accessories from every sheet of w
in Europe, it presents to the burning desert and mountains, and the uncultiv
plains which surround it, and to its own unmitigated waves, features not less calcu
to excite the most intense and grand emotions of grandeur and sublimity. Toward
east the shore is a long promontory of a series of wave-like sandhills, which, as th
turns westward, gradually diminish in height, losing gradually into mountains, w
are naked and white and extend westward to the extreme verge of the horizon.
Nowhere is the contrast between the traveller and contemplates it from the verdant p
of the Faioum more striking. Absolute solitude prevails on all sides; and no
presents itself to the eye that can suggest a reference to human society: but
many flights of water-fowl, as pelicans, wild-ducks, gulls, petrels, and white ib
are seen; while the surface of the lake is the scene of swimming on the lake;
the waters abound with innumerable varieties of fish. Whatever may be the
towards the middle, the water is extremely shallow near the land, and the bo
in many places consists of shell-sand, such as is everywhere deposited by the
Modern Egyptians and Thebans, see *Egypt as it is; or Travels in the V*
of the Nile. By James Augustus St John. London, 1834; vol. II. 238-41
have taken the deepest part, found the water of a brackish taste; not to the d
men, and the Pharaohs, who thought it "almost as salt as the sea;" but suffici
to render it disagreeable, though not unfit for drinking. The fisheries of the
and the Bahr Yousef were farmed at 300 purses per annum, or about £4000 ste
The Arabs call the lake *Bahr-el-Kerun*, or lake of the horns, but for what r
is uncertain.

The only other canal which deserves particular notice is the *canal of Mu*
d, recently formed by the Pasha to afford a navigable communication between
andria and the Nile. It runs from Alexandria to the Nile at Atfeh, near Fou
a serpentine course of about 40 miles: its mean depth being much above the le
the river, and its breadth averaging perhaps 200 feet. There is a sluice at each
to regulate the admission or escape of the water, but no means for the passa
boats. The canal is in fact a large ditch, without science in the plan, or skill i
execution. It is so contrived that the distance is increased about one-third, wi
the slightest necessity existing for deviating from a straight line. Though
nally constructed by the labour of the whole population, it likewise supplies Alexandria
water, and serves to irrigate the lands on both sides. The making of this
was commenced in 1819; and from the scarcity of the labour, to which they
unaccustomed, combined with the treatment and want of food and pure water, 2
persons perished in ten months, and were buried in the embankments.

The *canal of Nechoas* is now entirely filled up; but vestiges of it are still fou
different parts of the valley between Suez and the Nile, and it has been seriously
posed to restore it through part. The *Khalij*, or canal of Cairo, leaves the river
Fostat, and flows directly through the city to the *Birket-el-Hadjee*, or pilgrim's-
so called from its being the place where the great caravan of Mecca assembles.
other canals for the purposes of irrigation intersect the deltaic plains, and one t
ler has counted so many as 6000; but these channels, rapidly filling up by the m
deposite, retain considerably less water than formerly; and the natural birke
pools, increasing in extent in proportion as they become shallower, spread ove
fertile fields, and diminish the cultivated land. Much of the water which shou
retained in these reservoirs is thus lost by evaporation, and in the canals by int
tion, and the insufficiency of the banks; and hence the inhabitants of the villag
seldom command a supply of water for any length of time.— *St. John*, II. 353.

Besides the freshwater lakes already mentioned, there are several salt water lakes along the
as the *Marcotis*, *Mareotis*, *Et-Bourlos*, and *Menzaleh*. The lake Marcotis is a large shallow l
to the south east of Alexandria, studded with islands, and separated from the sea on its north
side by a long ridge of sand-hills. It is of great antiquity, but was dry for many centuries t
sea was let in to its bed by the British army in 1801. The lake Maadie or Aboukir lies to the
east of the Marcotis, separated from it by a narrow strip of land. The lake of Etko is a long n
lagoon, a little farther east. The lake Bourlos lies to the east of the Rosetta branch of the Nile
lake Menzaleh lies to the east of Damietta, and is bounded on the north and north-east by
narrow strip of low land which separates it from the sea. It communicates with the sea by tw
gable channels; but the southern portion of the lake itself, to the extent of about one-third of it
face, is not navigable, and the remainder is very shallow. It measures about 50 miles in l
from north-west to south-east, with a breadth varying from 12 miles to 30. It contains s
islands, and abounds with fish, which afford employment and subsistence to a numerous c
rather savage fishermen.

CLIMATE.—From the nature of its surface, and the general aridity of th
rounding deserts, Egypt is much hotter than most other countries under the

parallel of latitude. At some distance from the sea the heat of the plains is at all seasons scorching; but it sometimes happens that the violent north winds depress the temperature, even near the tropic, to the freezing point. The general height, however, of the thermometer, in the depth of winter, in Lower Egypt, in the afternoon, and in the shade, is from 50° to 60° Fahrenheit: in the hottest season it is from 90° to 100°; and in the southern parts of Upper Egypt it is generally about ten degrees higher. But though the summer heat is so great, it is seldom very oppressive, being generally accompanied by a refreshing northerly breeze, and the atmosphere is at the same time extremely dry. The nights of winter, on the contrary, are exceedingly cold in Lower Egypt; and, indeed, the keenness of the night air at that season is almost incredible. Every where in the shade it is cold, even by day, and a strong breeze constantly prevails, which increases the sharpness of the atmosphere; rendering it prudent, even in the sunshine, to go warmly clothed. To the neglect of this precaution may be attributed many of those dangerous attacks of fever and dysentery which travellers frequently experience in Egypt. — (*St. John*, I. 139.) The wind is very regular in June, July, August, and September, when it blows almost without interruption from the north and north-east. During the day, at that season, the sky is clear, without clouds or mists; but after sunset the cooling of the air condenses the vapours, which are then observed to pass with a hurried motion from north to south, which continues till after sunrise, when the solar heat rarifies them anew, and renders them again invisible. The period of the decrease of the Nile is accompanied by intermitting winds, which, however, still blow from the north, but with intervals of calm weather. In winter the winds are changeable; but at that season the cloudless atmosphere gives free scope to the solar rays, and the vegetation becomes luxuriant. The only symptoms of moisture then in the atmosphere are the abundant dews deposited in the night, and the fogs which appear in the mornings, though the latter are comparatively unfrequent. In the same season it occasionally rains in Egypt, but chiefly near the sea. At Cairo there are, on an average, four or five showers during the year, and in Upper Egypt only one or at most two. "Indeed," says Mr. St. John, writing near Benisouef, "nothing can be more incorrect than the opinion that it never rains in this part of Egypt. During the first week we were on the Nile it rained at least ten times, not slightly or sparingly, as if the climate were not used to it, but in long, heavy, drenching showers, which thoroughly soaked the earth, and must have been greatly useful in forwarding the processes of vegetation." —(I. 221). The approach of the vernal equinox changes the appearance of the country; the hot south wind then begins to blow, and continues at intervals during a period of somewhat more or less than 50 days (thence called the *khamseen* or *khumaseen*), commencing in April, and lasting throughout May; but it seldom blows for more than three days in succession. During its continuance the atmosphere becomes troubled, sometimes acquiring a purple tinge; a dry burning heat prevails every where, and whirlwinds, like the blasts of a heated furnace, sweep over the country, often raising the sand and even small stones to a considerable height, so as to form a black cloud, and afterwards depositing them in large heaps on the ground. The fine sand is forced into the houses through the smallest crannies, and every place is filled with it. These winds, though they seldom cause the thermometer of Fahrenheit to rise above 95° in Lower Egypt, or in Upper Egypt, above 105°,* are dreadfully oppressive even to the natives. During spring and summer the simoom blows occasionally, coming from the south-east or south-south-east, and carrying with it clouds of dust and sand. It is still more oppressive than the khamseen winds, but seldom lasts longer than a quarter of an hour or 20 minutes. The season of the khamseen is the only time in which the atmosphere of Egypt is generally unhealthy, and it is then that the plague, the fatal scourge of the Levant, is most severe. The ophthalmia, however, another very common Egyptian disease, makes its greatest ravages during the inundations, a circumstance which proves that it is not entirely owing to the glare of the sun and the heat of the khamseen winds.

VEGETABLE PRODUCTIONS. — To its singularly constituted atmosphere, and to the regular inundations of the Nile, Egypt owes the advantage of containing within its limits almost all the cultivated vegetables of the old world. The cultivated plants may be divided into two great classes; the one consisting of those which grow in the mud of the Nile; and the other embracing those produced on ground beyond the reach of the inundation, but which is watered artificially. In the first class are wheat,

* "This is the temperature in the shade. At Thebes I have observed the thermometer to rise above 110° during a khumaseen wind in the shade."—*Lane*, I. 3.

barley, spelt, beans, peas, lentils, sesamum, mustard, flax, anise, carthamum fronwood, tobacco, lupins, vetches, barsim or Egyptian trefoil, fenugreek, pum melons, cucumbers, and lettuce. The cucurbitaceous plants, and also tobac lupins, generally cover the banks of the river as the water subsides; the melo cucumbers grow almost visibly, but are generally watery and tasteless; the t is weak, but is reckoned much pleasanter to smoke than that of America. plants produced in the irrigated lands are chiefly the *holcus dhurra* or durrah, forms the common food of the people; its leaves are used for feeding cattle, stalks serve as fuel for the ovens; sugar-cane, indigo, cotton, and pot-herbs. C in particular, has lately become an article of great commercial importance; it is vated in large quantities, and is generally of excellent quality, though produce little more labour to the cultivator than planting and watering it. The sugar- also now grown in considerable quantity, and the manufacture of sugar is in a fl ing condition. Faioum is distinguished for its roses, which produce the muc rosewater: it also produces rice; but the best quality of that grain is raised the marshy grounds of Lower Egypt, and particularly near Lake Menzaleh, w was introduced in the time of the Khalifs. Of fruit-trees, the almond, the w and the cherry are not fonnd in Egypt; the pear, the apple, the peach, and the are neither abundant nor good; but citrons, lemons, oranges, pomegranates, ap and bananas prosper abundantly; and the colocynth or bitter apple has bec article of considerable trade. The sycamore or Pharaoh's fig, less valued for it than for its deep and broad shade, the carob, the jujube, the tamarind, and othe are cultivated; but none of these are equal, in number or usefulness, to the palm, which is cultivated alike in the lands that are naturally or artificially irri Groves of these palm-trees are to be seen containing 300 or 400, and sometim sisting of several thousands together. The olive tree is only met with in ga but there are some plantations, where the people preserve their fruits in oil, a them all over Egypt. The vine, in ancient times, formed an interesting branch ture, and produced the choicest wine; but at present it is only cultivated for its and its grapes. But all these vegetable productions are not found every where vary in different provinces; and some belong almost exclusively to particular di Clover, so abundant in the Delta and Lower Egypt, is rarely cultivated in th baid, where its place is supplied by gilban *(lathyrus sativus, L.)* Rice belo clusively to the Delta and the oases; and cole-seed, gortum, poppies, and l are almost confined to Upper Egypt, where also the greatest quantity of du cultivated. Date-trees are more abundant in the north; while vines, figs, ros olives, are limited to Faioum, and the gardens contiguous to large towns.—(son's *Topography of Thebes, &c.* 267.) There are plantations of mulberry t Wady Somulat, in the provinces of Sharkiyeh, Mansourah, Menouf, Garbiyeh, K Damietta, Rosetta, and Gheeza, consisting altogether of about 3000 fedd land, and three millions of trees.—*(Bowring*, 21). A large and beautiful frui celebrated among the ancients, the *persea* of the Greeks, seems to have disap from Egypt; but another plant, which makes a conspicuous figure in ancient wr the *lotus*, still remains. The plant properly so called is a species of *nymp* water-lily, which, after the inundation, covers all the canals and pools with its round leaves, among which the flowers, like cups of bright white or azure blu with inimitable grace on the surface of the water. The rose-lily of the N Egyptian bean, which is sculptured on the monuments, is not now found in the try. The *papyrus* is still found, and the *colocasium* is still cultivated for the s its large esculent roots. Many of the gardens of Egypt are beautiful in appea and rich in the products which they yield; the most celebrated are under the c Europeans; that of Ibrahim Pasha, in the island of Rhoda, is one of the most a tive. It contains several hundred teak trees in a flourishing state, all of whic grown from seed. The bamboo, the yam, the caoutchouc, the ginger, and the a root, have also completely succeeded, and may be cultivated without difficulty t extent. The custard-apple has likewise been introduced, and prospers. The vation of coffee and tea has also been tried, but without success; the soil not seem to be favourable to their production. But, though Egypt is so rich i tivated plants, it is entirely destitute of forests. The banks of the river and c canals sometimes present coppices of acacias and mimosas, and are also adorned groves of rose-laurel, willows, saules-kalef, casias, and other shrubs; and F contains impenetrable thickets of *cactus*, or the prickly pear; but none of thes nish fire-wood, and all the fuel which is used in the country is brought from Ca nia. The peasants burn cow-dung, which they collect with an almost ludi

assiduity. The cultivable land of Egypt is never at rest; every month has its flowers, and every season yields its fruits. In January, lupins, dolichos, and cummin are sown in Upper Egypt, while the wheat shoots into ear; and in Lower Egypt the beans and the flax are in flower Towards the end of the month, the orange, the citron, and the pomegranate begin to be covered with blossoms. Sugar-cane, senna-leaves, and various kinds of pulse and trefoil are then cut down. In February all the fields are green; the sowing of rice begins; the first barley crop is cut; cabbages, cucumbers, and melons ripen. March is the blossoming season for the greater part of plants and shrubs; the corn sown in October and November is now gathered; and the only trees not yet in leaf are the mulberry and the beech. The first half of April is the time for gathering roses; nearly every sort of corn is cut down and sown at the same time; spelt and wheat are ripe, as well as the greater part of the leguminous crops; and the Alexandrian trefoil yields a second crop. During May the reaping of the winter crops continues; *casia fistula* and hennah are in flower; the early fruits, as grapes, figs, carobs, and dates, are gathered. In June, Upper Egypt has its sugar-cane harvest; and the plants on the sandy grounds begin to wither and die. In July, rice, maize, and canes are planted; flax and cotton are pulled; ripe grapes are abundant at Cairo; and there is now a third crop of trefoil. In August the nenuphar and the jessamine flower; the palm-trees and the vines are loaded with ripe fruit; and the melons are surcharged with water. Towards the end of September, oranges, citrons, tamarinds, and olives are gathered, and a second crop of rice is cut down. In this month also, and still more in October, all sorts of grain and leguminous seeds are sown; the grass grows tall enough to hide the cattle; and the acacias and other thorny shrubs are covered with odoriferous flowers. The sowing continues more or less late in November, and before the end of the month the corn begins to spring; narcissuses, violets, and colocasias flower on the dried lands; the nenuphar disappears from the surface of the waters; dates and the sebestan fruit are gathered. In December the trees gradually lose their leaves; but the corn, the grass, and the flowers every where present the spectacle of a new spring.

ANIMALS. — The animal kingdom of Egypt will not detain us long. The want of meadows prevents the multiplication of cattle; which must also be kept in stables during the inundation. Asses, mules, and camels appear in full perfection; the asses, in particular, are fine animals, and so sprightly, that this animal serves as an object of comparison for a person in high spirits. There are great numbers of buffaloes; the Mamelukes used to keep a beautiful race of saddle horses, and great attention is still paid to this noble animal by the Pasha, for the mounting of his cavalry. In Lower Egypt there are sheep of the Barbary breed. Large beasts of prey find neither food nor cover; and hence, though the jackal and the hyena are common, the lion is but rarely seen. Crocodiles seem to be banished from the Delta, but are still met with in the higher parts of Upper Egypt. The ichneumon still exists, and has never been found any where else. Jerboas, hares, foxes, hedge-hogs, bats, and rats, are also found. The birds do not differ much from those of Europe; the famous ibis, according to Cuvier, is a sort of curlew, now called Abou-hannes. The Nile is said to contain some singular species of fish. The *coluber-haje*, an animal employed in the hieroglyphics as the emblem of Divine Providence; and the *coluber-vipera*, the true viper of the ancients, are still found. The animal kingdom likewise supplies vermin which very much detract from the comfort which might otherwise be derived from the genial climate of Egypt. In spring, summer, and autumn, flies are so abundant as to be extremely annoying during the day-time; musquitoes are troublesome at night, and sometimes even in the day; and every house which contains much wood-work (as most of the houses of the best class do) swarms with bugs during the warm weather. Lice are not always to be avoided in any season, but they are easily got rid of; in the cooler weather fleas are excessively numerous. —(*Lane's Account of the Manners and Customs of the Modern Egyptians*, I. 3.)

PEOPLE. — The inhabitants of Egypt may be classed as Arabs, Copts, Turks, Jews, Greeks, Armenians, Franks, and other foreigners. The *Arabs* form the great body of the people. They are characterised by an oval face, darkish skin; forehead of moderate size, seldom high, but generally prominent; small, deep-sunk, but sparkling eyes; an expressive physiognomy; a general angularity of form; short pointed beards; their lips habitually open, and shewing their teeth; muscular arms; the whole body more remarkable for agility than beauty, and more nervous than handsome. In general the Egyptian Arabs attain the height of about five feet eight, or five feet nine inches. In mature age most of them are remarkably well proportioned; the men

are muscular and robust; the women very beautifully formed and plump; and ne sex is too fat. In Cairo, and throughout the northern provinces, those who not been much exposed to the sun, have a yellowish but very clear complexion, a soft skin; the rest are considerably darker and coarser. The people of Middle E are of a more tawny colour, and those of the more southern provinces are of a bronze or brown complexion, being darkest towards Nubia, where the climate is test.—*Lane*, I. 31. The peasantry, called *felluhs*, seem to have been all cast i same mould. They are every where attached to the soil; their wretched cot exceed in filth and meanness the cabins of the Irish; and the inhabitants are g rally covered with rags. A few earthen pots, a large jar for grain, and a mat to on, constitute the whole of their furniture; their ordinary food is durrah-bread onions; a few eggs, or a coarse piece of buffalo-flesh is regarded as a feast. As poverty deprives them of all pretensions to free agency, they are universally crin timid, and dissimulating. Fear is their habitual passion. Credulous, ignorant, perstitious, no man has originality enough to be a heretic. In religion, morals, ners, and opinions, the son follows in the footsteps of his father without inqui reflection. The fellah marries and begets children, who run naked about the vil till the age of puberty; he then gives them a rag to bind about their loins; they begin to work, become possessed of a few piastres, and, marrying in their run the same career as their parents. Incapable of forming any conception o higher affections, their love is purely physical, women being simply in their eyes cessary of life like rice or durrah. Both sexes are highly profligate. Few A ever perform a journey to any large city without visiting the dancing girls, w numbers are so considerable, that the tax which they pay forms a considerable in the Pasha's revenue. Their wives, on the other hand, if left for a short tim their own guidance, easily forget their fidelity. Both in town and country the E tian Arabs are scrupulous observers of the external rites of their religion; but, th immersed in superstition, they are as generally lax in faith as in practical mor At Cairo, as in other capital cities, the inhabitants being engaged in a greater va of occupations, obliged to exercise a higher degree of ingenuity, and brought into quent contact with strangers, display more sociability and politeness than the fell and the artizans and shopkeepers are distinguished for their industry and attentio business. But, when not engaged in their professional or religious duties, the generally found in the coffee-houses, listening to the story-tellers, or in the p places, where mountebanks, jugglers, and dancing girls are performing. The pro tive powers of the human race in the valley of the Nile are very great; and w for some years, there has been no call for conscripts, the towns and villages crowded with children. The disproportion of males to females is also very gr so much, according to the Government returns, as 100 to 135, and polygam doubt assists in filling up the vacancies occasioned by the perpetual drafts of y men. In a very few years, were the country in a state of rest, the population w double itself, so easily is life supported, and so constant is the demand for labour. universal is early marriage, and so prolific is the Egyptian race, that a young wo is seldom seen without a child on her shoulders. The rate of mortality, how is also great, though it appears to be diminishing; and the prejudices of the fel against vaccination are gradually subsiding.

The *Copts* are said to amount to 150,000, of which number 10,000 are foun Cairo. In some parts of Upper Egypt are villages exclusively inhabited by th and they particularly abound in the Faioum. They are distinguished from the A by a darker complexion, flat foreheads, and hair partaking of the woolly charac eyes large, and raised at the angles; high cheeks; short, though not flat, noses; mouths at a distance from the nose, and rather thick lips; thin beards; a wan gracefulness in their shape; bandy legs, ill adapted for agility; and long flat to

* This description is taken from Malte Brun's Geography, but Mr. Lane's account does not ex agree with it. "The Copts," he says, "differ but little from the generality of their Mooslim c trymen; the latter being chiefly descended from Arabs and from Copts, who have embraced the of the Arabs, and have thus become assimilated to the Copts in features. I find it difficult, s times, to perceive any difference between a Copt and a Mooslim Egyptian beyond a certain dow and sullen expression of countenance which generally marks the former; and the Mooslims th selves are often deceived when they see a Copt in a white turban. We observe in the latter the shades of complexion, in different latitudes of the country, as in the former, varying from a yellowish colour to a deep bronze or brown. The eyes of the Copt are generally large and elong slightly inclining from the nose upwards, and always black; the nose is strait [straight?] excepti the end, where it is rounded and wide; the lips are rather thick; and the hair is black and curly. Copts are, generally speaking, somewhat under the middle size; and so, as it appears from mummies, were the ancient Egyptians." "The people who bear the greatest resemblance at pr to the ancient Egyptians are the Noobehs (or genuine Nubians); and next to these the Abyssi and the Copts, who are, notwithstanding, much unlike each other."—II. 399, 10.

Several centuries ago the Copts still retained their ancient language, which is yet employed by them in their religious worship; but in common use it is now completely superseded by the Arabic dialect of the country. In the villages, and throughout the country, the Copts are devoted, like the fellahs, to agriculture, though many of them follow trades. At Siout, for example, they are weavers; in Faioum, distillers of rose-water; at Menouf, mat-makers; and in Cairo, goldsmiths, tailors, masons, or cabinetmakers. Under the Mamelukes, when they were the only educated class in the country, they were employed as tax-gatherers and financiers; but they are now reduced to mere clerks. Bigotedly tenacious of their ancient customs, their women pass their lives in extreme retirement, and never appear unveiled, even before their nearest relations. As among other barbarians, the condition of the women is degraded and servile; but the mother of many children is held in higher esteem than she who is barren. Under all circumstances, however, the husband and the wife neither eat nor sit together, and live in a state of estrangement. Girls from ten to twelve years old wear a white veil, and are often married before the age of puberty; married women are distinguished by a black veil, which is ominous of their melancholy state of servitude. Severe in external observances, the Copts are no less lax in their morals than their Arab or Turkish neighbours. Adultery is common; and a kind of temporary marriage is likewise practised, which differs but little from female prostitution. The Copts are undoubtedly descendants of the ancient Egyptians, but are not an unmixed race; their ancestors, in the earlier ages of Christianity, having intermarried with Greeks, Nubians, Abyssinians, and other foreigners.—(*Lane*, II. 309.)

The *Turks* are the ruling class, and do not differ essentially in person, character, or manners from their brethren in Asia. Many of them, however, are now, comparatively speaking, highly accomplished in literature and science; but they all exhibit the same laxity of morals, and the same want of right principle, which every where characterises the people of the East. The splendid *Mamelukes*, who so lately ruled and tyrannized over Egypt, are completely extirpated.

The *Jews* are now fewer in number than formerly, and do not exceed 3000 at Cairo, and 500 at Alexandria. In their persons they are dirty, covered over with sores and scabs, and have watering eyes, all of which is the effect of the filthiness in which they are born and live.—(*Webster's Travels*, II. 207.) Like the rest of the inhabitants, they are generally reduced to poverty; none indeed are rich, and but few possess even a competency. The exceptions which occur are found at Alexandria. The Jews are now exempted from persecution; are hampered by no civil disability; and are allowed to purchase lands and houses no less than the Mussulmans. Poverty, however, confines them, at Cairo, to the worst quarter of the city, where they live in streets as filthy as can well be conceived, in which the plague commonly makes its first appearance, and commits its most fearful ravages. Their character exhibits in Egypt the same peculiarities as elsewhere: they are averse to all useful productive labour, and therefore seldom exercise any other trade than that of bankers or money changers, jewellers or petty traffickers, and are never found as labourers or husbandmen. At Alexandria, however, they lately monopolised the trade of butchers.—(*St. John*, II. 385.)

The *Franks* in Egypt consist principally of French, English, Germans, Italians, and Poles. Many of them are engaged in trade, and live, in a great measure, according to the customs of their respective countries; not a few are employed in the military and civil service of the Pasha, where some of them have attained the high rank of begh or bey, *i. e.* lord. Other foreigners from all parts of Western Asia and Northern Africa are likewise to be found in Cairo; but they form too inconsiderable a part of the population to require particular notice. The inhabitants of the deserts are Bedwin Arabs of various tribes, of whom the principal are the *Beni-Wassel* in the northern, and the *Ababde* in the southern portions of the eastern desert. They profess to be independent of the Pasha.

The numbers of the several classes of which the population of Egypt is mainly composed are nearly as follow:—

Arab Moslems,	1,750,000
Copts,	150,000
Turks,	10,000
Syrians,	5,000
Greeks,	5,000
Armenians,	2,000
Jews,	5,000
Total,	1,927,000

of the remainder, namely Arabians, Moghrebins, Nubians, Negroes, white Franks, &c. amounting altogether to about 70,000, the respective numbers a uncertain and variable. The Arabs of the deserts ought not to be included population of Egypt.

GOVERNMENT. — The government of Egypt is at present a monarchical des vested in the person of Mohammed Ali, a Turkish Pasha, who, though he ac ledges the supremacy of the Sultan, is nevertheless quite independent, and is t sovereign of the country, which he has, within a few years, raised to a high r a military power. Under the Pasha, the government of Upper Egypt is admini by a kiaya bey, and each sub-province has its *mamoor* or sheriff; under the ma are nazers, or inspectors of districts, whose jurisdiction extends over seven c or kashefs, governors of towns and their environs; and under each of these are seven or eight kaymakams, according to the number of villages in the di The duty of these last officers is to superintend the cultivation of the lands, collect the taxes, assisted by the shekh-beled, or native chief of each village is subordinate to the Turkish officers. A superintendent or nazer-shekh also looks the shekh-beled, under the immediate orders of the kashef; whil mobasher, a Christian inspector, appoints the numerous Copt scribes, and c their accounts. These officers are all paid from the government treasury; a only person who has a direct and legal claim on the fellah is the shekh- who exacts the twenty-fifth part of the produce, with presents of every kind, a ing to the means, or the fears, of the donor. But, besides these legal demand fellahs are subjected to the most ruinous extortion, amounting almost to robbe the part of the inferior governors; against whose exactions they can obtain dress without such presents to the higher officers as are quite beyond their In the neighbourhood of Cairo, where they have the fear of the Pasha before eyes, these functionaries are tolerably well behaved; but, in the more distant vinces of Upper Egypt, they carry their spoliation and tyranny to great excess. the consequence is, that the fellahs, robbed of their property, and of the prod their labours, are kept in the most miserable poverty, and deprived of all encou ment to improve their lands. Trees are seldom or never reared, or, if some fe planted in the vicinity of the large towns, no inducement is held out to atte their culture, and the despondent fellah wilfully neglects them, to avoid the tional tax.

The power of the Pasha is maintained by means of a large standing army, d lined in the European manner by European (chiefly French and Italian) officers which, in his wars with his master, the Sultan, proved a most efficient instru It is composed of all classes of his subjects, even from the most remote provin Nubia and Sennaar. Not content with his superiority by land, he has also equip numerous and powerful fleet, to preserve his communications with Candia an coasts of Syria, which were for several years part of his dominions. He has lik established a number of schools and colleges, which promise eventually to civilization among his people; he gives every encouragement to active and intel foreigners to settle in Egypt; and has even sent many of the more promising y to be educated in France, from which some of them have already returned accomplished in literature and science. But the necessities of his situation made him a hard taskmaster; he has rather *forced* than *fostered* the indus the nation; he has had recourse to monopolies for the purpose of supplying his niary wants; and he has shown himself, in other respects, only half informed the best means of governing a kingdom, and improving the condition of its p He has nevertheless effected wonders; and experience, perhaps, will point out t and his presumptive successor the best methods of attaining the object which seem to have in view, the possession of a rich and powerful kingdom. Moha Ali, perhaps the most extraordinary political adventurer that the modern Eas produced, is a native of Cavalla in Albania, and came to Egypt with the Tu army in 1801, in the capacity of bim-bashee, or colonel. By daring and intrig contrived to get possession of the vice-royalty, and confirmed himself in it b massacre of the principal Mameluke beghs, and the exile of the others who es with their lives. Subsequently, the Sultan is said to have made repeated attemp get rid of his too powerful subject by secret means, but these were always foiled b wary Pasha. At last their mutual jealousy led to an open war, in the course of w the Egyptian army proved more than a match for the imperial troops, defeating in three great battles, driving them out of Syria, and through Asia-Minor, almo the neighbourhood of Constantinople. This war, which broke out in 1830, wa

minated the following year by a peace, which left the Pasha master of Syria and Adana in addition to his former possessions; but, in 1840, he was compelled, by the operations of the British forces, in conjunction with those of the Sultan, to abandon Syria; and the European powers have since agreed to secure to him and his family the hereditary possession of Egypt and its dependencies, under the supremacy of the Court of Constantinople.

The Pasha is the great landholder of the kingdom, and his revenues consist principally of the land-rents, which are levied in proportion to the three qualities of land; the best paying from 40 to 30 or 20 real; the middling, from 18 to 14; and the lowest, from 12 to 8, each feddan; but the tax on the same land varies in proportion to the rise of the Nile, the islands generally paying 20 even after a low inundation.* Each fruit tree pays one piastre, equal to threepence sterling; and the use of the water wheels is also paid for by the fellahs. But so wretched is the system of agriculture, that this rent, enormously increased, indeed, as it is by the illegal exactions of the collectors and superintendents, keeps the fellahs in a state of the most abject and hopeless poverty; so much so, that in order to eke out their scanty means of subsistence, they are sometimes obliged to steal their own corn. As the Pasha publishes no accounts, the amount of his revenue is unknown, but it has been variously estimated by European travellers and residents at 25,000,000 of dollars; £2,100,000 sterling; and even from £2,500,000 to £3,000,000. About the end of 1839 the actual force of the Egyptian army was 159,300 men, of which 112,800 were infantry, 13,180 cavalry; 25,820 artillery; 5000 Bedwins, 1000 Albanians, 1500 Moghrebins and other irregulars. The number of ships of war was 10; 1 of 3 decks and 136 guns, 1 on the stocks, and 2 fitting out, 6 frigates, 4 corvettes, and 8 brigs. The management of the army is vested absolutely in the minister of war, assisted by a council, of which he is president, and which decides on all contracts for the supply of arms, accoutrements, and materials of war. The general of artillery has the direction and control of the arsenals, cannon foundries, gunpowder and salt-petre works, of the printing establishments and cloth manufactories, all of which are within the department of the minister of war. The *Nazers* receive their orders direct from the general of artillery, with whom they are in constant correspondence. They are the chiefs or directors of the various works, manufactories, and departments, and are themselves members of the council, which consists of 20, and meets every day for the despatch of business. Under them are the Moudyers or governors of departments, of whom there are 2 for Upper, 1 for Middle, and 4 for Lower Egypt. Their sub-delegates are the Mamoors, whose duty it is to see the contributions punctually paid; the canals, bridges, and dykes kept in proper order, and to superintend the manufacturing establishments. They are also expressly instructed to see vaccination enforced, and the rigid execution of orders for the levy of troops and workmen. The office used to be held by Turks, but is now also filled by natives, mostly fellahs. In the chief towns the general police is under the charge of the Bache Aga; the markets are superintended by the Mohteceb or Aga of provisions; and both officers give a daily report to the Kiahice or governor of the place, and receive his orders. In each quarter of the town is an officer, Sheikh-el-tumn, who acts as a sort of justice of peace, or commissioner of police. The citadel contains a spacious arsenal, where 900 workmen are employed in manufacturing muskets and other military necessaries. The cannon foundry employs 1500 men; and the consumption of iron and fuel is immense. There is also a musket work at Hod-el-Marsoud.

The administration of justice is more prompt and less capricious in Egypt than in most Mahometan countries. Publicity usually accompanies the proceedings of all the courts, whose decisions are generally just, though often rude and precipitate. The highest court is the Mekermeh, which exercises a sort of religious jurisdiction. It is the tribunal of final appeal, and its law is the Koran; but a code so vague, and so little suited to modern society, necessarily leaves great latitude for judicial decisions. The Mussulman reverence for the Koran is so devoted, that any sentence which can find a justification or a sanction in the phraseology of the sacred volume, is submitted to with the greatest reverence by the suitors. Indeed, their respect for all its dogmas is so unlimited, that it would be scarcely possible to introduce a philosophical system of jurisprudence in the East, unless it could be connected in some way or other with the doctrines of the Prophet. Another great difficulty would

* *Wilkinson's Topography of Thebes, &c.*, 268. A feddan is nearly 1 English acre; a *real* is 90 paras, or 6½d. sterling; so that, *in English*, the preceding statement will read thus:—The best land pays from 20 to 15 or 10 shillings the acre; the middling, from 9 to 7 shillings; and the lowest from 6 to 4 shillings.

meet the legislator at the threshold, namely, the complete exclusion of a great of the community from the operation of the laws; there is no power to pene into the Harem, and whatever misdeeds are practised there, neither police, laws, nor public opinion can reach. The very organization of society thus stan the way of justice. The Mekermeh is also the court for the registration of lands other real property, and no legal transfer can take place without its authorit (*Bowring*, p. 121.)

Productive Industry.—The agriculture of Egypt is in a very low condition; tellahs or peasants are in a state of wretchedness: they have neither proper im ments nor the means of improving their situation: for the rapacity of the governm deprives them of all the fruit of their exertions. But the productive powe the soil are incalculable; wherever water is spread there springs up a rapid beautiful vegetation; the seed is sown and watered, and scarcely any other ca required for the ordinary produce. Even in spots near the desert, which seem consist merely of sand, irrigation brings rapidly forth a variety of green herbs plants; and accordingly the most important branch of agriculture in Egypt, and which requires the chief consideration, is irrigation. The Pasha informed Dr. B ring that he had introduced not less than 38,000 sakias or machines for raising wa Wherever there is water there is fertility; and all the plants grown in summer raised by means of artificial irrigation in places beyond the reach of the inundat In fact, says Dr. Bowring, were there hands to plough, and water to irrigate, not easy to calculate what an immense tract of territory might be rescued f waste. Still, to counterbalance, as it were, the productive powers of the soil, e difficulties peculiar to eastern regions present themselves in Egypt. The hot w often destroy the hopes of the husbandman; and there are seasons in which khamseen winds dry up whole districts, even after irrigation. In addition to this, prospect of large and productive harvests is at times suddenly cut off by the vi tions of locusts, which come in myriads, like an all-destroying plague, followed multitudes of hawks and other birds, filling the air for a vast space, and then ascending on the fields of corn, which they completely lay waste, and then wing t way to another spot. Egypt is calculated to contain 3,000,000 feddans of cultivat soil; but of that quantity only 2,000,000 are cultivated, when the Nile rises from to 24 cubits; and when it does not rise above 19, the inundation is not permar enough to produce the desired effect. In the distribution of agricultural pro tions, the government generally assumes the initiative, by determining what quan of a particular article shall be cultivated in a given district, and at a price fi upon before the period of delivery. By this arrangement most of the produc the land comes into the hands of the government on terms fixed by itself; and, fact, the government considering itself as possessed of the fee-simple of the lands, gards the fellahs as labourers under its direction, who may, and who frequently abandon the lands, whenever the conditions of cultivation are not satisfactory them. When the fellah is poor the government prices scarcely enable him to ex but when the holder of the lands has capital for seed, and can afford to wait for returns, he may have from 15 to 20 per cent. profit on his outlay. In bad years government supplies the fellahs with seed; which must be repaid with inter after the harvest. The principal articles of produce are wheat, beans, lentils, b ley, maize, durrah, chick peas, lupins, helbeh a seed of a bitterish taste, wh flour is mixed with durrah by the fellahs, sugar, cotton, flax, indigo, saffron, bacco, henna, silk, opium, and linseed. But of all these cotton is incompara the most important, and is an article the introduction of which is wholly due to Pasha. The average produce may be said to fluctuate from 100,000 to 150,0 bales, each about two hundred weight, and the price varies from 8 dollars to per quintal. But the fellahs are very unwilling to engage in its cultivation; they are pillaged most unmercifully by the government officers, and the price lowed affords no profit; cotton, besides, produces only one crop a-year, while m other articles yield two or three harvests. Raw silk is also an object of s attention, and is likely to become more so; great numbers of mulberry trees h been planted, and the cultivation is still extending; the quantity produced is yet equal to the demand in Egypt, and considerable quantities are therefore import —(*Bowring's Report on Egypt and Candia*, 1840.

Education.—A general system of education has been established, consisting primary, secondary, and special schools, through the whole of which pupils are co pelled to pass. Primary schools are to be spread in the provinces according to the

pulation, to the extent of embracing altogether 5500 scholars, and are all to be conducted on the same system; each school is to be under the charge of a director and two teachers. The scholars are admitted from the age of 7 to 12, and receive instruction for three years, during which time they are taught to read and write Arabic, the first rules of arithmetic, and religious knowledge; and are also fed, lodged, and clothed. The secondary schools receive their pupils from the primary schools, for the purpose of fitting them for the special schools. Their course of instruction lasts four years, but may be extended to five, and embraces the Arabic, Turkish, and Persian languages; with arithmetic, elementary algebra, elementary geography, general history, general geography, penmanship, lineary design, and drawing. Each school has one director, one sub-director, three prefects of study, twelve masters, twelve professors of Arabic, Turkish, and Persian, one professor of history, one of geography, three drawing masters, two *sulus* and two *rika* professors; the courses of study are arranged by the council of public instruction. The schools are subjected to military discipline, and the scholars are lodged in barracks; they form three battalions, each consisting of four companies, and each company of 125 scholars. There is one preparatory school at Cairo for 1500 pupils, and one at Alexandria for 500. The special schools are for effecting translations from Turkish, Arabic, and French. The polytechnic school for providing officers for the artillery, engineers, department of roads and bridges, mines, and other services, is formed on the model of that of Paris; it was established in 1834, and in 1839 contained 225 pupils. Those who finish their courses of study satisfactorily obtain the rank of sub-lieutenants; those who are rejected become non-commissioned officers. There are besides a cavalry school, an infantry school, a medical school, and a veterinary school. The whole system of education is under the superintendence of a council of public instruction, which is charged not only with a general superintendence, but with the inspection in detail of all the schools; with the nomination of teachers for the approval of the minister; the appointment of all subordinate functionaries; the punitory and retributive regulations of the schools, and with all the correspondence connected with the business of instruction. The system is wholly compulsory; a certain number of children from each district is required to be sent to the public schools, where they are maintained as well as educated; and on this account parents are generally willing to send them; though in many cases much repugnance is felt lest the children should be detained as soldiers. These schools are no doubt an improvement on those which preceded them; but are far inferior to the well-organised seminaries of Europe; they labour under a great want of qualified teachers and class-books. The whole system, indeed, seems to have been formed more from a desire to introduce superior education for the few, than general instruction for the many; and to be wholly unsuited to a people just emerging from ignorance and barbarism. But there are many prejudices to be overcome, and the little which has been done, imperfect as it is, is highly meritorious. Among Mussulmans, reading has been considered of little value, further than as it enabled them to become acquainted with their sacred books; and the spirit of the Caliph Omar is still prevalent among the ulema (the learned), from whose lips is sometimes heard language similar to that recorded of the Saracen conqueror. "The koran," they say, "contains everything, and all that is out of the koran is worthless." As Europeans have been the principal instruments in diffusing education in Egypt, serious difficulties have also arisen from the different habits of thought and feeling between Moslems and Christians, the diversity of their mental training, the variety of their idioms, the embarrassments which European knowledge meets with at every step in the pursuit of synonymous words or phrases in Turkish and Arabic, and the prejudices, domestic, social, and religious, of the natives. It must also be added, that among the Europeans themselves too few have been trained by proper education at home to become instructors and directors of instruction abroad.—(*Bowring's Report*, p. 125–140.)

MANUFACTURES and TRADE.—Not content with improving and extending the cultivation of the soil, and increasing the amount of its produce, the Pasha has also endeavoured to enrich himself by the introduction of manufactures. He has erected at great expense mills and machinery for spinning and weaving cotton, and preparing various other articles; but, owing to various causes, and principally to the indolence, inattention, incapacity, and want of personal interest, on the part of the persons employed, his speculations have proved an almost total failure, though they are still perseveringly carried on. He has made himself at once the great landholder, manufacturer, merchant, and general monopolist of the trade of the country; everything is done at his instigation, and for his profit. No one else has any interest in what is done, and consequently everything is ill done; and were he out of the way, all his manufacturing

projects will probably fall to the ground. The trade of Egypt consists chiefly in the export of her raw produce, particularly cotton, and of the articles brought from the interior by the caravans; but the principal article is Negro and Abyssinian slaves, who are brought in great numbers to the slave-markets of Egypt, from which all the neighbouring provinces of the Turkish empire are supplied. The principal articles of import at Alexandria are wood, tarboushes, nails, spices, iron, pitch, cloth, cochineal, paper, and lead; but the extreme poverty of the people, and the circumstance of the great mass of them wearing scarcely any clothes at all, are such obstacles to the extension of the import trade, as only a complete change in the method of regulating their industry, and rewarding their labour, will remove.

Public Works. — The number of the Pasha's works of this kind is considerable, and comprehends establishments of every kind, as arsenals, manufactories, foundries, workshops, schools, hospitals, mosques, palaces, barracks, canals, locks, terracings, drainings, telegraphs, stables, sheepfolds, &c. But one of the greatest works he has contemplated, is the barring up of the waters of the Nile by a huge dam with sluices, near the fork of the Delta. The original suggestion emanated from the scientific men of the French expedition; and Bonaparte is said to have expressed a favourable opinion of it. M. Linant, who has had the direction of the work, estimates that it will, if completed, irrigate 4,275,000 acres, even in the lowest inundations, and without the aid of machines; and that with machines a very large additional number of acres may be supplied with water, to the distance of eight leagues (20 miles) above the barrage. He represents that it will meliorate the canal navigation, improve both the Damietta and Rosetta branches of the Nile, give to the Mahmudiah Canal sufficient water for the largest vessels to pass between it and the river, will, at a small charge, enable the Government to make the canal of Suez navigable, and will supply the Kalish of Cairo sufficiently all the year round. He objects to the present system of irrigation, that the canals do not raise the level of the water, while every year they become more and more filled with mud, and convey a smaller quantity of water; and shews, that in the uncertainty of the inundations no calculation can be made of the probable agricultural produce of the country. He estimates that the work will require five years for its completion, and that the expense will be about a million and a half sterling. On this report, orders were given for commencing the stupendous work; but it seems to have been begun without sufficient consideration, and, after a large expenditure, has been again abandoned, or deferred. Immense masses of materials have been collected; a railway has been formed to connect the Nile with the quarries of the Mokattam behind Cairo; arrangements were also made for the supply of a large quantity of timber from the forests near Scanderoon; a large body of workmen were collected; and about £170,000 were expended in the first operations; but all is at present suspended; and it is probable that the scheme will be superseded by the introduction of less expensive hydraulic machinery. The opinion is gaining ground that the barrage would neither be the safest, nor the least expensive plan of irrigation.—(*Bowring's Report*, p. 60.) Besides the great Mahmudiah Canal, from the Nile to Alexandria, which serves the double purpose of navigation and irrigation, many other canals have been recently constructed. In the Delta is the canal of Tantah, 54,000 yards long, and four wide, which preserves its waters throughout the year; the canal of Bonhych, 62,000 yards long, and four wide, on the Damietta branch; and that of Bahyreh, on the Rosetta branch, 104,000 yards long, and five wide. The Pasha has also constructed 38,000 machines for raising water, making the total number in Lower Egypt now exceed 50,000.—(*Ib.* 14.)

Internal Communication. — The Mahmudiah Canal and the Nile are the most active, and indeed the only channels of communication for the principal markets of Egypt. From the smallest cangias to the largest maashes, from boats of four or five tons to vessels of 120 tons burden, there is a perpetual activity on these two main arteries of trade. Boulak, the port of Cairo, and Atfieh, where the canal joins the Nile, are the principal places of shipment and landing. The cost of transit is subject to many fluctuations. The largest boats, or maashes, are only employed during the period of high inundation, and convey from Upper Egypt wheat, barley, and pulse. The navigation of the Nile employs a great number of the natives, who are generally strong muscular men. They undergo severe labour in rowing, pulling, and towing; but are very cheerful. In consequence of the continual changes which take place in the bed of the river, the most experienced pilot is liable frequently to run his vessel aground; and, on such occasions, it is necessary for the crew to leap into the water to shove off their boat with their back and shoulders. On this account, also, the boats are generally made to draw more water

at the head than at the stern; and hence the rudder is necessarily very wide. The better kind of boats, which are very numerous, are of a simple but elegant form, generally between thirty and forty feet in length, with two masts, two large triangular sails, and a cabin next the stern, usually about four feet high, and occupying about a fourth or a third of the length of the boat; and in most of them the cabin is divided into two or more apartments. Sudden whirlwinds and squalls being very common, a boatman is usually employed to hold the sheet in his hand, so that he may let it fly at a moment's notice. The number of boats on the river is about 4500. There are also large vessels, called jerms, which sail between Alexandria and Rosetta, and are also employed in conveying merchandise from Damietta to the outside of the mouth of the river, to be thence shipped in vessels lying out at sea. In summer, these jerms even go as far as Cyprus and Syria, but they are often lost. The ordinary mode of travelling and conveying goods through the deserts, which border on all sides the cultivated land of Egypt, is by means of camels along unformed paths. The journey between Cairo and Suez, a distance of 80 miles, can be accomplished in two, or at most three days, without inconvenience; and three stations have recently been formed on the road for the accommodation of travellers. Sometimes travellers prefer to cross the desert between Cosseir on the Red Sea, and Kenneh on the Nile; and, to accommodate them, four wells have been put in good order by the Pasha. Ladies perform the journey in tachtruans, a sort of palanquins carried by camels. A project has been long in contemplation for a railway between Cairo and Suez. The engineering difficulties are not many, for, with the exception of a few miles of sand, immediately on leaving Cairo, and a short distance similarly inconvenient near Suez, there is a hard, stony, and level foundation throughout the line; but, as the quantity of goods, and the number of travellers, could not furnish anything like an adequate return for the outlay, the project has been postponed, if not abandoned. There is a daily post between Cairo and Alexandria, which conveys letters in from 30 to 36 hours, but takes only Government despatches, and such private communications as the Government permits. The merchants of Alexandria, however, have a post of their own, which communicates three times a-week with Cairo, and delivers letters on the fourth day. A line of telegraphs has also been established between the two cities, by which communications are frequently made. It is not often interrupted by fogs, and news are conveyed by it several times a-day in case of need. A regular post is established by Government for communication with all its officers, from the one end of Egypt to the other; but, on especial occasions, messengers are dispatched on dromedaries, which travel at the rate of seven or eight miles an hour; and sometimes letters are sent by messengers on foot.—(*Bowring's Report*, 72.)

DIVISIONS.

CITIES AND TOWNS.—KAHEIRAH, or QAHEIRAH, or MISR-EL-KAHEIRAH (the GRAND CAIRO of the Franks), the capital of Egypt, and the largest city of Africa, is situate on a sandy plain about half a mile from the east bank of the Nile, in 30° north lat., and 31° 18′ east long., about 25 miles above the point of the Delta. Cairo, seen at a distance on the west side, is beautiful, and appears truly worthy to be the metropolis of Egypt. Skirted by groves and gardens, its light airy structures seem to be based on a mass of verdure; long lines of buildings, of gaudy appearance, and infinitely varied in form, rise behind each other; and the palace and the citadel, cresting a steep projection of the Mokattam ridge, lead the eye of the traveller, as he approaches from the Nile, to that vast rocky barrier, which protects the city from the desert blasts, and which, differing in this respect from all other hills, appears red at a distance, even where its tops seem to blend with the sky. Viewed on the other side, from the citadel, Cairo appears a large crowded city, with grey, flat-roofed houses, and 130 minarets of mosques peering above the houses and the trees. The city is in form nearly a parallelogram, about two miles in length, by one in breadth, surrounded with stone walls, which are pierced with a number of fine gates; and a canal runs through the centre of the city, which is filled with water during the inundation, but with green mud, emitting pestilential vapour, in the low season. The streets are narrow, winding, and unpaved; some of them are indeed so narrow that two persons may shake hands from the projecting windows of the upper stories. The city is divided into 53 districts or wards, called *harah*, several of which are distinguished by their peculiar population; as the Jewish, the Coptic, the Greek, and the Frank quarter. There are, however, several large open areas, as the *Kara-m-eidan*, the *Roumelieh*, the *Birket-el-fil*, and *El-Ezbekyeh*; the last two of which are covered with water during the inundation of the Nile. Surrounded with houses, they present sometimes a magnificent spectacle. The houses are built of earth or bricks; most of them have two or three storeys; but, having their windows opening upon interior courts, their outside presents to the street the appearance of so many prisons. The houses of the higher public functionaries, civil and religious, are distinguished by their greater size, their less faulty construction, and more ornamental appearance. A multitude of mosques, some of them very elegant, covered with arabesques in fine taste, and adorned with rich and graceful minarets, give to the city an imposing and varied aspect. Four of these are particularly distinguished: that of *Touloun*, a vast work of the ninth century, considered to be the finest Arab monument in Egypt, though now half ruined; the mosque of *El-Hakim*; that of *El-Azhar* (Loub-el-Ozah), with a magnificent dome, and a college attached to it, where the most celebrated doctors of Islam are educated; and the mosque of *Sultan Hassan*, the most remarkable for the size and the height of its dome, and of its two minarets, for the variety of its marbles, and the arabesque ornaments wrought in hard stone, wood, and bronze. The citadel is situate on the east side of the city on a spur of the Mokattam, which overlooks it, and renders it incapable of defence. Part only of the old walls remain, the rest having been replaced by bastions and curtains in the European style; and, what is singular, the only portion regularly fortified is that least open to foreign aggression, the side facing the city. It contains a palace of the Pasha, which is a magnificent building, and a new mosque, which is the finest in Cairo. The celebrated hall of Joseph, a building supported on lofty and handsome columns, was removed in 1829 to make way for the new mosque; but Joseph's well still remains. It consists of two parts, the upper and the lower well, and a winding staircase leads to the bottom, a depth of about 260 feet. Both the well and the hall received their name from the Fatemite Khalif Youssef, and not from the patriarch Joseph, as has been sometimes alleged. The city is supposed to contain 36,000 inhabited houses, and about 250,000 people. There are 31 public baths, 1200 coffee-houses, and several fine bazaars. Without the walls, on the east side, are the tombs of the Mameluke kings, a dynasty of Circassians who reigned from 1382 to 1517, when Egypt was added to the Turkish empire by Sultan Selim. Attached to each is a handsome mosque, schools, and dwelling-houses; but they are now neglected, and are falling to ruin. Within a few years a good library has been formed in Cairo, by the subscriptions of English residents, and the greatest liberality is shewn in admitting strangers. Cairo was founded by Gober, a general of El Moez, the first of the Fatemite Khalifs of Egypt, who, having been sent in the year of the Hejra 358 (A. D. 969) with a powerful army to invade Egypt, and having succeeded in conquering the country, founded a new city under the name of *El-Kaheirah*, which, in 362, became the capital. About a mile from the city, in a fine park, is the splendid hospital and medical school of *Ceasar-eb-Ein*.

In the vicinity are *Foutat*, or Old Cairo, on the eastern bank of the Nile, three miles south; *Boulak*, on the same bank, north-west, the port of Cairo, containing a custom-house, bazaar, baths, printing-house, silk-manufactories, fine gardens, and about 18,000 inhabitants. It is now a large town, with handsome new buildings, chiefly in the European style. *Shoubra*, a small village, with a fine summer palace of the Pasha, on the river; *Abou-zabel*, where there is a large hospital or infirmary, capable of containing 1800 patients, and a school of medicine and surgery attended by about 300 pupils; *Jezeh*, or *Gyzeh*, or *Geeza*, or *Ghezeh*, on the left, or western bank of the Nile, a little below Foutat, a small but industrious town, regarded by some travellers as the most agreeable place in all Egypt. Gyzeh is the chief town of a prefecture or shire. Opposite to this town is the island of *Rhoda* or *Roudah*, covered with fine gardens, and containing at its southern point the famous *Nilometer*, which is a graduated pillar in a well, shewing the height of the annual inundation.

ALEXANDRIA, called by the Turks and Arabs ISKANDERYEH or ISKENDEREH, is situate at the north-west corner of Egypt, on the shore of the Mediterranean Sea, in 31° 13′ N. lat. 29° 53′ E. long. The modern town occupies a neck of land which joins the Island Pharos to the continent. At the beginning of the present century Alexandria was a miserable place, with narrow dirty streets, and a scanty population of about 7000. It is now the great naval station of the Pasha's fleet, and the emporium of the greatly extended European commerce with Egypt, and already contains a motley population of 60,000, composed of all descriptions of Africans, Asiatics, and Europeans, and has become a respectable, if not a handsome city. The island of Pharos, which the Arabs call *Roudah el Tyn, garden of fig-trees*, which extends east and west on the north side of the city, consists of a dry saline soil, and dazzling white calcareous rocks, and is bordered with reefs, especially on the west side. At its north-eastern extremity, is situate the castle, a large, square, lofty building, surmounted by a light-house in the shape of a minaret, occupying, probably, the site of the ancient Pharos, one of the seven wonders of the world. The castle has been strongly fortified by the Pasha, and occupies a small island joined to the larger one by an artificial dike formed in part of ancient granite pillars laid across. This island and the isthmus occupied by the city, form two ports, the old port on the west, and the new port on the east. The old port is at the end of an extensive roadstead, the entrance to which lies through a chain of rocks which stretches from Cape Marabout on the mainland, to *Ras el Tyn*, fig-tree cape, the western end of the island. There are three channels into the road, the deepest of which will admit frigates. The port itself is sheltered from the violent winds that blow between north-west and north-east by the high coast of the island. The anchorage is good, and the port might be made one of the best in the world. The new port has also a line of rocks across its entrance, and is exposed to the violent north and north-east winds, which sometimes render anchorage impracticable. It is also very shallow in many parts. Upwards of 200 merchant vessels are frequently to be seen in the port at the same time. From 5000 to 6000 men are constantly employed in the dock-yard and arsenal. The naval hospital at Fig-tree point can hold 300 beds, in spacious, lofty, and well aired wards; there is another hospital in the arsenal for the workmen, and a garrison hospital in the suburbs of the town for 400 patients; there is also a lazaretto in the new port. But one great draw-

back is the want of fresh water; the inhabitants have to depend upon cisterns which are annually filled partly by the winter rains, and partly by water brought from the canal. To the south of the city, along the adjoining shore of the mainland, are the ruins of the ancient *Alexandria*, the city erected by order of Alexander the Great, 332 B. C., but of which scarcely a vestige now exists. Great part of the ancient site is enclosed by a double wall flanked with lofty towers, built by the Arabs; but it exhibits only shapeless heaps of ruins. It contains, however, at its north-east corner, two granite obelisks, still very entire, the one of which is erect, and the other lying near it on the ground. These are commonly called Cleopatra's needles, and are nearly of the same size; the whole height of the erect one, including the pedestal and three steps, is 79 feet. Near the centre of the enclosure stands the mosque of St. Athanasius, on the site of a church erected by that patriarch during the fourth century, and which contained the famous sarcophagus, supposed to be the tomb of Alexander, which is now in the British Museum. The cisterns also, for retaining the rain-water, are still in a great measure preserved, consisting of vaulted chambers supported by columns, which form arcades of two or three storeys. On the outside of the walls is the remarkable monument, called *Pompey's Pillar*, which stands on a mound about 40 feet high. The shaft, a single piece of red granite, is about 67 feet high; and, including the capital and pedestal, the height of the whole pillar is about 94 feet. It is of the Corinthian order, but in bad taste. On the west side of the plinth of the base is a Greek inscription, from which it would appear to have been erected in the time and to the honour of the Emperor Diocletian. Its foundation rests on a piece of yellowish breccia, with hieroglyphics, placed with the wrong end upwards. Near the south-western corner of the walls, in the calcareous rock which faces the sea, are almost countless excavations which once formed part of the necropolis or burial place of the Alexandrians. Fifteen miles north-east of the city are the castle, island, and bay of *Aboukir*, so renowned for the battle of the Nile 1st August 1798, and the battle of Aboukir 21st March 1801.

The only other towns deserving notice in Lower Egypt are *Rosetta*, *Damietta*, *Menhallet*, *Tantah*, *Semenhoud*, *Mansourah*, *El-Arish*, and *Suez*. *Rosetta*, which stands on the western bank of the western Nile, about five miles from the sea, is a well built town, surrounded by low walls, and containing 15,000 inhabitants; but the formation of the Mahmudiah Canal has diverted its trade to *Fouah*, which is improving in extent and wealth at the expense of Rosetta. *Damietta*, or *Damiatta*, or *Dimyat*, a large, irregularly-built town, stands on the right bank of the eastern Nile, about 7 or 8 miles from its mouth. It used to be the seat of a large trade, chiefly contraband, but it has no harbour, vessels being obliged to land and take in their cargoes at the mouth of the river on the outside of the bar, and the goods are carried to and from the city in boats. Its population has been estimated so high as 70,000 or 80,000; but, like Rosetta, it is now a place of no importance, nor does its limited population allow it to rank among the large towns. *Menhallet-el-kebir*, or the Great Quarter, which is considered the chief town of the Delta, is situate about 55 miles S.E. by E. from Rosetta, 48 S.W. from Damietta, and 63 nearly north from Cairo. It was also considered the most industrious manufacturing town in Egypt; the chief fabrics being those of silk, and particularly a sort of linen cloth with silk borders, used in the baths, with which it supplies the whole country. Population 17,000. *Tantah*, 20 miles S.W. of Menhallet, a town of 10,000 inhabitants, chiefly supported by the pilgrims that flock to the tomb of Seid Ahmed el Bedaouy, who died in the thirteenth century with great reputation for sanctity. So many as 150,000 persons sometimes assemble, and the mosque, which contains the holy shrine, is one of the most splendid buildings of modern Egypt. *Semenhoud*, supposed to be the ancient *Sebennytus*, which gave its name to a branch of the Nile, is situate on the western bank of the river near Menhallet, and is a flourishing town of 4000 or 5000 inhabitants. *Mansourah* is a large town on the right bank of the Nile, 10 miles below Semenhoud. *El-Arish* the frontier town of Egypt, towards Syria, is a miserable place in the midst of a desert, on the shore of the Mediterranean Sea. It stands on an eminence among sand-hills and clumps of trees, about half a mile from the sea; and at the distance of 174 miles E.N.E. from Cairo. It is supposed to be the ancient *Rhinocorura*. *Suez* or *Souweis* (*i. e.* the mouth or opening), is a very miserable town, situate at the head of the western gulf of the Red Sea, about 70 miles almost due east of Cairo, by the shortest line, but the actual distance on the usual road exceeds 78 miles. It is nevertheless important as the best naval station for the trade carried on between the Mediterranean and the Red Sea. It is a poor ill-built town, situated in a desert; it receives all its provisions from Cairo, and had till lately no water nearer than 12 miles, which even then was very brackish. In consequence, however, of experiments lately made, water has been found in sufficient abundance at no great depth, in the desert. In the roadstead there is very good anchorage for ships of 800 or 1000 tons. The high road between Suez and Cairo has been furnished with three stations for the accommodation of travellers.

In Upper Egypt, the only towns of modern importance are *Atfieh*, *Benisouef*, *Medinet-el-Faioum*, *Minieh*, *Ashmounein* or *Eshmounein*, *Es-Siout*, *Akhmim* or *Ekhmim*, *Girgeh*, *Kenneh*, *Esneh*, *Edfou*, *Assouan*, and *Cosseir*. *Atfieh*, or *Atfih*, a town of 4000 inhabitants, stands on the right bank of the Nile, in lat. 29° 28′ north, and is the capital of a prefecture. *Benisouef*, the residence of a mamoor or governor of a province, is a place of some importance, on the left bank of the Nile, about 60 miles above Cairo. It contains several mosques, caravansaries, and large private houses; with an extensive, well supplied bazaar, which is frequented once a-week by the peasants of the country round. The great sugar plantations of Egypt commence a little to the north of Benisouef; and these, together with the durrah, seem to occupy all the industry of the inhabitants, there being few fields of tobacco, wheat, cotton, or indigo. Opposite to Benisouef is the road to the convents of St. Anthony and St. Paul, the former named after the founder of monachism, the latter after the first hermit. St. Anthony or *Dair* or *Deir Antonios*, is about 76 miles from the Nile, and 18 from the Red Sea, and stands on the south side of the Wady el Araba. The other convent, called *Deir Bolos*, lies beyond the eastern corner of the Kalallah or Kalil mountains, only 9 miles from the coast. *Medinet*, the chief town or capital of Faloum, is a large populous city, 50 miles S.W. of Cairo; and occupies the site of the ancient Arsinoë, on the canal of Joseph, just before its separation into nine branches. The city contains several fine mosques, and is surrounded with beautiful gardens. *Minieh*, on the left bank of the Nile, 28° 8′ N. lat. the capital of a large district, is a pretty town, with a considerable population. "The *city of Minieh*," says Mr. St. John, "contains several mosques, straight clean streets, and rather neat shops, and appears to be more opulent and populous than any of the towns farther down the river."—(I. 251.) Mr. Webster, however, says that "the *village* is small, with an immense number of tombs, covering many times the space itself occupies." *Ashmounein*, on the left bank, at a little distance from the river, in lat. 27° 48′ N., is a town with a population estimated variously at 4000, 6000, 7000, or 10,000. *Es-Siout*, or *As-Siout*, the capital of Upper Egypt, about a mile and a half from the left bank of the Nile, 27° 9′ N. lat., is a place of considerable extent, nearly circular, half a mile from the river, and surrounded by spacious gardens, in the midst of sand-hills. The population is about 12,000; the houses are neat and well built, and much cleaner than ordinary. It carries on a considerable trade in linen cloth, earthenware, natron, and opium. A cotton manufactory was established here, several years ago, which gave employment to 800 men and boys; but the climate seemed to militate against it. The dust brought by the Khamseen winds insinuates itself among the machinery, impedes its motion, and with the heat, which warps and splits the wood-work, soon renders it useless. The dryness also of the atmosphere weakens the strength of the cotton, and makes the threads snap. *Akhmim* or *Ekhmim*, on the right bank, in lat 26° 32′, is a town of 10,000 inhabitants, with a large cotton factory, and the ruins of a temple and catacombs. *Girgeh* or *Jirgeh*, formerly the capital of Upper Egypt, which derives its

name from a monastery dedicated to St. George within the walls, is still a considerable
taining nine large mosques, whose elegant minarets and spacious domes standing in the m
uriant date trees, which give the place the appearance of a grove when viewed from the riv
aspect of much grandeur. The city stands close to the river, on the left bank, in 26° 20′ N
private houses, two or three storeys in height, with neat latticed windows, are built with
bricks, and appear to be larger and more commodious than in the majority of Egyptian t
cleanliness is by no means the characteristic of its inhabitants. *Kennek* or *Ghennek*, o
bank of the Nile, 26° 10′ N. lat., is famous for its manufacture of pottery called bardaks, m
rous clay, and in great request all over Egypt as water-coolers. The town also derives son
ance from its situation on the road to Cosseir, so that the greater part of the trade of that
Egypt passes through it. It is, on the same account, the place of assemblage for the Africa
pilgrims on their way to Mecca. The road to Cosseir lies almost due east through the des
tract quite practicable for wheel-carriages. *Esneh*, the last great town which occurs in
the river, situate on its left bank, in 25° 18′ N. lat., in a plain of considerable extent, is
place, and the rendezvous of the caravans of Dar-Fur and Sennaar. It has manufactories
cloth, pottery, and a kind of shawls called millayeh; and is famous throughout Egypt
camel-market or fair. It occupies the site of the ancient *Latopolis*, among the remains of w
beautiful portico of a temple, now used as a cotton warehouse. *Edfou*, a small town of abo
habitants, on the left bank of the river, 25° N. lat., where is made a kind of earthen ves
same shape as those represented in the ancient paintings. *Assouan* or *Es'Souan*, in Cop
which signifies "the opening," the Latin *Syene*, on the right bank of the Nile, in 24° 5′ 30
a small town with considerable trade. It is surrounded on all sides by dark and rugged r
which consist of that rose-coloured granite which from this place is called syenite; and
town for several miles are the quarries from which the ancient Egyptians procured the gr
for building their temples. The town is scattered in a straggling irregular shape on the
barren hill; it is, however, considered the most romantic spot in Egypt. The Nile here
pearance of a narrow lake surrounded by bare but picturesque rocks, at the foot of whic
belt of bright verdure, interspersed with scattered groves. There are but few ruins of t
city. *Cosseir*, or *Kosseir*, or *Kossir*, or *Kosayr*, or *Qoreir*, is a port on the Red Sea. The
assemblage of Arab huts, built of wood and mats, situate in a very poor and barren countr
any good water but what is brought from Arabia or the Nile. It has, however, a consider
though its harbour is small, and the anchorage unsafe for ships during several months o
Cosseir is 119 miles from the Nile at Kenneh, but only 108 from Koptos or Keft; the r
over a perfectly level tract passable by carriages. It is situate in 26° 6′ 39″ N. lat., and 34
long. Between Cosseir and Kenneh there are eight wells, four of which have been put into g

ANTIQUITIES.—Egypt possesses many charms for the traveller, and, in respect of antiqui
the palm above every other country. The celebrated PYRAMIDS demand our first attent
principal of these, three in number, are situate on a platform of rock, about 100 feet abov
of the Egyptian plain, at the distance of five miles S.E. of Geeza. The largest, called th
of Cheops, occupies a base of 750 feet square, and rises to the height of about 600 feet. It is
the others, of large blocks of stone, which form so many gigantic steps (above 200 in numb
top, where there is a small platform, affording an extensive view over a landscape of the m
ordinary features. To the south, scattered in irregular groups, are the pyramids of Sakkar
sir, and Dashour, glittering in the sun like enormous tents, and appearing from their nu
the confusion of their arrangement, to extend to an unknown distance into the desert. O
is the wilderness of Libya, stretching to the edge of the horizon; whose boundless un
apparently destitute of the very principle of vegetation, seem to be the prey only of the s
and the whirlwind. In the foreground the sand swells into hillocks resembling the kerne
pyramids. To the north and the east, the landscape presents a striking contrast to the sava
of the other sides; the valley of the Nile is seen luxuriantly covered with verdure and bea
fields, green meadows, wood of various growth and foliage, scattered villages, a thousan
sheets of water, and, above all, the broad glittering stream of the Nile itself, spreading fe
abundance like a beneficent god. Beyond this are the white buildings of Cairo, Boulak, an
backed by the long lofty range of the Mokattam hills, reflecting the bright rays of the sun.
the Nile is in flood, this blooming valley appears like a wide sea, with a few scattered island
trees peering above its smooth surface, with Cairo and the Mokattam hills forming its fart
This pyramid has long been open, and contains a small chamber, with a hollow sarcophagu
as King Pharaoh's tomb. Several other apartments and winding passages have lately been c
in its recesses by persevering travellers, particularly by Colonel Vyse, who has succeeded in
its whole internal structure. The next adjoining pyramid is that of Cephrenes, opened b
who discovered that he had been anticipated by Arab investigators, several centuries earl
still found in a sarcophagus some bones, which are believed to be those of a cow or ox.
456 feet high. The next is the pyramid of Mycerinus; and numerous pyramids are fou
south, for upwards of twenty miles, at Abousir, Sakkara, and Dashour; also in other pa
country, and even in Nubia; but for what purpose, by whom, or when, such stupendous fa
erected, is quite unknown. About 300 paces from the second pyramid is the gigantic sta
Sphinx. It was formerly covered to the neck with sand, but that having been cleared away b
Caviglia, the length of the complete statue was found to be 125 feet from the fore part to the
its paws projecting 50 feet forward. The breast, shoulders, and neck are those of a human
body is that of a lion. The head-dress resembles an old-fashioned wig; the ears project
ably; the nose is broken; the face seems to have been painted red; the features are Nubian
Egyptian; the expression is particularly placid and benign. It has been again covered up
to the neck.

THEBES, the city of the "hundred gates," the original capital of Egypt, now exists only in
which extend for many miles on both sides of the river, a little to the north of the latitude
The principal ruins are situate at Luxor, Luxor, El Uksor, or El Qosoor', Karnac and M
on the right, and Medinet-Abou and Gournah on the left bank of the river. The period of it
splendour appears to have been under the kings of the 18th, 19th, and 20th dynasties, whic
pollion places between the years 1822 and 1300 B.C. At that time it appears to have been
miles in circuit, and contained temples and palaces filled with immense wealth, which in la
was carried off by Cambyses, king of Persia. Laid waste by king Ptolemy Philadelphus, and
(28 B.C.) by Cornelius Gallus, this ancient city has never again been rebuilt, and now presen
mass of ruins, which may be regarded as the most magnificent, as well as the most ancien
world. Among the ruins on the left bank of the Nile are an immense hippodrome or circus;
mous palace of Rhamses-Meiamoun, at Medinet-Abou; the Memnonium of the Greeks, b
Champollion calls the Amenophion of the Egyptians, the ruins of which extend 1800 feet in le
contain more than 18 colossuses, the smallest of which is 20 feet high; and near the bank of
are two colossi in a sitting posture, 61 feet high. The most northerly of the two is called
but appears to be the image of king Amenophis III. of the 18th dynasty, and the celebrated
Memnon, of which the Greek writers report that its lips uttered musical sounds when they w
struck by the rays of the rising sun. The head of the younger Memnon, of extraordinary be

weighing 12 tons, was carried off by Belzoni, and presented by him to the British Museum. The tomb of Osymandias, as it is called by the Greeks, but whose proper title appears to be the Rhameseum, deriving its name from its founder Rhamses the Great, is the most ruinous of the monuments of Thebes: among its most perfect portions are a large hall, of which 30 columns still remain entire; and the enormous wreck of the colossal statue of Rhamses, which, though in a sitting posture, is 53 feet high above the base. The small temple of Athor is remarkable for its elegance and ornaments. The great Syringe, with its long corridors and large subterranean apartments. The ruins of Gournah present the imposing remains of the Menephtheum, or the palace of king Menephthah I. Along the right bank of the Nile we find, at Luxor, the remains of an immense palace, built by Amenophis-Memnon (Amenothf III.) of the 18th dynasty, and Sesostris the Great. In front of it were two obelisks, of 72 and 75 feet high, each formed of a single block of rose-coloured granite, of exquisite workmanship, and beside them four colossal statues of the same material; behind these is an immense front or gateway, 50 feet high, leading into a peristyle of 200 columns, the largest of which are about 10 feet in diameter. According to Champollion this immense fabric was the work of Rhamses the Great and several other kings. The smaller of the two obelisks was lately brought to Paris. At Kafr-Karnac is the Sphinx alley, extending more than 6000 feet in length, between Luxor and Karnac, and containing so many as 600 sphinxes of colossal size. But it is at Karnac that the magnificence of the ancient kings is fully exhibited. In the ruins of this wonderful palace the traveller is astonished by the grandeur of the buildings, which seem almost too great to have been the work of man. It contains an avenue of single stone pillars, each 70 feet in length, but all of them thrown down; a hall 318 feet long by 160 wide, having its roof supported by 134 pillars, the largest of which measures 70 feet high and 11 in diameter; and the circumference of their capitals being 64 feet, a hundred men may easily stand upon each of them! In another court are two obelisks, 70 feet high, but only one of them is erect; and in another hall or court is the largest of the existing obelisks, which is 91 feet high. On the walls are exhibited the portraits of most of the kings, whose deeds are represented in tablets of colossal size. Among them are Meneftah I. fighting with the enemies of Egypt, and returning in triumph; the campaigns of Rhamses the Great; and also those of Sesonchis, who is represented dragging at his feet the Theban trinity Ammon, Mouth, and Khous, with the chiefs of more than 30 vanquished nations, among which Champollion has found the name, in hieroglyphics, of *Ioudah-melek*, the king of Judah. To the west of Medinet-Abou are situate the tombs of the kings of the 18th, 19th, and 20th dynasties, cut in the calcareous rock, at different levels, in a dry valley, now called *Biban el Moluk* (tombs of the kings), on the left bank of the Nile. They are all of extraordinary splendour; the largest and most magnificent of them being that of king Rhamses-Meiamoun, which is adorned with sculptures of the highest interest. One of its small side halls contains, among other things, a representation of the operations of cookery; another, that of the richest and most sumptuous furniture; a third exhibits every sort of military arms and ensigns; with the barks and royal barges fully decorated. Several of these royal tombs contain on their walls numerous inscriptions, made by travellers of all ages, from the days of the Pharaohs, the Persians, the Greeks, and the Romans, to the travellers of the middle ages and those of our own times. The *Necropolis of Thebes* occupies an immense extent of ground on the left bank of the Nile, where are found tombs of all the kinds in use among the ancient Egyptians. It is in these tombs that the finest mummies and the most ancient papyri are found. The village of Gournah, indeed, partly consists of this necropolis; the Arabs live in the very tombs, whose former inhabitants they use for fuel. The trade in antiquities has been, since 1817, the only occupation of this ferocious and brutalized tribe of thieves.

MEMPHIS, the second capital of Egypt in point of antiquity, stood on the left bank of the Nile, not far from the great pyramids; its finest buildings were destroyed by Cambyses in the sixth century B. C.; and, at last in the seventh century of the Christian era the city was taken by assault and utterly destroyed by the Arab conquerors. Almost every trace of it has now disappeared, having been covered up by the annual deposits of the Nile, and the city is now represented by the villages of *Memf*, *Mitrahineh*, and *Bedreshein*. Near Abousir, in this neighbourhood, also are found the catacombs of birds so famous in the narratives of travellers; they consist of extensive corridors filled from top to bottom with little jars containing the mummies of these animals.

SAIS, the capital of the last native kings of Egypt, before the Persian conquest, is now represented by *Sa-el-hadjar*, a miserable village in the Delta, 40 miles S.E. of Rosetta. It was represented as the mother city of Athens, whose patron goddess Pallas-Athené, was the *Neith* of Sais, with the letters of the name transposed in writing; though this fact is disputed by some modern antiquaries. All that now remains of the splendour of Sais, consists of some colossal mounds.

Matarych or *Mataria*, a small village, 6 miles N.E. by N. of Cairo, contains several remains of buildings belonging to the ancient *On* or *Heliopolis* (Sun-town), so called by the Greeks on account of its magnificent temple of the sun. It was one of the largest cities of ancient Egypt; but even so early as the first century of the Christian era it was almost deserted, and many of its finest ornaments were carried off to embellish Rome, and more lately to adorn Constantinople. The ruins of the temple are still found, with the remains of a sphinx mentioned by Strabo, and a fine obelisk, consisting of a single block of granite, 68 French feet high, by 6½ broad at the base. *Belbeys* or *Balbeis*, 24 miles farther N., in the same direction, a village fortified by Bonaparte in 1798, is near the site of *Onion*, where was a Jewish temple, built on the model of that of Jerusalem, by Onias, son of the high priest Onias III.; where the same rites and ceremonies were practised as in the parent temple. It was closed by Vespasian, and afterwards fell to ruin. *San*, a fishing village near the lake Menzaleh, represents the ancient city called *Zoan* by the Hebrews, and *Tanis* by the Greeks, and which was most probably the residence of the Pharaohs of Moses, and the scene of his miracles. It still contains several obelisks, and also some other remains. Near the south-eastern corner of lake Menzaleh, is a Turkish fort called *Tyneh* or *Thineh*, in the vicinity of which are the ruins of *Pelusium*, the ancient bulwark of the north-eastern frontier of Egypt.

DENDERAH, near the left bank of the Nile, almost opposite Kennch, represents the ancient *Tentyris*. About three miles west of the village is the splendid and almost perfect temple of Athor, the Egyptian Venus, which is considered as the masterpiece of ancient Egyptian architecture. It contained a sculptured zodiac or planisphere, which was carried to France in 1821, and is now in the Louvre at Paris. Near Girgeh, 5 miles W. from the Nile, on the Bahr-Yusouf and the borders of the desert, are the remains of *Abydos*, accounted the second city of the Thebaid; and which contained a palace of Memnon, and the tomb of Osiris. Its ruins are almost completely covered with sand; but some of the buildings may be entered by the roof, where spacious apartments are found entire, adorned with hieroglyphs and paintings, the colours of which are quite fresh and brilliant. Splendid remains of temples are also found at Edfou, the *Apollinopolis magna* of the Latins; at Esneh; at *Kau* or *Gau*, the ancient *Antæopolis*, on the right bank of the Nile, 27° N. lat.; at *Cous*, or *Apollinopolis parva*, a little to the north of Thebes; at *Sheikh-Abadeh*, the ancient *Antinoe* or *Antinopolis*, on the right bank, 27° 48′ N.; at *Koom-Ombos*, north of Syené, and various other places. The very fine temple of *Hermopolis magna*, on the left bank of the Nile, a little to the north of Antinoe, was a few years ago undermined by the river, and destroyed. In its vicinity are still found the remains of a vast necropolis. A little farther north than Hermopolis, but on the right bank of the river, at the village of *Beni-Hassan*, are the remains of a place called by the Greeks *Speos Artemidos* (Diana's grot), containing innumerable hieroglyphics, paintings, and other remarkable objects.

Assouan or *Es Souan*, more than any other place in the world, presents that confused mixture of monuments which, even in the history of the most powerful nations, reminds us of the impotence of man. Here the Pharaohs and the Ptolemies built temples and palaces, which are now half covered with loose sand; and the Romans and Arabs constructed forts and walls; while, on the ruins of all these buildings, travellers of modern Europe bear witness to the presence of the soldiers and philosophers of Syene. And opposite to Assouan, on the south is a chain of beautiful and fertile islets. One of these, opposite to Assouan itself, is famous for the *syenite* of the ancients, now called *El-Sag*, where the remains of a fine obelisk are still to be seen, but the materials of its two temples have been carried off to build barracks and magazines at Assouan. A little farther south is the island of *El-Hesif*, the ancient *Philæ*, a beautiful little island about 400 feet long by 100 broad, rising in the middle of the river, and covered with columns, pylons, and towers, the ruins of its majestic temples, of which Denon distinguished eight, built at various periods, and quite separate, though some pains have been taken to combine those which were connected. The lowest cataract of the Nile is between Philæ and Elephantine. The ancient geographers and historians speak of it as a prodigious fall, whose sound deafened the adjacent inhabitants; but at present the fall is very inconsiderable, and the river exhibits only a series of rapids, as it dashes through amidst the granite rocks that strew its bed. About 37 miles N. of Assouan, on the left bank of the river, is *Hagar Silsili*, where are the most extensive and remarkable quarries in Egypt, perhaps in the world. No monuments which exist above ground convey so grand an idea of the labours of the Egyptians as these quarries, the most remarkable of all their works. Passages are as streets cut in the rock, and rising perpendicularly to the height of 30 or 40 feet on each side, sometimes straight, at other times winding, extend from the brink of the river into the very heart of the mountain, where the rock has been cut away and spaces cleared equal in size to the largest squares of London. Towards the north are seen innumerable chambers, like the dwellings of the Titans, and prodigious colonnades, extending round the base of the mountains. The rough-hewn immense roof is supported by huge, square, or polygonal columns of solid rock, sometimes sixty feet in girth. Enormous blocks of stone, completely severed from the mountain, are placed upon it, as massive pieces ready to be moved; and others still more vast have been cut and carried away, the places from which they were taken exceeding 40 feet in length.—(*St. John's Egypt*, II. 14.)

About 150 miles S.S.W. of Assouan, at the head of Foul Bay, on the shore of the Red Sea are the ruins of the ancient Berenice, where the main streets can still be distinguished, and even the materials of the houses, consisting of corals, madrepores, and petrifactions, the product of the adjoining sea. Opposite to the town is a very fine natural harbour, but too shallow for large vessels, and obstructed by a bar of sand. The extent of the ruins is about 2000 feet by 1000, which might have contained about 10,000 people. The site is now quite deserted. About 30 miles inland are the famous emerald mines of the ancients in the Jebel Zubara, they have been opened by modern speculators, but have been found to contain only a few emeralds of inferior quality.

This subject is very far from being exhausted, but it is only the principal and more important of the ancient remains that our space will allow us to notice.

§ 2. *NUBIA.*

The name Nubia is vaguely applied by European geographers to the vast region which extends southward from Egypt to the north-eastern borders of Abyssinia, and eastward to the Red Sea. It never formed a separate kingdom, or political division of Africa; but has, on the contrary, been always divided among a great number of little states of different lineage, and contained within its limits several contemporaneous independent states. Of late years, however, it has all been subjected to the dominion of the Pasha of Egypt, and garrisoned by his troops. Strictly speaking, it is only the northern part of the region that is called Nubia, the inhabited districts, above Wady Halfa, stretching to the Red Sea and the borders of Abyssinia were formerly known as the Kingdom of *Sennaar*, and are now called by the Turks *Turkish Arabia*, and by the Blacks, a name, however, which they extend as far west as Bornou, and only limit to the countries not subject to the Pasha. The greater part of the country consists of flat tracts of sand, that which is called the desert of Nubia extends on the east of the Nile from Assouan to Dongola. The traveller through it constantly traverses deep sand or sharp stones. It is not, however, without plains, for it contains hills which rise above 1000 feet, and is interspersed with wadys or valleys, that afford a supply of water, and support some trees, shrubs, and grass. In several places, however, the ground is covered with a layer of rock-salt, or studded with masses of granite, jasper, or marble. Now and then occurs a grove of stunted acacias, or tufts of colocynth and senna. The traveller often has access to no water to allay his thirst, except what is brackish or putrid, for the savage inhabitants lie in ambush near the few springs which the country contains. The western desert, or Libyan Sea, is also extensive, and called the desert of *Bahiouda*. Between these two wildernesses lies the narrow valley of the Nile, which, though deprived of the advantages of the regular inundations, in consequence of the height of the ground above the surface of the river, contains some districts, and more particularly islands, where a high degree of fertility rewards the industry of those who raise, by artificial means, the waters of the river to irrigate their lands. In many places the cultivable ground is only a few feet in width, while it increases in others to a quarter of a mile; but in some places the desert approaches to the very edge of the river. The southern parts of the country, which are watered by the Tacazze, the Astoras, and the Abiad, present a very different appearance. Along the banks of these rivers are immense savannahs, exhibiting at times, wide, boundless forests of gigantic grass, alternating with thickets of mimosa, leagues in extent, which are crossed and interwoven with thorny parasitic plants, impenetrable to man, and are the retreat of lions, tigers, and hyenas. Southwards, in the province of Fazoglo or Fasoglo, the plains are bordered with mountains of picturesque forms, but low, not exceeding, it is supposed, 3 or 4 feet above the level of the sea. They do not form connected chains, but stand isolated on the immense savannahs.—(*Russegger, in Athenæum, May 5, 1838.*)

From January till April the country is burned up with intolerable heat. The thermometer sometimes reaches 120° Fahrenheit, and the burning sands render travelling impracticable, except by night. The rainy season lasts from June till September, with frequent irregularities, covering the habitable country in the south with verdure; but frequently, the extreme heat, with the rains, and the formidable swarms of the salt-alya fly spread desolation even over that region. The northern limit, however, of the tropical rains is about 18° N. lat.; and the tract of country between that and Thebes, or even lower, is said to be the driest on the globe, and probably the hottest. The durrah and the banana are the principal sorts of grain, though wheat and millet are also cultivated. Two sorts of senna are exported; but the sugar-cane, which abounds along the banks of the Nile, is not turned to any account. The doum tree predominates in the forests, which also contain many species of palms, particularly the date tree, of which so many as 300,000, between Berber and Koroskó, are taxed by the Pasha. The acacia-vera and mimosa-nilotica extend from Egypt to Dar-Fur. The grass of the plains attains a height of twelve or fifteen feet, forming a mass as impenetrable as a wall; it is even difficult to form an idea of the grass forests which are found chiefly in the vicinity of the great rivers. Elephants, rhinoceroses, gazelles, ostriches, giraffes, and other usual African animals, are found within the limits of

Nubia. Wild dogs and foxes appear to be numerous, as Ruppell has discovered no less than four species. The variegated fox-dog is ochre-coloured, with thick fur, variegated with black; it was found both in Nubia and Upper Egypt, where it lives in the deserts, but does not burrow. The Nubian dog or rather wolf, which appears to be rare, is light grey, marked with a few black spots on the back, and has a black tail. The Kordofan fox occurs also in Nubia; it is nearly related to the fennic, which was also found by Ruppell in the neighbourhood of Ambukol, and in the desert of Korti, where it lives in holes dug by itself, and not on trees, as Bruce describes those of Abyssinia. Several birds appear to be peculiar to this region, or at least have not yet been known to inhabit any other part of Northern Africa; such as the occipital vulture, first discovered by Burchel in South Africa. It inhabits the borders of both Nubia and Abyssinia. Bustards, shrikes, thrushes, quails, and partridges, are also mentioned by travellers.

The high lands of northern Nubia are inhabited by two nearly independent nomadic tribes. One of these tribes occupy the western bank of the Nile, and are called the *Barabras*; but they call themselves *Nonbah*, *Kenouz*, &c. Barabra and Bereber is the general name by which the Nubians are known in Egypt, and according to Burckhardt, it seems to be derived from *Berber*, the name of a wady or district of Upper Nubia, on the right bank of the Nile, about 18° N. lat. The Barabras are a very lean race of people, apparently destitute of both fat and flesh, and consist of nerves and sinews with a few muscular fibres, more elastic than strong. Their shining skin is of a transparent black and brown; but this is the only resemblance they bear to the negroes of Western Africa. Their hollow eyes sparkle under an uncommonly projecting eyebrow, their nostrils are large, the nose sharp, the mouth wide, but the lips thin. The hair of the head and beard is thin and collected in small tufts. Wrinkled at an early age, but always lively and nimble, they only betray their age by the whiteness of their beards. Their physiognomy is cheerful, and they seem to be lively and good-humoured. The Nubians, says Mr. Holroyd, are a fine, strong, hard-working, industrious people; they possess a considerable share of pride and natural courage, and condemn most violently the unnatural propensities which are common among the Turks and many of the Arabs. The women are remarkable for their chastity, and their feelings are social and domestic. There are very few schools among them, and a man who is able to read and write is accounted a person of consideration. The eastern deserts, from Cosseir to the south of Nubia, are occupied by the *Ababdes*, a people who differ entirely in customs, language, and dress, from the Arabs found in Egypt. They are black, but have the same form of head as Europeans. Their heads are uncovered, but their hair is worn long. Their clothing consists of a piece of cloth worn over the loins. They anoint their bodies, and particularly their heads, with fat. They have no fire-arms, and few horses; they rear a sort of camel which they call aguine, which is smaller, better made, and more active than the common species. They are Mahometans, but not very rigid in their faith; and they bury their dead by covering their bodies with stones. The *Sheygya*, *Sheggeea* or *Shaykye*, are a race of negroes once peculiarly roving, fearless, and warlike, who occupy both banks of the Nile above Dongolah They had numerous slaves, whom they employed in tilling the ground, and other laborious duties, while they devoted themselves entirely to arms; but in consequence of a desperate battle with the Egyptian troops at Korti, in which they were entirely discomfited, they are now, like the other Nubians, subjects of the Pasha. In 1837, Mr. Holroyd found them reduced to poverty and the greatest state of degradation by Turkish misrule and despotism.

The *Noabah* are a gentle race of negroes, in the province of Sennaar, with small features, woolly hair, flat noses, and speak a soft sonorous language totally different from that of their neighbours. They are idolators, and in some respects Sabians, for they always do homage to the moon. They are circumcised; but keep herds of swine, and eat pork freely. In 1504, a negro nation, till then unknown, came down the Abiad, and subdued the Nubians. They called themselves *Shillouks* or *Shellukhs*, and founded the city of Sennaar on the Azrek. They were originally idolators, but their intercourse with Egypt has produced their conversion to Islam.

The people who dwell along the Nubian shore of the Red Sea appear to be of Arab origin, and still preserve in a great degree the habits of the ancient Troglodytes or dwellers in caves. They speak the Gheez language, a dialect of the Arabic. They are in the lowest stage of savage life, and derive their principal support from fishing. Towards the north-east, however, near Foul Bay, are a people of somewhat better habits, called the *Bisharees* or *Brjahs*, who lead a nomadic life; deriving abundant food from the milk and the flesh of their camels, cattle, and sheep. Bruce believed that they spoke a dialect of the Gheez, but the Arabian historians of Nubia make them belong to the race of Berebers or Barabras.

The old political divisions of the country have been obliterated by the recent Egyptian conquest, and we are not aware that the country has yet been divided anew into provinces and municipal districts. The cities and towns are few and unimportant; but the remains of ancient buildings and cave temples, along the Nile, chiefly in lower Nubia, form very attractive objects of curiosity to travellers and antiquaries. *Dongolah*, called also *Agouz Dongolah*, or Old Dongolah, the largest, richest, and most populous city of Nubia, during the middle ages, is now reduced to the size of a village, with about 300 inhabitants. It stands on the right bank of the Nile, in 18° N. lat. and 31° E. long. *Marakah*, or New Dongolah, a large thriving and populous town on the left bank of the Nile, about 70 miles N.N.W. of Old Dongolah, built several years ago by the Mamelukes, after their expulsion from Egypt, is the residence of a Turkish Aga, whose government extends from Wady Halfa to Wady Gammer. In the river to the north of Marakah is the magnificent *island of Argo*, about 30 miles in length, and 6 or 7 in breadth, formed by the rich alluvial deposits of the Nile, which produces grain, cotton, indigo, and dates. *Sennaar*, lately the capital of the kingdom of Sennaar, which extended over the greater part of Upper Nubia, and is said to have once had so many as 100,000 inhabitants, is now almost deserted, the people having emigrated to Aleis, ten days' journey to the south-east, at the period of the Egyptian conquest. The few who remain live in straw huts, with the exception of two or three slave merchants whose houses are made of mud. It stands near the left bank of the Azrek, in 13° 37′ N. lat. and 33° 30′ E. long. *Kartoum* or *Khartum*, at the confluence of the Abiad and the Azrek, is now the seat of government; it has sprung up since Soudan became subject to the Pasha, and contains about 15,000 inhabitants. *Shendy*, on the right bank of the Nile, about midway between the confluence of the Azrek and the Abiad, and the mouth of the Tacazze, a town of 800 or 900 houses, and a population of 7000, is now in ruins. Before the Egyptian conquest it was the principal commercial mart of Nubia, and a great slave market, lying on the route from Dar-Fur and Soudan to Souakin, where merchants and pilgrims took shipping for Jiddah. At Assour or Hafhour, a little village below Shendy, are the ruins of *Meroe*, a city celebrated for its monuments, its commerce, its oracle of Ammon, and its pontiff king, chosen, as was believed, by the god himself, from among his priests; and a little further down the river is the island of *Kourgos*, which contains three groupes of ancient mausoleums, of a pyramidal form. Below the junction of the Tacazze, on the right bank of the Nile, is *Berber*, a town of 8000 or 9000 inhabitants, which is the rendezvous of the slave merchants from Sennaar and Kartoom, who proceed to Cairo by the desert of Korosko. *Derr*, the chief town of Lower Nubia, is a small place, with a thriving and increasing population, on the right bank of the Nile, about 130 miles above Assouan A few miles further up is *Ibrim*, a fort or castle on a perpendicular rock overhanging the river; but it is now in ruins, having been destroyed by the Mamelukes. *Souakin*, *Suakem*, or *Swakem*, the only seaport of Nubia, is situated on the west

ABYSSINIA

the exhalations of stagnant water, occasion elephantiasis, ophthalmia, and many fatal diseases. The winter, in so far as weather is concerned, begins in June, and continues till the beginning of September, during all which time the incessant rain, often attended with thunder, and dreadful hurricanes, puts a stop to agricultural labour and military operations. The other months are not entirely exempt from inclement weather. The finest are those of December and January. But the mountainous surface of the country occasions many variations of climate and season. In the east, below the mountains on the borders of the Red Sea, the rainy season only begins when it ceases in the interior, and that region is burned up at other times with intolerable heat.

Abyssinia is said to contain many mines of iron, copper, lead, and sulphur; and gold of extreme fineness is or used to be produced in Damota, and the shallow mines of Narea. Bruce also informs us that the finest gold is found in the western provinces at the feet of the mountains Dyre and Tegla; and along the western frontier M. Russegger has lately found a prodigiously large vein of quartzose granite, consisting of quartz, with disseminated copper and silver ores of various kinds. At the south-eastern border of Tigré there is a great salt plain which is said to extend from south-east to north-west for four days journey, and which took five hours to cross it, when it was visited by Mr. Coffin in 1809. For about half a mile the incrustation was slippery, and broke under the tread, but farther on, he found it to be hard, rough, and irregular, like a sheet of ice. On the west side he found the Abyssinians cutting out pieces like a mower's whetstone, which is done with tolerable ease, as the salt lies in horizontal flakes. The salt near the surface is pure and hard, but beneath, it is coarser, and requires some exposure to the air before it hardens. In some parts the incrustation is three feet deep; but, in general, at the depth of two feet, it is too much mixed with earth to be fit for use in its native state. This district supplies the whole of Abyssinia with salt; and the mineral, when cut into long flat pieces, is one of the principal mediums of exchange.

Though situate within the tropics, the character of the vegetable productions of Abyssinia is somewhat extra-tropical, bearing but little affinity to the vegetation of the opposite and western coasts of Africa in the same latitude. The chief alimentary plants are millet, barley, wheat, maize, and teff. All travellers concur in praising the fine wheaten bread; but that is eaten by people of rank only. The teff or tafo is a grain smaller than mustard seed, with an agreeable taste, and not liable to be spoiled by worms. It is commonly sown in all parts of the country, and from it the bread is made which is generally used by all classes. The bread made from it is soft and spongy, with a sourish, but not disagreeable taste; and from this bread also, the people make bouza, a kind of beer, which is the common drink of the country, by pouring warm water upon it toasted, setting it by the fire, and stirring it frequently, till, after three or four days, it acquires a sourish taste. There are generally two harvests; one during the rainy season, in July, August, and September; and the other in spring. At Adowah and the neighbourhood, there are three crops. Some vines are cultivated, and wine is made, though in small quantity. The people cultivate also great quantities of a herbaceous alimentary plant, resembling the banana, which serves them for bread, and which Lobo calls *enete*. The papyrus is found also in the marshes as well as in Egypt; and Bruce asserts that the tree which produces the balm of Judea and myrrh is indigenous in Abyssinia, or more correctly speaking, on the coast of Adel. The whole of Abyssinia is scented with the perfumes exhaled from the roses, jessamines, lilies, and primroses, with which the fields are covered. The coffee shrub is also said to abound in the south-western parts of the country, and indeed is believed to have derived its name from the province of Kapha or Kaffa, where it is indigenous.

The animals of so extensive a country present, as might be expected, a great variety; but the zoology is very imperfectly known. It is only in the lower regions of forests that elephants and monkeys are found. The two horned rhinoceros is common; and both Lobo and Bruce think that the one-horned rhinoceros is also to be found. Hyenas are very numerous and ferocious, and prowl in the towns during night. There are also wild boars, and gazelles or antelopes; and, probably also, zebras. The cattle are numerous and of large size, and have horns of enormous length; there are also wild buffaloes, which sometimes attack travellers. The ass and the mule supply the place of the camel; while the horses, which are small but very lively, are only used for the purposes of war. Lions, too, with various kinds of leopards (one of which is black), and several species of dogs are mentioned by travellers. There are great numbers of serpents of remarkable species, and of enormous size. The lakes and rivers swarm with river horses and crocodiles. The varieties of birds are not less numerous; one of which is the great golden eagle. Travellers speak also of many kinds of wild bees, which build their nests under ground, and produce excellent honey; but the most remarkable insect is a fly, the saltsalya, the sting of which is dreaded even by the lion, and which forces whole tribes to change their residence. In size it is little larger than a bee, and has pure gauzy wings, without spot or colour. The head is large, and the mouth is furnished with three strong projecting hairs or bristles. As soon as this plague appears, and its buzzing is heard, the cattle forsake their food, and run wildly about the plain till they die, worn out by fear, fatigue, and famine. The inhabitants of all the countries from the mountains of Abyssinia northward to the confluence of the Nile and Tacazze are once a-year obliged to change their abode, and seek protection in the sands of Beja. The locusts are still more destructive, laying waste whole provinces, and involving the inhabitants in the miseries of famine. Bruce speaks also of a black ant, nearly an inch long, which cut his carpets in shreds.

The Abyssinians or Agazians approach the European model, in respect of their handsome forms, features, and long hair; but they are distinguished from all other known races by a peculiar complexion, which Bruce compares sometimes to pale ink, and sometimes to an olive brown; and which, according to the French institute of Egypt, seems to partake of a bronze colour. The language called the Gheez, which is spoken in Tigré, is regarded as a dialect derived from the Arabic. The Amharic language has also many Arabic roots, but gives evidence of a peculiar origin in its syntax. It would appear, therefore, that Abyssinia, first peopled by an indigenous or primitive race, has received, more especially in its northern and maritime parts, a colony of Arabs. The Abyssinians are nominally Christians of the Jacobite sect, and used to have an ecclesiastical primate, called the Abuna, appointed by the Coptic patriarch of Alexandria; but in reality their religion is a corrupt mixture of Paganism, Judaism, and Christianity of the lowest kind, and has very little influence on their manners and conduct. They are deeply sunk in superstition, and are altogether in a very low state of civilization. They live in round huts with conical roofs of straw; a light cotton dress, some pieces of carpet, and a few articles of pottery, form their chief objects of luxury. Their children go naked till the age of puberty. The arts and mechanical professions are chiefly in the hands of strangers, and especially Jews, who furnish all the smiths, masons, and thatchers of the country. The GALLAS are a savage people who made themselves masters of the south-western provinces; and are distinguished from the Negroes by their low stature, deep brown complexions, and long hair. They live entirely on raw flesh; they besmear their faces with the blood of their enemies, and hang their entrails round their necks, or interweave them with their hair. Their ferocity and filthiness indeed surpass every idea that can be formed of them. They worship trees, stones, the moon, and some of the stars; and believe in magic, and a future state. The SHANGALLANS inhabit the wooded heights called Kolla by the Abyssinians, in the north-western parts and to the west of the Tacazze. They are decidedly Negroes, of deep black colour, with woolly hair; but their faces are not unlike those of apes. They spend one part of the year under the shadows of trees, and the rest in caves dug in soft rocks. Some of the tribes live on elephants and rhinoceroses, others on lions and boars, and some on locusts. They go quite naked, and

MOGHREB OR MAGHRIB.

ARDH EL MOGHREB is the name given by the Arabs to the countries of northern Africa which lie to the west of Egypt. The name signifies THE WEST; and the people of these countries are called by their oriental brethren *Moghrebins* or *Mogrubbins*, that is, *Westmen* or *Westlanders*. Moghreb is divided into four portions: 1. *Bilad*-ul-Beruber*, the country of the Berebers, or Barbary, subdivided into *Barka*, *Afrikiyah*, *Moghreb-ul-Ausat* (the Middle West), and *Moghreb-ul-Aksa* (the Far West, or Marocco); 2. *Bilad-ul-Jerid*† (the country of dates); 3. *Es Sahara* (the Desert); and 4. *Bilad es Soudan* (Negroland, or the country of the blacks.) *Bilad-ul-Jerid* is, properly speaking, only the southern portion of Barbary, comprising the region which occupies the southern declivities of the Atlas, as far as the Great Desert: it has no definite limits, and is rather a common appellation than a proper name; we shall therefore consider the first and second of these Arabic divisions as one geographical region, under the European name of *Barbary;* reserving a separate section for each of the other two.

BARBARY.

BOUNDARIES AND DIMENSIONS.—BARBARY comprehends that long narrow tract of country which forms the southern coast of the Mediterranean Sea, from Egypt to the Atlantic Ocean, being bounded on the north by that sea, and on the south by the ill-defined limits of the Great Desert or Sahara. It lies between the parallels of 28° and 36° N. lat., and between 11° 30′ W. and 27° 12′ E. long., extending about 2000 miles in length, and varying in breadth from a few miles to more than 400.

GENERAL ASPECT.—The Atlas mountains form the nucleus of Barbary; the western portion of the region is composed of these mountains, and their interjacent valleys, with a border of flat country of varying breadth, on each side of them, which slopes towards the Mediterranean Sea and the Atlantic Ocean on the one side, and towards the Great Desert on the other. Moghreb-ul-Aksa or Marocco, has its greatest length from south-west to north east, and lies between the Atlas on the east, and the Atlantic Ocean on the west. The country appears to rise by three great steps or terraces from the sea to the mountains; and is divided into three portions by the rivers Seboo and Om-erbergh. Of these, the northern portion, which extends from the Strait of Gibraltar to the latitude of Fez (with the exception of the northern spur of the mountains), is almost level to the foot of the Atlas. From the Seboo to the Om-erbergh, the country dips considerably to the west, and still more so from the latter river to the plain of Marocco. Throughout these plains there is a great want of wood; even on the skirts of the Atlas the timber does not reach a great size; but the capabilities of the soil appear to be remarkable. From the foot of Atlas to the Atlantic is one vast corn plain, which, by means of irrigation, might be rendered highly productive; but at present it is covered with weeds.‡ Moghreb-ul-Ausat, or the middle west, nearly corresponds in extent with Algiers, and is separated from Marocco by the extensive desert of Angad. Of that portion of the region which lies to the north of the Atlas, the soil and aspect are in general fertile and pleasant; but to the south of the mountains little else is to be seen than naked rocks, or plains scorched by the sun, and cursed with incurable barrenness. Even on the northern side, the fertile tracts are small in extent; vast plains destitute of trees, and bearing but scanty marks of vegetation, occur at frequent intervals; and the eye of the traveller is seldom refreshed by the appearance of human industry and cultivation. In Tunis, which comprises the greater part of Afrikiyah (*i. e.* the Roman province of *Africa Propria*), the cultivable plains are of considerable extent; and well-watered valleys occur among the spurs of the Atlas. The soil has been celebrated for centuries; it was once considered the granary of the world, and the most valuable province of the Roman empire. The fertility of the soil almost surpasses belief; the ground is soft and yielding, and so rich and productive, that it requires only to be turned up with a stick in order to yield any species of crop without manure, care,

* This word *Bilad* has several other forms, when expressed in Roman letters, as *Beled*, *Belled*, *Biled*, *Blad*, *Bled*, and means country, region, township, town.

† *Jerid* is the name of the dry branches of the date-tree, which are used as javelins.

‡ Capt. Washington, Journal, R. Geog. Soc. Lond. vol. I. But M. Graberg de Hemso does not exactly agree with him; for he tells us that in Marocco the land susceptible of cultivation does not exceed one-fourth part of the surface, though much of the other three parts consists of rich pasturage.

jujebs, melons, pumpkins, saffron, the white mulberry, the indigofera glauc the sugar cane. The gardens yield nearly all the species of pulse known in E Wheat is sown in autumn, and gathered in April or May; maize and sorghu sown in spring, and cut down in summer; oats grow spontaneously. Some fruits, such as the fig, are inferior in quality to those of Europe; but the acorn like our chestnuts.

In Marocco, the cultivation of the land is pursued chiefly by the Moors and The only trees on which any care is bestowed are the olive, date, palm, l orange, apple, and pear. Wheat is the grain cultivated most extensively, an a quality equal to any in Europe. It yields a return of twenty-five for one; t in Algiers it is said the produce is generally only twelve for one. Barley is u food by the Moors only in times of scarcity; but it is extensively consumed by and poultry. It generally yields from twenty to thirty fold. Next to wheat, (sorghum or millet) is the most extensively cultivated grain in Marocco, wh forms the principal article of food of the lower orders; it yields 140 fold. M grown chiefly along the sea-coast, and in the southern provinces, and forms entirely the food of the slaves; its produce is often 300 fold. Rye, which in great abundance in the western provinces of the interior, is the only grain al to be exported; it is, however, of little value, and is rarely used as human The stalks of all these species of grain are burned on the ground for manure. is produced in the western provinces of Marocco, but is so bad in quality, th supply of the Sultan and his court is imported from America. Calavances a vegetable most generally cultivated, but other vegetables, of various kinds, g abundance. Potatoes have been introduced, and thrive in the northern prov but, as they degenerate after the second or third crop, a renewal of the seed is sary. There are also many other roots to which the Moors and Arabs have re for subsistence in times of scarcity. Various fruits, and aromatic plants are pr in abundance.

Animals.—The animal kingdom comprises most of the species which are fo the rest of Africa, excepting the rhinoceros, hippopotamus, giraffe, zebra, and of the monkey tribes. Barbary produces fine horses, and also two kinds of ass one large and strong, the other very small. The cattle generally are small and the cows yield but little milk, and that is of an unpleasant taste. Goats and are plentiful; but swine, being held in abhorrence by the Moslem, are found the houses of Europeans. Cats, dogs, and European poultry are common; a Arabs pay great attention to the rearing of bees. Of all the domestic anima sheep are the most important in number and value. In Marocco alone (the on trict where we have any approach to accurate statistical information) they are puted at forty or forty-five millions, of which no less than 700,000 are slaug annually at the grand festival called A'id-ul-kebir, on the last day of the M year; on which occasion every male above the age of twenty is required to kil his own hands one or more sheep, according to his means, and the number family. The quality of the wool, especially in the provinces of Temsena and Meskeen, is very fine, superior indeed to that of Europe, and is exported from and Sallee; the produce of the southern provinces, which is the most abund exported from Mogadore. The amount exported, however, does not exceed stones annually. The goat ranks next to the sheep, and contributes to a vari useful domestic purposes, particularly as the cows yield but little milk, which case in all warm countries where they are not artificially fed. The goats in M are estimated at 10 or 12 millions; the number of camels at half a million, a is well known, these form an important article in the wealth of an Arab. The in Marocco are estimated at 400,000, and are not allowed to be exported, exc a special favour. The asses amount to 2,000,000; the mules are found in still g numbers, and a good mule is more valued than even a good horse. As dogs are put to death in this country, they necessarily exist in offensive numbers, alt the scanty provisions of the people leave them but little food to spare for their It is confidently asserted, that these animals are never affected with hydrop either in northern Africa, or, indeed, in any Mahometan country; but, thoug escape, mules, it is said, are subject to this malady in Moghreb-ul-Aksa. N least important among the animals of Barbary is the locust, whose multiplying is almost incredible. It is said that one female lays 700,000 eggs in the sand, are hatched in a short time. The locusts are eaten by the Moors.

People.—The people of Barbary may be divided into seven classes: Moors, Berebers, Shellukhs, Jews, Turks, and Negroes.

The *Moors* are generally the inhabitants of the towns and cultivated plains; and, though they speak a dialect of Arabic, their physical constitution, their complexion, which is whiter than that of the Arabs, their countenance, which is fuller, with a less elevated nose, and less expressive physiognomy, seem to indicate that they are a different race, descended probably from a mixture of the ancient Mauritanians and Numidians with the various foreign races which have conquered or settled in the country. At present they constitute the higher classes in all the cities of Marocco, and fill all the chief offices of government; while in Algiers and Tunis they form the greater portion of the population. The men of the genuine Moorish race are above the middle stature, muscular, and have a grave and noble carriage. They have black hair, their skin is a little swarthy, but rather fair than brown; their faces are somewhat full, and their features are less strongly marked than those of the Berebers and Arabs. The nose is generally rounded; the mouth of middle size; and the eyes large but not lively. The men are rather fat, though sometimes handsome; the women are formed on a scale proportionate to that of the men; they have all black hair and beautiful dark eyes; and some of them are even extremely pretty. They never wear stays; and as excessive obesity is considered the perfection of female beauty, they do all in their power to become fat, and are of course very defective in shape. They deem it also a mark of beauty to have hanging breasts; and torture their children in attempts to draw down and lengthen them into the most hideous deformity. The children, however, of both sexes are extremely pretty, with a mild expression, and beautiful eyes, and are generally more intelligent, for their age, than their parents. The Moors exercise almost every calling known in Europe; they are joiners, carpenters, ropemakers, coopers, weavers, shoemakers, tanners, embroiderers, tailors, jewellers, watchmakers, blacksmiths, cutlers, armourers, and so forth. But these several trades are generally still in their infancy among them; and their work is performed in the slowest manner; but as they are very abstemious, while every article of food is cheap, they contrive, with very little labour, to maintain themselves and their families. All employment requiring exertion is shunned by them; they are fond, however, of riding on horseback; and horsemanship forms the pride and amusement of those who can afford it. Their feats in this art are often very wonderful; they are particularly fond of galloping, and then suddenly stopping; some will even lift articles from the ground while going at full speed; but they have not the art of training their horses to any sort of pace between a walk and a gallop. "The character of these Africans," says M. Grabeg de Hemso, "I can conscientiously aver, is made up of all that is meanest and vilest in the heart of man. They are now exactly the same barbarians as their ancestors were in the days of Sallust and Procopius; that is to say, they are fickle, perfidious, cruel, and incapable of being restrained by either fear or kindness. Even their countenance has in it something sinister and revolting, which cannot be contemplated without an involuntary shudder." Other travellers give much the same account of them. "The Moors," says M. Rozet (*Voyage dans la Regence d'Alger*), "are vindictive and treacherous, though devoid of general bravery or military talent. Neither are bad faith, perjury, and idleness, the only faults of this people; they are tainted with the most hideous and most revolting propensities. Their boasted abstemiousness is a mere consequence of their idleness. Those among them who can afford it live well; many of them now drink wine and spirits, and it is by no means uncommon to see Moors reeling along the streets of Algiers drunk. Indeed several public houses, kept by Spaniards and Italians, are filled with them from morning till night. Their known perfidy prevents them having any confidence in each other; their thieving propensities are beyond all belief; and there is no noble and generous feeling among them. They massacre without pity their enemies when defenceless. With so many vices they have no redeeming virtue that I know of." They are, of course, all Mahometans, of the sect of Malek; extremely fanatical, and, like the fanatics of other religions, consider their piety as a compensation for every moral defect, and heresy as a stain which can scarcely be rendered more tolerable by the brightest assemblage of moral qualities. In spite of their indolence, says M. Rozet, they generally receive a better education than the people of France. Almost all the men read, write, and know something of arithmetic; but the Koran comprises almost the only subject of their literary education. M. Rozet, however, met Moors at Algiers who were really well-informed men, and who spoke several languages, were tolerably well acquainted with geography, and even knew something of history. Music is nearly unknown among them.

The *Arabs* of Barbary do not differ essentially from those of Egypt and Arabia. Those of Marocco are chiefly Bedwins, or dwellers in tents, and lead a pastoral life.

They are hospitable, and faithful to their promise; and yet they are noted as t
They are a hardy race, slightly made, and under the middle size. The girl
young are pretty; but the women are very ugly, owing to exposure to the s
hard work.—*(Capt. Washington, Journal R. Geog. Soc. Lond.* I.) The A

soil, and who occupy houses and cottages; and the Bedwins. They are ge
tall and well formed; their bodies fleshy, without being either fat or thin.
hair is black, their foreheads high, their eyes quick and piercing, their mou
nose well made, their face oval and their features rather long; their skin is
sometimes dark olive, and many of them are as black as negroes, without, ho
losing any of the other characteristics of their race. They are proud and
and cut off the heads of their vanquished enemies, but seldom add torture, li
Moors and Berebers. They are moderate in their use of food, able to endur
hardship, are good riders, and skilful in the use of arms. Their women occupy
selves with keeping bees and silk-worms, and prepare the stuff for the clot
their husbands and the covering of their tents. The Arabs are all proverbial
pitable. Their tents are covered either with a coarse cloth or with palm leav
arranged in a ring, with the tent of the Sheikh in the centre; and are freq
surrounded with a thorn hedge, as a defence against the lions. These ring-can
called *duar*.

The *Berebers* and *Shellukhs* appear to be essentially the same people, th
considerable difference is observable between them. They are believed to
aboriginal natives of northern Africa, and are extended across the whole bre
the continent from Marocco to Egypt. The Berebers form at present four d
nations: 1. The *Amazighs* or *Amazirghs* or *Kabyles;* 2. the *Shellukhs;* 3. th
ricks; and 4. the *Tibboos*. The meaning of the name Bereber is not acc
known; but, in its present shape it is known to be the Arabic plural of Berbe
it appears probable that the Arabs borrowed it from the Greeks, and used
synonyme of their own word ajumi (strangers, *i. e.* not Arabians). The Am
or Amazirghs occupy the valleys, and higher parts of the Atlas, from Jebel Te
Marocco, to the Gulf of Sidra, divided, however, into many different tribe
speak as many cognate dialects. In Algiers they are called generally *Kabayil* (
the plural of *Kabileh*, a tribe), and in Tunis, *Zowavah.—(M. Gruberg de Her
Journal of Royal As. Soc. G. B.* III. 106, &c.) They are remarkable for their
figures, handsome features, and fair complexions. There are many families
them with blue eyes, and colour as florid as that of the natives of northern E
The Amazighs are chiefly shepherds and hunters; they live in a savage state,
lages planted on hill tops; and not a few of them dwell in caves. In the mor
ductive parts of their valleys, they cultivate the ground, and rear many bees.
Kabyles are described as being about the middle height, with brown comple
sometimes verging on black, and brown and glossy hair; thin, but extremely
and robust; with bodies beautifully formed, and an elegance in their attitudes
is only to be found in ancient statues. There is, however, in their countenanc
expression of savageness, and even of cruelty; but they are active and extr
intelligent. They are a remarkably industrious people, and, by working the mi
their native mountains, procure lead, copper, and iron. With the lead they
bullets for war and the chase; and with the copper they manufacture ornamer
their women. It is even said that they work gold and silver. They also make
barrels, implements of husbandry, and various rudely formed utensils, which th
to the Moors and Arabs; with knives, swords, and other sharp instruments, no
elegant in form, but of good quality. They likewise make gunpowder for thei
use, but do not sell it. One of their articles of trade is a kind of black soap,
of olive oil and kelp. The tribes on the borders of the plains, and some of the
valleys, breed sheep and cattle in considerable numbers; they have also num
flocks of goats, which supply them with milk, and of the flesh of which th
very fond. Their beeves are small, but their asses and mules are the best in Ba
In their political state they are divided into tribes, each of which is governe
Sheikh, as among the Arabs; and there are families among them which are reco
as patricians. These tribes sometimes confederate under a Sheikh-zabo, for pu
of war or plunder. They are a warlike race, and jealous of their independence
have a very savage mode of warfare. They give no quarter to the enemy wh
into their hands, and it is fortunate for him if they are satisfied with cutting o
head; for they often mutilate and torture their prisoners in the most cruel m
Knavery is held in respect among them, and a breach of promise is not consi

disbonourable. The Berebers are nevertheless said to be faithful and hospitable to friends, though cruel to enemies, and hostile to strangers. With respect to their language, all the information which M. Graberg has been able to collect, confirms the opinion that it presents a character highly original, approaching somewhat to the Hebrew; and he consequently believes it to be derived from the Phœnician. It has no affinity whatever with the Arabic, except in a few words, as religious, metaphysical, and technical terms, expressions of new ideas, and such like, which have been adopted from their Arabic neighbours. They are generally Moslems. The *Shellukhs* possess the southern ridges of the Atlas to the south of Fez. They are a people of nearly the same character as the other Berebers, but they live separately; and, although their habitations are sometimes very near, they have no social intercourse; nor is an instance known of individuals of the two nations having intermarried. Their languages, however, have certainly a great affinity. At present neither the Berebers nor the Shellukhs know of any other written character than the Arabic. The *Tuaricks* and the *Tibboos* are the possessors of the middle and eastern parts of the Sahara.

The *Jews* are here, as elsewhere, a proscribed race. In Morocco they are confined to certain districts, but reside for the most part in seaport towns and villages, being employed in commerce, or as artizans and interpreters; and it is through their agency that all intercourse with foreigners is carried on. They are very numerous in Morocco, and are chiefly the descendants of those who were driven out of Europe in the fourteenth and fifteenth centuries. They contrive to amass wealth, notwithstanding their state of degradation, and the persecution which they suffer from the fanatical Moors. Those who live among the Berebers enjoy a comparatively happy lot, particularly the ancient families known by the name of *Pilistin*, who are supposed to have been established in the country from remote antiquity. In Algiers they enjoyed great immunities before the invasion of the Turks; but under the Turkish dominion they lost most of their privileges, and were treated with great severity. The trade of broker is the only profession they now exercise there. The upper classes of them transact business with the European merchants; those of the middle and lower classes act as agents to the Arabs and Berebers. At Algiers an Arab would not sell a couple of fowls without the aid of a Jew, who has always a per centage for his trouble. In Tunis they appear to be in a somewhat better condition. They are the best mechanics; occupy the highest situations among the tax-gatherers; generally farm the revenues; and regulate the value of the money. They are also entrusted with the keeping of the jewels and valuables of the Bey; are thus his treasurers, private secretaries, and interpreters; and the little that is known of medicine, science, and art, is for the most part confined to them. They are in possession of many monopolies, and some of them are enormously rich. The total number of Jews in Barbary is estimated at 700,000; of whom about 300,000 reside in Marocco, from 150,000 to 200,000 in Tunis, and the remainder are scattered in Algiers and Tripoli. With the exception of those in Algiers, the Jews of Barbary are governed by their own laws. Those in Tunis have a kaid or governor appointed by the Bey, and who may be considered as their first magistrate in all things temporal; but their spiritual concerns are managed by the chief rabbi, who possesses great power, more than even the kaid himself. The Jews are all a very laborious people; and are in fact the only working class in Barbary.

The *Turks* have been for three centuries the dominant people of Algiers, Tunis, and Tripoli, and do not differ in any respect from their brethren in Asia. Sprung from them is a mixed race called *Koulouglis*, consisting of the offspring of Turks by Moorish women. They are generally a well-formed handsome people, possessing most of the vices of the Moors, but displaying much more refinement and cleanliness. With the Moorish features they have whiter skins, and are more comely; they lead a life of ease and indolence, being generally rich, from the inheritance of their fathers — an inheritance accruing mostly from the profits of piracy.

From time immemorial the people of Barbary have possessed Negro slaves, brought from Soudan. Almost all the Moors, with the exception only of the very poorest classes, possess slaves, whose habits and manner of living are precisely the same as those of their masters. They exercise all sorts of callings, and many of them are masons. The negroes may purchase their freedom either with money or by services; and many persons when they die manumit all their slaves. The latter then become Moslems, if they were not so already, and immediately enjoy all the immunities of free citizens. Such is the origin of the negro population now existing in Barbary. They are distinguished from the Moors only by their features and complexion, and

perhaps by a few superstitious practices peculiar to themselves; but they enjoy many political and civil privileges of the latter. They often enlist as soldiers, and are generally very brave. In Morocco they form the Sultan's body-guard, which is composed of the best portion of his army.

Besides the classes already mentioned, there are a few Christians, who are chiefly European merchants, and also a small number of renegadoes in the principal towns; but Christian slavery no longer exists.

Barbary is divided into four large independent states: — *Morocco*, *Algiers*, *Tripoli*, and *Tunis*, which last includes *Barca*.
